If the instrument does not meet the requirements of each of the following tests it is to be considered defective and should be repaired. Tests should be conducted at ambient room temperature 25°C (77°F). The instrument must be baked and resealed if opened. The instrument should be tapped lightly when test readings are taken.

BALANCE TEST

a. With the instrument in its normal operating position, scale vertical and upright, pivot axis horizontal, the pointer shall be on the center of the zero mark on the scale.

b. Tilt the instrument from this position 60 degrees to the left, to the right, and forward or backward. The pointer shall not deviate more than one-half the pointer tip width from its original position when checked in any of the aforementioned positions. If it does it will be necessary to rebalance the moving element assembly.

TROUBLE SHOOTING CHART

TROUBLE	PROBABLE CAUSE	REMEDY
FRICTION	Damaged pivots or jewel screws. Foreign particle in air gap. Fuzz on moving coil. Moving coil touching core. Distorted spring. Jewel screws too tight.	Replace pivots or jewel screws. Remove particle. Remove fuzz. Readjust jewel screws for proper moving coil clearance. Replace moving coil if it is bent or distorted. Realign spring with fine tweezers or replace it entirely. Readjust jewel screws.
NO INDICATION	Open moving coil. Poor solder connection.	Replace moving coil. Resolder connection.
VARIABLE READING	Poor connections. Friction. Loose balance weight. Distorted spring in moving element.	Tighten or resolder connections. See FRICTION section above. Replace balance weight and rebalance. Realign spring with fine tweezers or replace it entirely.
INDICATES LOW	Friction. Loose connections. Spring test too high. Shorted turns on moving coil or incorrect moving coil. Incorrect resistance. Insufficient magnet strength.	See FRICTION above. Tighten or resolder connections. Replace springs. Replace moving coil. Replace or adjust resistor. Recharge and treat magnet.
INDICATES HIGH	Spring test too low. Incorrect moving coil. Excessive magnet strength. Incorrect resistance.	Replace springs. Replace moving coil. Treat magnet. Replace resistor.
CALIBRATION ERROR IN EXCESS	Moving element poorly balanced. Distorted spring.	Rebalance moving element. Realign spring with fine tweezers or replace it entirely.

DIELECTRIC TEST

a. Gradually apply 1500 Volts RMS, sinusoidal 60 cycles, for five seconds between the back connection terminals, connected together, and the case. Gradually reduce the voltage at the end of the five second test.

b. If breakdown occurs check the instrument internally for loose metal particles.

WATERTIGHTNESS

a. Immerse the instrument in water and apply a vacuum equivalent to an absolute pressure of two inches of mercury for two minutes. There shall be no stream of bubbles from the instrument. Bubbles from the water or clustered around the instrument may be ignored.

b. After releasing the vacuum and removing the instrument from the water there shall be no evidence of water within the case.

c. If moisture is found within the case replace the gasket and reseal.

ADJUSTMENT PROCEDURES

FINAL JEWEL ADJUSTMENT

a. Make the final jewel adjustment under open circuit conditions. Alternately adjust the top and bottom jewel screws until the distance from the core to the top and bottom of the moving coil is equal.

b. Deflect the pointer from its original rest position and let the pointer oscillate. Tighten the top jewel screw slowly until a slight damping is detected. Back off from this point one-eighth to one-quarter of a turn.

c. Apply red butyl methacrylate cement, Weston SND 23317-001, to the top and bottom jewel screws.

MAGNET CHARGING

a. If the mechanism assembly was disassembled the magnet must be recharged on a suitable magnet charger having a capacity of at least 33,000 ampere turns DC.

b. After charging, the pointer must deflect in a clockwise direction with positive polarity applied to the bracket top insulated solder abutment.

c. *If the pointer deflects to the opposite direction, reverse* the charge on the magnet.

BALANCING MOVING ELEMENT

Before attempting to balance the moving element make sure that the pointer is straight and swings parallel to and between 0.05 and 0.10 inch from the scale plate. The moving element must be well balanced about the axis of rotation in order that the calibration will check in the normal operating position as well as when tilted. Adjustable balance weights are provided on the pointer arms for balancing purposes. The general procedure for balancing the instrument moving element is as follows:

a. Hold the instrument so that the scale plate is in horizontal position and adjust the pointer to 0 by means of the bracket top abutment.

b. Turn the instrument so that the scale is in a vertical position and the pointer is parallel to the floor.

c. Adjust the tail weight, in or out, until the pointer rests at the 0 mark and is parallel to the floor.

d. Rotate the instrument until the pointer is perpendicular to the floor.

e. Adjust the side arm weights until the pointer rests at the 0 mark and is perpendicular to the floor.

f. Repeat steps b. thru e. until proper balance is achieved. (See Balance Test.)

INSTRUMENT SEALING

NOTE

Perform Calibration Procedure, if necessary, prior to sealing.

a. The instrument window, flange, gasket, and bezel must be clean before sealing. Never use alcohols, petroleums, or similar solvents on the window.

b. Dampen a soft cotton pad with Weston anti-static solution "Statnul" ® and apply to the inside and outside surfaces of the window. Allow a slight haze to form by air drying. Polish with a soft clean cotton pad until haze is just visible.

c. Insert a dirt free metal spacer (such as a paper clip) between case flange and window for ventilation during next step.

d. Bake instrument in an oven, free of dirt and lint, for 2 hours at 145° -165° F.

e. Upon removal from oven, remove metal spacer and immediately press window tightly against case flange with palm of hand to provide a temporary seal while completing following steps.

f. Place the instrument with the bezel and window face down on a flat soft surface and align the holes on the bezel with the holes of the case flange.

g. Tighten all four case to bezel screws lightly initially to hold bezel in place, then proceed to tighten screws at a torque of 5 to 6 in. lbs. When tightening screws, tighten screws directly opposite one previously tightened.

h. When sealed, the instrument must pass the aforementioned watertightness test.

CALIBRATION PROCEDURE

a. Prior to instrument calibration wire resistor coil in series with the mechanism, as shown in Figure 2.

b. Connect the instrument to the standard calibrator as shown in Figure 1, using leads with 0.065 ohms resistance. Apply end scale voltage. If the pointer does not go beyond the end scale mark the spring test is too high, the moving coil has an insufficient number of turns, or the magnet is not fully charged.

c. Position the mechanism between the jaws of an energized demagnetizing coil. Increase the voltage to the demagnetizing coil slowly until the pointer rests at the end scale mark with end scale voltage applied.

d. Exercise care not to over-treat as the magnet will then have to be recharged.

PECULIAR REPLACEMENT PARTS LIST
MODEL 1511 DC MILLIVOLTMETER

GENERAL

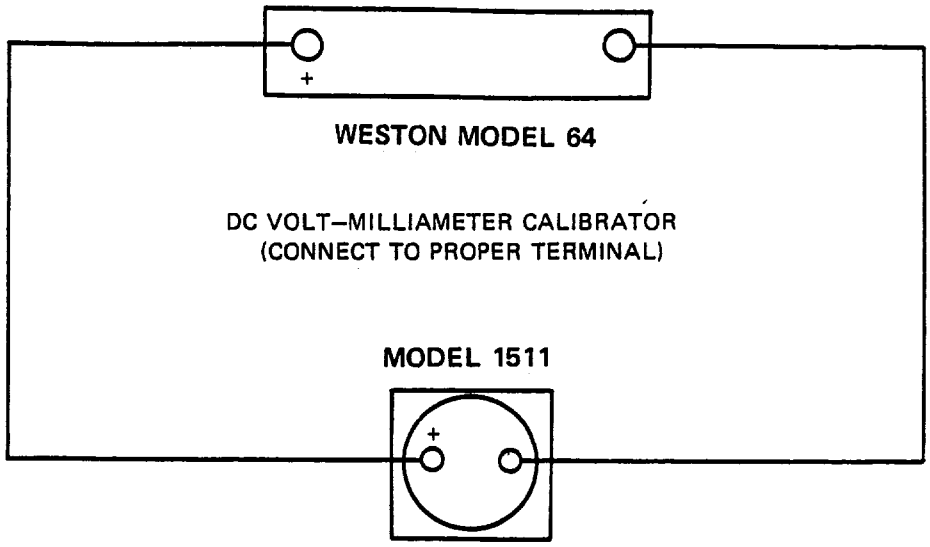
This manual contains operating, maintenance, testing and calibration instructions with replacement parts list for the Weston Model 1511 DC Milliammeter, part number 253199, manufactured by Weston Instruments Division, Weston Instruments, Inc., Newark, New Jersey.

This milliammeter is a sealed, ruggedized, permanent magnet, moving coil type instrument designed for use in the vicinity of shock or vibration. It is provided with a special slotted bezel to allow for external edge lighting.

The meter is calibrated and tested as a milliammeter but indicates Volts, DC. It is intended for use with an external 30,000 ohm resistor.

TABLE OF SPECIFICATIONS

Range	0 to 1 Milliampere DC
Scale	0 to 30 Volts DC
Resistance	100 ohms $\pm$ 1%
Accuracy	$\pm$ 2% of full scale
Case	1.5 inch dia steel barrel with rubber shock mountings.



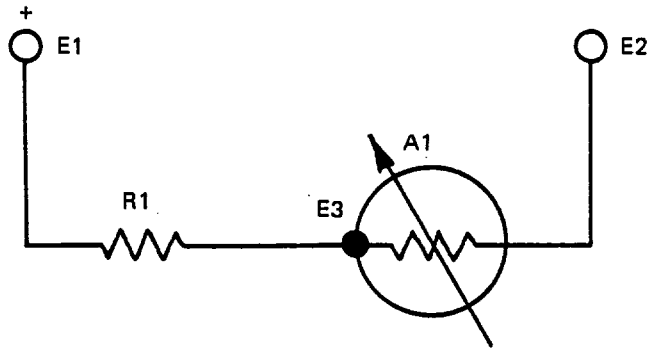


Figure 1. Calibration Circuit

A1 - Instrument Mech Assy (Resistance 17 ohms ± 20%).
E1 - Case Positive Back Connection Terminal.
E2 - Case Negative Back Connection Terminal.
E3 - Bracket Insulated Top Terminal.
R1 - Resistance Coil (94.0 ohms +15% - 0%).

Figure 2. Internal Wiring Diagram.

OPERATING AND INSTALLATION INSTRUCTIONS

a. Mount the instrument on a vertical panel prepared in accordance with the drilling plan. (See Figure 3.) The panel material may be steel or a nonmagnetic material since the case provides magnetic shielding.

b. Connect the circuit lead wires to the back connection terminals, observing proper polarity.

MAINTENANCE INSTRUCTIONS

a. It is recommended that the instrument be tested for proper performance at twelve month intervals. It should always meet the requirements as stated in the Test Procedure and Calibration Check.

b. No lubrication is required of this instrument.

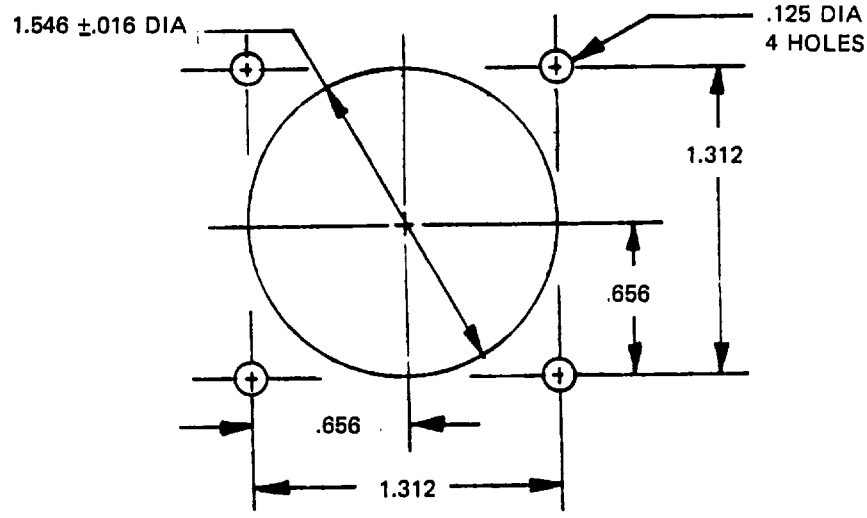

Figure 3. Panel Drilling Plan

CALIBRATION CHECK

a. Connect the instrument in circuit as illustrated in Figure 1.

b. Energize the instrument and check each cardinal point on the scale from 0 to end scale mark.

c. Each indication must be accurate to within 2% of full scale.

d. If the indications are not within the accuracy limits, refer to the following trouble shooting chart and test procedures to determine the probable cause of calibration error.

TEST PROCEDURES

If the instrument does not meet the requirements of each of the following tests it is to be considered defective and should be repaired. Tests should be conducted at ambient room temperature 25°C (77°F). The instrument must be baked and resealed if opened. The instrument should be tapped lightly when test readings are taken.

BALANCE TEST

a. With the instrument in its normal operating position, scale vertical and upright, pivot axis horizontal, the pointer shall be on the center of the zero mark on the scale.

b. Tilt the instrument from this position 60 degrees to the left, to the right, and forward or backward. The pointer shall not deviate more than one-half the pointer tip width from its original position when checked in any of the aforementioned positions. If it does it will be necessary to rebalance the moving element assembly.

TROUBLE SHOOTING CHART

TROUBLE	PROBABLE CAUSE	REMEDY
FRICTION	Damaged pivots or jewel screws. Foreign particle in air gap. Fuzz on moving coil. Moving coil touching core. Distorted spring. Jewel screws too tight.	Replace pivots or jewel screws. Remove particle. Remove fuzz. Readjust jewel screws for proper moving coil clearance. Replace moving coil if it is bent or distorted. Realign spring with fine tweezers or replace it entirely. Readjust jewel screws.
NO INDICATION	Open moving coil. Poor solder connection.	Replace moving coil. Resolder connection.
VARIABLE READING	Poor connections. Friction. Loose balance weight. Distorted spring in moving element.	Tighten or resolder connections. See FRICTION section above. Replace balance weight and rebalance. Realign spring with fine tweezers or replace it entirely.
INDICATES LOW	Friction. Loose connections. Spring test too high. Shorted turns on moving coil or incorrect moving coil. Incorrect resistance. Insufficient magnet strength.	See FRICTION above. Tighten or resolder connections. Replace springs. Replace moving coil. Replace or adjust resistor. Recharge and treat magnet.
INDICATES HIGH	Spring test too low. Incorrect moving coil. Excessive magnet strength. Incorrect resistance.	Replace springs. Replace moving coil. Treat magnet. Replace resistor.
CALIBRATION ERROR IN EXCESS	Moving element poorly balanced. Distorted spring.	Rebalance moving element. Realign spring with fine tweezers or replace it entirely.

DIELECTRIC TEST

a. Gradually apply 1500 Volts RMS, sinusoidal 60 cycles, for five seconds between the back connection terminals, connected together, and the case. Gradually reduce the voltage at the end of the five second test.

b. If breakdown occurs check the instrument internally for loose metal particles.

WATERTIGHTNESS

a. Immerse the instrument in water and apply a vacuum equivalent to an absolute pressure of two inches of mercury for two minutes. There shall be no stream of bubbles from the instrument. Bubbles from the water or clustered around the instrument may be ignored.

b. After releasing the vacuum and removing the instrument from the water there shall be no evidence of water within the case.

c. If moisture is found within the case replace the gasket and reseal.

ADJUSTMENT PROCEDURES

FINAL JEWEL ADJUSTMENT

a. Make the final jewel adjustment under open circuit conditions. Alternately adjust the top and bottom jewel screws until the distance from the core to the top and bottom of the moving coil is equal.

b. Deflect the pointer from its original rest position and let the pointer oscillate. Tighten the top jewel screw slowly until a slight damping is detected. Back off from this point one-eighth to one-quarter of a turn.

c. Apply red butyl methacrylate cement, Weston SND 23317-001, to the top and bottom jewel screws.

MAGNET CHARGING

a. If the mechanism assembly was disassembled the magnet must be recharged on a suitable magnet charger having a capacity of at least 33,000 ampere turns DC.

b. After charging, the pointer must deflect in a clockwise direction with positive polarity applied to the bracket top insulated solder abutment.

c. If the pointer deflects to the opposite direction, reverse the charge on the magnet.

BALANCING MOVING ELEMENT

Before attempting to balance the moving element make sure that the pointer is straight and swings parallel to and between 0.05 and 0.10 inch from the scale plate. The moving element must be well balanced about the axis of rotation in order that the calibration will check in the normal operating position as well as when tilted. Adjustable balance weights are provided on the pointer arms for balancing purposes. The general procedure for balancing the instrument moving element is as follows:

a. Hold the instrument so that the scale plate is in horizontal position and adjust the pointer to 0 by means of the bracket top abutment.

b. Turn the instrument so that the scale is in a vertical position and the pointer is parallel to the floor.

c. Adjust the tail weight, in or out, until the pointer rests at the 0 mark and is parallel to the floor.

d. Rotate the instrument until the pointer is perpendicular to the floor.

e. Adjust the side arm weights until the pointer rests at the 0 mark and is perpendicular to the floor.

f. Repeat steps b. thru e. until proper balance is achieved. (See Balance Test.)

INSTRUMENT SEALING

NOTE

Perform Calibration Procedure, if necessary, prior to sealing.

a. The instrument window, flange, gasket, and bezel must be clean before sealing. Never use alcohols, petroleums, or similar solvents on the window.

b. Dampen a soft cotton pad with Weston anti-static solution "Statnul"® and apply to the inside and outside surfaces of the window. Allow a slight haze to form by air drying. Polish with a soft clean cotton pad until haze is just visible.

c. Insert a dirt free metal spacer (such as a paper clip) between case flange and window for ventilation during next step.

d. Bake instrument in an oven, free of dirt and lint, for 2 hours at 145° -165° F.

e. Upon removal from oven, remove metal spacer and immediately press window tightly against case flange with palm of hand to provide a temporary seal while completing following steps.

f. Place the instrument with the bezel and window face down on a flat soft surface and align the holes on the bezel with the holes of the case flange.

g. Tighten all four case to bezel screws lightly initially to hold bezel in place, then proceed to tighten screws at a torque of 5 to 6 in. lbs. When tightening screws, tighten screws directly opposite one previously tightened.

h. When sealed, the instrument must pass the aforementioned watertightness test.

CALIBRATION PROCEDURE

a. Prior to instrument calibration wire resistor coil in series with the mechanism, as shown in Figure 2. The resistance of the coil shall be adjusted to allow for instrument terminal resistance as given in Table of Specifications.

b. Connect the instrument to the standard calibrator as shown in Figure 1. Apply full scale current. If the pointer does not go beyond the end scale mark the spring test is too high, the moving coil has an insufficient number of turns, or the magnet is not fully charged.

c. Position the mechanism between the jaws of an energized demagnetizing coil. Increase the voltage to the demagnetizing coil slowly until the pointer rests at the end scale mark with full scale current applied.

d. Exercise care not to over-treat as the magnet will then have to be recharged.

PECULIAR REPLACEMENT PARTS LIST
MODEL 1511 DC MILLIAMMETER
P/N 253199

In order to formulate the complete replacement parts list for this milliammeter insert the following line item information into the common parts list. Upon transposition, the common parts list will become a complete and specific replacement parts list for part number 253199.

OVERHAUL MANUAL

AIRCREW SEAT HARNESS TYPE E. 136879/80

1. DESCRIPTION AND OPERATION

A. DESCRIPTION

The seat harness consists of the following parts:

(1) Shoulder strap assembly.

(2) Right and left-hand lap belts.

(3) Release buckle.

(4) Harness reel.

Shoulder Strap Assembly (See figure 1).

This strap assembly is a Y-shaped harness made from nylon webbing. The single strap of the harness is attached to the harness reel, and another strap is stitched in position to form 'arms' of equal length. Metal buckle plug-in fittings are stitch into folds on each end of the strap 'arms'.

Lap Belts (See figure 1).

The lap belts, which are made in left and right hand parts, are also made in nylon webbing. The belts have metal snap hook attachment plates on one end and plug-in fittings on the other end. The snap hook attachment plates secure the belts to the seat and the plug-in fittings engage in the release buckle. The plug-in fitting on one belt is permanently anchored to the release buckle. Both lap belts are fitted with adjustment buckles.

Release Buckle.

The release buckle is a cylindrical housing in which the plug-in fittings on the shoulder straps and free lap belt are inserted and automatically secured. The buckle contains mechanism which, when operated, immediately releases the shoulder straps separately, or the shoulder straps and lap belts simultaneously.

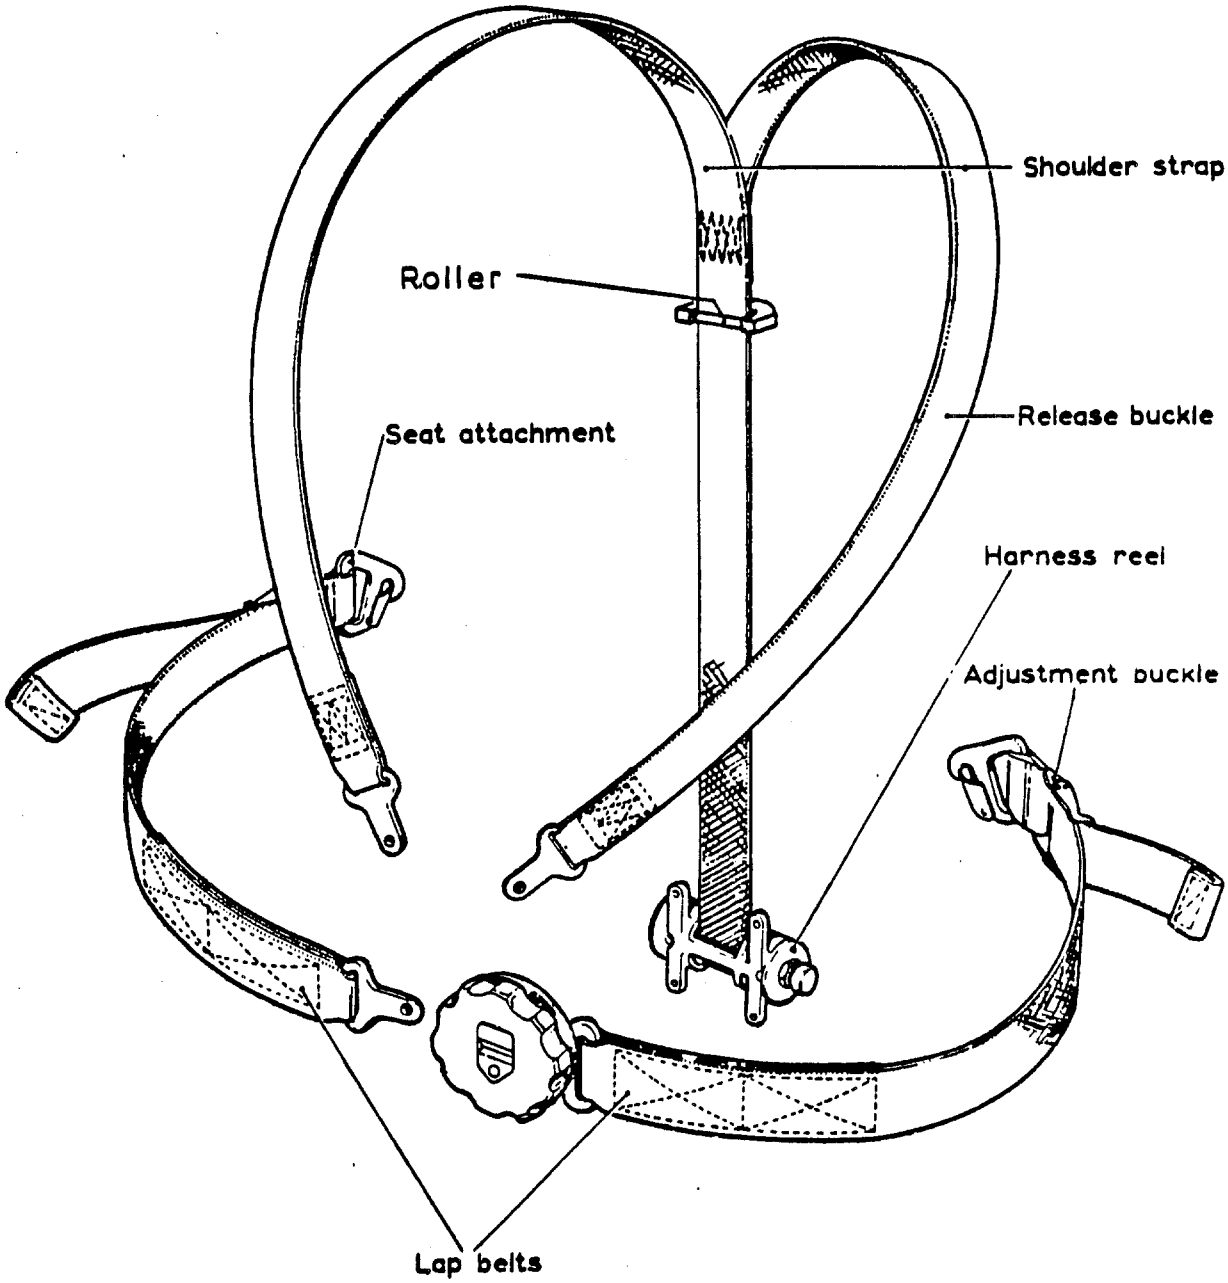

Figure 1. Harness Assembly

Harness Reel Assembly (See figure 2)

The Reel is a cylindrical body with integral mounting lugs which houses the harness spool. The spool, which consists of a central drive shaft with a guide disc at each end, is mounted in bearing plates. The drive shaft has a square end for engagement with a helical torsion spring, and it has a flange formed on the opposite end. This flange has three tracks machined in it to accommodate three steel balls.

Adjacent to the drive shaft flange, and mounted on a shaft protruding from the centre bore in the drive shaft, there is an inertia plate. The inertia plate also has three tracks machined in one face for engagement with the steel balls, and it has teeth machined in the opposite face.

Fixed to the end of the reel body is a brake plate which has teeth machined in the face opposite the inertia plate. In the centre bore of the brake plate there is a damper assembly. The damper has an outer shaft with teeth formed on its face and a hollow shaft which slides in the bore of an adaptor. The hollow shaft accommodates a spring loaded plunger and the adaptor is threaded to suit the nut on the operator unit assembly.

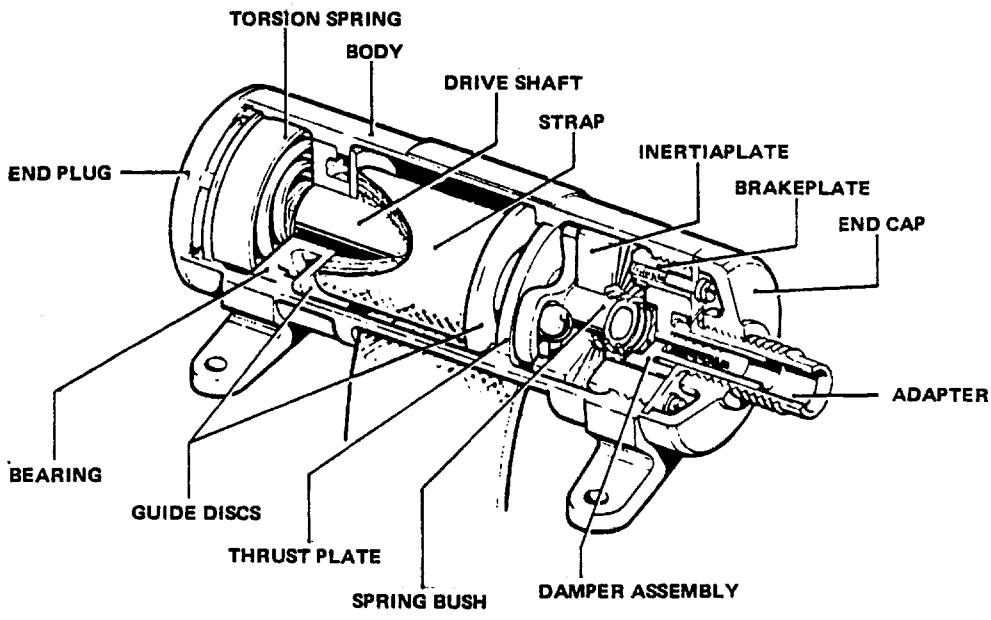

Figure 2. Harness Reel

B. Operation

With the shoulder straps and the lap belts connected to the buckle, the crew member is able to move forward without restriction to the limit of the shoulder strap reel-out. As the crew member moves backward and forwards the shoulder harness strap reels-in and out of the harness reel under the control of the helical torsion spring. While this easy movement is in progress the drive shaft and inertia plate move in harmony through the agency of the steel balls.

When the shoulder harness is drawn from the reel at accelerations in excess of 1 to 1.5 G, the drive shaft rotates too rapidly for the steel balls to transmit the drive to the inertia plate. This lag causes the balls to ride up the sloping tracks thus moving the inertia plates away from the drive shaft, causing the teeth in the inertia plate to engage with the teeth in the brake plate preventing further rotation of the drive shaft and, consequently, no further reel-out of the shoulder harness.

The reel will remain locked until the load in the shoulder harness falls below that exerted by the helical torsion spring. The drive shaft will then rotate, reeling in the reel strap, at the same time allowing the balls and inertia plate, under pressure from the inertia plate spring, to return to their original retracted position against the drive shaft. Free movement can then again take place.

The shoulder harness can be released independently by depressing and releasing the pawl in the front cover of the release buckle. The whole harness can be released by turning the front cover in any direction.

C. DATA

Acceleration of reel strap to produce locking	1.0 to 1.5 G
Movement of wearers shoulders sideways or forward with lap belt fastened	180 degrees
Maximum movement when locking at 1.5 G	1.5 in.
Maximum movement when locking at 15 G	0.5 in.
Ultimate strength of shoulder straps as a pair	2,400 lb. Min.
Ultimate strength of lap strap	2,400 lb. Min.
Weight of complete harness	3 lb. 6 oz. Approx.

2. DISASSEMBLY.

(A) Shoulder Strap Assembly.

(B) Lap Belts.

(C) Release Buckle.

CAUTION: THESE ASSEMBLIES MUST NOT BE DISMANTLED. IF IT IS FOUND, AS THE RESULTS OF CHECKS OR SERVICE EXPERIENCE THAT THEY ARE DEFECTIVE, THEY SHOULD BE REJECTED.

(D) Harness Reel (See figure 3).

Check that the work bench and all tools are absolutely clean. Obtain key part number B. 74435 and proceed as follows:

(1) Remove snap-on end plug (1).

(2) Pull out strap (2) to full extent, insert key part number B. 74435 and engage sliding end with body.

(3) Release straps (2) by screwing Extractor Key Part No. A. 74699 onto strap retaining pin (3) and easing the strap retaining pin out through the end of the shaft.

(4) Disengage the sliding end and allow the drive shaft to unwind slowly in a clockwise direction and remove the key.

(5) Remove Anderton clip (4) and retaining plate (5).

(6) Carefully remove spring (6) by withdrawing it from the centre.

(7) Recoil the spring and tie with locking wire or string.

(8) Unscrew end cap (7).

(9) Cut locking wire (8) and loosen screws (9).

(10) Remove screw (9) and collect washers (10).

(11) Remove adaptor (11), damper assembly (23) and spring (12).

(12) Unscrew locking peg (13) and brake plate (14).

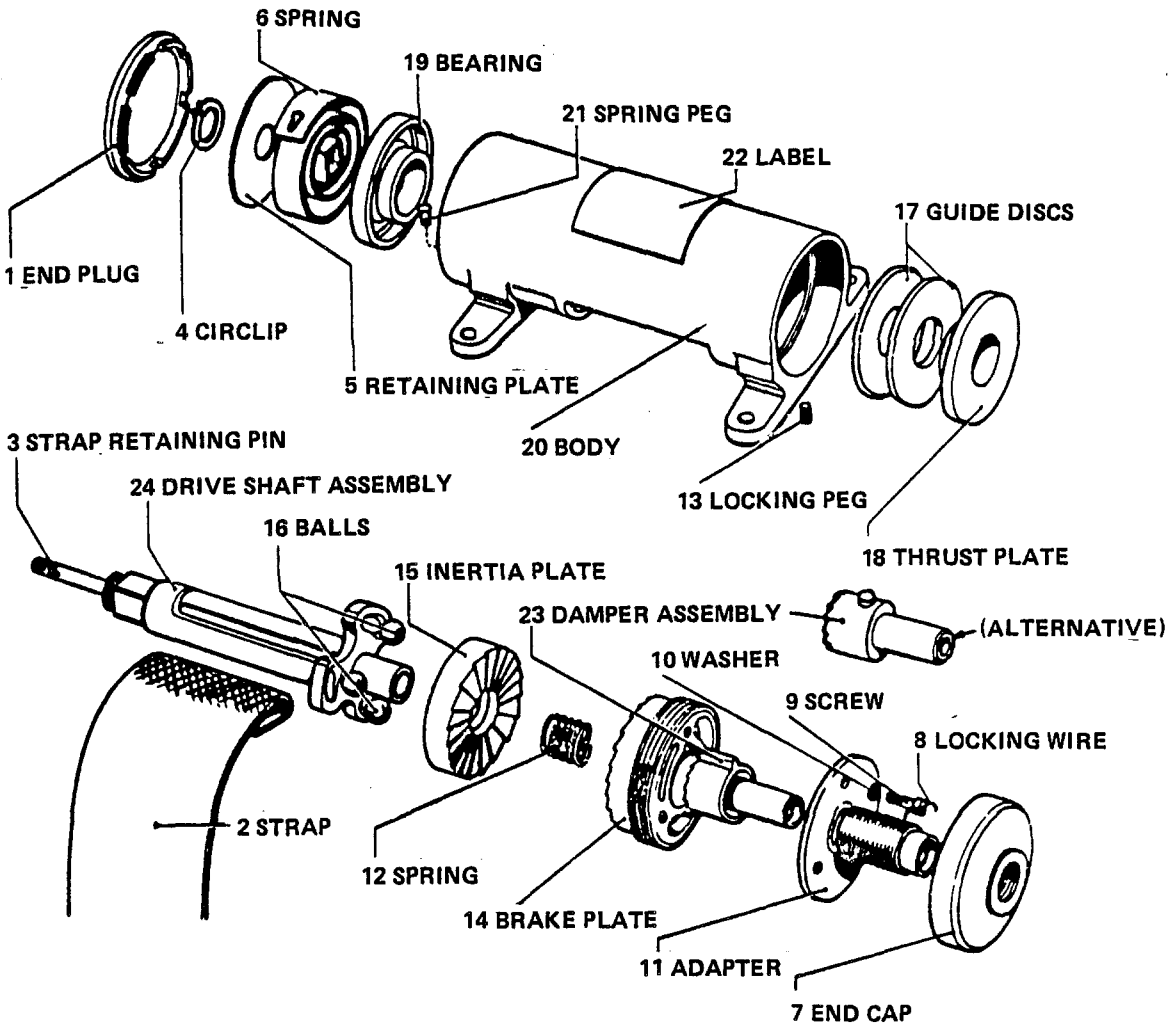

Figure 3. Exploded View of Harness Reel

(13) Withdraw inertia plate (15) and collect steel balls (16).

(14) Draw out drive shaft assembly (24).

(15) Collect guide discs (17) through slot in body (20).

(16) Draw out thrust plate (18) and bearing (19).

NOTE: Dismantling of the damper assembly (23) and drive shaft assembly (24) is not recommended. The spring peg (21) should only be removed if it is damaged.

3. CLEANING.

A. Shoulder Strap and Lap Belts.

Clean the webbing with a soft brush using pure soap and clean water.

CAUTION: DO NOT USE CAUSTIC SOLUTIONS FOR CLEANING PURPOSES.

B. Release Buckle.

Clean exterior with a clean, dry cloth and blow out dust and dirt with a jet of clean dry air.

C. Harness Reel.

Clean all unpainted metal parts with carbon tetra-chloride.

4. INSPECTION.

A. Shoulder Strap and Lap Belts.

(1) Check webbing for cleanliness, fraying, opening of weave, evide of deterioration, security of stitching and attachments.

(2) Inspect attachments for distortion, cracks, corrosion and other damage.

(3) Apply proof load test described in 'Testing'.

B. Release Buckle.

(1) Check buckle cover and casing for signs of distortion, corrosion and damage.

(2) Check correct operation.

(3) Apply proof load test described in 'Testing'.

C. Harness Reel.

(1) Check all parts for cleanliness, signs of distortion, corrosion and damage.

(2) Check all plastic parts for cleanliness, tears, dents and abrasio

(3) Examine torsion spring for set, cracks, damage and distortion c centre square.

(4) Check that spring moment equals 2.5 lb/in. approx.

(5) Inspect spring peg for security, and signs of damage or corrosic

(6) Check steel balls for corrosion, cracks and chips.

(7) Examine ball tracks for severe burrs, distortion, signs of seve wear and jamming.

NOTE: The ball tracks become indented during normal use and during inspection the severity should be gauged.

(8) Check all face teeth for burrs, severe breaks, chipping and other damage.

NOTE: The top of the teeth become worn during normal use. The purpose of inspection is to gauge the severity of wear.

(9) Check that inertia plate spring will compress to 0.35 in. under a load of 0.75 lb. approx.

(10) Check integrity of damper key and keyway in brake plate.

(11) Check that the damper spring retaining pin moves freely and returns immediately the load is relieved.

(12) Check that the internal bore in the adaptor is clean and free of burrs, and that there are no signs of malfunctioning.

(13) Check serviceability of all threads.

(14) Check that parts are not worn beyond the limits specified in the table of Fits and Clearances.

5. REPAIR.

A. Shoulder Strap and Lap Belts.

(1) If any parts of this assembly fail to pass the inspection or proof tests, they should be renewed.

CAUTION: AFTER RENEWING A PART, THE WHOLE ASSEMBLY MUST BE SUBJECTED TO A PROOF TEST (See 'Testing').

B. Release Buckle.

(1) If the release buckle fails to pass the inspection or proof tests, it should be returned to the manufacturer.

C. Harness Reel.

(1) Renew all metal parts which are distorted worn, damaged or corroded.

(2) Renew the inertia plate if the teeth or ball tracks are severely worn or damaged.

(3) Renew the drive shaft assembly if the ball tracks are severely worn or damaged.

(4) If the teeth on the brake plate are severely worn or damaged:

(i) Fit the adaptor to the new plate and secure with the three screws and washers.

(ii) Screw this assembly firmly into the reel body.

(iii) Check to see that the peg hole in the body is not coincident with one of the adaptor screws.

(iv) Unscrew, if necessary, sufficiently to clear adaptor screw

(v) Using a No. 21 (0.159 in.) drill, bore through until drill breaks into a brake plate cavity.

CAUTION: DO NOT DRILL BEYOND BRAKE PLATE CAVITY AND ENSURE THAT DRILL FOLLOWS TH CENTRE OF LOCKING PEG HOLE.

(vi) Tap hole 10-32 U.N.F.

(vii) Disassemble parts and remove all swarf.

(5) Renew all plastic parts which are worn, torn, deformed or otherwise damaged.

(6) Renew the steel balls if they are cracked, chipped, corroded or otherwise damaged.

(7) Renew the torsion spring if it fails to pass the inspection checks.

(8) If the spring peg is damaged:

(i) Carefully drill out existing peg.

(ii) Fit new peg and rivet carefully.

(9) Renew the damper assembly if it fails to pass the inspection checks.

(10) Rectify slight damage to external threads with a fine file.

(11) Renew all parts which are worn beyond the specified limit.

6. ASSEMBLY.

A. Harness Reel (See figure 3).

CAUTION: IT IS ABSOLUTELY ESSENTIAL THAT ASSEMBLY OPERATIONS SHOULD BE CARRIED OUT IN CONDITIONS OF SCRUPULOUS CLEANLINESS.

NOTE: The following instructions assume that all the necessary repairs have been carried out.

(1) Insert bearing (19) and thrust plate (18) squarely into body (20) and retain with Loctite grade 'C'.

CAUTION: DO NOT ASSEMBLE DRIVE SHAFT ASSEMBLY (24) UNTIL THE LOCTITE HAS FULLY HARDENED (4 HOURS MINIMUM

(2) Apply grease (Spec. DTD 825) to the bearing surfaces of thrust plate (18) and bearing (19).

(3) Insert guide discs (17) through slot in body.

(4) Slide drive shaft assembly (24) through thrust plate, guide discs and bearing.

NOTE: When performing the above operation ensure that the radiused edges of the guide discs face each other.

(5) Lightly smear balls (16) with grease (Spec. DTD 825) and drop them in the tracks in the drive shaft flange.

(6) Slide on inertia plate (15) and engage its tracks with the balls.

(7) Unite adaptor (11) and brake plate (14) and secure with screws (9) and washers (10).

NOTE: Do not tighten screws at this stage.

(8) Slide in damper assembly (23) and check that it moves freely.

(9) Tighten screws (9) and repeat check for free movement of the damper assembly.

(10) Apply grease (Spec. DTD 825) to spring (12) and fit it over bush protruding through inertia plate.

(11) Taking great care, screw the brake plate and the damper assembly into the body (20).

(12) Adjust the brake plate until the tapped hole is aligned with the peg hole in underside of body.

(13) Insert locking peg (13) and tighten firmly.

(14) Lightly apply grease (Spec. DTD 825) to torsion spring (6).

(15) Hook the spring over its peg with the short end of the spring to the left.

NOTE: In its assembled position, anti-clockwise rotation, viewed from this end, should tighten spring.

(16) Slide square in centre of spring over the end of the drive shaft.

(17) Fit retaining plate (5) and Anderton clip (4).

(18) APPLY TESTS DESCRIBED IN 8.0 TESTING.

NOTE: After satisfactory completion of tests proceed with the following:

(19) Wire-lock screws (9).

(20) Screw on end cap (7).

(21) If the harness reel is not to be fitted with a harness (i.e. the reel is to be used as a spare) proceed as follows:

(i) Insert reel in polythene bag together with strap retaining pin (3) and end plug (1).

(22) If a harness is to be fitted to the reel, proceed as follows:

(i) Insert key (Part No. B. 74435) into shaft and turn in an anti-clockwise direction until the spring becomes solid, then slacken off one complete turn.

(ii) Slide handle to engage with body.

(iii) Fold over end of reel strap (2) to about 3/8 in.

(iv) With a steel rule or similar instrument, push the fold on strap firmly into the slot in drive shaft, ensuring that the folded over portion of the reel strap, where it joins the shoulder strap, is toward the centre of the reel and that the reel strap passes through the correct hole in the body. (See figure 1).

NOTE: When finally inserted, the end of the reel straps should be flush with or very slightly below the outer surface of the drive shaft.

(v) Screw Extractor Key (Part No. A. 74699) on retaining pin (3) and insert it through the end of the shaft, checking that the strap does not bunch up at one end of the slot.

(vi) Pull firmly on the strap to wedge the retaining pin.

(vii) Remove the key and allow the strap to reel-in SLOWLY.

(viii) Check that the strap reels-in and out freely.

(ix) Snap on end cap.

NOTE: If the harness assembly is not to be returned to service immediately, insert it, together with the associated lap belts into a polythene bag and pack in a suitable carton.

B. Materials

The following grease is to be used during assembly.

Grease DTD 825 American Spec. MIL. G. 3278A.

7. FITS & CLEARANCES (See figure 4)

A. Harness Reel.

Ref. No. Fig. 5 (1)	Description (2)	Dimension new (inches) (3)	Clearance new (inches) (4)	Permissible worn Clearance (inches) (5)	Remarks (6)

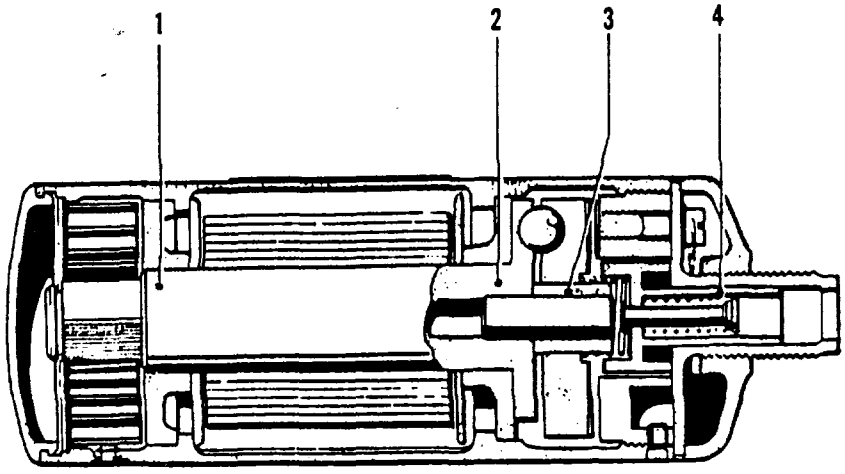

Figure 4. Key Diagram - Fits and Clearances

8. TESTING.

A. Harness and Release Buckle.

(1) Unite harness and release buckle.

(2) Attach lap belts and reel strap as shown in Figure 5.

(3) Apply a load of 650 lb. approx. to shoulder harness.

(4) Reduce load to 110 lb. and operate release buckle.

(5) Check that the load applied at the rim to release the buckle does not exceed 20 lb.

NOTE: If the release buckle fails to pass the specified test, or if any part of the harness is found to be defective, they should be renewed.

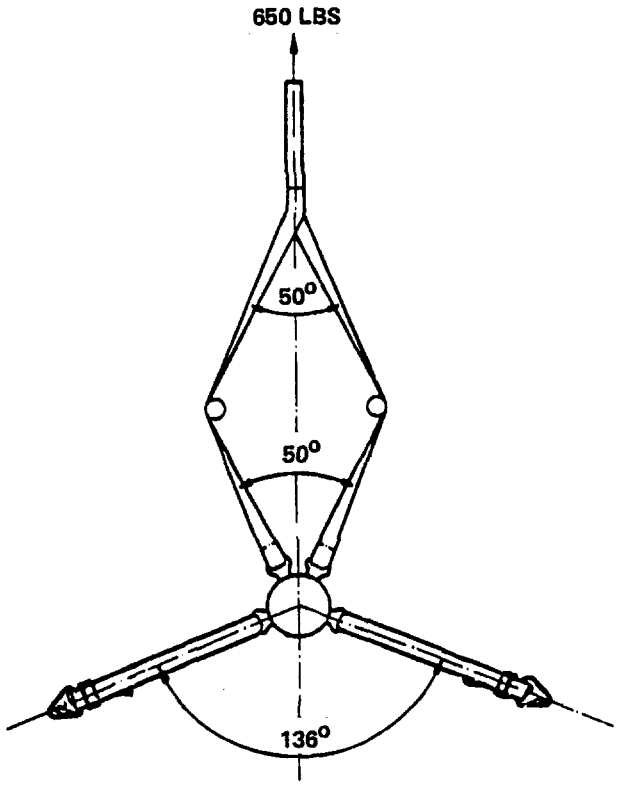

Figure 5. Proof Loading Diagram

B. Harness Reel.

(1) Using key (Part No. B74435) pre-load torsion spring by turning approximately five turns in an ANTI-CLOCKWISE direction.

(2) Fit test strap (Part No. B74407) as described in Assembly 6.22.

(3) Check that the test strap reels-in and out freely.

(4) Fit reel on test rig (Part No. E74467) raise beam and attach the strap (See figure 6).

(5) Set the weight to the 1G position.

(6) Release the beam.

(7) Raise and release beam six times and check locking.

(8) If the reel consistently locks in the 1G position (more than four times out of six):

(i) Remove the three adaptor screws and collect their washers.

(ii) Withdraw the adaptor and the damper assembly taking care not to drop spring.

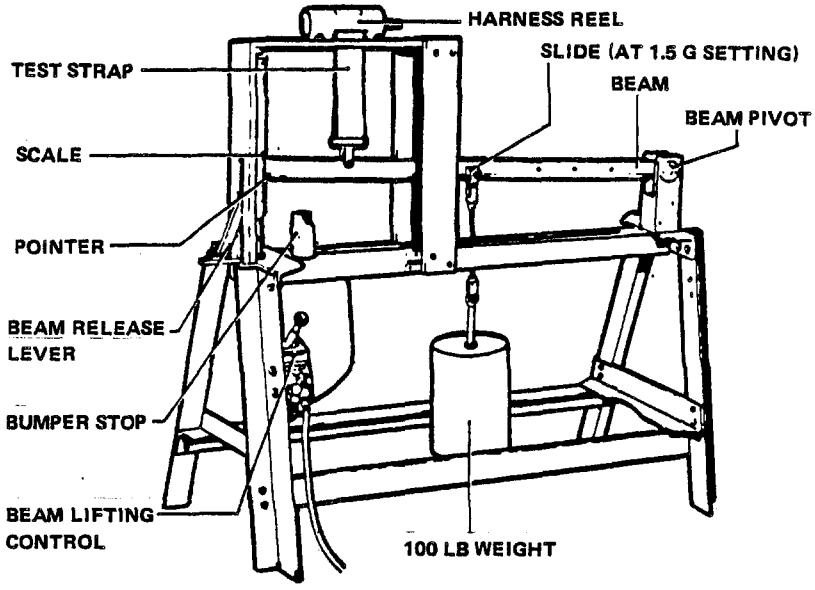

Figure 6. Test Rig

(iii) Insert shims (Part No. B74408) into the front recess of the damper.

(iv) Reassemble and repeat the above test.

(v) Fit additional shims, if necessary, until reel locks above 1G.

(9) Slide the weight to the 1.5G position on beam.

(10) Release the beam sharply and check that the reel locks within 1.5 in. movement of the strap.

(11) Repeat the test six times to check for consistent functioning.

(12) After satisfactory completion of tests, complete assembly and preparation for service or store as instructed in Assembly 6.21 and 6.22.

9. TROUBLE SHOOTING

FAULT	PROBABLE CAUSE	REMEDY
Reel consistently locks at 1G loading.	'G' setting too low.	Dismantle and add shims.
Reel does not lock at 1.5G.	Too many shims added.	Dismantle and reduce number of shims.
Reel locks when strap is fully retracted.	Torsion spring load too high.	Remove strap and slacken off spring.

10. SPECIAL TOOLS, FIXTURES AND EQUIPMENT.

ITEM	DESCRIPTION	PART NUMBER
1	Test Key	Teleflex - B 74435
2	Extractor Key	Teleflex - A 74699
3	Test Strap	Teleflex - B 74407
4	Test Rig ('G' Setting)	Teleflex - E 74467

11. STORAGE.

A. Preparation

(1) If the original packing is not available, prepare the following:

(a) Packing in temperate areas:

(i) Cartons with suitable supports.

(ii) A label giving the following information:

(a) Type, mark and serial number of component.

(b) Date of removal from aircraft.

(c) Date of last overhaul.

(d) Note of any change of part.

(e) Reason for return of component.

(b) Packing in tropical areas:

(i) Items listed above.

(ii) Sufficient water resistant paper to completely enwrap components.

(iii) Polythene bag large enough to contain component and its paper wrapping.

(iv) Wrap component in the paper, insert in polythene bag and heat seal bag.

(v) Place component in the carton, secure it, enclose label described above and seal carton.

(2) If the original packing is available this should be used, and a label described above, should be included.

MAINTENANCE MANUAL; P/N 25-60-01

INTRODUCTION

1. Intended Use

This Maintenance Manual has been prepared for intended use by holders of the Type "Tul-Aircrew" Life Preserver. It outlines Inspection, Testing, and Repair Procedures. The Illustrated Parts List Section will prove helpful in ordering spare parts or components.

2. Format

The format of this Manual complies with the requirements of ATA Specification No. 100. The page number blocks allocation is as follows:

Pages 1 - 100	Description and Operation
Pages 201 - 300	Maintenance Practices
Pages 1101 - 1200	Illustrated Parts List

3. Manufacturer's Certification

This Manual complies with the Canadian Ministry of Transport Airworthiness Requirements.

4. Quality Assurance

All manufacturing, standard of quality in materials and workmanship, is controlled by an approved Quality Assurance System.

5. Approval

D.O.T. Civil Air Approval Number: 5012 L3 (SRL)

MAINTENANCE MANUAL; P/N 25-60-01

SECTION 1

DESCRIPTION AND OPERATION

1. Introduction

A. This publication is issued as the Maintenance Manual for the Type "Tul Aircrew" Life Preserver, Part No. TUL-6111.

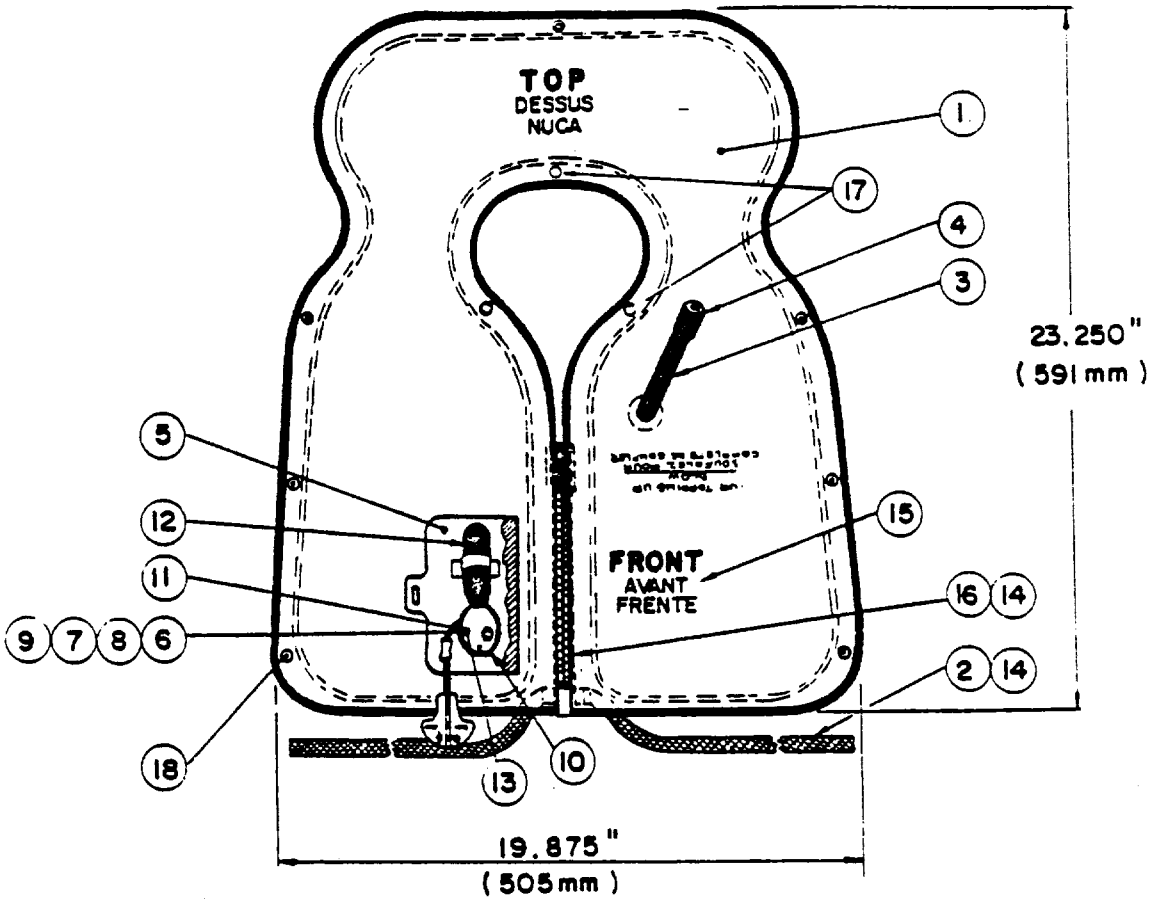
B. This Maintenance Manual is prepared to the requirements of A.T.A. Specification No. 100.

2. Description

A. General

i. This Life Preserver, shown in Fig. 1, consists of a stole, or buoyancy chamber, fitted with a nylon zippered front closure and webbing waist tie straps; CO_2 and oral inflation systems, and peripheral press-stud fasteners to retain compact folding of the preserver when worn in the deflated state.

B. Detail



i. The buoyancy chamber is constructed of single ply nylon fabric coated on one side with urethane.

ii. All seams (of the buoyancy chamber) are joined by a di-electric welding process employing a radio frequency sealing press.

iii. Initial inflation of the chamber is achieved by a CO_2 cylinder housed into the body of a manually activated operating head. (See list of Associated Publications for Manufacturer's Data).

iv. An oral inflation tube, fitted with a spring-loaded non-return valve, provides a means of 'topping-up' or deflating the preserver, as required.

v. The deflated preserver is packed in a plastic pouch (P/N TUL-6136).

LIFE PRESERVER, TYPE "TUL AIRCREW"
FIGURE 1

3. Operation

A. Donning the Preserver

i. The preserver is donned over the head, with the zipper fully open; and the oral tube and CO_2 cylinder facing outwards.

ii. The zipper is fully closed.

iii. The waist tie straps are passed around the back and tied snugly at the front.

B. Inflating the Preserver

i. The inflator toggle is jerked sharply downward, as indicated on the attached instruction tag, to inflate the chamber.

ii. To inflate the chamber harder, the red oral inflation tube is used.

iii. To release air from the chamber, the valve in the end of the inflation tube is depressed with the tip of a finger; and the air is squeezed out of the preserver.

4. Technical Data

A. Service Capacity.....1 Person

B. Minimum Effective Displacement....23 lbs.(10.43 Kg)

C. Gas Inflation Assembly

i. Inflator.....840 AM

ii. CO_2 Gas Charge.....12 grams

D. Weight Data

i. Life Preserver (Less Pouch Container)... 10 oz.(283 gr)

ii. Life Preserver (Packed in Pouch, P/N TUL-6136)... 10-1/2 oz.(298 gr)

E. Recommended Service Life.....6 yrs.(See Note)

NOTE: Statistics indicate that coated fabrics which are subject to gas pressures must be limited to a certain "life". This life is dependent upon the climatic, storage and operational conditions to which the material might be exposed. It is therefore recommended that the type "Tul Aircrew" Life Preserver be limited to a service life of six years from date of manufacture.

TUL SAFETY EQUIPMENT LTD.

SECTION 2

MAINTENANCE PRACTICES

1. Inspection

A. General

i. Inspections should normally be carried out on a monthly basis; however, if life preservers are stowed in an aircraft, they may be inspected in accordance with the relevant aircraft maintenance/ inspection schedule.

ii. Inspections should also be conducted when unusual circumstances dictate, such as:

(a) when the preserver has been immersed in water,

(b) when it has been inadvertently inflated,

(c) if it is suspected of having been contaminated with POL products or acid,

(d) if it shows signs of having been unduly mishandled,

(e) when the container shows signs of damage such as rips, tears, or contamination,

(f) when the technician feels that an inspection is warranted for any reason.

iii. A record card or log book should be maintained for each preserver to indicate what inspection or maintenance work has been conducted, when and by whom.

B. Detail

i. Inflate the buoyancy chamber and inspect for wear, holes, contamination or any other visible signs of damage.

ii. Ensure that all printing is legible and free of smudges.

B. Detail - Continued

iii. Examine the inflator to ensure that the safety pin has not been broken; and that the body, lanyard and pull toggle show no evidence of surface damage.

iv. Check the oral inflation tube for wear or damage.

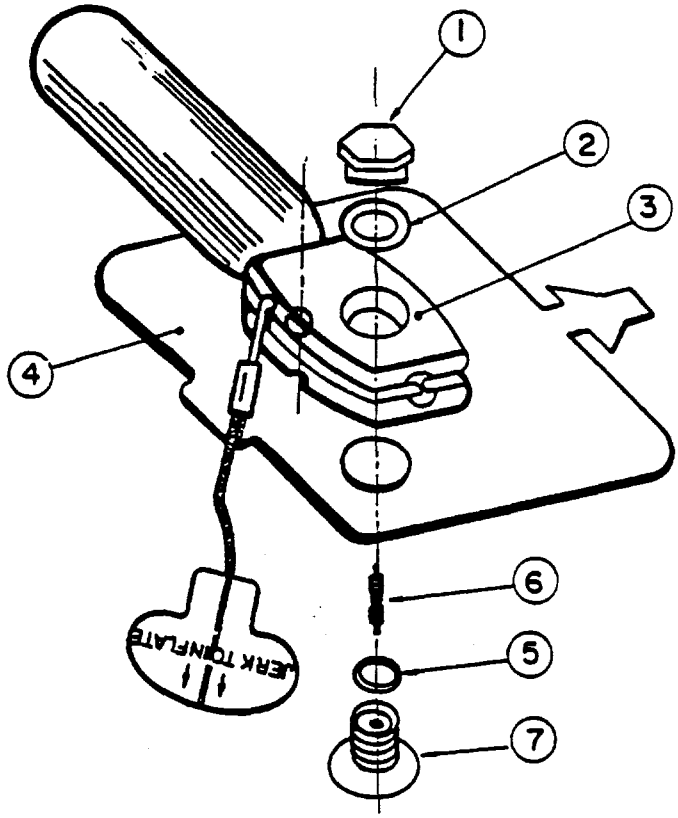
v. Check the zipper for damage and proper operation.

vi. Check the press fasteners for evidence of damage or corrosion and proper operation.

vii. Inspect all sewing for loose threads, broken or missing stitches.

viii. Inspect plastic container for damage and operation of press fastener.

2. Testing Procedures



A. Buoyancy Chamber (24 hour test)

i. Inflate the chamber to 1 1/2 psig (0.105 kg/cm^2).

CAUTION: DO NOT EXCEED THIS PRESSURE.

Chamber should not have lost its shape or firmness after a 24 hour period.

NOTE: A reasonably constant room temperature should be maintained throughout the test.

REMOVAL PROCEDURE

a) Remove Cap Nut (1),
b) Remove and discard Upper Seal Washer (2),
c) Remove Inflator/Cylinder assembly (3),
d) Remove Inflator Cover (4),
e) Remove and discard Lower Seal Washer (5),
f) Valve Core (6) is left into Stem (7) for test purposes; if leaking, replace Core.

INSTALLATION PROCEDURE

Reverse removal procedure; install new Items 2 & 5. Secure Cap Nut (1) wrench tight.

COMPONENTS REMOVAL/INSTALLATION

FIGURE 201

A. Buoyancy Chamber - Continued

ii. Should the chamber loose its shape within 24 hrs., strip the preserver of its removable accessories and immerse the inflated preserver in water to detect the leak. See Figure 201 for component removal/installation.

NOTE: Repair procedures are covered in Para. 3 of this Section.

B. CO_2 Cylinder and Inflator

i. The CO_2 cylinder is tested for weight only. Weigh the cylinder on a gram scale; weight must conform to that stamped on the cylinder, otherwise replace cylinder.

ii. The operating lever pull-off load is approx. 1 1/2 lbs. (0.68 kg). This amount of pressure is required tc break the safety-pin and overcome the spring pressure on the cam lever.

iii. With the cylinder removed, pull the "Jerk to Inflate" toggle and observe the travel of the CO_2 cylinder seal piercing pin inside the inflator. Ensure the pin raises and retracts as the lever is pulled through its full travel.

iv. Reset the lever and install a new safety-pin.

CAUTION: ENSURE HEAD IS RESET BEFORE REPLACING CYLINDER.

C. Oral Inflation Valve

i. Blow air through the oral inflation valve to ensure free passage and ease of operation.

3. Repair Procedures

A. General

i. The room or section wherein repairs are carried out must provide protection from direct sunlight, be isolated from areas where POL products are used or stored, be dust and dirt free, and be of an even temperature.

ii. Refer to Components List and Recommended Spares (Para. 5) for procurement of bulk materials and component parts used for repairs.

iii. Refer to Section 3, Illustrated Parts List for components description and specification data.

B. Buoyancy Chamber

i. Patch material must be the same as that used in the manufacture of the preserver.

ii. The adhesive used for repair must be compatible with the chamber fabric coating, i.e. urethane base.

NOTE: For mixing ratios and storage requirements, for adhesives, refer to the manufacturer's data sheet.

iii. As a general rule, a patch must extend at least 1 inch (25 mm) beyond the perimeter of the hole or tear; e.g. if the diameter of a jagged hole is 1 inch (25 mm), the patch should be 3 inches (76 mm) in diameter. If a tear is 1 inch (25 mm) long, the patch should be 3 inches (76 mm) long by 2 inches (50 mm) wide. L-shaped tears are to be treated as round holes reckoning the distance between the ends of the tear as the diameter.

NOTE: Patches should be either circular or rectangular with rounded corners. Odd shapes such as triangular or eliptical should not be used.

B. Buoyancy Chamber - Continued

iv. To apply a patch, follow these steps:

(a) Cut patch to size,

(b) Clean fabric around the damaged area with soapy water,

(c) Dry area with clean dry cloth,

(d) Rub area with a pad dampened sparingly with solvent,

(e) Brush on two coats of adhesive solution, allowing the first coat to become tacky before applying the second,

(f) When second coats on both the patch and the chamber have become tacky, place patch in position,

(g) Roll the patch with a hand roller,

(h) Work out any air bubbles with a wooden spatula,

(j) Dust area with french chalk (to prevent sticking of over-solutioned areas when preserver is folded later).

v. Repairs are limited as follows:

(a) Damaged areas must not exceed 1 inch (25 mm) thus patches are limited in size to 3 inches (76 mm) in diameter or in length.

(b) Do not apply more than two patches to each side of each chamber.

(c) Do not apply patches in seam areas; if a seam is damaged, the preserver must be discarded.

vi. The following Special Tools, Fixtures, Materials and Equipment are required for chamber repair:

(a) Single ply, urethane coated nylon material,
(b) Inflation and vacuum pump,
(c) Steel roller,
(d) Scissors,

B. Buoyancy Chamber - Continued

vi. (e) 1/2 inch (13mm) round brush (for adhesive),
(f) Wooden spatula,
(g) Urethane adhesive,
(h) Solvent,
(j) Polyethylene sheeting (to cover work table),
(k) Valve core removing tool (Schrader),
(l) 9/16 box end spanner (hexagon)

C. Components

i. No repairs are to be carried out on components such as Operating Heads, CO_2 Cylinders, Press-Studs, Zipper, etc. Defective items are to be replaced.

4. Folding and Packing Procedures

A. General

i. In order to provide comfort to the wearer and also minimize the perimeter of the deflated preserver when worn, a folding procedure has been implemented to satisfy both conditions.

ii. When folded, as outlined below and illustrated in Fig. 202, Steps 1 to 4, the Life Preserver becomes quite comfortable to wear.

iii. Steps 5 to 8 illustrate the packing procedure.

B. Folding Detail (Refer to Fig. 202, Steps 1 to 4)

i. Deflate the preserver and lay it face down as per Step 1,

ii. Fold right and left lower lobes of preserver, approx. 45^{o}, and slightly below the mid-lateral male press-stud; as per Step 2,

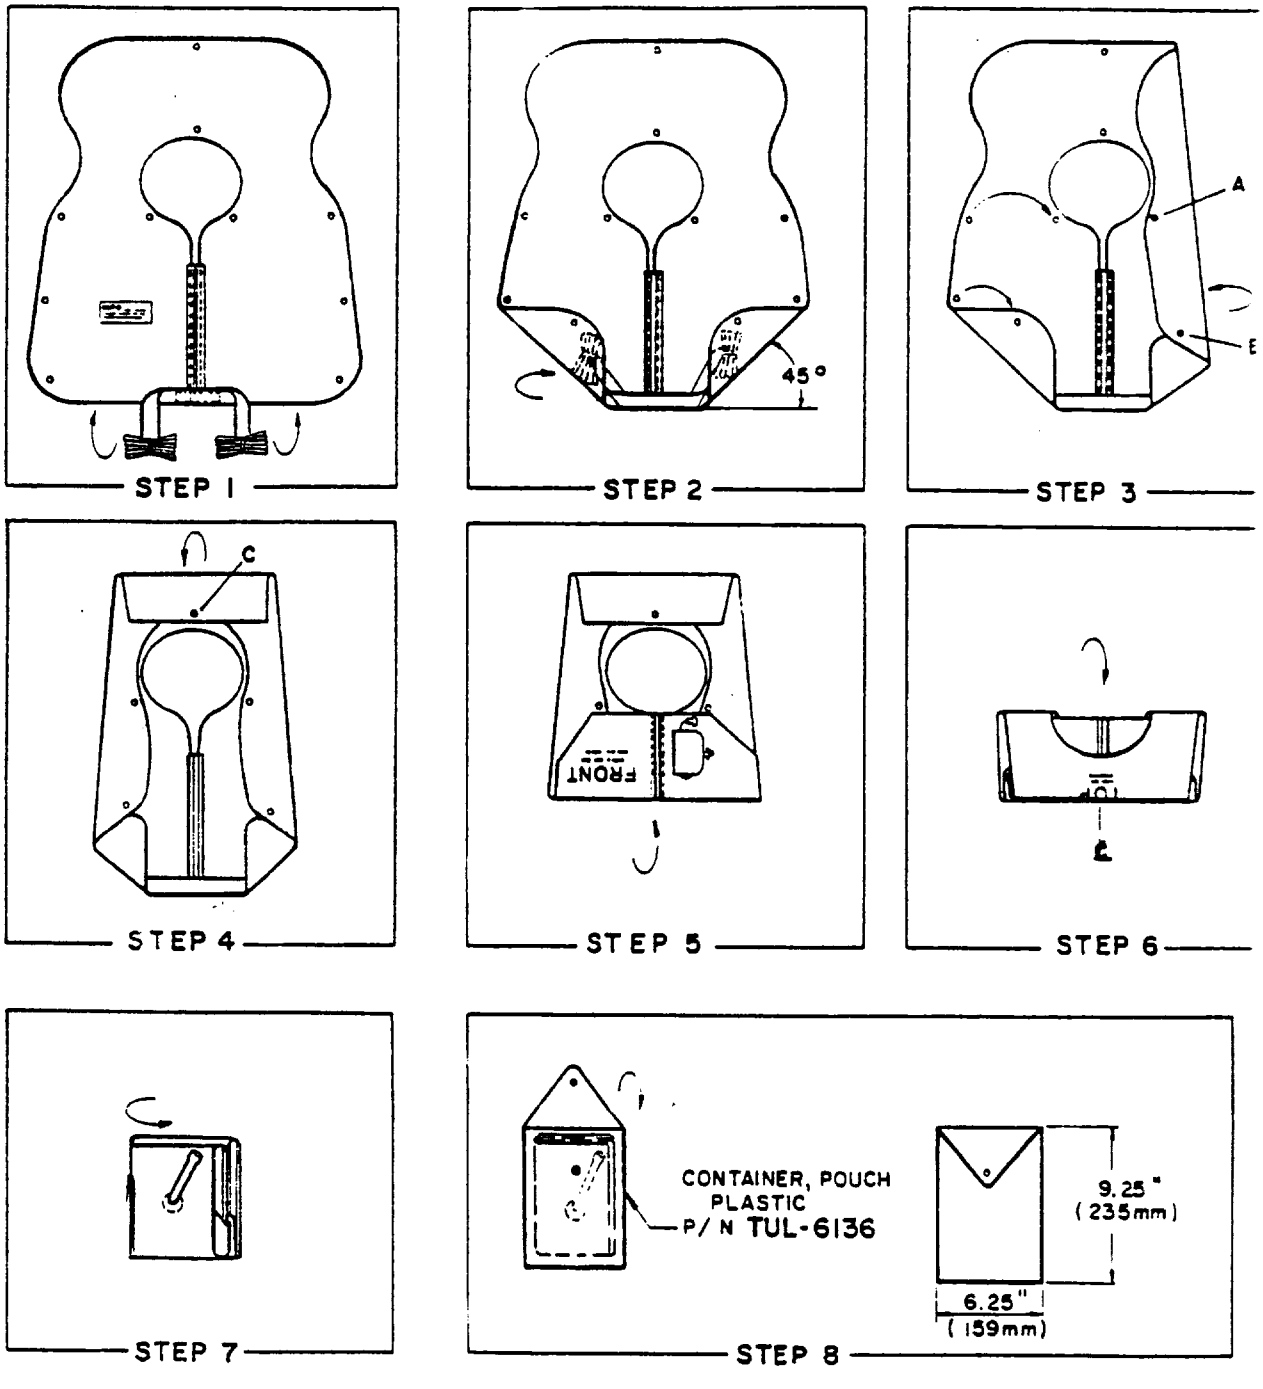
iii. Fold right side in half in order to fasten press-stud assemblies at "A" and "B" as shown in Step 3,

iv. Repeat Step 3 on left side of preserver and complete folding top section as per Step 4,

B. Folding Detail - Continued

v. Fold upper section of preserver downwards and fasten the upper press stud assembly as per Step 5.

C. Packing Detail (Refer to Fig. 202, Steps 5 to 8)



i. Fold lower half of preserver towards center, as per Step 5,

ii. Fold upper half of preserver on top of previous fold, as per Step 6,

iii. Fold unit in half, oral tube facing uppermost, as shown in Step 7,

iv. Place unit in pouch and fasten flap to complete packing, as per Step 8.

4. Folding and Packing Procedures

P/N TUL-6174
MAINTENANCE MANUAL, P/N 25-60-05

INTRODUCTION

1. Intended Use

This Maintenance Manual has been prepared for intended use by holders of the TUL Types 35 MK IV (-2) and (-3) Adult Life Preserver. It Outlines inspection, testing, repair and packing procedures. The Illustrated Parts List section will prove helpful in ordering spare parts or components.

2. Format

The format of this Manual complies with the requirements of ATA Specification No. 100, Revision 18. The page number blocks allocation is as follows:

Pages 1 - 100	Description and Operation
Pages 201 - 300	Maintenance Practices
Pages 1101 - 1200	Illustrated Parts List

3. Manufacturer's Certification

The Life Preserver is manufactured in compliance with TSO-C13d, Minimum Performance Requirements.

4. Quality Assurance

All manufacturing standard of quality in materials and workmanship, is controlled by an approved Quality Assurance System.

5. Effectivity

This Manual is applicable to Type 35 MK IV (-2) and Type 35 MK IV (-3). Where effectivity only applies to either one or the other, type, such will be stated in the effectivity block at the bottom of the applicable page (s).

MAINTENANCE MANUAL, P/N 25-60-05

SECTION 1

DESCRIPTION AND OPERATION

1. INTRODUCTION

A. This publication is issued as the Maintenance Manual for the TUL, TYPES 35 MK IV (-2) and (-3) Adult Life Preservers P/N TUL-6174.

B. This Maintenance Manual is prepared to the requirements of A.T.A. Specification 100, Revision NO.18.

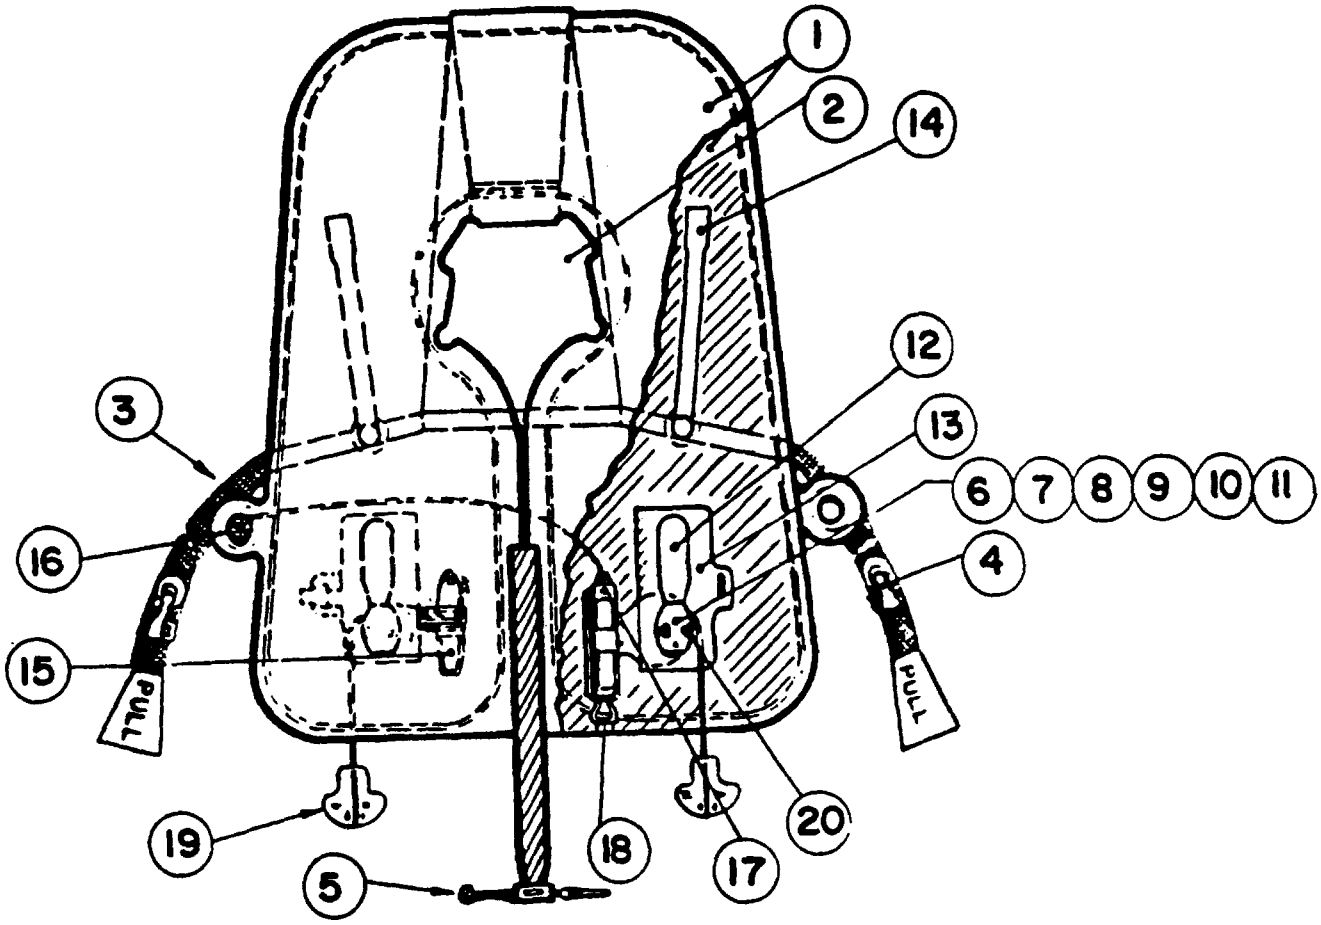
2. DESCRIPTION

A. General

(1) The life preservers shown in Figures 1 and 2 consists of two superimposed stoles or buoyancy chambers, fitted with an adjustable quick donning-waist belt, CO^2 and oral inflation systems, a water activated light/s and a whistle.

(2) The Type 35 MK IV (-3), (Ref. Fig.2) used by crew members only, is flame orange in colour; has 2 sea-lights relocated on the upper portion of the chambers; and has strips of Retro-Reflective Tape at the front.

B. DETAIL

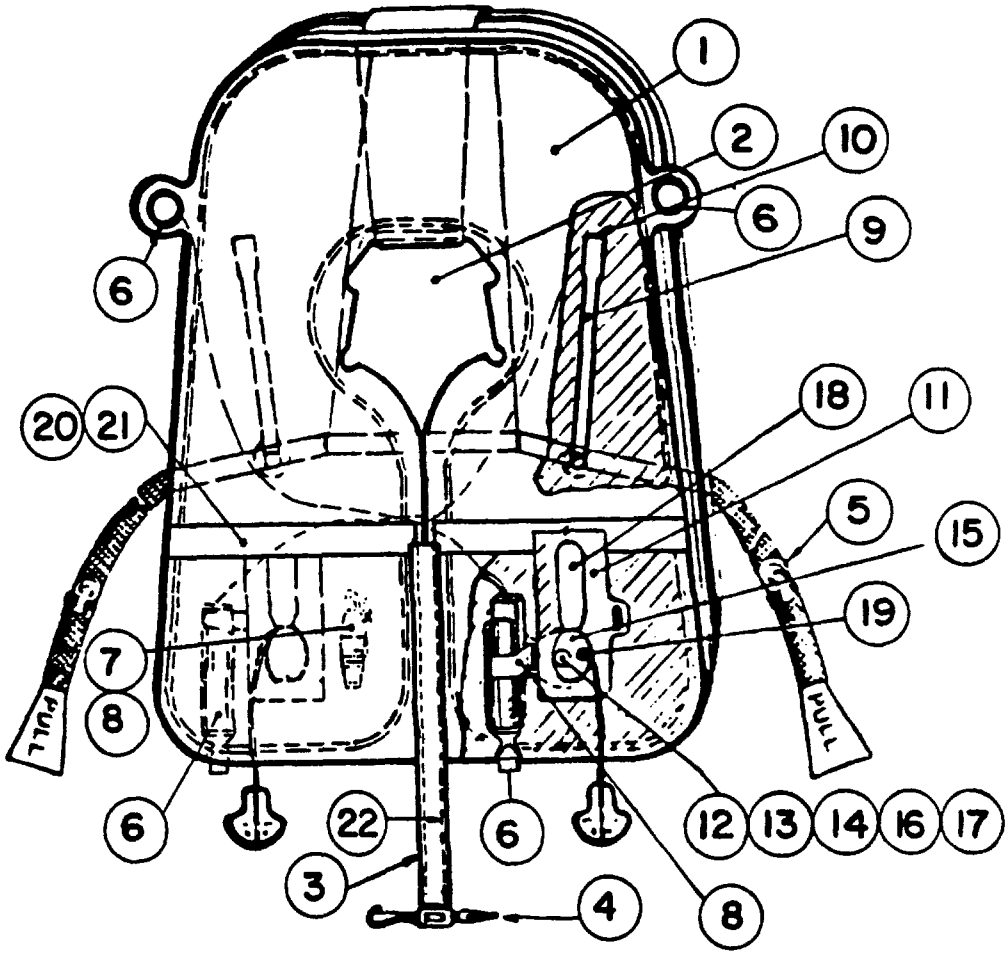


(1) The buoyancy chambers are constructed of single ply nylon fabric coated on one side with urethane.

(2) All seams (of the chambers) are joined by a dielectric welding process employing a radio frequency sealing press.

(3) Initial inflations of each chamber is achieved by a CO^2 cylinder attached to a mamually activated operating head. (See list of Associated Publications for Manufacturer's data.)

(4) An oral inflation tube, fitted with a spring loaded non-return valve, provides a means of 'topping up' or deflating the preserver as required.



(5) The whistle (normally used as an audible attention getting device in all survival kits) is constructed of high impact plastic and is attached to the preserver with a short length of cord.

LIFE PRESERVER, TYPE 35 MK IV (-3)

FIGURE 2

2. DESCRIPTION - Cont....

B. Detail

(6) The survivor light, which facilitates the location of survivors of an emergency landing in water, is attached to one chamber of the preserver with a detachable tab. (For further information on this item, see the list of Associated Publications for Manufacturer's data.)

(7) The life preserver is normally supplied packed in carrying case P/N TUL- 6108 or 6108H ; however, packaging to customer's specifications is also available.

3. OPERATION

A. Donning the Preserver

(1) The preserver is donned over the head with the back piece behind the wearer.

(2) The straps are pulled around the body and the D Rings are engaged in the snap hooks on the front strap.

(3) The free ends of the straps, (marked Pull) are pulled through the adjustment buckles until snug.

B. Inflating the Preserver

(1) The red toggles marked 'Jerk to Inflate' are jerked sharply downward to inflate the chambers.

NOTE: If, for some reason, one chamber is damaged and fails to inflate, one chamber will provide the support necessary for safe flotation.

(2) To inflate the chambers harder, the red oral inflation tube is used.

(3) To release air from chamber, the valve in the end of the inflation tube is depressed with the tip of a finger.

3. OPERATION - Cont'd. ....

C. Activating the Survivor Light

(1) The light will remain in operation until the battery plugs are removed to allow ingress of water. Plugs are removed by pulling on the plastic toggle marked "Pull to Light".

4. TECHNICAL DATA

A. Service Capacity ..... 1 Person

B. Minimum Effective Displacement..15.87 kg (35lbs.)

C. Gas Inflation Assembly (2 req'd.)

(1) Inflator ..... Halkey Roberts, 840 AM

(2) CO2 Gas Charge ..... 16 grams

D. WEIGHT DATA

(1) Life Preserver (less container)....0.65kg (1lb.7oz) (2) Life Preserver (packed in container P/N)
TUL-6101 .....0.71kg (1lb.9oz)

E. RECOMMENDED SERVICE LIFE

Statistics indicate that coated fabrics which are subject to gas pressure must be limited to a certain 'life'. This 'life' is dependent upon the climatic, storage and operational conditions to which the material might be exposed. It is therefore recommended that the TUL Types 35 Life Preservers over 10 years of age, which do not pass the leakage test or that require repair, be removed from service and disposed of.

ADDENDUM TO MAINTENANCE MANUAL 25-60-05

Packing Procedure for Life Preserver,
Type 35 Mk IV (-2) and (-3)
in Constant Wear Container, P/N TUL-6137

Issued by: Tul Safety Equipment Ltd.

Per: M. Paquin
Engineering Manager

Date: August 21, 1986

ADDENDUM TO MAINTENANCE MANUAL 25-60-05

Packing Procedure for Life Preserver, Type 35 Mk IV (-2) and (-3) in Constant Wear Container

A- General

Subsequent to satisfactory inspection/repair and testing of the life preserver as per Section 2 of Maintenance Manual; the following Packing Procedure shall apply:

B- Detail (Refer to Appendix "A")

1. Thoroughly deflate the buoyancy chambers
2. Lay the constant wear container on table, "Tul" logo facing uppermost
3. Insert the life preserver on top of the container back panel, as shown in Diagram 1; back flap extended, nylon face uppermost; double-end snaps and toggles exposed
4. Accordion fold sides of buoyancy chambers and fasten velcro closure on left and right sides of container
5. Accordion fold upper and lower top sections of buoyancy chambers, over and under back flap and fasten container velcro closure as per Diagram 3.
6. Tuck in lower half of preserver inside container and complete closure as per Diagram 4, ensuring both inflator toggles (Jerk to Inflate) are readily accessible for operation.
7. Diagram 5 depicts waist belt attachment configuration when life preserver is worn.

Issued by: Tul Safety Equipment Ltd.
Per: M. Paquin
Engineering Manager
Date: August 21, 1986

Packing Procedure

APPENDIX "A"

SECTION 2

MAINTENANCE PRACTICES

1. INSPECTION

A. General

1. Life preservers should be inspected at regular intervals. The intervals between inspections are not to exceed 12 months.

2. Life preservers should be withdrawn from the aircraft whenever the plane is undergoing servicing or maintenance. The life preservers should be inspected at this time and re-issued.

3. Inspection should also be conducted when unusual circumstances dictate, such as:
   (a) when the preserver has been immersed in water,
   (b) when it has been inadvertently inflated,
   (c) if it is suspected of having been contaminated with POL products or acid,
   (d) if it shows signs of having been unduly mishandled,
   (e) when the container shows signs of damage such as rips, tears, or contamination.

4. A record card or log book should be maintained for each preserver to indicate what inspection or maintenance work has been conducted, when and by whom.

B. Detail

(1) Inflate the buoyancy chambers and inspect for wear, holes, contamination or any other visible signs of damage including broken stitches in the neck area.

(2) Examine the operating heads to ensure that the cord is securely fastened to the operating lever and is not frayed. The toggle should be free of cracks and the printing legible. Remove the CO2 cylinder from the heads; and visually check all metal parts for damaged threads, nicks, burrs or corrosion.

(3) Check the oral inflation tubes for wear or damage.

(4) Examine the survivor light base, lens and bulb for cracks or other damage. Check the lead wire for damage and security.

Inspect the battery casing for swelling, splits, or other damage. Ensure the battery plates do not show evidence of corrosion or incrustations.
Measure battery case thickness; if more than 7/16" replace light assembly.

NOTE: The service life of the survival light/battery ass'y. is indefinite provided it meets the I/I inspection criteria; otherwise the defective assembly must be replaced.

B. Detail-- continued

(5) Check the harness system for broken stitches, fraying or contamination and the metal parts for rust, corrosion or damage. Ensure snap hook and D-ring adjustment device spring action is positive.

(6) Inspect the back piece for security and ensure that all printing is legible.

(7) Examine whistle for damage.

(8) Examine the container or pouch for damage and contamination with particular emphasis on the operation of the snap fasteners.

2. TESTING PROCEDURES

A. FUNCTIONAL TEST

(a) Perform this test when the life jacket is five years old.

(b) With the jacket fully assembled, discharge the CO2 cylinders into the cells. The cells should fully inflate with no loss of CO2.

(c) Exhaust all CO2 thoroughly prior to conducting the Integrity Test.

B. INTEGRITY (OVERPRESSURE) TEST

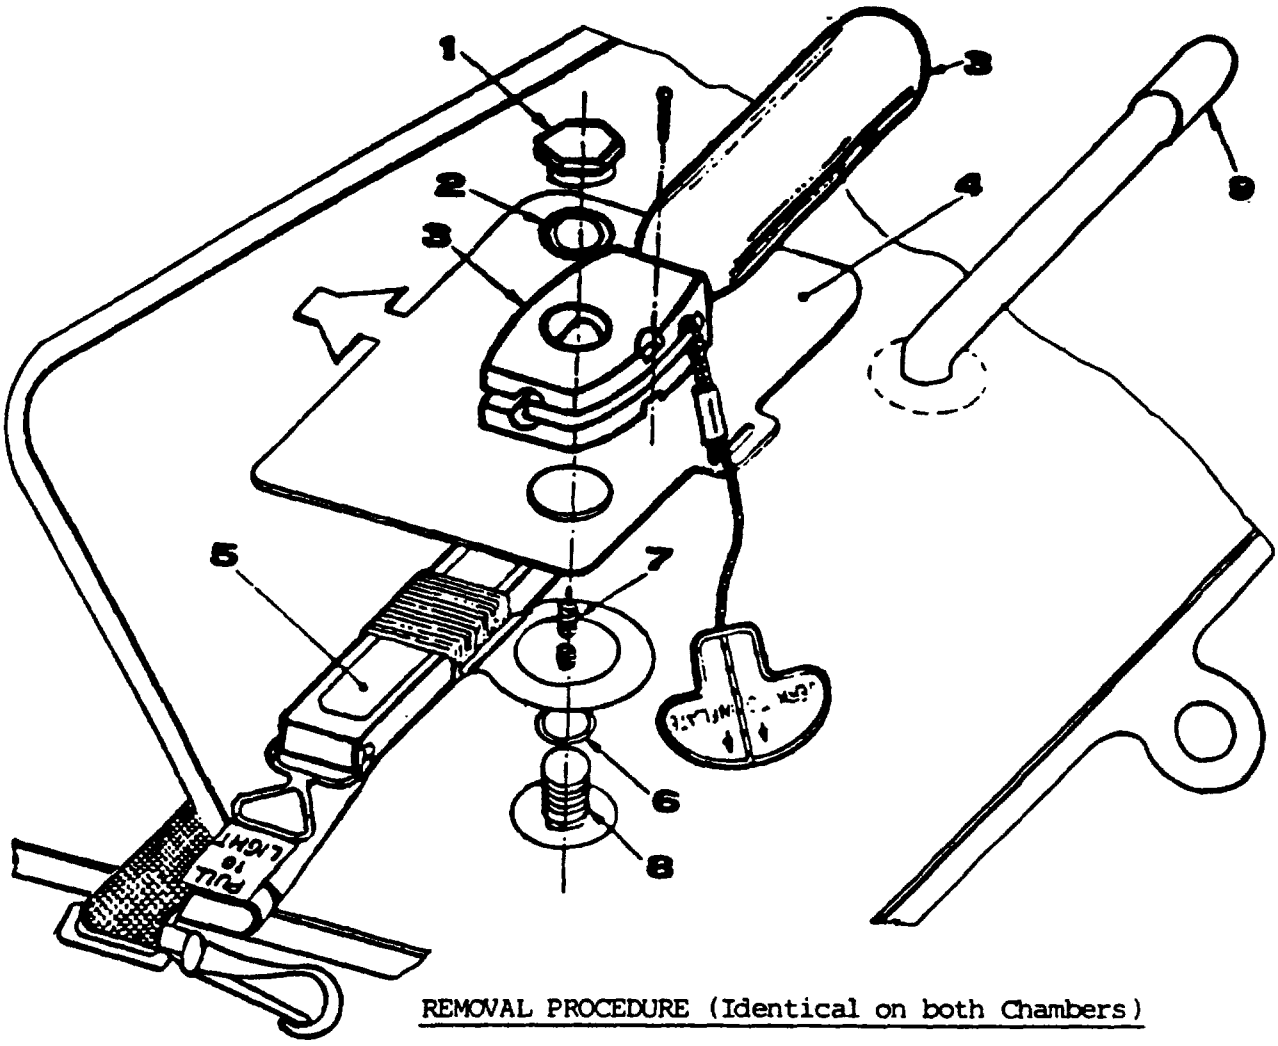
(a) Perform this test every five years of service life, or following any repairs to fabric cells.

(b) Inflate each cell with oil- and water-free shop air to 5 psig for a period of not less than 5 minutes or more than 10 minutes.

(c) There shall be no evidence of fabric or seam failure. Following successful completion of this test, perform the Leakage Test.

C. LEAKAGE TEST

(a) Perform this test following each inspection prior to folding and storing the jacket whether or not repairs were necessary.



(i) Slowly inflate both life jacket cells to not more than 3 psig. After 5 minutes, readjust pressure to 2 psig.

(ii) The life preservers will pass if any one of the following time-leak checks are met:

Time Intervals	Pressure	Time Intervals	Pressure
4 hours	1.8 psi	18 hours	1.4 psi
6 hours	1.7 psi	24 hours	1.3 psi
12 hours	1.5 psi		

(iii) A life preserver with any cell that fails the time-leak check will be rejected and set aside to determine the cause and the required repair.

(b) Life preservers that pass the Leakage Test should be deflated, and the CO2 cylinders should be reinstalled.

REMOVAL PROCEDURE (Identical on both Chambers)

a) Remove cap nut (1)
b) Remove and discard upper seal washer (2)
c) Remove inflator/cylinder assembly (3)
d) Remove inflator cover (4)
e) Remove battery and sea-light assembly (5)
   Remove whistle on opposite chamber.
f) Remove and discard lower seal washer (6)
g) Valve Core (7) is left into stem (8) for test purposes;
   if leaking, replace core.
h) If leaking, check valve (9) shall be replaced.

INSTALLATION PROCEDURE

Reverse removal procedures, install new items 2 & 6, secure cap nut (1) wrench tight.

COMPONENT REMOVAL/INSTALLATION
Figure 201

D. CO2 CYLINDERS AND OPERATING HEADS (Test at Each Inspection)

(1) CO2 Cylinders are tested for weight only. Weigh the cylinder on a gram scale. Gross weight stamped on the cylinder is the minimum allowable for that cylinder; and the maximum allowable gross weight is + 2.5 grams. Cylinders not meeting this criteria are to be rejected.

(2) With the cylinder removed, pull the operating head toggle; and observe the travel of the cylinder piercing pin beyond the sealing gasket inside the head. Ensure pin raises and retracts as the lever is pulled through its full travel. Check gasket seal for condition; replace faulty gasket with new one.
Reset the lever against the head body and reinstall red safety clip (or a new rivet) as applicable.

(3) CAUTION: Ensure head is reset before replacing cylinder.

E. ORAL INFLATION VALVE (Test at Each Inspection)

(1) Blow air through oral inflation valve to ensure free air passage and ease of operation.

F. WHISTLE: (if applicable) (Test at Each Inspection)

(1) Operate to ensure proper function; if faulty, reject and replace with new unit.

3. REPAIR PROCEDURES

A. GENERAL

The following condition preservers are considered non-repairable and shall be removed from service and disposed of:

(1) Preservers over 10 yeafs of age which fail the leakage test; or require repair;

(2) Preservers where any oral tube is cut or split open.

(3) Preservers on which oil, grease, or any other foreign substance has caused a deterioration of the coated fabric;

(4) Preservers of which any cell has become porous.

(5) Preservers of which any cell has more than two punctures.

(6) Preservers with holes where patches must overlap seams, other patches, or the seal area of the oral tube, or inflator stems.

B. BUOYANCY CHAMBERS

(1) Patch material must be the same as that used in the manufacture of the preserver.

(2) The adhesive used for repair must be compatible with the chamber fabric coating, i.e. urethane base.

NOTE: For mixing ratios and storage requirements for adhesives, refer to the manufacturer's data sheet.

(3) As a general rule, a patch must extend at least 25 mm (1 inch) beyond the perimeter of the hole or tear; e.g. if the diameter of a jagged hole is 25 mm (1 inch), the patch should be 76 mm (3 inches) in diameter. If a tear is 25 mm (1 inch) long, the patch should be 76 mm (3 inches) long by 50 mm (2 inches) wide. L-Shaped tears are to be treated as round holes reckoning the distance between the ends of the tear as the diameter.

NOTE: Patches should be either circular or rectangular with rounded corners. Odd shapes such as triangular or elliptical should not be used.

(4) To apply a patch, follow these steps:

(a) Cut patch to size.

(b) Clean fabric around the damaged area with soapy water.

(c) Dry area with clean dry cloth.

B. Buoyancy Chambers

(4) Cont'd.....

(d) Rub area with a pad dampened sparingly with solvent.
(e) Brush on two coats of adhesive solution, allowing the first coat to become tacky before applying the second.

(f) When second coats on both the patch and the chamber have become tacky, place patch in position.

(g) Roll the patch with a hand roller.
(h) Work out any air bubbles with a wooden spatula.
(j) Dust area with french chalk (to prevent sticking of over-solutioned areas when preserver is folded later.)

(5) Repairs are limited as follows:

(a) Damaged areas must not exceed 1 in. (25mm), thus patches are limited in size to 3 ins.(75mm) in Diameter or in length.

(b) Do not apply more than two patches to each side of each chamber.

(c) Do not apply patches in seam areas, if a seam is damaged, the preserver must be discarded.

(6) The following Special Tools, Fixtures, Materials and Equipment are required for chamber repair:

(a) Single ply, urethane coated, nylon material
(b) Inflation and vacuum pump
(c) Steel roller
(d) Scissors
(e) 1-2 inch (13mm) round brush (for adhesive)
(f) Wooden spatula
(g) Urethane adhesive
(h) Solvent
(j) Polethylene sheeting (to cover work table)
(k) Valve core removing tool (Schrader)
(L) 9/16 Box-end spanner (hexagon)

C. Harness Tie Tapes and Back Piece

(1) Damaged webbing may be replaced as follows:

(a) Carefully remove existing stitching.
(b) Cut New webbing of same type using removed webbing as a pattern.
(c) Stitch new webbing as per the original.

(2) Broken or missing stitches should be re-sewn with matching thread.

C. Harness Tie Tapes and Back Piece - Cont'd.....

(3) The complete backpiece may be replaced if required.

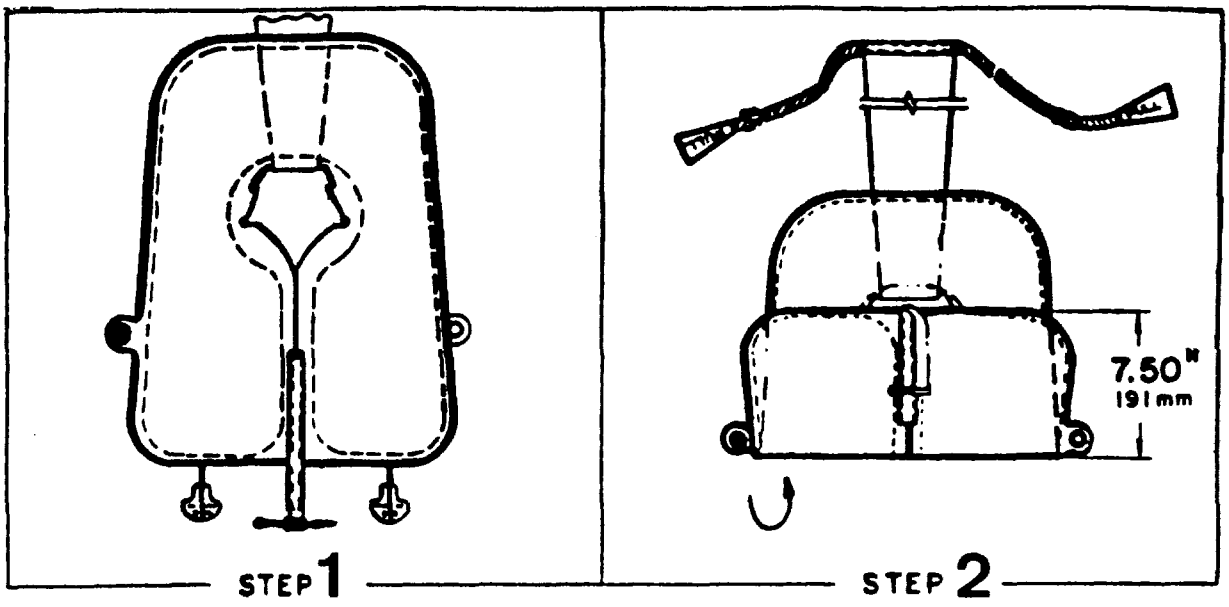
(4) Broken or frayed stitching between the chambers may be re-sewn if the chamber flanges are not damaged.

D. Components

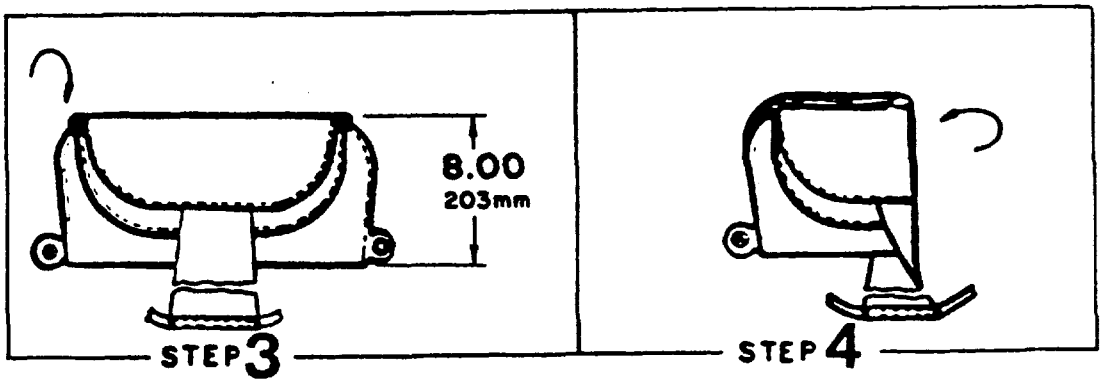
(1) No repairs are to be carried out on components such as Survivor Light Assemblies, Operating Heads, CO^2 Cylinders, Whistles, Buckles, Retainers, Washers, etc. Defective items are to be replaced.

4. PACKING PROCEDURES (Applicable to Preservers furnished with carrying case P/N TUL-601, or Plastic Pouch, P/N TUL-6176.

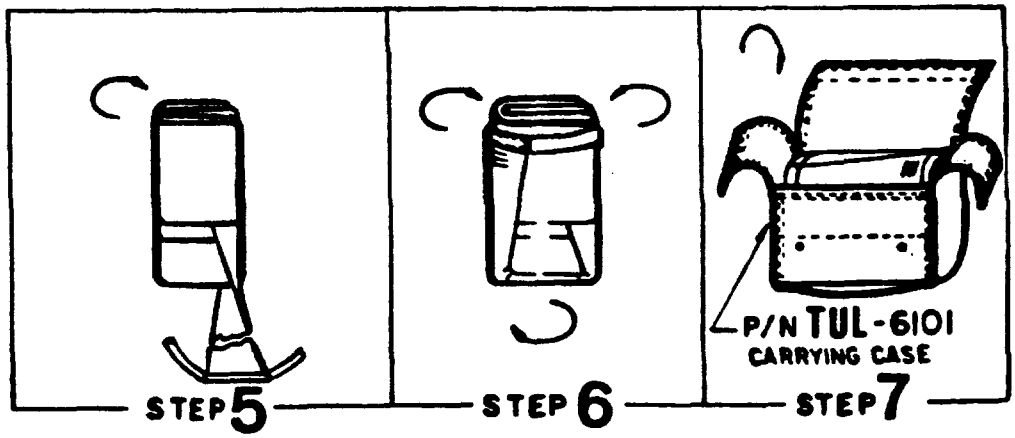
A. General



(1) In order to ensure safe storage of the preserver in its container, and to provide for immediate exposure of the donning and operating instructions when the container is opened by a potential user in an emergency, a sequential or step-by-step packing technique is used. Each event of this sequence is important and should be adhered to for maximum effect. Packing steps shown in Figure 202 are suitable for either type of container.



B. Detail



(1) Deflate the preserver and lay it out as per Step 1
(2) Fold the bottom up and locate the swivel snap hooks as shown in Step 2
(3) Fold the top down over the bottom - Step 3

CAUTION: AVOID BENDING THE ORAL INFLATION TUBES

(4) Fold in half, as illustrated in Step 4
(5) Fold in half again, as per Step 5
(6) Wrap the back piece around the folded preserver in a clock-wise direction, tucking in straps, D-ring/Adjusting devices and the lens and tab, as shown in Step 6
(7) Insert the preserver into the container with the instructions facing up as illustrated in Step 7
(8) Fasten the side and top flaps (in that order) of the container to complete the packing sequence. (Heat seal if pouch PN TUL-6176 is used)
(9) Complete control card or log book entries as applicable.

1.0 GENERAL DESCRIPTIONS

1.1 The HAL-035-AVH model is a hand held fire extinguisher that consists of an extinguisher assembly (part# 100-9750) and an aviation bracket (part # 200-9770). This unit employs bromochlorodifluoromethane as the extinguishing agent which is ejected through a hose and nozzle by means of nitrogen at a pressure of approximately 100 PSI (689 KPA). Both the agent and expellant gas is contained in the cylinder. The extinguisher is suitable for use at temperatures above -40 F (-40 C). This extinguisher also has an approved rating for the three types of fires.

PAPER, WOOD, CLOTH, RUBBISH, COMBUSTIBLES

VOLATILE LIQUIDS, GAS, OIL, PAINTS

ELECTRICAL EQUIPMENT, MOTORS

2.0 OPERATING INSTRUCTIONS

2.1 To operate, hold extinguisher upright.

2.2 Pull locking pin, breaking nylon tie.

2.3 Stand at least 6 feet (2 meters) away from fire and aim discharge hose at base of flame.

2.4 Squeeze lever and use a sweeping motion from side to side at the base of fire.

3.0 INSPECTION

3.1 Normally a quick check monthly to ensure that unit is available and operable.

3.2 Monthly inspection:

A) Pressure Gauge indicator within operational limits.

B) Break seal intact.

C) Hose unobstructed and properly attached.

D) Operating instructions legible and facing outward.

E) No obvious physical damage or corrosion present.

3.3 Yearly Inspection:

A) All the aforementioned monthly.

B) Unit weight ensuring its not below the minimum recorded on label.

NOTE: ANY DEFICIENCY FROM THE ABOVE INSPECTIONS IS CAUSE FOR IMMEDIATE CORRECTIVE ACTION.

4.0 MAINTENANCE

4.1 A thorough examination of the unit.

4.2 Frequency: Every six years.

A) All mechanical parts to ensure functional.

B) Expelling agent to ensure intact.

C) No obvious physical damage or corrosion present.

NOTE: REPLACE ANY PARTS FOUND TO BE DEFICIENT.

5.0 USE

5.1 Recharge immediately after use.

6.0 RECORDS

6.1 Record all maintenance and recharge dates on a tag and securely attach to extinguisher.

7.0 HYDROSTATIC TESTING

7.1 Hydrostatic testing of the HAL-035-AVH model shall be performed by persons having a practical knowledge of pressure testing procedures, safeguards and having available suitable testing equipment and facilities.

7.2 If, at any time, an extinguisher shows evidence of corrosion or mechanical injury, it shall be hydrostatically tested.

7.3 During examination, when an extinguisher cylinder or shell has one or more conditions listed in this subdivision, it shall not be hydrostatically tested but shall be destroyed by the owner.

7.3 (A) When there exists repairs by soldering, welding, brazing, or use of patching compounds.

7.3 (B) When the cylinder or shell threads are damaged.

7.3 (C) When there exists corrosion that has caused pitting, including under removable name plate band assemblies.

7.3 (D) When the extinguisher has been burned in a fire.

7.4 The frequency of hydrostatic testing of this extinguisher as specified in the standard for portable fire extinguishers (NFPA-10) is a maximum of twelve years or sooner as determined by inspection.

WARNING: THE EQUIPMENT FOR HYDROSTATICALLY TESTING CYLINDERS SHALL BE OF THE WATER JACKET TYPE THAT MEETS THE SPECIFICATIONS OF THE C.G.A. PAMPHLET C-1.

NFPA-10: THE NATIONAL FIRE PROTECTION ASSOCIATION STANDARD FOR PORTABLE FIRE EXTINGUISHERS (NFPA-10) IS CONSIDERED PART OF THIS MANUAL. THE NFPA-10 STANDARD PROVISIONS APPLY TO THE SELECTION, INSTALLATION, INSPECTION, MAINTENANCE AND TESTING OF PORTABLE FIRE EXTINGUISHING EQUIPMENT. NFPA-10 MAY BE PURCHASED FROM THE NATIONAL FIRE PROTECTION ASSOCIATION, BATTERYMARCH PARK, QUINCY, MA 02269.

CGA: COMPRESSED GAS ASSOCIATION (CCA) PAMPHLETS C-1, C-6, AND P-1 ARE CONSIDERED PART OF THIS MANUAL. THE CGA RECOMMENDATIONS APPLY TO HYDROSTATIC TESTING, VISUAL INSPECTION AND HANDLING OF COMPRESSED GAS CONTAINERS. CGA PAMPHLETS CAN BE OBTAINED FROM THE COMPRESSED GAS ASSOCIATION, 500 5TH AVENUE, NEW YORK, NEW YORK 10036.

8.0 DISASSEMBLY

WARNING: OBSERVE PRESSURE GAUGE BEFORE DISASSEMBLY. RELEASE ANY PRESSURE THRU AN APPROVED RECHARGE/RECOVERY SYSTEM FOR HALON 1211 ONLY.

NOTE: SEE 13.0, FIG. 1 FOR ILLUSTRATED PARTS.

8.1 Disassemble hose assembly (25) from valve body (15) by turnincounterclockwise.

8.2 Remove valve assembly from shell (4) by turning counterclockwise.

8.3 Unscrew plastic tubing (7) from valve body by turning counterclockwise.

8.4 To remove plunger assembly (14), use a vise-grip type wrench. Squeeze and lock onto the leaf spring (17). Remove leaf spring and push plunger down.

9.0 REPAIR

9.1 Clean all parts thoroughly prior to inspection.

9.2 Any parts that must be replaced should be with Flag replacement components to ensure proper sizes and material are used.

10.0 ASSEMBLY

10.1 Use 13.0, Fig. 1 as reference.

10.2 Lubricate plunger assembly (14) at the "O" rings (10) (13). Use Dow Corning #230 silicone or equivalent. Also apply lubricant to "O" ring (8) and threads of valve body (15) where they will meet with shell threads.

10.3 Insert plunger into valve body. Using the vise-grip wrench, squeeze the leaf spring and replace the spring into the handle notch and into the plunger groove.

10.4 Squeeze lever (19) to ensure proper working action.

10.5 Rethread plastic pickup tube (7) into valve body (15) in a clockwise rotation.

10.6 Thread valve assembly into shell in a clockwise rotation (4). Be sure not to rip or tear "O" ring (8) while tightening valve assembly.

10.7 Extinguisher is ready to be recharged at this point before adding the hose assembly. See recharge instructions (12.0).

11.0 FITS AND CLEARANCES

11.1 When servicing this extinguisher examine all moving mechanical parts for a free or unobstructed fit.

12.0 RECHARGE INSTRUCTIONS

WARNING: BEFORE RECHARGING OR SERVICING ANY HALON 1211 FIRE EXTINGUISHER OR APPARATUS, THE EQUIPMENT TO BE USED SHALL COMPLY WITH ONE OR MORE OF THE FOLLOWING STANDARDS AND SPECIFICATIONS.
UL 2006 HALON 1211 RECOVERY/RECHARGE EQUIPMENT.
ULC/ORD-C1058.5 HALON RECOVERY/RECONDITIONING EQUIPMENT.
ULC/ORD-C1058.18 SERVICING OF HALON EXTINGUISHING SYSTEMS.
ISO 7201 FIRE EXTINGUISHING MEDIA-HALOGENATED HYDROCARBONS.

12.1 Servicing extinguishers should be performed by qualified, experienced personnel only.

12.2 Extinguisher to be recharged after use or as indicated by a thorough inspection or when servicing a unit.

12.3 Check extinguisher label for correct weight of Halon 1211 agent and for proper recharging pressure prior to recharging.

12.4 Pressurize Halon 1211 recharge tank to 100 PSI (689 KPA) with nitrogen through gas inlet connection. Do not over pressurize. If several extinguishers are to be recharged at the same time, it becomes necessary to add more nitrogen to keep pressure at 100 PSI (689 KPA).

12.5 Remove hose assembly (25) if attached and replace it with charging adaptor (3/8 - 24 thread connection).

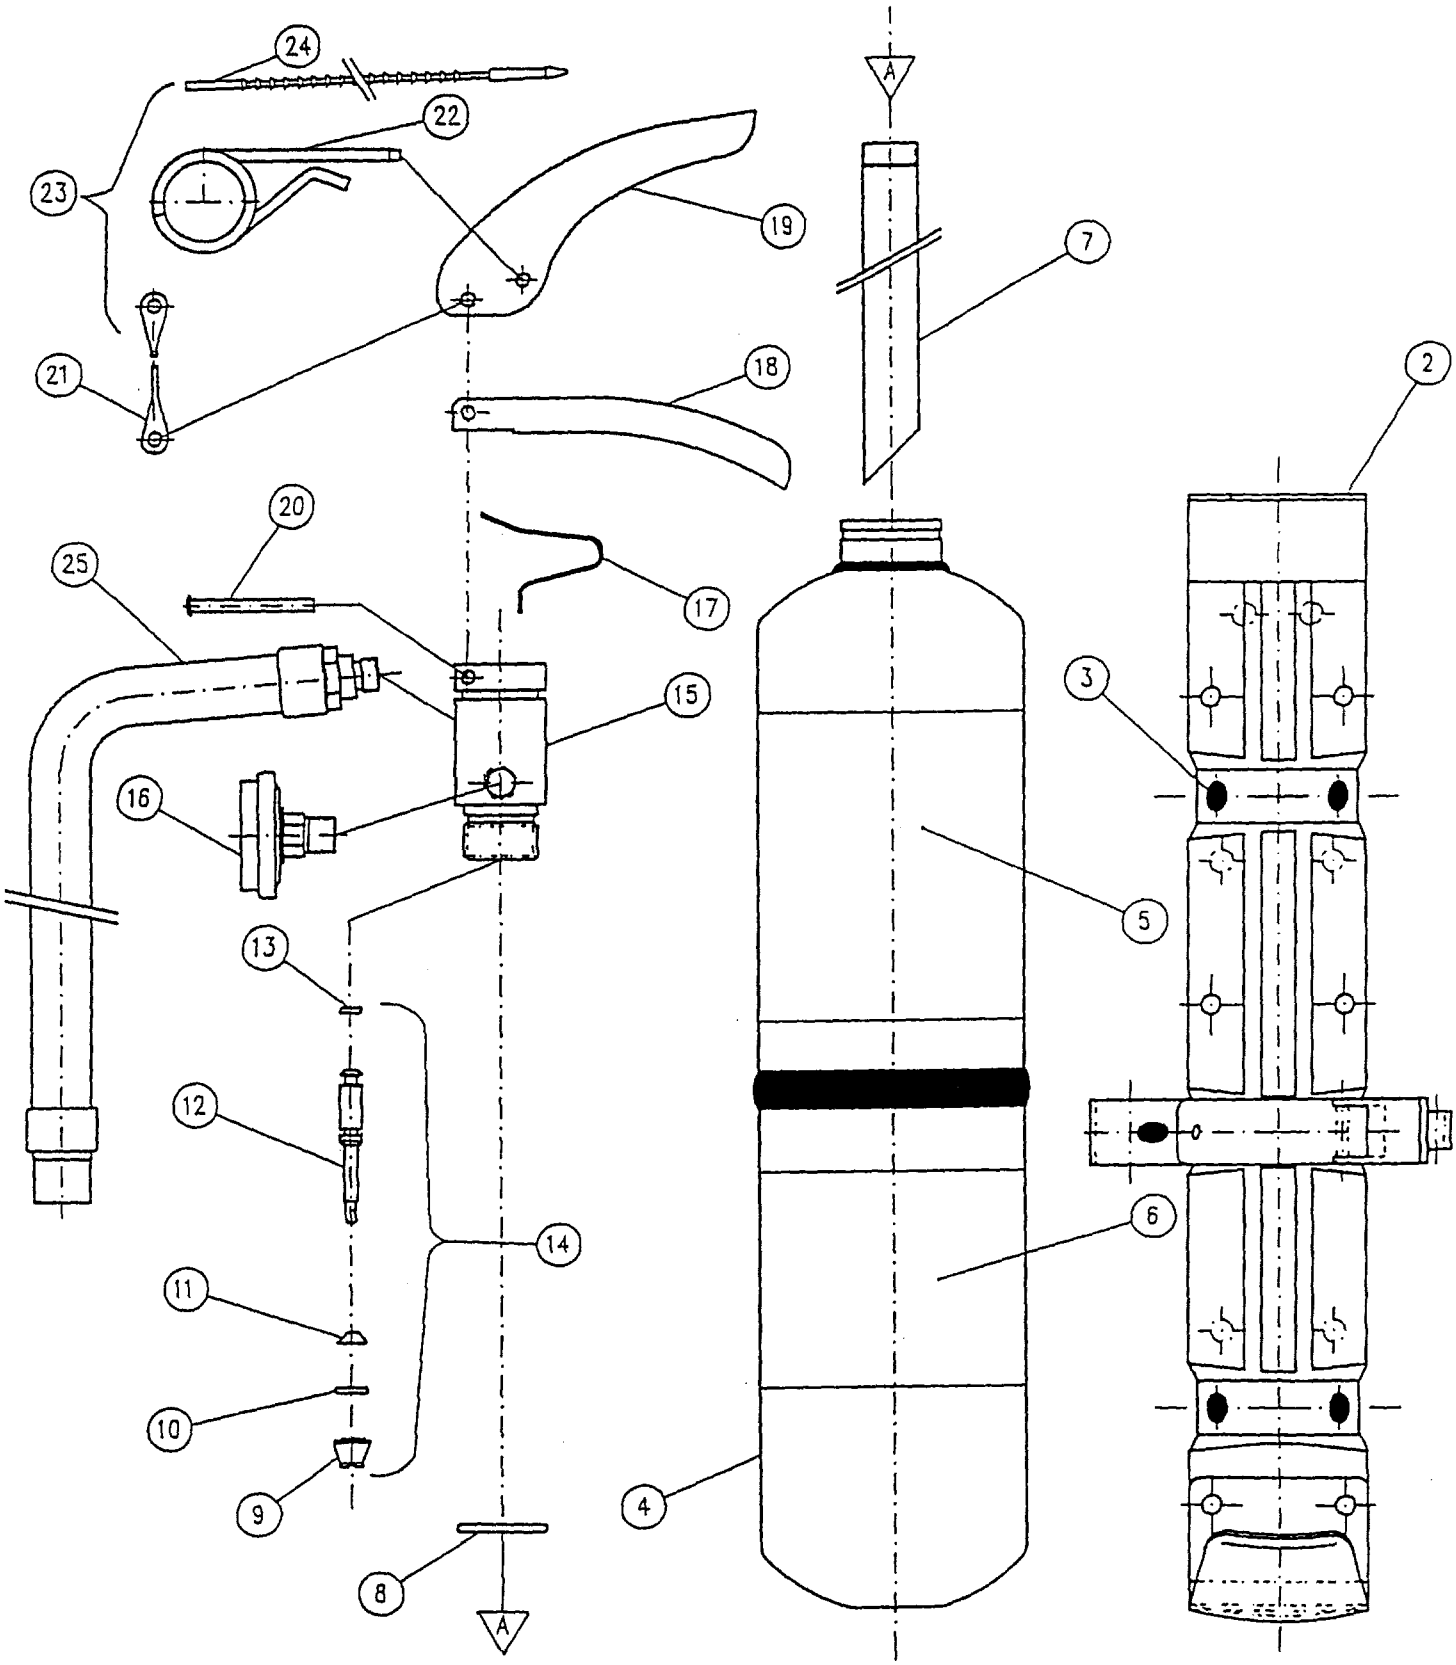
12.6 Place extinguisher on a scale and clamp extinguisher valve open with "U" clamp under handle.

12.7 Fill unit with the required amount of Halon 1211 and pressurize to 100 PSI (689 KPA) with nitrogen.

12.8 Shake extinguisher and re-pressurize if necessary.

12.9 Vent any line pressure before removing "U" clamp from extinguisher valve.

12.10 Remove charging adaptor and replace hose assembly.



NOTE: AFTER RECHARGING HAS BEEN COMPLETED, CLOSE NITROGEN VALVE AND CLOSE HALON VALVE. OPEN ALL OTHER LINES AND VENT INTO A RECHARGE/RECOVERY SYSTEM.

12.11 After recharging extinguisher apply a soap and water solution to all possible leakage points. No bubbles should form at these points.

12.12 Dry extinguisher off making sure no water remains inside valve. Use air hose if possible.

12.13 Record all maintenance information performed on each extinguisher before being returned for use.

12.14 When returning an extinguisher for use make sure the extinguisher is placed securely into or onto the accompanying bracket.

OVERHAUL MANUAL

OM. 108

HAND-OPERATED FIRE EXTINGUISHERS

Type 25H, 26H, 30H, 31H, 34H, 35H, and 38H

(First issued - December, 1963
as Provisional Manual No. 26-9-5)

This manual complies with British Civil Airworthiness Requirements Section A, Chapter A6-2. The technical accuracy of this manual has been verified and is certified as correct.

Signed. Nov/68

REVISION RECORD

The introduction of data by revision or amendment not certificated in accordance with British Civil Airworthiness Requirements, Chapter A6-2, will invalidate the initial certification on the title page of this Manual relative to the part revised. Revisions or amendments embodied in this Manual which have been certificated by an approved Design Organisation other than that applicable to the initial certification, must be recorded on separate record sheets.

PUBLICATION TITLE						AIRCRAFT OR LOCATION		
REV. No.	INSERTION DATE	BY	REV. No.	INSERTION DATE	BY	REV. No.	INSERTION DATE	BY

RETAIN THIS RECORD IN THE FRONT OF THE MANUAL. ON RECEIPT OF REVISIONS INSERT REVISED SHEET(S) OR ALTER TEXT IN ACCORDANCE WITH INSTRUCTIONS SUPPLIED. ENTER REVISION NUMBER, DATE INSERTED AND INITIAL.

OVERHAUL MANUAL

for

HAND-OPERATED FIRE EXTINGUISHERS

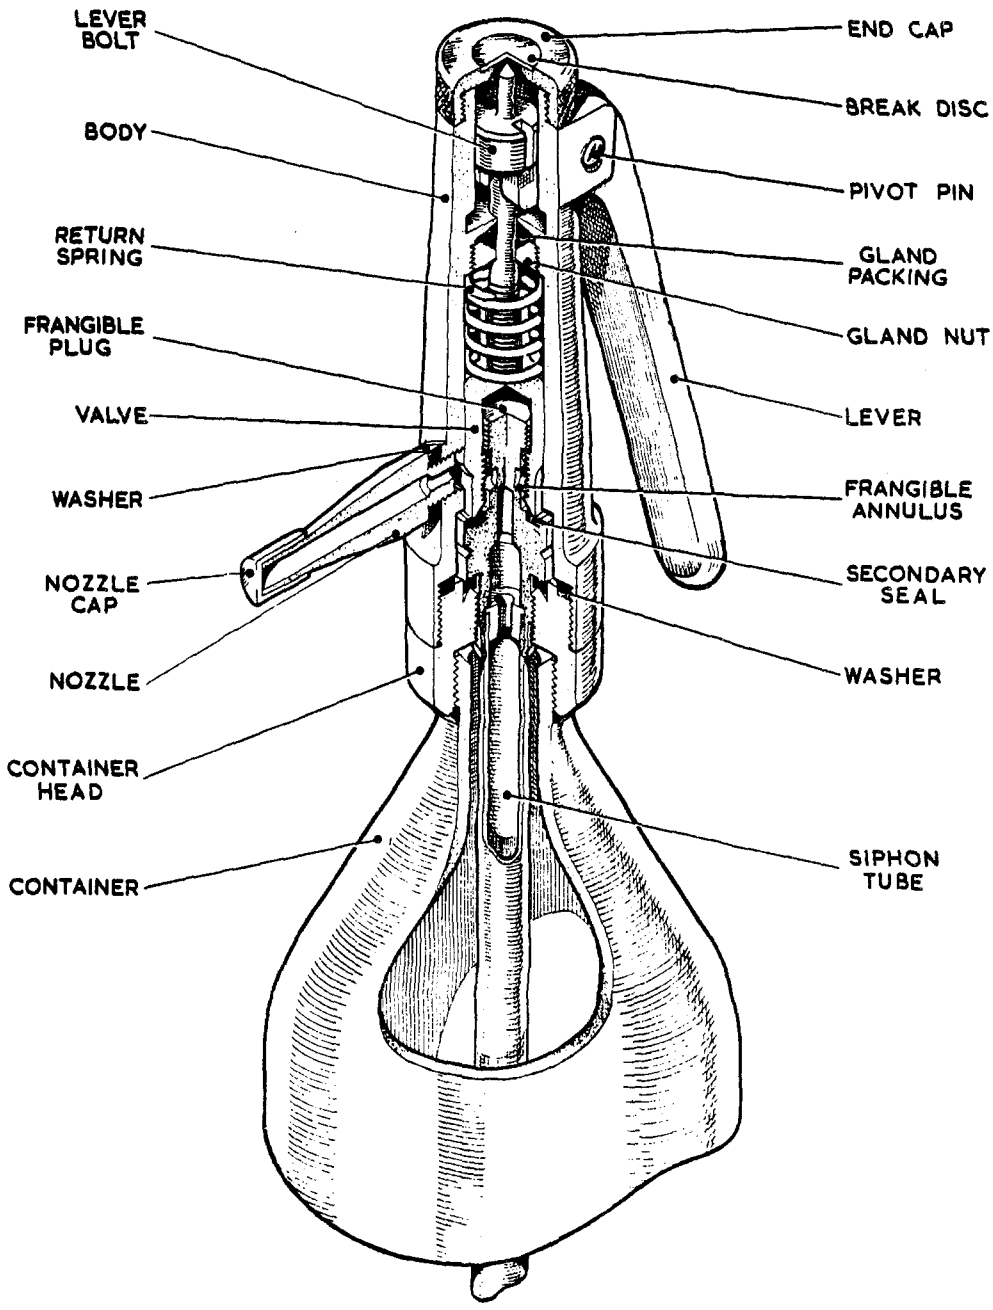
Type 25H, 26H, 30H, 31H, 34H, 35H and 38H

1. DESCRIPTION, OPERATION AND DATA

A. Description

These hand extinguishers all have the same type of lever operated head; use one of two sizes of seamless copper container; and are filled with one of three different kinds of liquefied extinguishant. Dry nitrogen gas is used as a pressurising agent. The design ensures that leakage is virtually impossible before the frangible annulus is fractured by the action of the operating lever.

When the extinguisher is operated, a jet or spray of extinguishant is discharged from a nozzle. Releasing the lever operates a valve which checks the flow of extinguishant and retains the remainder of the charge for further use.



B. Operation

Pressure on the operating lever fractures the frangible annulus, allowing the pressurised extinguishant to discharge through a nozzle. When the lever is released a spring forces a cylindrical valve onto a secondary seal, thus interrupting the flow of extinguishant and preventing leakage. Operation of the lever to initiate discharge also causes a pin to pierce a disc at the end of the body to provide a clear visual indication that the extinguisher has been operated.

C. Data

Details of the main differences between the different types of extinguishers are listed in Table 1.

Brief Details of Extinguishers

Table 1.

CHAPTER 26

38H

2. OVERHAUL OF TIME-EXPIRED EXTINGUISHER

NOTE: The overhaul of extinguishers should be undertaken only by a Graviner approved organisation. Details of the filling plant and other special equipment necessary for the repairs of extinguishers can be obtained from Graviner (Colnbrook) Limited.

A. Cleaning

Clean exterior of extinguisher with 'white spirit' or similar hydrocarbon solvent. Dry with compressed air jet and a clean dry cloth.

B. Inspection

(1) Inspect container for damage such as chafing, scoring or dents.

(2) If any damage is found likely to weaken a container, the extinguisher should be emptied, disassembled, and the container scrapped.

(3) If damage is restricted to protective finish, remove remaining paint or lacquer and re-spray as detailed in section 3.

(4) If the container is free from the faults in (1), or its condition is as (3) above, check that extinguisher weight is within one ounce of that stamped on the body. If weight is low, extinguisher should be examined to locate leak, then emptied and disassembled.

(5) If weight check is satisfactory, remove nozzle cap (21), lightly smear end of nozzle (19) with grease (Item M.2) then fit new nozzle cap.

3. OVERHAUL OF DISCHARGED EXTINGUISHER

NOTES: (1) Overhaul of extinguishers should be undertaken only by a Graviner approved organisation. Details of filling plant and special equipment necessary can be obtained from Graviner (Colnbrook) Limited.

(2) 'Item' numbers in the following text refer to special tools, equipment and materials necessary for overhaul. Special tools and equipment (prefix 'A' or 'B') are listed in Section 5 of this manual, and materials (prefix 'M') are listed in the Illustrated Spare Parts Catalogue.

WARNING: ENSURE THAT EXTINGUISHER IS FULLY DISCHARGED BEFORE DISASSEMBLING.

A. Clean Extinguisher

Clean exterior of extinguisher with 'white spirit' or similar hydrocarbon solvent. Dry with compressed air jet and a clean dry cloth.

B. Disassemble Extinguisher

(1) Remove nozzle cap (21), nozzle (19) and washer (20); scrap washer and nozzle cap.

(2) Unscrew cap assembly (16) using tool (Item A. 1.).

(3) Remove lever bolt (8) with fork screwdrive. Scrap lever bolt.

(4) Extract pivot pin (14), remove lever (13) and spacing washers (15). Scrap pivot pin and washers.

(5) Screw tool (Item A. 3) into nozzle bore and use it to unscrew the body (7) from container head (2).

(6) Withdraw valve (12) spring (11) and sealing washer (22) from body. Scrap sealing washer, valve and spring.

(7) Unscrew and scrap frangible plug (6) from bore of valve (12).

(8) Unscrew gland nut (10) using tool (Item A. 2), remove and scrap gland packing (9) and gland nut (10).

(9) Unscrew and scrap siphon tube assembly (3) from container (1).

C. Remove protective finish

(1) Container

(a) Immerse container, head uppermost, in paint stripper solution (Ite M. 3), up to container/head joint.

(b) Remove after 10 minutes in solution and brush off any paint still adhering to the container.

(c) Rinse container thoroughly in clean running water and place, neck down, in rack to dry.

(2) Body and Nozzle

(a) Prepare caustic soda solution:

Sodium hydroxide	1 lb. 9 oz.
Sodium cyanide	11 oz.
Water	5 gal.

Use solution at 50° C to 70° C

WARNING: THIS SOLUTION IS BOTH CAUSTIC AND POISONOUS. IT SHOULD NOT BE ALLOWED TO ENTER EYES OR MOUTH. HANDS SHOULD BE WASHED THOROUGHLY AFTER ITS USE ESPECIALLY WHERE THE SKIN IS BROKEN.

(b) Submerge body and nozzle in caustic soda solution.

(c) Remove components from solution after 15 - 20 minutes and brush off loosely adhering lacquer.

(d) Wash components in clean running water and allow to dry.

D. Inspect Extinguisher Components

(1) Inspect container exterior for damage such as chafing, scoring or dents. If the container is damaged in any way that is likely to weaken it, it should be scrapped.

(2) Inspect container interior for corrosion.

(3) Inspect the following reclaimable components for serviceability and condition of screw threads where applicable:-

(a) Body

(b) Lever

(c) Nozzle

(4) Obliterate date and weight stamped on body.

E. Repair Cap Assembly

(1) Inspect cap assembly (16) for damage and serviceability of screw threads.

(2) Heat cap assembly (16) until solder is fluid then remove break disc and excess solder from cap recess. Scrap break disc.

(3) Coat recess in cap with solder paint (Item M.10). Place new break disc (17) in recess and heat assembly until solder is fluid (230° C approximately). Remove heat and allow solder to set. Neutralise in soda solution (4 oz. sodium carbonate to 1 gallon of water), then rinse assembly in clean water.

F. Pressure Test Container

Test container to 750 lb/in^2 using hydraulic test rig. (Item B.3 with adaptor Item B.4.) Use washer H.143 (item 22) as seal between adaptor and container head for this test.

G. Prepare Container for Re-filling

(1) Prepare an acid cleaning solution consisting of the following:-

(a) Chromium trioxide (commercial)	10 lb.
(b) Sulphuric acid, concentrated (commercial)	$4\frac{1}{2}$ pints.
(c) Water	10 gal.

(2) Immerse container in this cleaning solution so that solution flows into and fills the container, then stand container vertically in the solution. The level of solution should come up to the neck joint.

(3) Remove container from solution after suitable immersion time (see Note), and rinse exterior and interior of container thoroughly in clean running water.

NOTE: Cleaning should be effective in 2 - 3 minutes in fresh cleaning solution, but the solution can be used until 5 minutes immersion is required for satisfactory cleaning. At this point fresh solution should be used.

(4) Finally, rinse in hot water, and then place vertically, neck downwards, in rack to dry.

WARNING: SUITABLE RUBBER GLOVES AND PROTECTIVE CLOTHING SHOULD BE WORN DURING ACID CLEANING OPERATIONS.

(5) Buff and polish container. (Types 25H and 26H only).

H. Fit New Siphon Tube Assembly

Fit a new siphon tube assembly (3) to container head (2). Screw in three or four threads only.

NOTE: Do not fit sealing washer (5) at this stage.

I. Fill Container

Fill container with extinguishant and pressurise with dry nitrogen in accordance with filling plant instructions. The type and amount of extinguishant and the nitrogen pressure are listed in Table 2.

TYPE	EXTINGUISHANT	WEIGHT (± 1 oz)	NITROGEN PRESSURE (lb/in^2 at 20° C)
25H	M.B. (Item M.11)	2 lb 9 oz	65
26H	M.B. (Item M.11)	1 lb 9 oz	65
30H	CB (Item M.12)	2 lb 15 oz	100
31H	CB (Item M.12)	1 lb 13 oz	100
34H	BCF (Item M.13)	2 lb 9 oz	65
35H	BCF (Item M.13)	1 lb 9 oz	65
38H	BCF (Item M.13)	2 lb 9 oz	100

Extinguisher Filling Data
Table 2

J. Test for Leaks

Immediately after removal from filling plant, submerge container head uppermost in hot water (35° C to 80° C) for 15 minutes. Watch for stream of bubble indicating leakage. Use container leakage test rig (Item B.2) for this test.

K. Identify Extinguishant Batch

If container is free from leaks, obliterate original extinguishant batch number from container head (2) and metal stamp new extinguishant batch number. Stamp letter 'R' as suffix to container serial number to indicate that it has been overhauled.

L. Re-assemble Extinguisher

(1) Soak new gland packing (9) in fluid (Item C.1) for at least 30 minutes.

(2) Insert gland packing in body (7) and screw in gland nut (10) one or two threads only with tool (Item A.2.)

(3) Fit lever (13) to body with spacing washers (15) and screw in pivot pin (14). Do not tighten pivot pin.

(4) Fit lever bolt (8) into body, passing screwed end of bolt carefully through gland packing. Tighten gland nut with tool (Item A.2.)

(5) Fit spring (11) and valve (12) to lever bolt. Using a fork screwdriver, screw lever bolt onto valve a few threads only.

(6) Screw up lever bolt until base of valve is 3/4 inch inside body, measured from outside edge of screwed bore of body.

(7) Fit washer (22) into body.

(8) Fit sealing washer (5) to groove machined in frangible plug assembly (6).

(9) Assemble body to container in the following way:-

(a) Compress lever hard to body and carefully rotate container whilst entering frangible plug into body.

(b) Feel carefully for outward pressure on lever while slowly rotating container. This pressure will indicate that thread on frangible plug is screwing into valve. Ensure that container head engages properly with bore of body.

(c) While rotating, ease lever back gradually to compensate for pressure until lever is felt to be free and is in normal ready-to-operate position.

CAUTION: LACK OF CARE IN PERFORMING THIS OPERATION CAN BREAK THE FRANGIBLE PLUG AND DISCHARGE THE EXTINGUISHER.

(10) Screw tool (Item A.3) into nozzle bore in body and tighten body to container. Remove tool.

(11) Remove pivot pin, lever and spacing washers.

(12) Fit wash (20) to nozzle (19). Screw nozzle into body and tighten. Fit new sealing cap (21) to nozzle.

(13) Fit cap assembly (16) to body. Hand tighten only.

(14) Use revolving wire brush to give bright metal finish to copper plating of container head (2), body (7) and nozzle (19).

(15) Coat container head, body and nozzle with clear lacquer (M.8) using brush. Allow lacquer to dry.

(16) Cover container head, body and nozzle. Spray container with protective finish as follows:-

Types 25H and 26H	.....	Item M.8
Types 30H and 31H	.....	Item M.5 then Item M.7
Types 34H, 35H and 38H	.....	Item M.4 then Item M.6

(17) Types 35H and 38H only - apply extinguisher indentification to container using stencil (Item B.6) and white paint (Item M 9.)

(18) Fix label (23) to container.

(19) Fit lever (13) to body using new spacing washers (15) and new pivot pin (14). Tighten pivot pin and stake to secure.

(20) Remove cap assembly (16). Adjust lever bolt (8), using fork screwdriver to give approximately .030 inch free movement at outer end of lever (13). Replace cap assembly, tighten with tool (Item A.1), and stake to secure.

(21) Remove nozzle cap (21), smear end of nozzle with grease (Item C.2), re-cap.

(22) Check weigh extinguisher, and ensure that the weights are within the limits listed in Table 3.

TYPE	WEIGHT
25H	5 lb 3 oz (± 4 oz)
26H	3 lb 15 oz (± 4 oz)
30H	5 lb 9 oz (± 4 oz)
31H	4 lb 3 oz (± 4 oz)
34H	5 lb 7 oz (± 4 oz)
35H	3 lb 15 oz (± 4 oz)
38H	5 lb 7 oz (± 4 oz)

Filled Weights of Extinguishers
Table 3

(23) Metal stamp on body:-

(a) Weight of complete extinguisher.

(b) Date of overhaul suffixed by 'R' to indicate that it has been over-hauled (repaired).

(24) Brush clear lacquer (Item M.8) over stamping on body and allow to dry.

(25) Use leak detector (Item B.5) to check for leaks at all joints.

4. STORAGE INSTRUCTIONS

A. Storage Conditions

(1) Store extinguishers horizontally, in a cool dry atmosphere, away from corrosive fumes.

(2) Check weigh extinguishers at periods of approximately 12 months during storage and ensure that the weight is within one ounce of that stamped on the extinguisher body.

B. Storage Period

The maximum storage life of one of these extinguishers is five years from the date of original manufacture, or last overhaul. At the end of this period an extinguisher should be sent to the manufacturer, or to an approved organisation, for overhaul.

5. OVERHAUL PERIOD

Extinguishers, whether in service or in storage, should be sent for overhaul five years after the date of manufacture, or last overhaul.

6. SPECIAL TOOLS AND EQUIPMENT

A. Special Tools

Item	Description	Graviner Part No.
A.1	Cap assembly spanner	T.1916
A.2	Gland nut spanner and gland balancer	T.1917
A.3	Body spanner	T.1918

B. Special Equipment

Item	Description	Graviner Part No.
B.1	Filling plant	T.863 or T.1260

ILLUSTRATED SPARE PARTS CATALOGUE

SECTION II: INTRODUCTION

This Illustrated Spare Parts Catalogue has been prepared in accordance with the basic requirements of the ATA Specification 100 (Revision 14) for Manufacturers Technical Data. Its purpose is to enable parts to be clearly identified and/or replacement parts to be properly ordered. It is composed of the following five separate sections, of which this INTRODUCTION section is one:-

SECTION I	Alphabetical Table of Contents
SECTION II	Introduction
SECTION III	Group Assembly Parts List
SECTION IV	Alpha/Numerical Parts List Index
SECTION V	Vendors Code/Name Index

An explanation of each individual section follows, together with the detailed notes for general use.

Alphabetical Table of Contents

This section (Section I) contains a guide, in alphabetical sequence, to the contents of the various sections contained within the Illustrated Spare Parts Catalogue. A list of all the illustrations is also given.

Group Assembly Parts List

This section (Section III) is compiled strictly in accordance with the ATA Specification No. 100 for Manufacturers Technical Data. The relevant Chapter (Chapter 26, which covers Aircraft Fire Protection Systems) is divided into the three subsidiary subjects of Detection (26.10) Extinguishing (26.20) and Explosion Suppression (26.30). Each assembly within the Subject(s) is suitably cross-referenced by Chapter No., Subject No., Item No. and Figure No.

Alpha/Numerical Parts Index

Section IV contains all part numbers listed in Section III. It is arranged in alpha/numerical sequence and refers to Chapter No., Subject No., Item No., and Figure No.

Parts with no identification number are listed in the beginning of the index in alphabetical order. Part number arrangement begins in the extreme left-hand position from left to right, one position at a time, until all parts are arranged in sequence. The order of precedence in the beginning of the part number arrangement on the extreme left-hand positions is as follows:-

Letters A through Z
Numerals 0 through 9

The alpha '0' is considered as numeric 'zero'.

Vendor's Code-Name Index

Section V contains a list of manufacturers names, addresses, code names or Federal Suppliers codes (where applicable) and is arranged in alpha/numerical sequence. The prefix V is used to indicate the Federal Supplier's code (where applicable) the prefix VG being used to indicate manufacturers who do not have a Federal Suppliers codification number.

Illustrations

All illustrations are, as far as possible, located on left-hand pages and the relevant listings on the facing right-hand page. If there is more than one page of listings, the first page will be the facing right-hand page, with other pages following in proper sequence. A view of each assembly and sub-assembly, exploded as necessary to show the component parts thereof, is provided to illustate each part included in the Parts List, and to show their assembly/disassembly relationship for overhaul purposes.

All illustrated parts are allocated an item number which corresponds to an iten number of the parts list page(s), in the column provided. Continuity of illustra and relevant breakdown parts is maintained by cross-reference of figure numbers.

Vendor items are assigned a parenthesized Federal Supplier's codification number (prefixed V) or a Graviner's vendor code number (prefixed VG) followir the nomenclature.

Units Per Assembly

This column shows the number of units per 1 off 'next higher assembly'. Requirements that vary on installation(s) shown as 'AR' to indicate 'As Require

Assembly Order

The assembly order is maintained by a system of indentation of part titles to show true generation breakdown sequence. Attaching parts are listed immediately following the part they attach, and are terminated by the symbol *** as shown below:-

1 2 3 4 5 6 7
Assembly
Attaching Parts for Assembly
* * *
. Details of Assembly
.. Sub-assembly
.. Attaching Parts for Sub-assembly
* * *
... Details of Parts for Sub-assembly
... Etc.

Unit per assembly must be multiplied by sub-assembly and sub sub-assembly quantities to provide total quantity per highest assembly listed. When two or more assemblies are made up of a large number of identical parts, they are 'mirrored' and the details combined. Details not common to all assemblies ar suitably annotated by reference to the Part No. of the assembly.

Example:

ITEM No.	PART NUMBER	1 2 3 4 5 6 7	USAGE CODE
1-	34H	Assembly	A
1-	38H	Assembly	B
1	H153	. Container	A
1	H151	. Container	B
2	H137/1	. Head container	A & B
3	H178	. Assy, frangible plug and siphon tube	A
3	H294	. Assy, frangible plug and siphon tube	A
4	H403	.. Washer, sealing	A & B
5	H138	.. Plug, frangible	A
		.. etc.	

The example given shows the applicability of the various sub-assemblies to the particular assemblies, the usage code column being used to clearly indicate which particular part is used on any particular type of an otherwise fundamentally similar unit.

Item Numbers

Parts not illustrated in detail are designated by means of a hyphenated item number.

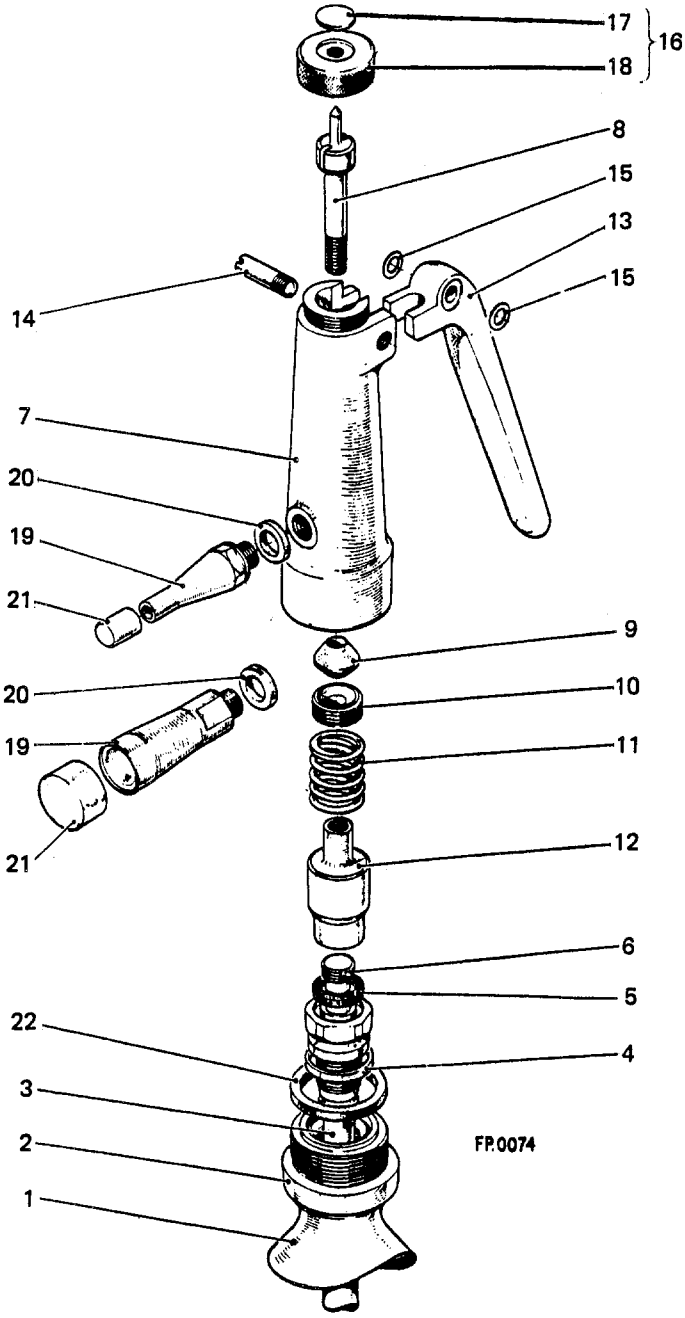
Summary of Materials and Adhesives

This summary, located at the back of the Illustrated Parts List, contains a list of standard parts, materials and adhesives required in conjunction with the changing of parts.

Modifications

To ensure that the information in this Illustrated Parts List is compatible with the equipment, no retrospective Graviner Design Modifications will be incorporated into this list without the written assurance of the customer that he intends to install a particular modification. The exception to the above will be incorporation of 'Spares Replacement' and/or 'Mandatory' Modifications.

Revisions



Revisions will be issued periodically. A record sheet for Revisions incorporated in the Illustrated Parts List is provided behind the Revision marker card.

A revision to the catalogue consists of a Transmittal Sheet together with the new or revised replacement pages. This Transmittal Sheet lists the Chapter, Subject, Item and Pages affected, with instructions to remove existing pages and insert pages where applicable. The transmittal sheets should be filed behind the Revision Record.

Abbreviations

The following standard abbreviations are used throughout this Manual:-

AC	-	Alternating Current
Amp	-	Ampere
AR	-	As Required
assy.	-	Assembly
BA	-	British Association
BSF	-	British Standard Fine
ch. hd.	-	Cheese Head
csk. hd.	-	Countersunk Head
c/w	-	Complete With
dia.	-	Diameter
DC	-	Direct Current
hx. hd.	-	Hexagonal Head
instln.	-	Installation
L/H	-	Left Hand
mF	-	Micro Farad
msh. hd	-	Mushroom Head
NA	-	Not Applicable
NHA	-	Next Highest Assembly
No.	-	Number
NP	-	Nonprocurable
pF	-	Pico Farad
Ref.	-	Reference
rd. hd.	-	Round Head
R/H	-	Right Hand
UNF	-	Unified Fine Thread
V	-	Vendor (on Federal Supplier's Code list)
VG	-	Vendor (Graviner's Supplier's Code)

TO ALL HOLDERS OF PACIFIC SCIENTIFIC HTL/KIN-TECH DIVISION
COMPONENT MAINTENANCE MANUAL ATA 26-20-200
FOR P/N 17300 AND P/N 17400
DATED MAR 1/95

APPLICABILITY: BOEING VERTROL

THIS SHEET TRANSMITS REVISION NO. 3

DATED MAR 15/99

HIGHLIGHTS

We reprinted this manual in its entirety. Please replace all of the pages of your manual with this revision. We made many general format and layout changes in addition to technical changes.

Chapter/Section and Page No.	Description of Change
Title Page	Listed the revision date and added airline part numbers with customer part number cross-reference.
Record of Revisions	Listed the revision number and date.
Service Bulletin List	Revised date.
List of Effective Pages	Listed the revision date for the affected pages.
All Sections	Updated procedures and reformatted entire manual.

TO: HOLDERS OF THE FIRE EXTINGUISHER COMPONENT MAINTENANCE MANUAL ATA 26-20-200 FOR P/N 17300 AND P/N 17400 DATED JUN 1/73.

REVISION NO. 2 DATED MAR 1/95
HIGHLIGHTS

THIS PUBLICATION HAS BEEN REPRINTED IN ITS ENTIRETY DUE TO THE NUMBER OF PAGES AFFECTED BY THIS REVISION. REPLACE ALL THE PREVIOUSLY ISSUED COPIES OF THE MANUAL.

The highlights of the revision are outlined below. All pages have been revised to the format of ATA 100, Revision 30 and the AECMA Simplified English guidelines.

Chapter/Section and Page No.	Description of Change	Effectivity
Title Page	Listed the revision date.	All Models
Record of Revisions	Listed the revision number and date.	All Models
Service Bulletin List	Revised date.	All Models
List of Effective Pages	Listed the revision date for the affected pages.	All Models
Introduction	Added a list of the part numbers with a customer part number cross-reference. Added a Product Support Services paragraph. Added an Abbreviations and Unit Symbols paragraph.	All Models
Page 1 thru 4	Added electrical schematics for the cartridge to Figure 1. Revised Table 1.	All Models
Page 101 thru 108	Upgraded the Test Equipment list. Added a ground strap/circuit tester for personnel safety while handling the cartridges. Revised the Hydrostatic Test Requisites and upgraded the tooling. Added paragraph AA for a weldment drying procedure.	All Models
Page 301 thru 304	Added a Disassembly Sequence Chart. Upgraded the Disassembly Equipment list, replaced the discharge tool with the discharge recovery tool and added a recovery/ recycle system. Added a ground strap/circuit tester for personnel safety while handling the cartridges. Revised the discharge method to capture the Halon 1301 fire extinguishing agent.	All Models
Page 401 and 402	Updated the Cleaning Materials list. Added a cleaning description for the weldment. Removed usage of Methyl-Ethyl-Ketone solvent.	All Models

Chapter/Section and Page No.	Description of Change	Effectivity
Page 501 thru 504	Added a Check Tools and Equipment list. Upgraded the Weight Check procedure and added a Maximum Weight list. Added the cartridge life limits and a ground strap/circuit tester for personnel safety while handling the cartridges. Added a cartridge disposal procedure and the Cartridge Disposal Setup figure.	All Models
Page 601 and 602	Removed usage of Methyl-Ethyl-Ketone solvent. Added the Replacement of Bonded Plates procedure - removed the spot weld method.	All Models
Page 701 thru 709	Upgraded the Assembly Equipment list. Revised the pressure switch assembly procedure. Upgraded the charging procedure and added the Nitrogen Charge Pressure Versus Temperature chart. Added a ground strap/circuit tester for personnel safety while handling the cartridges. Added a Storage Materials list, the storage marking data, and the storage temperatures.	All Models
Page 801	Added a Torque Limits list.	All Models
Page 901 thru 903	Added a Special Tools, Fixtures, and Equipment list; removed the tool illustrations.	All Models
Page 1001 thru 1011	Added to the list of manufacturer's. Added a Numerical Index. Revised the item number assignment to reflect the order of disassembly.	All Models

INTRODUCTION

1. Scope

   A. This Checkout and Component Maintenance Manual (CMM) contains the maintenance instructions and an illustrated parts list for the 86 Cubic Inch Fire Extinguisher. The fire extinguisher is manufactured by Pacific Scientific Company, HTL/Kin-Tech Division, Duarte, California.

2. Usage Guide

   A. Refer to the Table of Contents to find the necessary procedures or maintenance data. This Manual is written to ATA 100, Revision 30 and AECMA Simplified English guidelines.

      (1) **Description and Operation** gives the function, primary components, and technical properties of the fire extinguisher.

      (2) **Testing and Fault Isolation** contains the test and fault isolation procedures.

      (3) **Disassembly** contains the procedures to discharge the extinguishing agent and disassemble the fire extinguisher before repair or part replacement.

      (4) **Cleaning** contains procedures to clean the fire extinguisher and components.

      (5) **Check** contains the procedures to check the parts for too much wear, corrosion, and other damage.

      (6) **Repair** contains the repair procedures.

      (7) **Assembly** contains the procedures to reassemble, refill, and store the fire extinguisher.

      (8) **Fits and Clearances** contains the assembly torque ranges and the minimum height dimensions for the fill, discharge, and switch bosses (as applicable).

      (9) **Special Tools, Fixtures, and Equipment** describes the recommended special tools, fixtures, and test equipment.

      (10) **Illustrated Parts List** contains the information needed to order spare parts. A numerical index and an exploded-view drawing are provided to help identify the parts.

   B. The recommended tools and materials are given in each section. Equivalent items can be used.

3. Product Support Services

   A. Product support services for the fire extinguisher are available from Pacific Scientific Company.

   B. For technical documentation, please contact:

PACIFIC SCIENTIFIC COMPANY
6805 NW 87 Avenue
Miami, Florida 33178 U.S.A.

Telephone: (305) 477-4711
FAX: (305) 477-9799
SITA: MIAPSXD

C. For repair and overhaul, and spare parts please contact:

Buckinghamshire	FAX:	44 (1628) 810124
England SL8 5YS	SITA:	LHRPSCR

4. Verification Dates

Procedure	Date
Testing/Fault Isolation	Feb 15/99
Disassembly	Feb 15/99
Assembly	Feb 15/99

5. Revision Service

A. Revised pages will be issued when necessary throughout the service life of the fire extinguisher. The revised part of the page will be identified by a change bar or capital **R** in the left margin.

6. Abbreviations and Unit Symbols

A. Abbreviations and unit symbols which may be used in this manual are defined below. All weights and measurements are given first in the English standard units followed by the metric equivalent in parentheses.

Assy - Assembly
ATA - Air Transport Association
cfh - Cubic feet per hour
CAGE - Commercial and Government Entity
cm - Centimeter (1 cm = 0.394 inch)
DC - Direct Current
DOT - Department of Transportation
EFF - Effectivity
FAA - Federal Aviation Administration
FIG. - Figure
ID - Inside Diameter
IPL - Illustrated Parts List
kg - Kilogram (1 kg = 2.205 pounds)
kPag - Kilo Pascal-gauge (1 kPag = 0.15 psig)
m^3/hr - Cubic meter per hour
m - Meter (1 m = 3.281 feet)
mA - Milliampere
mm - Millimeter (1 mm = 0.0394 inch)
N·m - Newton-meter (1 N·m = 8.3 in-lb)
NHA - Next Higher Assembly
No. - Number
OD - Outside Diameter
Para. - Paragraph
P/N - Part Number
psig - Pounds per square inch-gauge
RF - Reference
rpm - Revolutions per minute
SB - Service Bulletin
sccs - Standard cubic centimeter per second
V - Volt
VDC - Voltage - Direct Current

DESCRIPTION AND OPERATION

A. The fire extinguisher stores fire extinguishing agent under high pressure. When the sensors indicate smoke, the pilot operates a control switch sending an electrical signal to the cartridge mounted in the discharge outlet (see Figure 1). This causes the cartridge to detonate, which fractures a valve plug and releases extinguishing agent to extinguish the fire.

1. Description

A. The fire extinguisher is a spherical, stainless steel container (see Figure 2). Its primary components include:

- Container weldment
- Fill fitting
- Pressure gauge
- Discharge outlets (two on some units)
- Cartridges (two on some units)

B. The weldment is an all-welded stainless steel shell, which includes fill, discharge, and gauge bosses.

C. An electrically actuated cartridge (see Figure 1) is installed in the housing assembly. The cartridge can be removed or installed (even when the fire extinguisher is pressurized). The cartridge is safety wired to the discharge outlet and caution tagged for safety.

D. The fill fitting is a combination filling device and safety relief assembly. If the ambient temperature should rise abnormally, a fusible check valve within the fill fitting melts. This relieves the contents of the container through the fill fitting.

E. The discharge outlet is a flow path for the extinguishing agent. The discharge outlet is safety wired to the weldment to a secure installation. The discharge outlet consists of a valve plug that is held securely by a destructible housing assembly and stem assembly. A discharge outlet capable of rotating 360° (even when the fire extinguisher is pressurized) is installed between the housing assembly and discharge boss.

F. The fire extinguisher is equipped with a pressure gauge and guard.

G. The fire extinguisher is shipped with protective caps to cover the discharge outlet and the fill fitting. The shunt wire/caution tag installed on the cartridge, protects the firing circuit from detonating with electromagnetic interference.

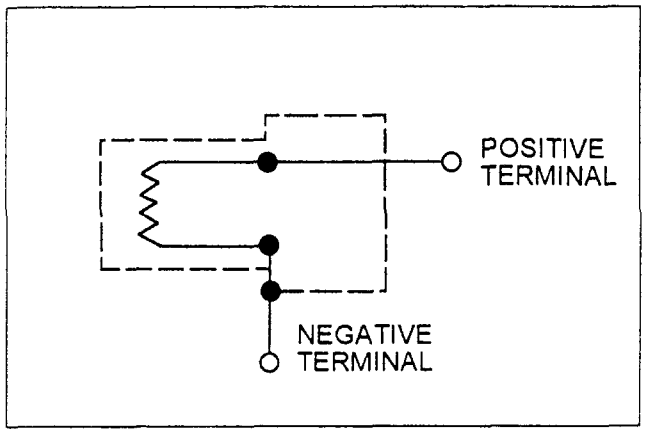

Figure 1. Cartridge Schematic

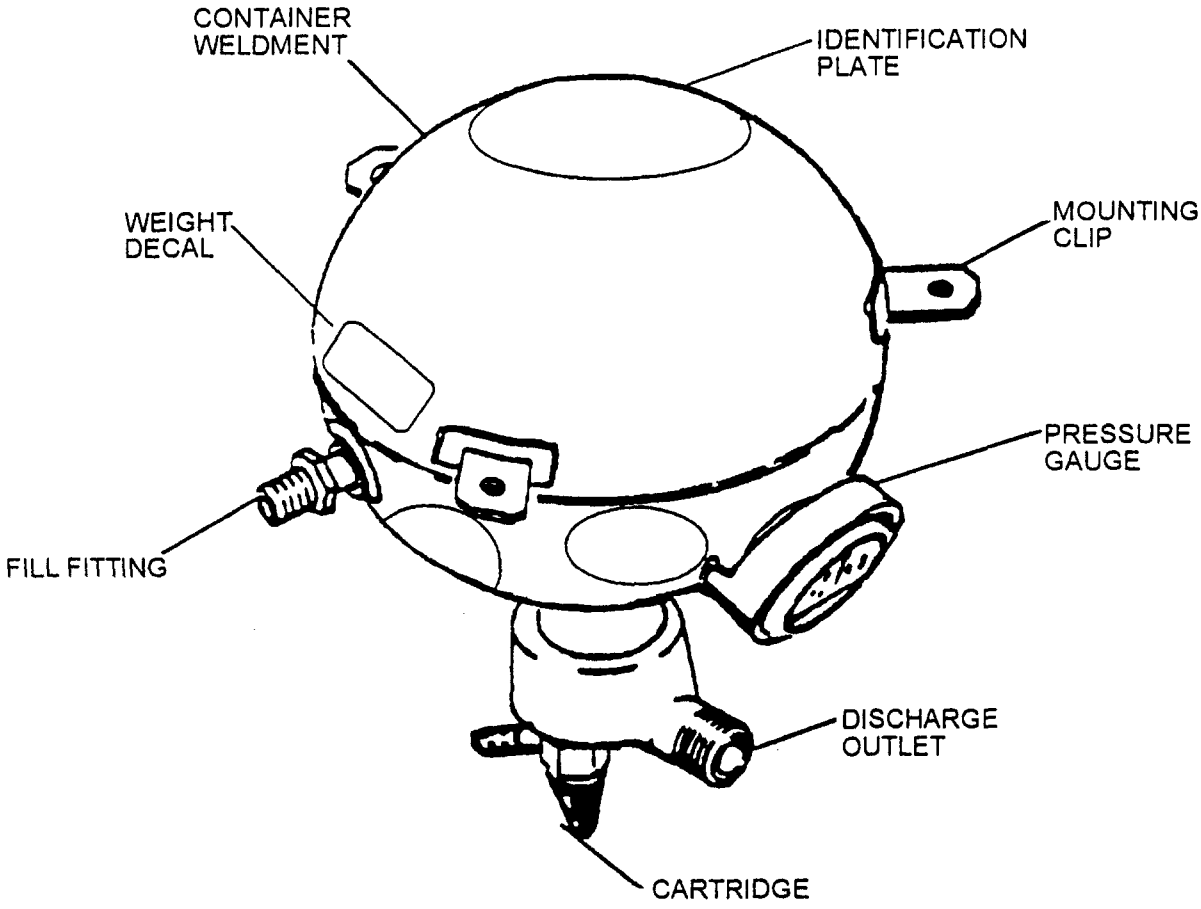

Figure 2. Primary Components

2. Operation of Fire Extinguisher

A. To release the extinguishing agent, the pilot operates a control switch, applying 18 to 30 VDC, 3.0 amperes current to the cartridge terminals. The current detonates the explosive charge in the cartridge (Figure 1). The explosion breaks the end of the housing assembly, removing the mechanical locking force against the valve plug. The pressurized extinguishing agent forces the valve plug outward. The extinguishing agent is discharged through the discharge outlet into the distribution network.

B. The pressure gauge indicator should be checked regularly to make sure that the fire extinguisher is charged.

3. Technical Properties

A. The technical properties of the fire extinguisher are given in Table 1.

Table 1. Technical Properties for Fire Extinguisher

Property	Specifications
Description	
Manufacturer	Pacific Scientific, HTL/Kin-Tech Division
Part Number	P/N 17300 and P/N 17400
Nomenclature	Fire Extinguisher, 86 Cubic Inch
Functional Properties	
Internal Volume	86 cubic inches (1,5 liter)
Extinguishing Agent	Bromotrifluoromethane ($CBrF_3$)
Pressurizing Gas	Nitrogen (N_2)
Pressure Data at 70°F (21°C)	
Charge Pressure	600 to 625 psig (4137 to 4309 kPag)
Hydrostatic Pressure Test	1650 psig (11377 kPag) minimum
Burst Pressure	
P/N 17300	3000 psig (20685 kPag) minimum
P/N 17400	2700 psig (18617 kPag) minimum
Safety Relief Temperature Range	215°F to 226°F (101°C to 108°C)
Ambient Temperature Range	-65°F to +165°F (-54°C to +74°C)
Weight Data	
P/N 17300	
Empty Fire Extinguisher	3.60 pounds (1,63 kg) maximum
Extinguishing Agent (full charge)	2.00 to 2.12 pounds (0,91 to 0,96 kg)
Nitrogen Charge	0.11 pound (0,05 kg) maximum
Charged Fire Extinguisher	5.83 pounds (2,64 kg) maximum
P/N 17400	
Empty Fire Extinguisher	2.76 pounds (1,25 kg) maximum
Extinguishing Agent (full charge)	1.00 to 1.25 pounds (0,45 to 0,57 kg)
Nitrogen Charge	0.11 pound (0,05 kg) maximum
Charged Fire Extinguisher	4.12 pounds (1,87 kg) maximum
Allowable Weight Deviation - actual weight versus weight marked on identification plate	Minus 0.10 pound (0,05 kg)

Table 1. Technical Properties for Fire Extinguisher (Continued)

Property	Specifications
Cartridge Data	
Voltage	18 to 30 VDC
Current Rating	
All Fire	3.0 amperes minimum
No Fire	0.5 ampere, 1.0 Watt for five minutes
Test Current	50 mA maximum
Bridgewire Resistance	0.9 to 1.4 ohm per each bridge
Service Life	4 years
Maximum Life (service and storage)	6 years
Mating Terminal Size	
Positive Terminal	8-32UNC-2A
Negative Terminal	8-32UNC-2A
Fusible Valve	
Code Color	Blue
Relief Temperature	215°F to 226°F (102°C to 108°C)
Fill Fitting End	MS33656-4
Discharge Outlet End	MS33656-16

TESTING AND FAULT ISOLATION

1. General

A. This section contains the testing and fault isolation procedures. Perform the leak test and cartridge test, before disassembly to identify the quantity of maintenance.

B. The recommended test equipment and materials are given in Table 101.

NOTE: Equivalent items can be used.

Table 101. Test Equipment and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Bag, Plastic (large enough to enclose weldment)	---	Commercially available
Cap, Hydrotest	83330165	Pacific Scientific (05167)
Cradle, Fire Extinguisher	83000242	Pacific Scientific (05167)
Digital Multimeter	79	John Fluke (89536)
Fitting, Hydrotest 0.750-16 UNJF Thread	---	Commercially available
Ground Strap & Circuit Tester	WT25	Walter G. Legge Co. (84832)
Hydrotest Test Stand	---	Commercially available
Leak Detector	HLD 4000-310 Series C	Inficon (56507)
Oven or Heater, 250°F (121°C)	---	Commercially available
Plug, Gauge Boss 1/4-18 NPT Thread	---	Commercially available
Protective Caps		
Cartridge Cover	5/8-SC	CaPlugs (99017)
Cartridge Port	PD-50	CaPlugs (99017)
Cartridge Thread	1/2-SC	CaPlugs (99017)
Discharge Boss	PD-200	CaPlugs (99017)
Discharge Outlet End	CD-22	CaPlugs (99017)
Fill Boss	PD-40	CaPlugs (99017)
Fill Fitting End	CD-4	CaPlugs (99017)
Pressure Gauge Fitting	WW-O	CaPlugs (99017)
Safety Chamber, Cartridge	83330118	Pacific Scientific (05167)
Tank, Gaseous Nitrogen (GN_2) 1000 psig (6900 kPag)	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

Table 101. Test Equipment and Materials (Continued)

Nomenclature	Part or Specification Number	Source (CAGE)*
Test Fitting 1/8-27 NPT	---	Commercially available
Vacuum Source	---	Commercially available
Weighing Scale ±0.01 pound (0,005 kg) 0 to 120 pounds (55 kg)	Series 3000/3000E	Pennsylvania Scale Company (03964)

* Refer to the IPL, paragraph 2, for the address.

2. Leak Test

WARNING: THE CARTRIDGES (5, IPL FIGURE 1) ARE EXPLOSIVE DEVICES. INADVERTENT DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAPS (10) AND SHUNT WIRE/CAUTION TAGS (-15) MUST BE INSTALLED ON THE ELECTRICAL CONNECTOR.

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 101). Test the ground circuit.

B. Verify the shunt wire/caution tags (-15) is installed on the cartridges (5) between the positive and negative terminals.

C. Remove the cartridges (5) from the housing assemblies (25). Refer to Disassembly section, paragraph 2.

CAUTION: DO NOT USE COMPRESSED AIR TO BLOW CONTAMINANTS FROM THE DISCHARGE BOSS. COMPRESSED AIR CAN DAMAGE THE RUPTURE DISC.

D. Use a cotton swab or vacuum (Table 101) to clean dirt and other contamination from the discharge bosses.

E. Separate the fire extinguisher from other filled fire extinguishers. Use shop air to blow away any extinguishing agent in the air immediately around the fire extinguisher.

F. Wait two hours for any leakage to collect.

G. Set the sensitivity scale on the leak detector (Table 101) to 1×10^{-6} sccs.

H. Hold the detector probe 1/4 inch above the surface of the unit to light touching of the unit and check each discharge boss, the pressure gauge (80), and the fill fitting (60) for a minimum of 60 seconds each, then slowly move the probe over the weld joints.

I. If leak detection indicates no leak, proceed to paragraph N.

J. If leak detection indicates a leak, place the fire extinguisher in a large plastic bag (Table 101) and close the bag.

K. Wait 2 hours, then probe the air inside the plastic bag (Table 101) and check each discharge boss, the pressure gauge (80), and the fill fitting (60) for a minimum of 60 seconds each, then slowly move the probe over the weld joints. Record the leakage at each test point.

L. Calculate the leakage rate, as follows:

$$L_r = \frac{L_i \times V}{T \times F}$$

Where:
- L_r = Leakage rate (sccs)
- L_i = Detector reading (sccs)
- V = Volume of plastic bag, less weldment volume
- T = Time (in seconds) of weldment inside plastic bag
- F = Flow rate of leak detector (5 sccs) for Inficon 3000 *

* Refer to equivalent leak detector manual for flow rate.

M. If the leakage rate exceeds 1×10^{-6} sccs, repair or replace the fill fitting (60) and pressure gauge (80) as applicable, and repeat leak test.

N. If the leakage rate is less than 1×10^{-6} sccs, reinstall the cartridges (5) (refer to Assembly section, paragraph 6).

O. Install the protective caps (Table 101).

3. Cartridge Test

WARNING: THE CARTRIDGES (5, IPL FIGURE 1) ARE EXPLOSIVE DEVICES. INADVERTENT DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAPS (10) AND SHUNT WIRE/CAUTION TAGS (-15) MUST BE INSTALLED ON THE ELECTRICAL CONNECTORS (EXCEPT WHEN SPECIFIED IN THE PROCEDURE).

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 101). Test the ground circuit. Refer to Figure 101.

B. Ground the safety chamber (Table 101).

C. Verify that the shunt wire/caution tags (-15, IPL Figure 1) are installed on the cartridges (5).

WARNING: THE CARTRIDGE MUST BE TESTED IN A FIXTURE THAT PROVIDES PROTECTION FOR PERSONNEL. THE SAFETY CHAMBER IS DESIGNED FOR THIS PURPOSE.

D. Thread the cartridges (5), with the shunt wire/caution tags (-15) and o-rings (20) installed, into the safety chamber (Table 101).

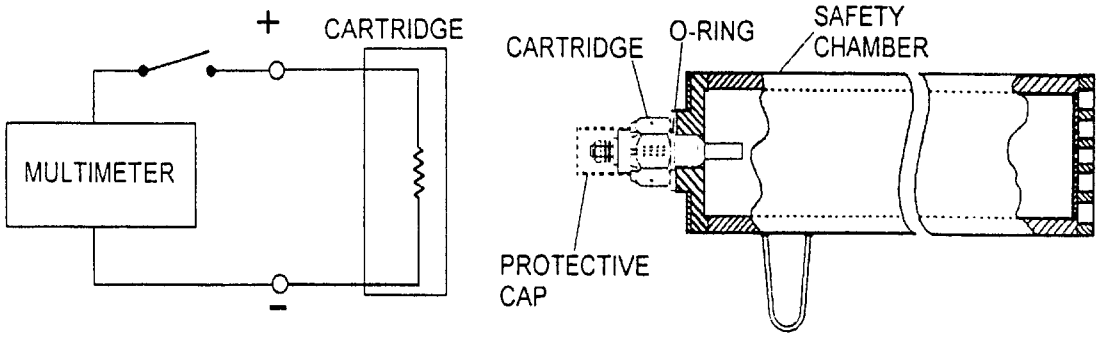

Figure 101. Cartridge Test Setup

CAUTION: TEST DEVICES THAT PASS MORE THAN 50 MILLIAMPERES CURRENT CAN AFFECT THE USEFUL LIFE AND RELIABILITY OF THE CARTRIDGE. DO NOT USE A VOLTMETER, FLASHLIGHT BATTERY, CONTINUITY LIGHT, OR SIMILAR DEVICE.

E. Set up the digital multimeter (Table 101), as follows:

(1) Disconnect the test leads from the digital multimeter.

(2) Connect the digital multimeter to a power source.

(3) Press the green button to turn on the digital multimeter power.

(4) Press the V and mA buttons at the same time to select the low display range.

(5) Ensure that the digital multimeter is set to measure DC power.

(6) Press the gray button (second from the left) to select the 2 ohm range.

(7) Plug the black test lead into the COMMON terminal. Plug the red test lead into the LOW RANGE terminal.

(8) Hold the probe ends together and adjust the ZERO control until the display reads zero.

F. Remove the shunt wire/caution tag (-15, IPL Figure 1) from the cartridge (5).

CAUTION: DO NOT BEND THE CARTRIDGE CONNECTOR PINS.

G. Measure the bridgewire resistance across the cartridge connector positive terminal to the negative terminal.

REQUIREMENT: EACH BRIDGEWIRE RESISTANCE MUST BE 0.9 TO 1.4 OHM.

H. Dispose of the cartridge that fails this test (refer to Check section, paragraph 7).

I. Disconnect the digital multimeter. Reinstall the shunt wire/caution tags (-15) on the cartridges (5).

J. Remove the cartridge from the safety chamber.

4. Hydrostatic Pressure Test Requisites

A. The DOT requires these units to be hydrostatically tested at five year intervals. FAA, CAA, and DOT rules may impose other requirements.

B. The approved method of testing is by water jacket volumetric expansion, which uses high internal water pressure to determine total volumetric expansion.

5. Hydrostatic Test Procedure

A. Set up the hydrostatic test equipment.

B. Prepare the fire extinguisher for the hydrostatic test, as follows:

(1) Disassemble the fire extinguisher to remove the cartridges (5), housing assemblies (25), discharge outlets (35), fill fitting (60), and pressure gauge (80). Refer to the Disassembly section.

(2) Install plugs and caps (Table 101) in the boss locations.

C. Perform hydrostatic test per test stand (Table 101) manufacturer's instructions.

REQUIREMENT: THE PERMANENT VOLUMETRIC EXPANSION MUST NOT EXCEED 10 PERCENT OF THE TOTAL VOLUMETRIC EXPANSION.

NOTE: If the test pressure cannot be maintained due to a failure of the test apparatus, the test may be repeated at a pressure increase of 10 percent or 100 psig (690 kPag), whichever is the lower value.

D. Repeat the test once if system error is suspected. Replace the weldment if the weldment fails both tests.

E. Remove the caps and plugs (Table 101) from the weldment. Drain the water from the weldment.

F. Heat in an oven or heater (Table 101) to 225°F to 250°F (107°C to 121°C). Heat the weldment for one hour or until completely dry.

G. Inspect the weldment (refer to the Check section, paragraph 3).

H. Stamp the hydrostatic test date and DOT identification number next to the pressure stamp on the mounting lug.

6. Pressure Gauge Functional Test

A. Install the pressure gauge (80) into the test fitting (Table 101).

B. Using an adjustable, calibrated source of dry nitrogen (Table 101), apply gradually increasing pressure to the gauge while monitoring and recording gauge and source pressure indications.

C. Accuracy of recorded pressure gauge indications are as follows:

PRESSURE GAUGE	MASTER GAUGE
1000 psig (6895 kPag), 1500 psig (10343 kPag)	±40 psig (±276 kPag)
600 psig (4137 kPag)	±20 psig (±138 kPag)
300 psig (2069 kPag), 500 psig (3448 kPag), 900 psig (6206 kPag)	+40 psig (+276 kPag) -20 psig (-138 kPag)

D. Failure of the pressure gauge to perform as described above is cause for rejection. Remove and replace gauge (80) (refer to Check section, paragraph 8).

DISASSEMBLY

1. General

NOTE: Refer to the Testing and Fault Isolation section to establish the condition of the fire extinguisher or most probable cause of a malfunction. This determines the extent of disassembly required.

CAUTION: REMOVE THE PROTECTIVE CAPS (TABLE 301) ONLY WHEN NECESSARY FOR MAINTENANCE. THE CONNECTORS AND BOSSES MUST BE COVERED AT ALL OTHER TIMES TO PREVENT CONTAMINATION AND DAMAGE.

A. This section contains the fire extinguisher discharge and disassembly instructions. Skip the unnecessary steps, if only partial disassembly is necessary. Refer to Figure 301 for a disassembly sequence chart.

NOTE: Refer to the Repair section to replace the identification plate (95, IPL Figure 1), caution plate (90), and pressure plate (85).

B. The recommended tools and materials are given in Table 301.

NOTE: Equivalent items can be used.

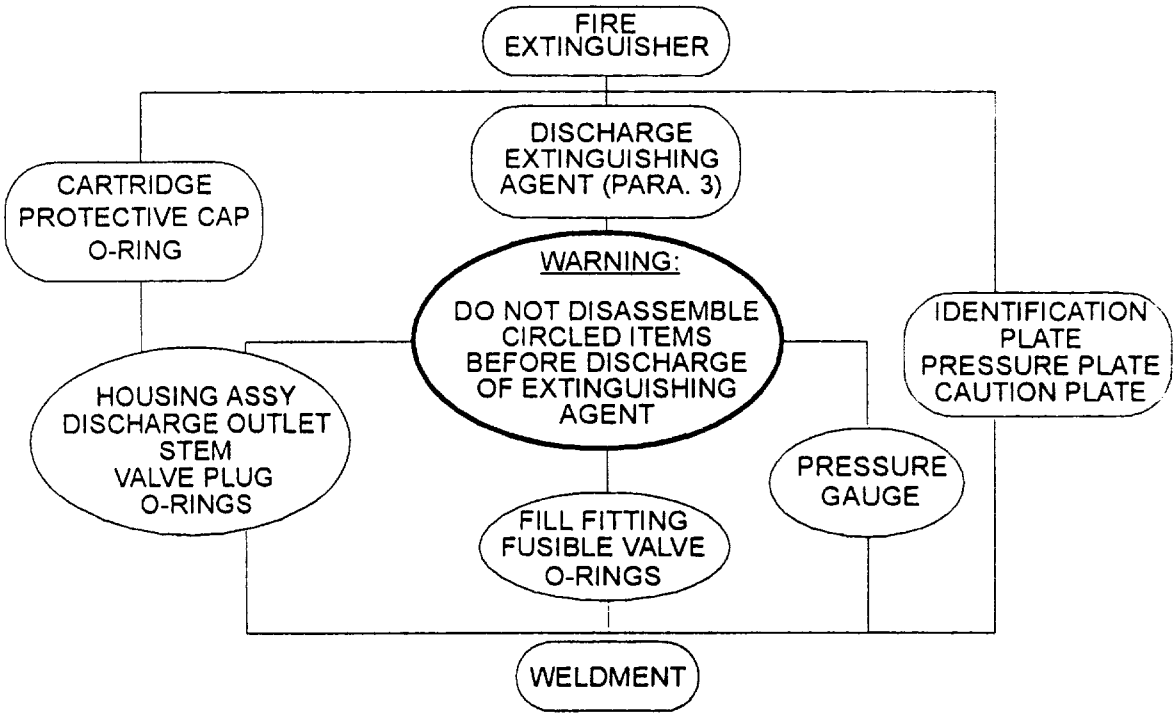

Figure 301. Disassembly Sequence Chart

Table 301. Disassembly Tools and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Bar Tool (4 inch length x 1/2 inch width x 1/8 inch thickness)	---	User furnish
Cradle, Fire Extinguisher	83000242	Pacific Scientific (05167)
Discharge Recovery Tool	59000059	Pacific Scientific (05167)
Ground Strap and Circuit Tester	WT25	Walter G. Legge Co. (84832)
Halon Recovery Recycle System	A6-06-2000-75-0 (Model H 1301)	Neutronics Inc. (5R712)
Protective Caps		
Cartridge Cover	5/8-SC	CaPlugs (99017)
Cartridge Port	PD-50	CaPlugs (99017)
Cartridge Thread	1/2-SC	CaPlugs (99017)
Discharge Boss	PD-200	CaPlugs (99017)
Discharge Outlet End	CD-22	CaPlugs (99017)
Fill Boss	PD-40	CaPlugs (99017)
Fill Fitting End	CD-4	CaPlugs (99017)
Pressure Gauge Fitting	WW-O	CaPlugs (99017)
Safety Bag, Heat Sealable Electrostatic	22024509	Noland Paper Co. (OAZM2)
Stem Holding Tool	13254	Pacific Scientific (05167)
Wrench, Open End 5/8, 9/16, and 1-1/4 inch	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

CAUTION: DO NOT USE METAL TOOLS TO REMOVE THE O-RINGS. METAL TOOLS CAN SCRATCH THE O-RING GROOVES, CAUSING LEAKAGE AND POSSIBLE CORROSION.

C. Note the procedure and locations of safety wiring to help reassembly. Replace the o-rings at each overhaul.

2. Cartridge

WARNING: THE CARTRIDGE (5, IPL FIGURE 1) IS AN EXPLOSIVE DEVICE. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAP (10) AND SHUNT WIRE/CAUTION TAG (-15) MUST BE INSTALLED ON THE ELECTRICAL CONNECTOR.

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 301). Test the ground circuit.

B. Verify the shunt wire/caution tags (-15, IPL Figure 1) are installed on the cartridges (5) between the positive and negative terminals.

C. Put the weldment (105) in the cradle (Table 301). Cut the safety wire and remove the cartridges (5) from the housing assemblies (25).

D. Remove the cartridges (5) from the housing assemblies (25) by unscrewing the cartridge, while holding the hexagonal head of the housing assembly with at wrench (Table 301), to prevent accidental discharge.

E. Put the cartridges (5) in electrostatic safety bags (Table 301).

WARNING: DO NOT DISASSEMBLE THE FIRE EXTINGUISHER FURTHER UNTIL THE EXTINGUISHING AGENT HAS BEEN DISCHARGED. REFER TO PARAGRAPH 3 BELOW.

3. Discharge Procedure

NOTE: Use this procedure to discharge the extinguishing agent before removing the housing assemblies (25, IPL Figure 1), fill fitting (60), or pressure gauge (80).

WARNING: DO NOT DISCHARGE THE EXTINGUISHING AGENT INTO THE ATMOSPHERE. THE EXTINGUISHING AGENT MUST BE RECLAIMED AND RECYCLED. DO NOT HOLD THE FIRE EXTINGUISHER DURING DISCHARGE, THE DISCHARGE RECOVERY TOOL, DISCHARGE BOSS, AND WELDMENT WILL ICE OVER.

A. Remove the cartridges (refer to paragraph 2 above).

B. Thread the discharge recovery tool (Table 301) on the fill fitting (60). Connect the discharge recovery tool to a recovery tank or a Halon recovery system (Table 301). See Figure 302.

C. Turn the plunger in to depress the fusible valve (75) inside the fill fitting (60). After the extinguishing agent has fully discharged, remove the discharge recovery tool.

4. Discharge Outlets

A. Remove the cartridges (refer to paragraph 2 above).

B. Put the weldment (105, IPL Figure 1) in the cradle (Table 301).

C. Using the wrench (Table 301), remove the housing assemblies (25) from the discharge outlets (35), then lift the discharge outlet from the discharge boss. Remove and discard the o-rings (30).

NOTE: If the discharge outlets (35) and stems (40) do not separate from the housing assemblies (25), use the stem holding tool (Table 301) fastened to a table.

D. Unscrew and remove the stems (40), using a bar tool (Table 301) inserted through the largest exposed holes of the stems (40).

E. Remove the discharge outlets from the discharge bosses.

DISCHARGE SETUP
FOR FILL FITTING
(PREFERRED METHOD)

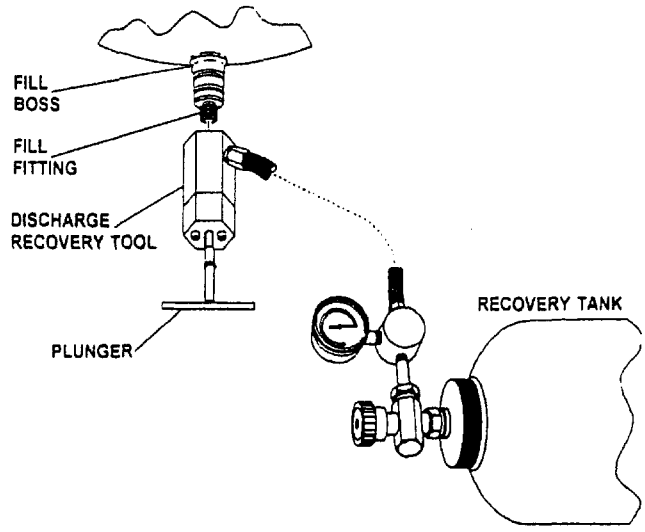

Figure 302. Discharge and Recovery Setup

F. Remove the valve plugs (50), then remove and discard the o-rings (55). If the valve plugs (50) and the o-rings (55) are not unseated, remove the valve plugs (50) and the o-rings (55), as follows:

(1) Hold the fire extinguisher with the discharge boss downward over an open box containing suitable cushioning material or install the stems (40) before proceeding, for safety purposes.

(2) Connect an external source of compressed air or gaseous nitrogen to the fill fitting (60).

(3) Slowly pressurize the fire extinguisher to approximately 50 psig (75 psig maximum) or until the valve plugs (50) and the o-rings (55) are blown out.

(4) Remove external pressure.

5. Fill Fitting

A. Discharge the extinguishing agent (refer to paragraph 3 above).

B. Put the weldment (105, IPL Figure 1) in the cradle (Table 301).

C. Using a wrench (Table 301) slowly remove the fill fitting (60) from the fill boss. Remove and discard the o-ring (65) from the fill fitting (60).

D. Remove the fusible valve (75) from the fill boss. Remove and discard the o-ring (70).

6. Pressure Gauge

A. Discharge the extinguishing agent (refer to paragraph 3 above).

B. Put the weldment (105, IPL Figure 1) in the cradle (Table 301).

C. To remove the pressure gauge (80), proceed as follows:

(1) Loosen the pressure gauge using a wrench (Table 301).

(2) Unscrew the pressure gauge (80) from the weldment (105) and remove the pressure gauge from within the gauge guard enclosure.

THIS IS A BLANK PAGE

CLEANING

1. Cleaning Materials

A. The recommended cleaning materials are given in Table 401.

NOTE: Equivalent items can be used.

Table 401. Cleaning Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Alcohol, Isopropyl	Federal Specification TT-I-735	Commercially available
Cloth, Lint-free	---	Commercially available
Light Probe	---	Commercially available
Oven or Heater, 250°F (121°C)	---	Commercially available
Protective Caps		
Cartridge Cover	5/8-SC	CaPlugs (99017)
Cartridge Port	PD-50	CaPlugs (99017)
Cartridge Thread	1/2-SC	CaPlugs (99017)
Discharge Boss	PD-200	CaPlugs (99017)
Discharge Outlet End	CD-22	CaPlugs (99017)
Fill Boss	PD-40	CaPlugs (99017)
Fill Fitting End	CD-4	CaPlugs (99017)
Pressure Gauge Fitting	WW-O	CaPlugs (99017)
Tape, Duct	---	Commercially available
Vacuum Source	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

2. Metal Parts

WARNING: INCORRECT HANDLING OF A CHARGED FIRE EXTINGUISHER CAN CAUSE ACCIDENTAL DISCHARGE OF THE EXTINGUISHING AGENT AND POSSIBLE INJURY. DO NOT APPLY PRESSURE TO, OR INSERT ANYTHING INTO THE DISCHARGE BOSS. THE CLEANING SOLVENT IS FLAMMABLE AND AN IRRITANT TO THE EYES AND NOSE. USE SOLVENT ONLY IN A WELL VENTILATED AREA AWAY FROM OPEN FLAMES. IF EYES BECOME IRRITATED, FLUSH WITH WATER.

CAUTION: ANY SCRATCHES OR DENTS ON THE SURFACE OF A RUPTURE DISC WILL CHANGE ITS CALIBRATION. SCRATCHED OR DENTED RUPTURE DISCS MUST BE REPLACED.

A. Clean all the metal parts with lint-free cloths and isopropyl alcohol (Table 401).

B. Dry all parts thoroughly with clean, lint-free cloths.

3. Weldment

A. Clean the inside of the weldment (105, IPL Figure 1) as follows:

(1) Pour 1/4 to 1/2 cup of isopropyl alcohol (Table 401) into the weldment.

(2) Shake the weldment in a circular movement, and drain the alcohol into a disposal container.

(3) Repeat the procedure until no further metal chips or filings are evident in the alcohol. Use a light probe (Table 401) and inspect the inside of the weldment.

(4) Heat an oven or heater (Table 401) 225°F to 250°F (107°C to 121°C). Heat the weldment for one hour or until completely dry.

B. Vapor hone unwanted discoloration from the outside of the weldment, as follows:

(1) Install the protective caps (Table 401).

(2) Cover the data plates with duct tape (Table 401).

(3) Vapor hone the weldment (wet or dry glass bead). Do not vapor hone the protected threads on the fill, discharge, and switch bosses.

(4) Remove the duct tape and protective caps, then clean the weldment completely (refer to paragraph 3.A above).

CHECK

1. Tools and Equipment

A. The recommended tools and equipment are given in Table 501.

NOTE: Equivalent items can be used.

Table 501. Check Tools and Equipment

Nomenclature	Part or Specification Number	Source (CAGE)*
Cradle, Fire Extinguisher	83000242	Pacific Scientific (05167)
Depth Micrometer or Indicator	---	Commercially available
Ground Strap and Circuit Tester	WT25	Walter G. Legge Co. (84832)
Light Probe	---	Commercially available
Power Supply or Battery, 30 VDC, 3.5 Amperes	---	Commercially available
Protective Caps		
Cartridge Cover	5/8-SC	CaPlugs (99017)
Cartridge Port	PD-50	CaPlugs (99017)
Cartridge Thread	1/2-SC	CaPlugs (99017)
Discharge Boss	PD-200	CaPlugs (99017)
Discharge Outlet End	CD-22	CaPlugs (99017)
Fill Boss	PD-40	CaPlugs (99017)
Fill Fitting End	CD-4	CaPlugs (99017)
Pressure Gauge Fitting	WW-O	CaPlugs (99017)
Safety Chamber, Cartridge	83330118	Pacific Scientific (05167)
Weighing Scale, ±0.01 pound (0,005 kg) 0 to 120 pounds (55 kg)	Series 3000/3000E	Pennsylvania Scale Company (03964)

* Refer to the IPL, paragraph 2, for the address.

2. Fire Extinguisher Weight Check

WARNING: INCORRECT HANDLING OF A CHARGED FIRE EXTINGUISHER CAN CAUSE ACCIDENTAL DISCHARGE OF THE EXTINGUISHING AGENT AND POSSIBLE INJURY. DO NOT APPLY PRESSURE TO, OR INSERT ANYTHING INTO THE DISCHARGE BOSS OR FILL FITTING.

A. Remove the protective caps (501).

NOTE: The weight marked on the identification plate (95, IPL Figure 1) does not include the protective caps (Table 501).

B. Put the cradle (Table 501) on the weighing scale (Table 501). Adjust the weighing scale to zero.

C. Put the fire extinguisher in the cradle.

D. Weigh the fire extinguisher. Record the weight to the nearest 0.01 pound (0,005 kg).

REQUIREMENT: MAXIMUM WEIGHT WITH THE CARTRIDGES (5) AND THE SHUNT WIRE/CAUTION TAGS (-15) AND WITHOUT THE PROTECTIVE CAPS (TABLE 501) IS SHOWN IN TABLE 502.

Table 502. Maximum Fire Extinguisher Weight

Fire Extinguisher	Maximum Weight	Allowable Deviation
P/N 17300	5.83 pounds (2,64 kg)	0.10 pound (0,05 kg)
P/N 17400	4.12 pounds (1,87 kg)	0.10 pound (0,05 kg)

E. Compare the current weight of the fire extinguisher to the last weight etched on the identification plate (95). Per the requirements above, if the fire extinguisher is more than 0.10 pound (0,05 kg) below the last recorded weight, test the fire extinguisher for leakage (refer to the Testing and Fault Isolation section, paragraph 2).

F. Install the protective caps (Table 501).

3. Container Weldment

A. Inspect the weldment (105, IPL Figure 1) for scratches or dents that could reduce its strength as a pressure vessel. Replace the weldment if the dents are deeper than 1/16 inch/inch (0,06 mm/mm) of average dent diameter, or the scratches are deeper than 0.004 inch (0,10 mm) or longer than 2 inches (5,08 cm).

B. Inspect all welded joints for cracks, breaks, or tears, especially at the mounting lugs.

4. Discharge Outlet

A. Under strong light, and preferably under magnification, inspect the discharge outlet (35, IPL Figure 1) for cracks, corrosion, crossed threads, stripped threads, chafing, scoring, and any other damage that might decrease operation. Dark stains on inside surfaces, caused by previous firing of the cartridge, are acceptable. Replace the discharge outlets that are not acceptable.

5. Fill Fitting

A. Check the fill fitting (60, IPL Figure 1). Replace the fill fitting if it is not acceptable.

6. Cartridge

WARNING: THE CARTRIDGES (5, IPL FIGURE 1) ARE EXPLOSIVE DEVICES. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAPS (10) AND SHUNT WIRE/CAUTION TAGS (-15) MUST BE INSTALLED ON THE ELECTRICAL CONNECTORS (EXCEPT WHEN SPECIFIED IN THE PROCEDURE).

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 501). Test the ground circuit.

B. Verify the shunt wire/caution tags (-15) are connected between the positive and negative terminals of the cartridges (5).

C. Check the service date (month/year) etched on the wrench flats of the cartridges (5). Dispose of the cartridge (as specified in paragraph 7, below) if its service life or combined life (service and storage) exceeds the limits.

REQUIREMENT: THE CARTRIDGES (5) HAVE A MAXIMUM INSTALLED SERVICE LIFE OF 4 YEARS AND A COMBINED SERVICE/STORAGE LIFE OF 6 YEARS.

7. Cartridge Disposal

WARNING: THE CARTRIDGE MUST BE DETONATED IN A FIXTURE THAT GIVES PROTECTION FOR PERSONNEL. THE SAFETY CHAMBER IS DESIGNED FOR THIS PURPOSE.

A. Ground the safety chamber (Table 501). The ground strap must be connected and grounded.

B. Make sure that the shunt wire/caution tags (-15) are installed on the cartridges (5) between the positive and negative terminals.

C. Cut the safety wire and remove the cartridges (5) from the housing assemblies (25). Refer to Disassembly Section, paragraph 2.D. Leave the o-ring (20) installed on the cartridge.

D. Thread the cartridges (5), with the shunt wire/caution tags (-15) installed, tightly into the safety chamber (Table 501). See Figure 501.

E. Remove the shunt wire/caution tags (-15) and connect electrical wires terminated with alligator clips to the cartridge terminals.

F. Connect the wire leads to a 30 VDC power supply or battery (Table 501). Stand back five feet (1.5 meters) minimum, and close the switch to detonate the cartridge.

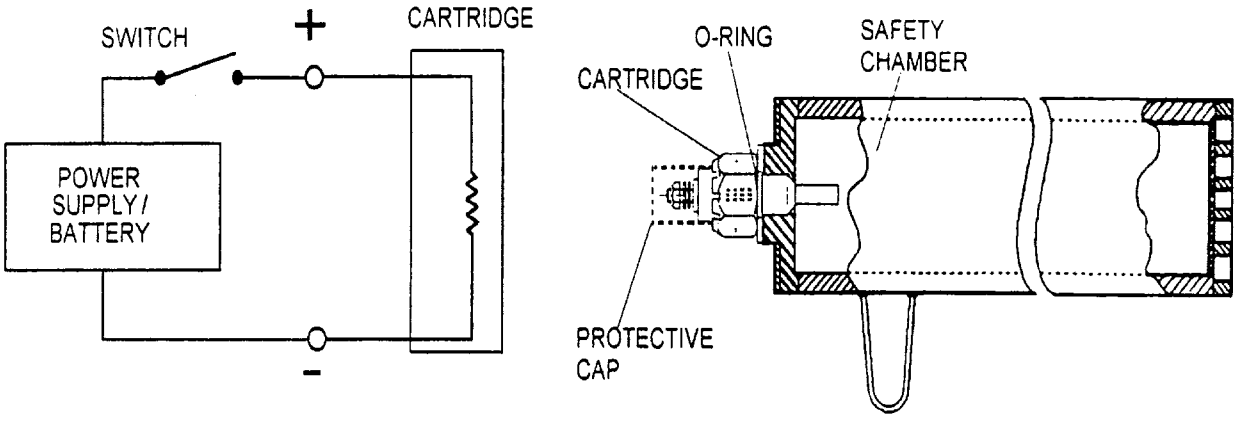

Figure 501. Cartridge Disposal Setup

8. Pressure Gauge

A. Verify that the pressure gauge functional test has been successfully completed (refer to Testing and Fault Isolation section, paragraph 6).

REPAIR

1. General

A. The repair instructions are limited to replacement of a damaged pressure, caution, and identification plate (85, 90, and 95, IPL Figure 1). Refer to the Disassembly and Assembly sections to replace all other components.

B. The recommended tools and materials are given in Table 601.

NOTE: Equivalent items can be used.

Table 601. Repair Tools and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Adhesive, Epoxy	Scotchweld 1838 A/B	The 3M Company (04633)
Alcohol, Isopropyl	Federal Specification TT-I-735	Commercially available
Sandpaper, 240 grit	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

C. Repairs that require welding, except those covered in the Assembly section of this manual, are not permitted unless authorized in writing by Pacific Scientific Company.

D. After Pacific Scientific Company approval, repairs that require welding must be made in accordance with the latest FAA directives and under the supervision of a certified FAA mechanic with an airframe rating. If any doubt exists regarding penetration of the weld, inspect the welded part in accordance with MIL-STD-453.

2. Replacement of Bonded Plates

A. Copy the information from the old identification plate (95, IPL Figure 1) to the new identification plate.

B. Use 240 grit sandpaper (Table 601) to roughen the face of the old plates and the back of the new plate (85, 90, or 95).

C. Clean the plate using isopropyl alcohol (Table 601). Let dry.

D. Mix the two-part epoxy adhesive (Table 601) 5 parts A to 4 parts B, until the adhesive has a uniform color.

NOTE: The working life of the adhesive is 60 minutes at 75°F (24°C).

E. Apply an even coat of adhesive to the plate, and press the new plate on the old plate from the center out.

F. Remove all excessive adhesive. Make sure the bond line around the plate is smooth and even. Fill any voids along the edge with adhesive.

G. Cure the adhesive for 12 hours at 75°F (24°C). Tape, clamps, or other devices can be used to hold the plate in place until the adhesive cures.

THIS IS A BLANK PAGE

ASSEMBLY (INCLUDING STORAGE)

1. General

A. This section contains the fire extinguisher reassembly, refill, and storage instructions. Skip unnecessary steps if the fire extinguisher is partially assembled.

NOTE: Refer to the Repair section, paragraph 2, to replace the pressure, caution, and identification plate, (85, 90, and 95, IPL Figure 1).

B. The recommended tools and materials are given in Table 701.

NOTE: Equivalent items can be used.

Table 701. Assembly Tools and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Alcohol, Isopropyl	TT-I-735	Commercially available
Bar Tool (4 inch length x 1/2 inch width x 1/8 inch thickness)	---	User furnish
Charging Fixture	83000148	Pacific Scientific (05167)
Cradle, Fire Extinguisher	83000242	Pacific Scientific (05167)
Ground Strap & Circuit Tester	WT25	Walter G. Legge Co. (84832)
Hoist	---	Commercially available
Lubricant	822 (Spec MMS-N306A)	Dri Lube Company (06186)
Protective Caps		
Cartridge Cover	5/8-SC	CaPlugs (99017)
Cartridge Port	PD-50	CaPlugs (99017)
Cartridge Thread	1/2-SC	CaPlugs (99017)
Discharge Boss	PD-200	CaPlugs (99017)
Discharge Outlet End	CD-22	CaPlugs (99017)
Fill Boss	PD-40	CaPlugs (99017)
Fill Fitting End	CD-4	CaPlugs (99017)

Table 701. Assembly Tools and Materials (Continued)

Nomenclature	Part or Specification Number	Source (CAGE)*
Tank, Extinguishing Agent with Stand, 150 pounds (68 kg)	---	Commercially available
Tank, Gaseous Nitrogen (GN_2), 2000 psig (13800 kPag)	---	Commercially available
Tape, Foam Insulated (1/2 inch wide and 1/4 inch thick)	---	The 3M Company (04633)
Thermocouple	---	Commercially available
Thread Tape, Teflon (1/2 inch wide)	---	Commercially available
Valve Plug, Insertion Tool	13253	Pacific Scientific (05167)
Weighing Scale, ±0.01 pound (0,005 kg) 0 to 120 pounds (55 kg)	Series 3000/3000E	Pennsylvania Scale Company (03964)
Wrench, Open End 5/8, 9/16, and 1-1/4 inch	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

2. Pressure Gauge

A. Put the fire extinguisher in the cradle with the gauge boss up. Wrap the pressure gauge (80) thread with the thread tape (Table 701).

B. Insert the pressure gauge (80) inside the gauge guard on the weldment (105) and screw the pressure gauge fitting into the gauge boss until finger tight.

C. Using a wrench (Table 701) on the pressure gauge wrench flats, full tighten the pressure gauge in place.

3. Discharge Outlet

A. Using lubricant (Table 701), lubricate the o-rings (30, 45, and 55).

B. Install the o-rings (55) on the valve plugs (50). Position the valve plugs (50) in the discharge boss, screw the valve plug insertion tool (Table 701) into the discharge boss to seat the valve plugs (50). Remove the valve plug insertion tool.

C. Install the o-rings (45) on the stems (40). Lubricate the threads of the stems (40) and install in the discharge boss. Using bar tool (Table 701), tighten the stems (40) into the discharge boss.

D. Position the discharge outlets (35) on the stems (40).

E. Install the o-rings (30) on the housing assemblies (25). Lubricate the threads of the housing assemblies (25) and install in the stems (40), torque 145 to 155 inch-pounds (16 to 18 N•m).

4. Fill Fitting

A. Using lubricant (Table 701), lubricate the o-rings (65 and 70, IPL Figure 1).

B. Install the o-ring (70) on the fusible valve (75).

C. Insert the fusible valve (75) into the fill boss.

D. Install the o-ring (65) on the fill fitting (60).

E. Install the fill fitting (60) into the fill boss.

F. Torque the fill fitting (60) 90 to 100 inch-pounds (10 to 11 N•m).

5. Extinguisher Recharge

NOTE: See Figure 701 to set up the recharge stand and related equipment. Write the recharge data on a copy of Table 703.

A. Put the cradle (Table 701) on the weighing scale (Table 701). Adjust the weighing scale to zero.

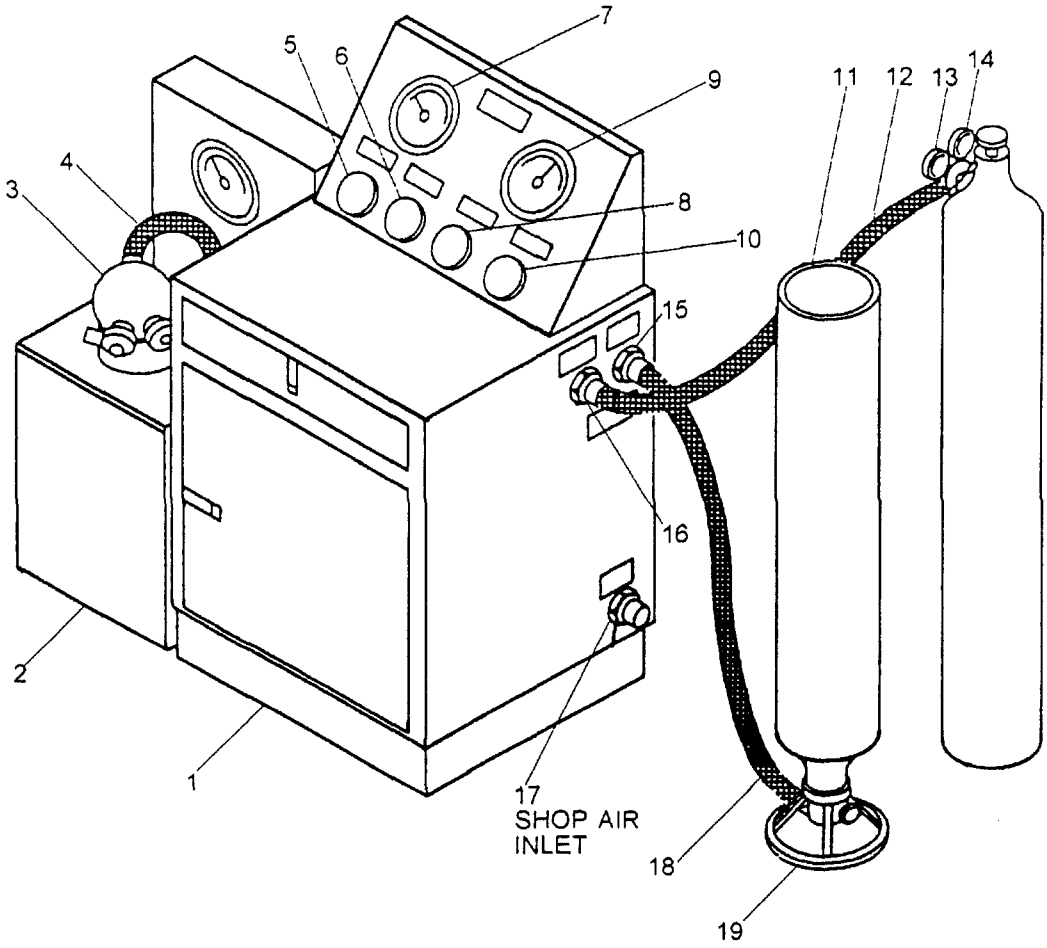
B. Put the fire extinguisher in the cradle. Write the weight in entry 1 of Table 703.

NOTE: Weigh the fire extinguisher with the cartridges (5), and shunt wire/caution tags (-15) on the weighing scale. Remove the protective caps (Table 701).

C. Thread the charging fixture (Table 701) onto the fill fitting.

D. Add entry 1 of Table 703 to the charge weight given in entry 3. Write the sum in entry 5. Add entry 1 to the charge weight given in entry 2. Write the sum in entry 3.

E. Open the manifold valve (6) and agent valve (10), to allow the fire extinguishing agent to flow from the tank (11) into the fire extinguisher. Do not move the fire extinguisher, cradle, or hose.



F. Close the agent valve (10) at the charge weight given in entry 3. Disconnect the charging fixture and charging hose (4). Write the weight of the filled fire extinguisher in entry 4.

G. Connect the charging hose (4) and the charging fixture to the fill fitting. Close the vent valve (5).

H. Write the thermocouple temperature in entry 5. Find the minimum and maximum nitrogen charge pressure from Table 704 for the thermocouple temperature recorded in entry 5 of Table 703. Write the minimum and maximum pressure in entry 6.

I. Adjust the regulator (13) on the nitrogen tank (14), using the nitrogen pressure gauge (9), to a pressure within the charge pressure range given in entry 6.

J. Open the nitrogen valve (8) and the charging fixture valve, then charge the fire extinguisher to the required pressure, as shown by the manifold pressure gauge (7, Figure 701).

LEGEND:

1. CONTAINER RECHARGE STAND (INCLUDES COMPRESSOR ASSEMBLY)
2. WEIGHING SCALE*
3. FIRE EXTINGUISHER IN CRADLE*
4. 1/4 - INCH FLEXIBLE CHARGING HOSE
5. VENT VALVE

Figure 701. Fire Extinguisher Refill Setup (Sheet 1 of 2)

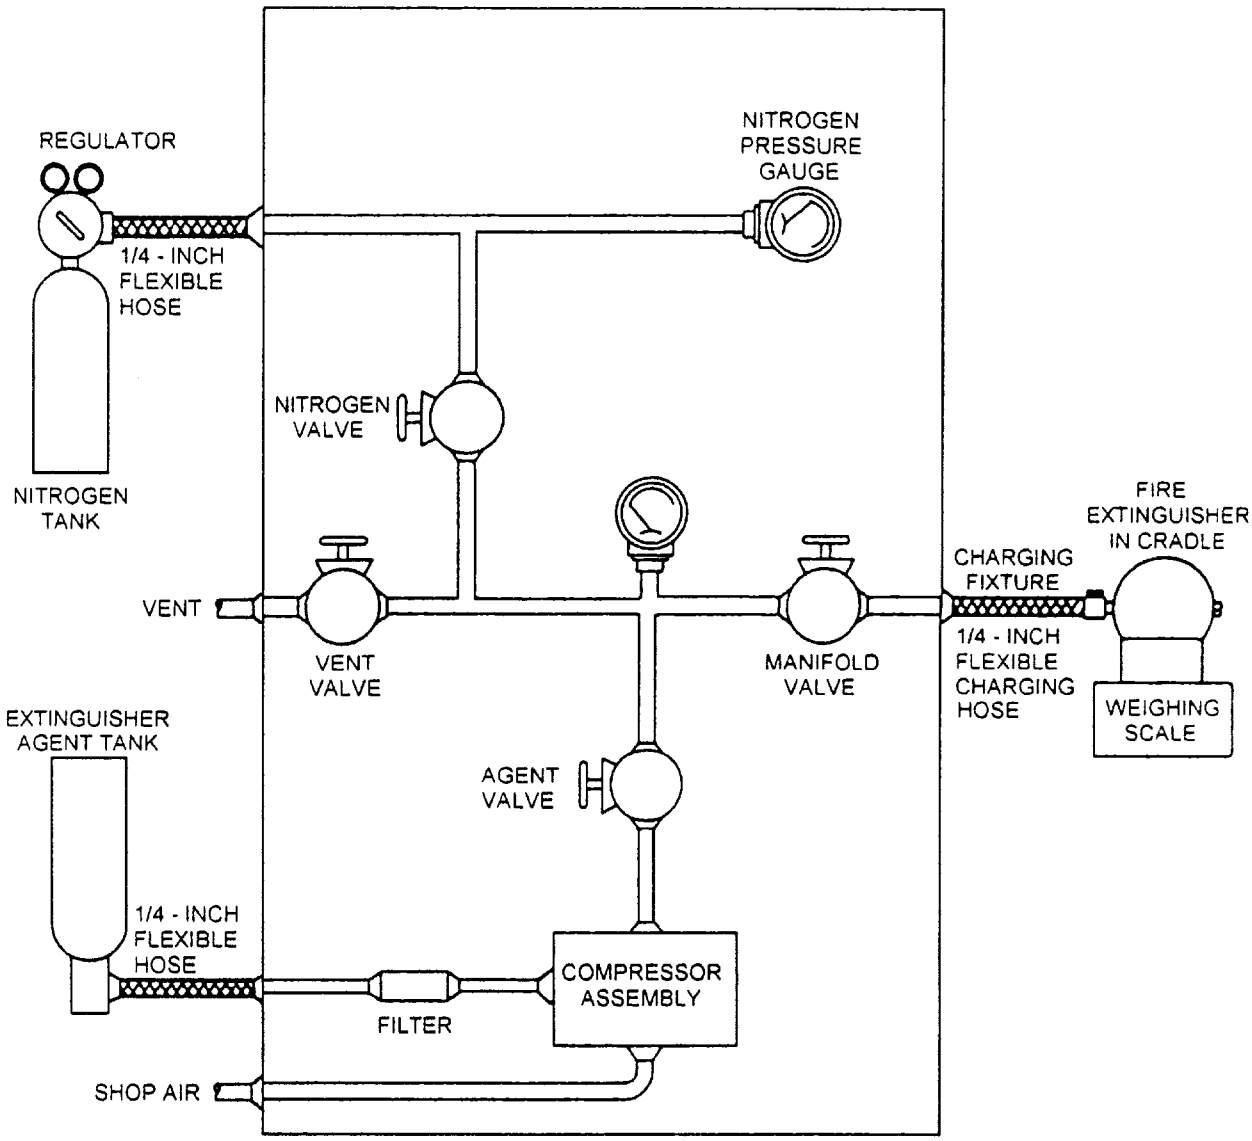

Figure 701. Fire Extinguisher Refill Setup (Sheet 2 of 2)

Table 702. Fire Extinguisher Refill Record

Part Number: _____ **Serial No:** _____	
Date of Refill: _____ **Pressure Switch Ser. No:** _____	
Weight Certified By: _____ **Hydrostatic Test Date:** _____	
Item	As Noted
1. Empty fire extinguisher on cradle (charging hose disconnected)	_____ pounds (kg) Actual
2. Required weight of extinguishing agent P/N 17300 P/N 17400	Pounds (kg) 2.00 to 2.12 pounds (0,91 to 0,96 kg) 1.00 to 1.25 pounds (0,45 to 0,57 kg)
3. Desired fill weight of fire extinguisher on cradle (charging fixture and hose disconnected) (entry 1 plus entry 2)	_____ pounds (kg) (Calculated)
4. Fire extinguisher filled with extinguishing agent on cradle (charging fixture and hose disconnected)	_____ pounds (kg) (Actual. Must meet entry 3 requirement)
5. Thermocouple temperature	_____ °F (°C)
6. Required nitrogen charge pressure at thermocouple temperature	_____ Psig (kPag) Minimum _____ Psig (kPag) Maximum
7. Actual nitrogen charge pressure (from manifold gauge)	_____ Psig (kPag
8. Filled fire extinguisher on cradle after nitrogen charge (charging fixture and hose disconnected)	_____ pounds (kg)
9. Calculated nitrogen weight (subtract entry 4 from entry 10)	_____ pounds (kg) (Calculated)
10. Actual weight of filled fire extinguisher with the cartridges and without the protective caps (Table 701)	_____ pounds (kg)

K. Close the charging fixture valve. Hold the fire extinguisher at arm's length and pressure gauge facing away from body. Shake the fire extinguisher until the nitrogen charge pressure stabilizes. Write the actual charge pressure from the manifold pressure gauge (7) in entry 7. Add nitrogen, if necessary, to raise the pressure to the minimum required pressure, repeat until pressure is stabilized.

Table 703. Nitrogen Charge Pressure Versus Temperature

Temperature (°F)	Pressure		Temperature (°F)	Pressure		Temperature (°F)	Pressure	
	Min	Max		Min	Max		Min	Max
60	567	587	74	617	637	88	669	689
62	574	594	76	624	644	90	677	697
64	581	601	78	632	652	92	686	706
66	588	608	80	639	659	94	694	714
68	595	615	82	647	667	96	703	723
70	602	622	84	654	674	98	713	733
72	609	629	86	662	682	100	720	740

NOTE: If the measured temperature is not in the table, use the higher temperature listed for the required pressure.

L. Close the nitrogen valve (8, Figure 701) and turn the fill fitting (60, IPL Figure 1) into the fill boss. Open the vent valve (5, Figure 701) and disconnect the charging fixture and charging hose (4).

M. Remove the fire extinguisher and the cradle from the weighing scale.

N. Check for leakage (refer to Testing and Fault Isolation section, paragraph 2).

O. Calculate the nitrogen charge weight. Write the result in entry 9.

P. Weigh the charged fire extinguisher (Table 704). Write the weight in entry 10.

Table 704. Charged Fire Extinguisher Weight

Fire Extinguisher	Maximum Charged Weight	Fire Extinguisher	Maximum Charged Weight
P/N 17300	5.83 pounds (2,64 kg)	P/N 17400	4.12 pounds (1,87 kg)

Q. Vibratech the charge weight (entry 10 of Table 703) and recharge date on the identification plate (95, IPL Figure 1). Do not use an impression or ink stamp.

R. Install the cartridges (refer to paragraph 6 below).

6. Cartridges

WARNING: THE CARTRIDGES (5, IPL FIGURE 1) ARE EXPLOSIVE DEVICES. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAPS (-10) AND SHUNT WIRE/ CAUTION TAGS (-15) MUST BE INSTALLED ON THE ELECTRICAL CONNECTIONS.

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 701). Test the ground circuit.

B. Make sure the protective caps (-10) and shunt wire/caution tags (-15) are installed on the cartridges (5) between the positive and negative terminals.

C. Lubricate the o-ring (20) (refer to Table 701). Install the o-rings (20) on the cartridges (5), then install the cartridge in the housing assemblies (25). Torque the cartridge 90 to 100 inch-pounds (10 to 11 N•m).

D. Install safety wire (Table 701) and connect the cartridge to the discharge outlet. Refer to MS33540.

7. Storage Instructions

A. The recommended materials are given in Table 705.

NOTE: Equivalent items can be used

Table 705. Storage Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Cardboard Container	12 inch x 12 inch x 12 inch (30 cm x 30 cm x 30 cm)	Commercially available
Packing Material	---	Commercially available
Plastic Bag	18 inch x 12 inch (45 cm x 30 cm)	Commercially available
Safety Bag, Heat Sealable, Electrostatic	22024509	Noland Paper Co. (OAZM2)
Wooden Box	Large enough for each cartridge, compartmented for multiple cartridges if required	User supply

* Refer to the IPL, paragraph 2, for the address.

B. Fire Extinguisher

NOTE: With protective caps (10) and shunt wire/caution tags (-15) installed on the cartridges (5), it is safer to store the fire extinguisher with the cartridge installed in the discharge outlet.

(1) Install the protective caps (Table 701) on the discharge outlets. Make sure the shunt wire/caution tags (-15) are installed on the cartridges (5).

(2) Insert the fire extinguisher into a plastic bag (Table 705). Put the fire extinguisher in a cardboard container (Table 705). Fill the cardboard container with packing material (Table 705), as needed to prevent damage to the components.

(3) Write the fire extinguisher part number, date of last hydrostatic test, and overhaul date on the outside of the cardboard container. Also, write the cartridge part numbers and the dates of their Service/Storage Life.

(4) Attach the following warning/caution stickers to the outside of the cardboard container.

(a) Non-Flammable Gas

(b) Compressed Gases, N.O.S. (Bromotrifluoromethane, Nitrogen), UN195

(c) Fragile - **DO NOT DROP**

(d) Storage temperatures are +40°F to +100°F (+4°C to +38°C).

C. Cartridge

WARNING: THE CARTRIDGES (5, IPL FIGURE 1) ARE EXPLOSIVE DEVICES. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAPS (-10) AND THE SHUNT WIRE/CAUTION TAGS (-15) MUST BE INSTALLED.

(1) Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 701). Test the ground circuit.

(2) Make sure the protective cap (10) and shunt wire/caution tag (15) is installed on the cartridge (5).

(3) Put the cartridge in an electrostatic safety bag (Table 705), then into a correctly sized wooden box (Table 705), and seal.

(4) Write the cartridge part number and the Service/Storage dates on the outside of the wooden box. Mark the wooden box with Pyrotechnic, UN0367.

(5) Storage temperatures are +40°F to +100°F (+4°C to +38°C).

THIS IS A BLANK PAGE

FITS AND CLEARANCES

1. Torque Limits

A. Assembly torque limits are given in Table 801.

Table 801. Torque Limits

IPL Figure 1 Item Number	Nomenclature	Torque Range
5	*Cartridges*	*90 to 100 inch-pounds* (10 to 11 N·m)
25	Housing Assemblies	145 to 155 inch-pounds (16 to 18 N·m)

THIS IS A BLANK PAGE

SPECIAL TOOLS, FIXTURES, AND TEST EQUIPMENT

1. Special Tools, Fixtures, and Equipment

A. The special tools, fixtures, and test equipment recommended for maintenance of the fire extinguishers are given in Table 901. Item numbers listed in Table 901 refer to IPL Figure 1.

NOTE: Equivalent items can be used.

Table 901. Special Tools, Fixtures, and Equipment

Nomenclature	Part No.	Source (CAGE)*	Use
Bar Tool (4 inch length x 1/2 inch width x 1/8 inch thickness)	---	User furnish	To remove and install stems (40)
Cap, Hydrotest	83330165	Pacific Scientific (05167)	To cap the discharge boss for the hydrostatic test
Charging Fixture	83000148	Pacific Scientific (05167)	To connect the extinguishing agent and nitrogen tanks to the fill fitting (60) to refill the fire extinguisher
Cradle, Fire Extinguisher	83000242	Pacific Scientific (05167)	To support the fire extinguisher for maintenance and testing
Digital Multimeter	79	John Fluke (89536)	To check the cartridges (5)
Discharge Recovery Tool	59000059	Pacific Scientific (05167)	To connect the fire extinguisher to the recovery tank, and to depress the fusible valve (75) in the fill fitting (60)
Fitting, Hydrotest 0.750-16 UNJF Thread	---	Commercially available	To plug the fill boss for the hydrostatic test
Ground Strap & Circuit Tester	WT25	Walter G. Legge Co. (84832)	To ground the technicians for safe handling of the explosive cartridges (5)
Halon Recovery Recycle System	A6-06-2000-75-0 (Model H 1301)	Neutronics Inc. (5R712)	To recover and recycle Halon

* Refer to the IPL, paragraph 2, for the address.

Table 901. Special Tools, Fixtures, and Equipment (Continued)

Nomenclature	Part No.	Source (CAGE)*	Use
Hydrotest Test Stand	---	Commercially available	To pressurize the weldment (105) for the hydrostatic test
Leak Detector	HLD 4000-310 Series C	Inficon (56507)	To check for leakage of the extinguishing agent
Light Probe	---	Commercially available	To check the inside of the weldment (105) for unwanted materials and damage
Oven or Heater 250°F (121°C)	---	Commercially available	To dry the weldment (105) after the hydrostatic test and cleaning
Plug, Gauge Boss 1/4-18 NPT Thread	---	Commerically available	To plug the gauge boss for the hydrostatic test
Power Supply or Battery 28 VDC, 3.5 Amperes	---	Commercially available	To detonate cartridges (5) that have exceeded the maximum service and/or storage life
Protective Caps			To prevent contamination and damage
Cartridge Cover	5/8-SC	CaPlugs (99017)	
Cartridge Port	PD-50	CaPlugs (99017)	
Cartridge Thread	1/2-SC	CaPlugs (99017)	
Discharge Boss	PD-200	CaPlugs (99017)	
Discharge Outlet End	CD-22	CaPlugs (99017)	
Fill Boss	PD-40	CaPlugs (99017)	
Fill Fitting End	CD-4	CaPlugs (99017)	
Pressure Gauge Fitting	WW-O	CaPlugs (99017)	
Recharge Stand	8126300	Pacific Scientific (05167)	To fill the weldment (105) with extinguishing agent and Nitrogen
Safety Chamber, Cartridge	83330118	Pacific Scientific (05167)	To safely enclose the cartridges (5) for testing and for detonating before disposal
Stem Holding Tool	13254	Pacific Scientific (05167)	To hold the stems (40)

* Refer to the IPL, paragraph 2, for the address.

Table 901. Special Tools, Fixtures, and Equipment (Continued)

Nomenclature	Part No.	Source (CAGE)*	Use
Tank, Extinguishing Agent with Stand, 150 pounds (68 kg)	---	Commercially available	The extinguishing agent source for fire extinguisher recharge
Tank, Gaseous Nitrogen (GN_2) 2000 psig (13800 kPag)	---	Commercially available	The Nitrogen source for fire extinguisher recharge
Tank, Gaseous Nitrogen (GN_2) 1000 psig (6900 kPag)	---	Commercially available	The source for pressure tests
Tape, Foam Insulated (1/2" wide x 1/4" thick)	---	The 3M Company (04633)	To tape thermocouple to the fire extinguisher
Test Fitting, 1/8-27 NPT	---	Commercially available	To test the pressure gauge
Thermocouple	---	Commercially available	To test the temperature during recharge
Valve Plug Insertion Tool	13253	Pacific Scientific (05167)	To assemble the valve plugs (50)
Weighing Scale, ±0.01 pound (0,005 kg) 0 to 120 pounds (55 kg)	Series 3000/3000E	Pennsylvania Scale Company (03964)	To check the fire extinguisher charge weight and the recharge weight
Wrench, Open End 5/8, 9/16, 1-1/4 inch	---	Commercially available	To remove and install the housing assemblies (25), fill fitting (60), and pressure gauge (80)

* Refer to the IPL, paragraph 2, for the address.

THIS IS A BLANK PAGE

ILLUSTRATED PARTS LIST

1. Introduction

A. Purpose

(1) This IPL illustrates and lists the spare parts with attaching hardware.

B. Guide to use of the IPL

(1) If the part number is not known:

(a) Find the part in the illustration for the IPL Figure.

(b) Note the item number assigned to the part.

(c) Refer to the parts list and find the item number in the **Fig & Item** column.

(2) If the part number is known:

(a) Refer to the numerical index or parts list and find the part in the **Part Number** column.

(b) Note the figure number and item number assigned to the part.

(c) Refer to the illustration to find attaching hardware and related assembly parts.

2. Manufacturer Names and Address

A. The CAGE codes for the manufacturers of the parts, materials, special tools, and test equipment which may be referenced in this CMM are given below. The codes are taken from Cataloging Handbook H4/H8. The absence of a code in the **Nomenclature** column of the Detail Parts List means the part is manufactured or modified by the HTL/Kin-Tech Division of Pacific Scientific Company.

Code	Name and Address
OAZM2	Noland Paper Company 6600 Valley View Street Buena Park, California 90620 U.S.A.
03990	The ARO Corporation One ARO Center Bryan, Ohio 43506 U.S.A.
03964	Pennsylvania Scale Company 21 Graybill Road Leola, Pennsylvania 17540 U.S.A.
04633	The 3M Company Adhesives Coatings & Sealers Division 3M Center St. Paul, Minnesota 55101-1428 U.S.A.

Code	Name and Address
05167	Pacific Scientific Company HTL/Kin-Tech Division 1800 Highland Avenue Duarte, California 91010 U.S.A. Tel: (626) 359-9317 (626) 357-2102 FAX (626) 359-7013 SITA LAXPSCR
06186	DriLube Company 711 West Broadway Glendale, California 91204 U.S.A.
09669	Stanley Proto 1764 Oxford Street P.O. Box 5595, Terminal A London, Ontario, Canada N6A 4R6
10836	Greif Bros. Corp. Fibre Drum Division P.O. Box 398 Lindenhurst, New York 11767 U.S.A.
18675	Marking Methods Inc. 301 S. Raymond Ave. Alhambra, California 91803-1531 U.S.A.
3A054	McMaster-Carr Supply Co. 9630 Norwalk Blvd. Whittier, California 90670-2932 U.S.A. Tel: (562) 695-2449
5R712	Neutronics Inc. 456 Creameny Way Exton, Pennsylvania 19341-2532 U.S.A. Tel: (610) 524-8800 FAX (610) 524-8807
54636	Sherwin-Williams Company 101 Prospect Avenue N.W. Cleveland, Ohio 44115 U.S.A.
56507	Inficon, Leybold-Heraeus,Inc. 6500 Fly Road East Syracuse, New York 13057 U.S.A.
84832	Walter G. Legge Co., Inc 444 Central Avenue P.O. Box 591 Peekskill, New York 10566 U.S.A.
89536	John Fluke Mfg. Company 6920 Seaway Boulevard Everett, Washington 98206 U.S.A.
99017	Protective Closures Co., Inc. CaPlugs Division 2150 Elmwood Avenue Buffalo, New York 14207 U.S.A.

3. Explanation of Numerical Index Entries

A. The Numerical Index is provided to help find parts in the Detail Parts List by part number. The figure number, item number, and total quantity required are given for each entry.

B. The part numbers are arranged from left to right, one character at a time. The order of precedence is: (1) dash, (2) letter A through Z, and (3) numerals 0 through 9.

4. Explanation of Detail Parts List Entries

A. The Detail Parts List is arranged in general sequence of disassembly. The parts are illustrated in an exploded-view illustration and listed in the related parts list.

(1) **Fig & Item** Column

(a) The first number at the top of each **Fig & Item** column is the figure number of the corresponding illustration. The number given opposite each part number is the item number assigned to the part in the illustration.

(b) A dash (-) in front of an item number means the part is not illustrated.

(c) Alpha-variants A through Z (except I and O) are assigned to item numbers, when necessary to identify:

- Added parts
- Alternate parts
- Service bulletin modified parts

(2) **Part Number** Column

(a) This column contains the manufacturer's part number for each part, as modified to meet the requirements of ATA 200/2000. These modifications can include:

1 Removal of blank spaces and special characters, with the possible exception of dashes. Dashes are permitted only between numeric characters.

2 Insertion of a reference part number compatible with ATA 200/2000 if the manufacturer's part number exceeds 15 characters. In these cases, the manufacturer's part number is given in the **Nomenclature** column.

(3) **Nomenclature** Column

(a) This column contains descriptive nomenclature for each part, the manufacturer's CAGE code (if the part is not manufactured by Pacific Scientific Company, HTL/ Kin-Tech Division), part number (if longer than 15 characters or modified per ATA 200/2000), service bulletins affecting the part, and obsolete part numbers.

(b) The indenture system used in the **Nomenclature** column indicates the relationship of one part to another, as follows:

1 2 3
End Item or Major Assembly
ATTACHING PARTS
Attaching Parts for End Item or Major Assembly
* * *
. Detail Parts for End Item or Major Assembly
. Subassemblies
ATTACHING PARTS
. Attaching Parts for Subassemblies
* * *
. . Detail Parts for Subassemblies
ATTACHING PARTS
. . Attaching Parts for Detail Parts
* * *

(c) Assemblies, subassemblies, and detail parts subject to modification, deletion, addition, or replacement by an issued service bulletin, are annotated to indicate both pre- and post-service bulletin configurations. The term (PRE SB XXXX) in the **Nomenclature** column designates the original configuration, and the term (POST SB XXXX) identifies assemblies and parts after the modification has been completed.

(d) The terms defined below are used when applicable to indicate the interchangeability of parts.

Term	Abbreviation	Definition
Alternate	ALT	The listed part is alternate to, and interchangeable with, other parts within the same item number variant group or other item numbers if designated.
Superseded By	SUPSD BY	The part is replaced by and is not interchangeable with the item number designated in the notation.
Supersedes	SUPSDS	The part replaces and is not interchangeable with the item number designated in the notation.
Replaced By	REPLD BY	The part is replaced by and is interchangeable with the item number designated in the notation.
Replaces	REPLS	The part replaces and is interchangeable with the item number designated in the notation.

(4) **Eff Code** (Effectivity Code) Column

(a) This column contains effectivity codes (A, B, etc) to indicate the alternate models or configurations of the end item to which the parts apply. This column is left blank when the parts apply to all models or configurations, included in the parts list.

(5) **UPA** (Units Per Assembly) Column

(a) The quantity shown in this column represents the units required for one NHA or, when referring to attaching parts, the quantity to attach one such item. The abbreviation RF (reference) indicates that the end item assembly is listed for reference purposes.

NOTE: THE FIRE EXTINGUISHER IS MANUFACTURED WITH METAL PLATES (85, 90, AND 95). ORIGINALLY, THE FIRE EXTINGUISHER WAS MANUFACTURED WITH THE FOLLOWING DECALS:

Part Number	Description
13093	Fill Decal
13200	Swivel Decal
13206	Nameplate Decal
13218-2	Pressure Temperature Decal
13287	Safety Decal
31575100	Nameplate Decal

SUPPLEMENT

1. Scope

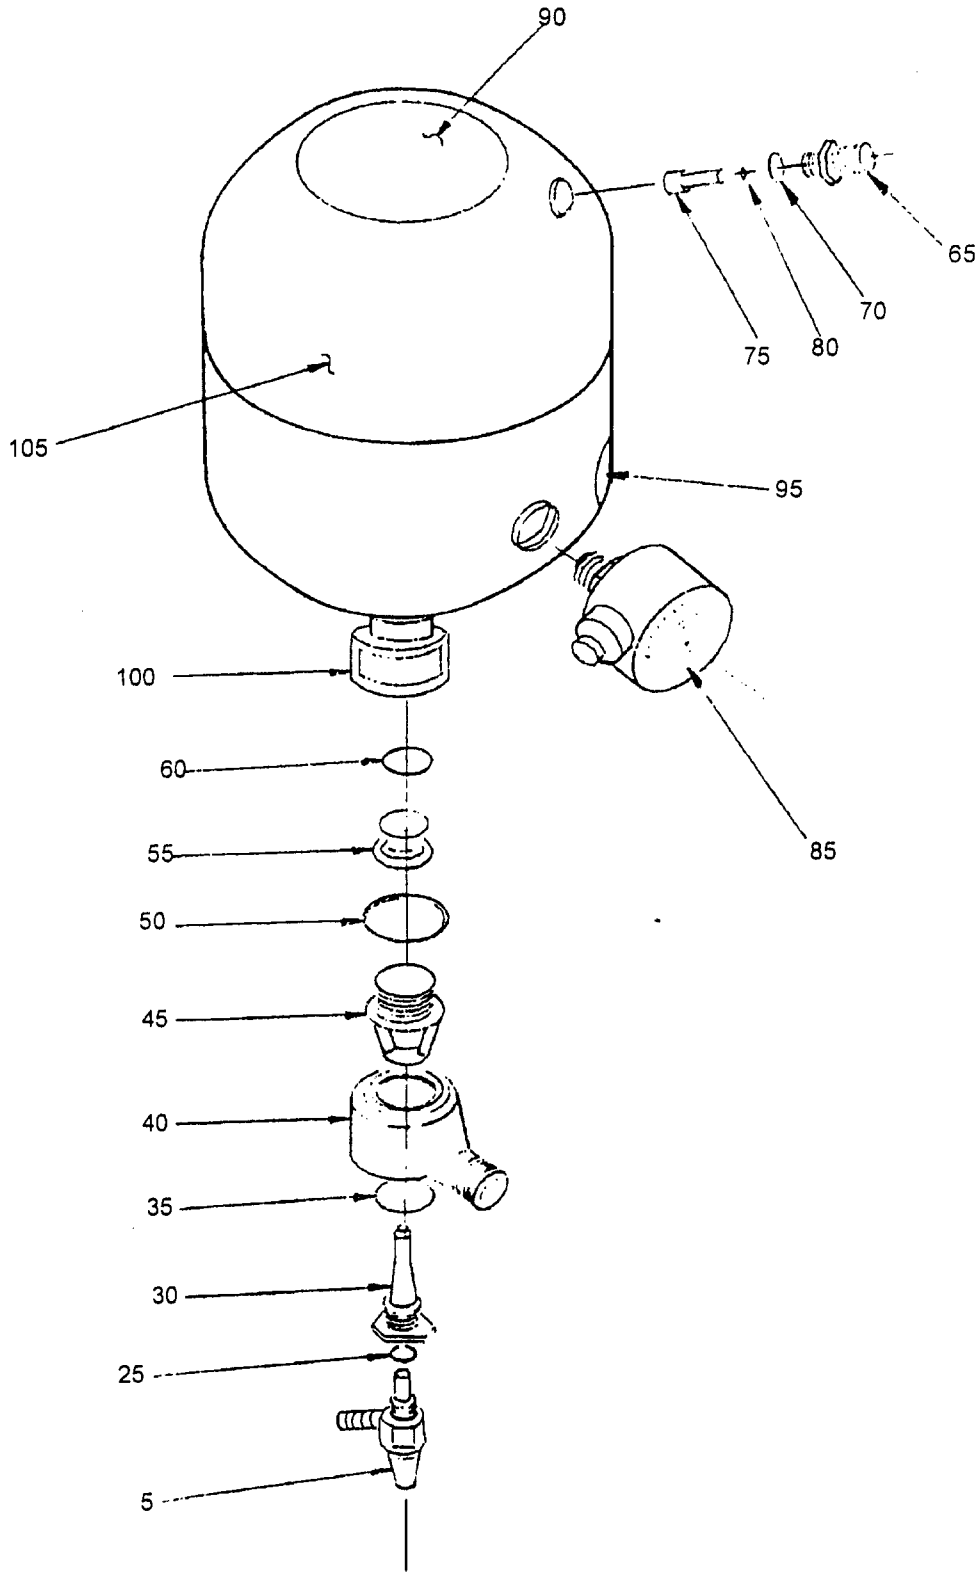
A. This Supplement contains the technical properties, the spare parts information, and an exploded-view drawing to help identify the parts that can be ordered. The fire extinguisher is manufactured by Pacific Scientific Company, HTL/Kin-Tech Division, Duarte, California.

B. The testing and fault isolation procedures, the disassembly, repair, check, cleaning, fits and clearances, and assembly instructions are contained in Component Maintenance Manual 26-20-202.

2. Technical Properties

A. The technical properties of the o-ring bottle fire extinguishers are given in the table below.

Table 1. Technical Properties for Fire Extinguisher



Property	Specifications
Description	
Manufacturer	Pacific Scientific, HTL/Kin-Tech Division
Part Number	P/N 30100043
Nomenclature	Fire Extinguisher, 60 Cubic Inch
Functional Properties	
Internal Volume	60 cubic inches (1,0 liters)
Extinguishing Agent	Bromotrifluoromethane ($CBrF_3$)
Pressurizing Gas	Nitrogen (N_2)
Ambient Temperature Range	-65°F to +160°F (-54°C to +71°C)
Pressure Data at 70°F (21°C)	
Charge Pressure	600 to 625 psig (4137 to 4309 kPag)
Hydrostatic Pressure Test	1800 psig (12411 kPag) minimum
Burst Pressure	2400 psig (16548 kPag) minimum
Weight Data	
Empty Fire Extinguisher	2.25 pounds (1,02 kg) maximum
Extinguishing Agent (full charge)	2.00 to 2.10 pounds (0,91 to 0,96 kg)
Nitrogen Charge	0.07 pound (0,03 kg) maximum
Charged Fire Extinguisher	4.42 pounds (2,01 kg) maximum
Allowable Weight Deviation - actual weight versus the last weight marked on data plate	Minus 0.10 pound (0,05 kg)

Table 1. Technical Properties for Fire Extinguisher (Continued)

Property	Specifications
Cartridge Data	
Voltage	18 to 30 VDC
Current Rating	
All Fire	3.0 amperes minimum
No Fire	0.5 ampere, 1.0 Watt for five minutes
Test Current	50 mA maximum
Bridgewire Resistance	0.9 to 1.4 ohm
Service Life	6 years
Maximum Life (service and storage)	9 years
Mating Receptacle	MS3106-10SL-4S
Pressure Data	
Maxing Switch Current	1.0 amp Lamb Load at 28 VDC
Temperature Range	-65°F to +220°F (-53°C to +104°C)
Burst Pressure	3750 psig (26576 kPag)
Increasing Pressure, Switch Closes	265 to 400 psig (1827 to 2758 kPag)
Decreasing Pressure, Switch Opens	265 to 200 psig (1827 to 1379 kPag)
Pressure Range Data at 70°F (21°C)	0 to 1500 psig (0 to 10343 kPag)
500 to 700 psig (4137 kPag)	±35 (±241 kPag)
Balance of Scale	±50 (±345 kPag)
Rupture Disc Valve	
Code	-22
Fill Fitting End	MS33656-4
Discharge Outlet End	MS33656-12

3. Detailed Parts List

NOTE: The items in the detailed parts list are made or supplied by the HTL/Kin-Tech Division of Pacific Scientific, or by the suppliers shown in this list. Pacific Scientific does not give approval for items that are procured from suppliers who are not shown in this list. Approval from Pacific Scientific is not necessary for government and industry standard parts.

Charge Pressure	$600^{+.25}_{-.00}$ PSIG @ 70° F (21.1° C)
Proof Pressure	3000 PSIG @ 70° F (21.1° C)
Burst Pressure	3900 PSIG @ 70° F (21.1° C)
Safety Relief Temperature Range	215° F to 226° F (101° C to 107.7° C)
Electrical Data:	
Voltage	18 to 30 VDC
Resistance	$1.15 \pm .25$ ohms
Current (All Fire):	
Recommended Minimum	3.0 amps
Maximum Test Current	50 ma
Fitting Ends:	
Outlet,	Per MS 33656-10
Fill and Relief	Per MS 33656-4
Weight:	
Agent	$2.50^{+.15}_{-.00}$ lbs
Total Weight (Max.)	6.08 lbs

TECHNICAL DATA EXPORT LEGEND

This data is exported pursuant to the requirements of the United States Government Export Administration Act of 1969, as amended, and promulgated by the export administration regulations as issued by the U.S. Department of Commerce. The data may not be reproduced and shall not, without the written permission of HTL Division, Pacific Scientific, be used for purposes of manufacture nor shall it be disclosed, re-exported nor transmitted directly or indirectly from the importing foreign country to any person, government, governmental entity or institution of another foreign government. It is understood and agreed that the use of this data shall be limited to the following purposes: (i) use by Support Service Contractors (except for manufacture), (ii) emergency repair or overhaul work, (iii) receiving inspection of hardware, (iv) evaluation of a bid or proposal. By acknowledgment of receipt of data containing this legend, importer agrees to comply thereto.

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this document.

HTL | ADVANCED TECHNOLOGY DUARTE, CA.

SERVICE BULLETIN

P/N 31000010

1. PLANNING INFORMATION

A. EFFECTIVITY

This Service Bulletin is applicable only to the HTL Fire Extinguisher, Part Number 31000010.

B. REASON

This Service Bulletin is issued to revise HTL Overhaul Manual 26-20-200 by adding the Fire Extinguisher, Part Number 31000010 configuration.

Except for the pages identified in this Bulletin, HTL Overhaul Manual 26-20-200 shall apply in its entirety.

C. DESCRIPTION

HTL Fire Extinguisher, Part Number 31000010 is 378 cubic inches in volume and contains $9.00^{+.10}_{-.00}$ pounds of agent. ($CBrF_3$). It contains an electrical switch integral with the pressure gauge which will signal low pressure between 265 and 200 psig.

TECHNICAL DATA EXPORT LEGEND

This data is exported pursuant to the requirements of the United States Government Export Administration Act of 1969, as amended, and promulgated by the export administration regulations as issued by the U.S. Department of Commerce. The data may not be reproduced and shall not, without the written permission of HTL Division, Pacific Scientific, be used for purposes of manufacture nor shall it be disclosed, re-exported nor transmitted directly or indirectly from the importing foreign country to any person, government, governmental entity or institution of another foreign government. It is understood and agreed that the use of this data shall be limited to the following purposes: (i) use by Support Service Contractors (except for manufacture), (ii) emergency repair or overhaul work, (iii) receiving inspection of hardware, (iv) evaluation of a bid or proposal. By acknowledgment of receipt of data containing this legend, importer agrees to comply thereto.

INTRODUCTION

1. Scope
   A. This Component Maintenance Manual (CMM) contains the maintenance instructions for the O-ring Bottle Fire Extinguishers. The fire extinguishers are manufactured by Pacific Scientific Company, HTL/Kin-Tech Division, Duarte, California.
   B. The technical properties, an exploded-view, and the detailed parts list for the O-ring Bottle Fire Extinguishers are contained in separate Supplements.
2. Usage Guide
   A. Refer to the Table of Contents to find the necessary procedures or maintenance data. This Manual is written to ATA 100, Revision 30 and AECMA Simplified English guidelines.
      (1) **Description and Operation** gives the function, primary components of the o-ring bottle fire extinguishers. The technical properties are contained in Supplements.
      (2) **Testing and Fault Isolation** contains the test and fault isolation procedures.
      (3) **Disassembly** contains the procedures to discharge the extinguishing agent and disassemble the o-ring bottle fire extinguishers before repair or part replacement.
      (4) **Cleaning** contains procedures to clean the o-ring bottle fire extinguishers and components.
      (5) **Check** contains the procedures to check the parts for too much wear, corrosion, and other damage.
      (6) **Repair** contains the repair procedures.
      (7) **Assembly** contains the procedures to reassemble, refill, and store the o-ring bottle fire extinguishers.
      (8) **Fits and Clearances** contains the assembly torque ranges and the minimum height dimensions for the fill, discharge, and switch bosses (as applicable).
      (9) **Special Tools, Fixtures, and Equipment** describes the recommended special tools, fixtures, and test equipment.
      (10) **Illustrated Parts List** contains the introduction to the detailed parts list. The corresponding Supplement contains an exploded-view drawing and a detailed parts list. The information in the Supplement is used identify and to order spare parts.
   B. The recommended tools and materials are given in each section. Equivalent items can be used.
3. Product Support Services
   A. Product support services for the o-ring bottle fire extinguishers are available from Pacific Scientific Company.
   B. For technical documentation, please contact:

PACIFIC SCIENTIFIC COMPANY
6805 NW 87 Avenue
Miami, Florida 33178 U.S.A.

Telephone: (305) 477-4711
FAX: (305) 477-9799
SITA: MIAPSXD

C. For repair and overhaul, and spare parts please contact:

PACIFIC SCIENTIFIC COMPANY	Telephone:	(305) 477-4711
6805 NW 87 Avenue	FAX:	(305) 477-9799

4. Verification Dates

Procedure	Date
Testing/Fault Isolation	---
Disassembly	---
Assembly	---

5. Revision Service

A. Revised pages will be issued when necessary throughout the service life of the o-ring bottle fire extinguishers. The revised part of the page will be identified by a change bar or capital **R** in the left margin.

6. Abbreviations and Unit Symbols

A. Abbreviations and unit symbols which may be used in this manual are defined below. All weights and measurements are given first in the English standard units followed by the metric equivalent in parentheses.

Assy - Assembly
ATA - Air Transport Association
cfh - Cubic feet per hour
CAGE - Commercial and Government Entity
cm - Centimeter (1 cm = 0.394 inch)
DC - Direct Current
DOT - Department of Transportation
EFF - Effectivity
FAA - Federal Aviation Administration

sccs - Standard cubic centimeter per second
V - Volt
VDC - Voltage - Direct Current

DESCRIPTION AND OPERATION

A. The o-ring bottle fire extinguisher stores fire extinguishing agent under high pressure. When the sensors indicate smoke, the pilot operates a control switch sending an electrical signal to the cartridge mounted in the discharge outlet (see Figure 1). This causes the cartridge to detonate, which fractures a housing assembly and releases extinguishing agent to extinguish the fire.

1. Description

A. The o-ring bottle fire extinguishers (see Figure 2) primary components may include:

- Container weldment
- Fill fitting
- Pressure devices
  - Pressure gauge, pressure switch, or temperature compensated pressure switch (depending on the unit)
- Gauge guard (on some units)
- Fusible valve or rupture disc valve
- Discharge outlet (more than one on some units)
- Cartridge (more than one some units)

B. The weldment is an all-welded stainless steel shell, which includes fill, discharge, and gauge bosses.

C. An electrically actuated cartridge (see Figure 1) is installed in the housing assembly. The cartridge can be removed or installed (even when the o-ring bottle fire extinguisher is pressurized). The cartridge is safety wired to the discharge outlet and caution tagged for safety.

D. The fill fitting is a combination filling device and safety relief assembly. If the ambient temperature should rise abnormally, an eutectic metal within the fill fitting melts. This relieves the contents of the container through the fill fitting.

E. The discharge outlet is a flow path for the extinguishing agent. The discharge outlet is safety wired to the weldment to a secure installation. The discharge outlet consists of a valve plug that is held securely by a destructible housing assembly and stem assembly. A discharge outlet capable of rotating 360° (even when the o-ring bottle fire extinguisher is pressurized) is installed between the housing assembly and discharge boss.

F. Most o-ring fire extinguishers are equipped with a pressure device (pressure gauge, pressure switch, or temperature compensated pressure switch). Some o-ring fire extinguishers are also equipped with a gauge guard.

G. The o-ring bottle fire extinguishers are shipped with protective caps to cover the discharge outlet and the fill fitting. The shunt wire/caution tag installed on the cartridge, protects the firing circuit from detonating with electromagnetic interference.

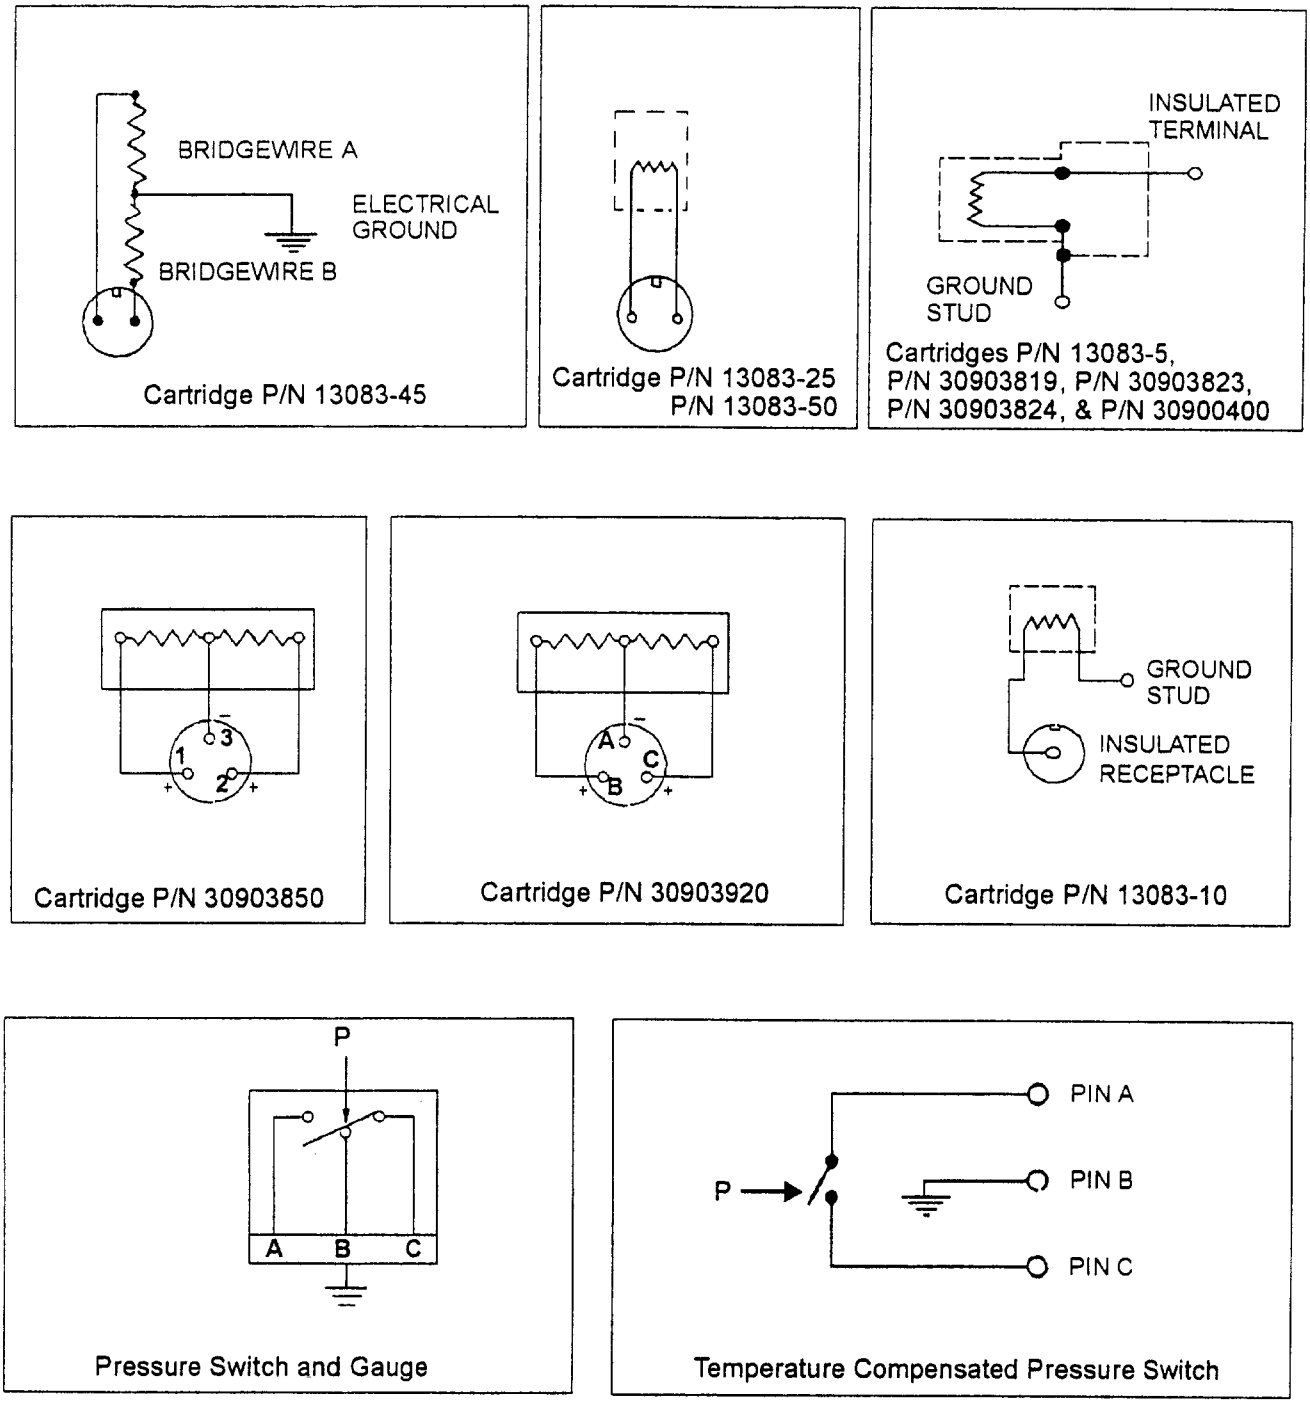

Figure 1. Cartridge and Pressure Device Schematics

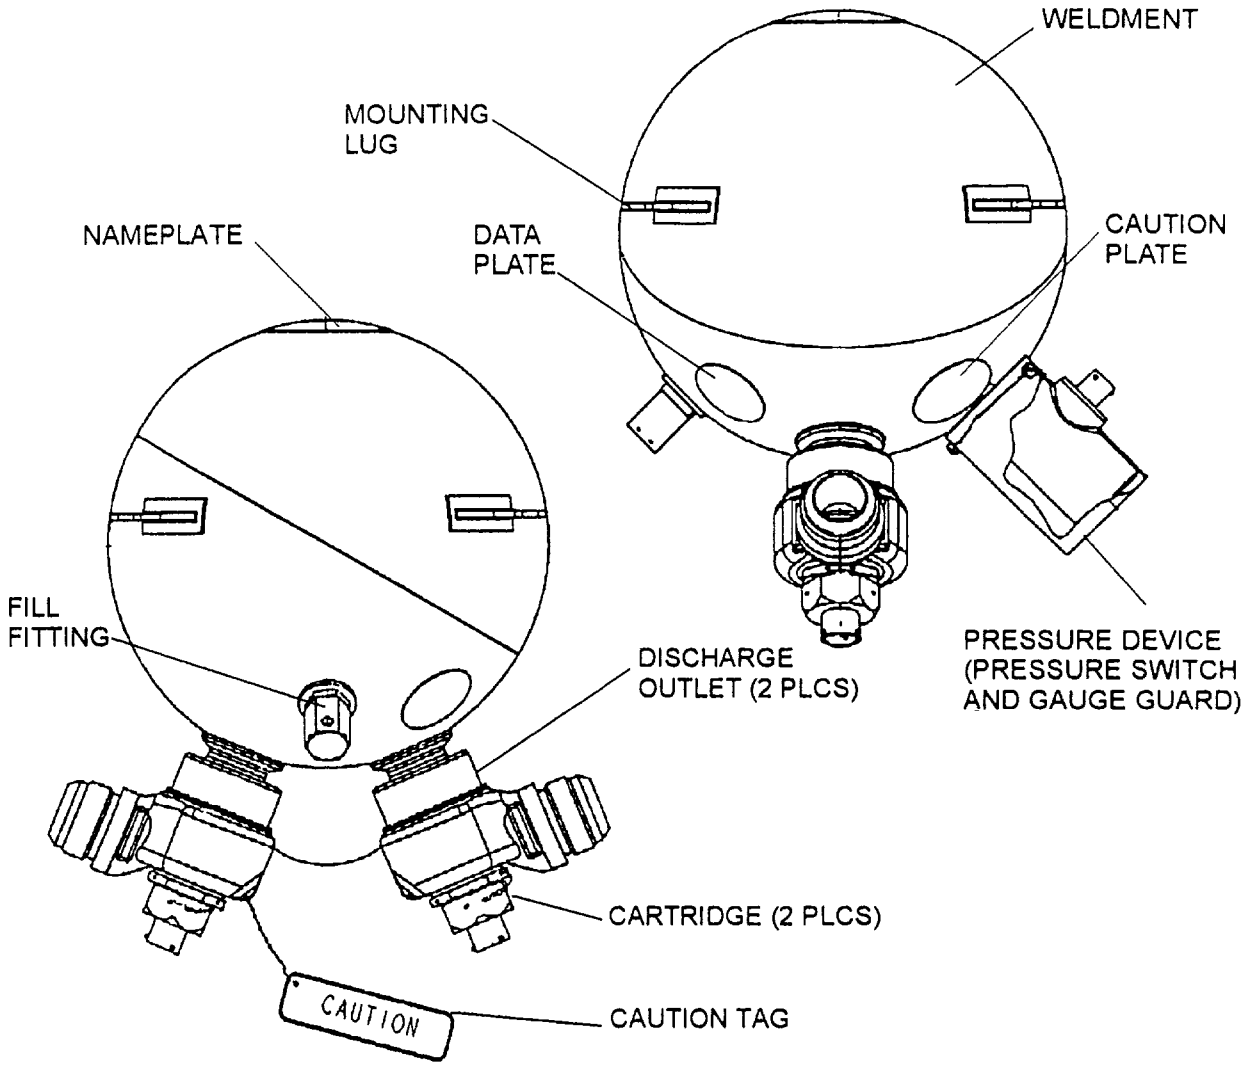

Figure 2. Typical Components

2. Operation of Fire Extinguisher

A. To release the extinguishing agent, the pilot operates a control switch, applying 18 to 30 VDC, 3.0 amperes current to the cartridge terminals. The current detonates the explosive charge in the cartridge (Figure 1). The explosion breaks the end of the housing assembly, removing the mechanical locking force against the valve plug. The pressurized extinguishing agent forces the valve plug outward. The extinguishing agent is discharged through the discharge outlet into the distribution network.

B. The pressure device indicator should be checked regularly to make sure that the o-ring bottle fire extinguishers is charged.

3. Technical Properties

A. The technical properties of the o-ring bottle fire extinguishers are contained in separate 26-20-202 Supplements.

THIS IS A BLANK PAGE

TESTING AND FAULT ISOLATION

1. General

A. This section contains the testing and fault isolation procedures. Perform the leak test and cartridge test, before disassembly to identify the quantity of maintenance.

B. The recommended test equipment and materials are given in Table 101.

NOTE: Equivalent items can be used.

Table 101. Test Equipment and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Bag, Plastic (large enough to enclose weldment)	---	Commercially available
Cap, Hydrotest	83330165	Pacific Scientific (05167)
Digital Multimeter	79	John Fluke (89536)
Fitting, Hydrotest 0.750-16 UNJF Thread	---	Commercially available

2. Leak Test

WARNING: THE CARTRIDGE IS AN EXPLOSIVE DEVICE. INADVERTENT DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAP AND SHUNT WIRE/CAUTION TAG MUST BE INSTALLED ON THE ELECTRICAL CONNECTOR.

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 101). Test the ground circuit.

B. Verify the shunt wire/caution tags is installed on the cartridge between the positive and negative terminals.

C. Remove the cartridge from the housing assembly. Refer to Disassembly section, paragraph 2.

D. Use a cotton swab or vacuum (Table 101) to clean dirt and other contamination from the discharge bosses.

E. Separate the o-ring bottle fire extinguisher from other filled fire extinguishers. Use shop air to blow away any extinguishing agent in the air immediately around the o-ring bottle fire extinguisher.

F. Wait two hours for any leakage to collect.

G. Set the sensitivity scale on the leak detector (Table 101) to 1 x 10^{-6} sccs.

H. Hold the detector probe 1/4 inch above the surface of the unit to light touching of the unit and check each discharge boss, the pressure device, and the fill fitting for a minimum of 60 seconds each, then slowly move the probe over the weld joints.

I. If leak detection indicates no leak, proceed to paragraph N.

J. If leak detection indicates a leak, place the o-ring bottle fire extinguisher in a large plastic bag (Table 101) and close the bag.

K. Wait 2 hours, then probe the air inside the plastic bag (Table 101) and check each discharge boss, the pressure device, and the fill fitting for a minimum of 60 seconds each, then slowly move the probe over the weld joints. Record the leakage at each test point.

L. Calculate the leakage rate, as follows:

$$L_r = \frac{L_i \times V}{T \times F}$$

Where:
L_r = Leakage rate (sccs)
L_i = Detector reading (sccs)
V = Volume of plastic bag, less weldment volume
T = Time (in seconds) of weldment inside plastic bag
F = Flow rate of leak detector (5 sccs) for Inficon 3000 *

* Refer to equivalent leak detector manual for flow rate.

M. If the leakage rate exceeds 1 x 10^{-6} sccs, repair or replace the fill fitting and pressure device as applicable, and repeat leak test.

N. If the leakage rate is less than 1 x 10^{-6} sccs, reinstall the cartridges (refer to Assembly section, paragraph 6).

O. Install the protective caps (Table 101).

3. Cartridge Test

WARNING: THE CARTRIDGE IS AN EXPLOSIVE DEVICE. INADVERTENT DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAP AND SHUNT WIRE/CAUTION TAG (-15) MUST BE INSTALLED ON THE ELECTRICAL CONNECTOR (EXCEPT WHEN SPECIFIED IN THE PROCEDURE).

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 101). Test the ground circuit. Refer to Figure 101.

B. Ground the safety chamber (Table 101).

C. Verify that the shunt wire/caution tag is installed on the cartridge.

WARNING: THE CARTRIDGE MUST BE TESTED IN A FIXTURE THAT PROVIDES PROTECTION FOR PERSONNEL. THE SAFETY CHAMBER IS DESIGNED FOR THIS PURPOSE.

D. Thread the cartridge, with the shunt wire/caution tag and o-ring installed, into the safety chamber (Table 101).

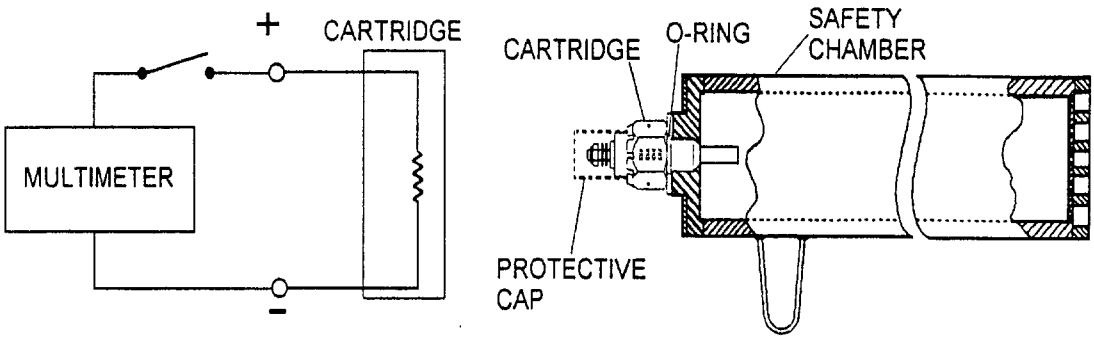

Figure 101. Cartridge Test Setup

CAUTION: TEST DEVICES THAT PASS MORE THAN 50 MILLIAMPERES CURRENT CAN AFFECT THE USEFUL LIFE AND RELIABILITY OF THE CARTRIDGE. DO NOT USE A VOLTMETER, FLASHLIGHT BATTERY, CONTINUITY LIGHT, OR SIMILAR DEVICE.

E. Set up the digital multimeter (Table 101), as follows:

(1) Disconnect the test leads from the digital multimeter.

(2) Connect the digital multimeter to a power source.

(3) Press the green button to turn on the digital multimeter power.

(4) Press the V and mA buttons at the same time to select the low display range.

(5) Ensure that the digital multimeter is set to measure DC power.

(6) Press the gray button (second from the left) to select the 2 ohm range.

(7) Plug the black test lead into the COMMON terminal. Plug the red test lead into the LOW RANGE terminal.

(8) Hold the probe ends together and adjust the ZERO control until the display reads zero.

F. Remove the shunt wire/caution tag from the cartridge.

CAUTION: DO NOT BEND THE CARTRIDGE CONNECTOR PINS.

G. Measure the bridgewire resistance across the cartridge connector positive terminal to the negative terminal.

REQUIREMENT: EACH BRIDGEWIRE RESISTANCE MUST BE 0.9 TO 1.4 OHM.

H. Dispose of the cartridge that fails this test (refer to Check section, paragraph 7).

I. Disconnect the digital multimeter. Reinstall the shunt wire/caution tag on the cartridge.

J. Remove the cartridge from the safety chamber.

4. Hydrostatic Pressure Test Requisites

A. The DOT requires these units to be hydrostatically tested at five year intervals. FAA, CAA, and DOT rules may impose other requirements.

B. The approved method of testing is by water jacket volumetric expansion, which uses high internal water pressure to determine total volumetric expansion.

5. Hydrostatic Test Procedure

A. Set up the hydrostatic test equipment.

B. Prepare the o-ring bottle fire extinguisher for the hydrostatic test, as follows:

(1) Disassemble the o-ring bottle fire extinguisher to remove the cartridge, housing assembly, discharge outlet, fill fitting, and pressure device. Refer to the Disassembly section.

(2) Install plugs and caps (Table 101) in the boss locations.

C. Perform hydrostatic test per test stand (Table 101) manufacturer's instructions.

REQUIREMENT: THE PERMANENT VOLUMETRIC EXPANSION MUST NOT EXCEED 10 PERCENT OF THE TOTAL VOLUMETRIC EXPANSION.

NOTE: If the test pressure cannot be maintained due to a failure of the test apparatus, the test may be repeated at a pressure increase of 10 percent or 100 psig (690 kPag), whichever is the lower value.

D. Repeat the test once if system error is suspected. Replace the weldment if the weldment fails both tests.

E. Remove the caps and plugs (Table 101) from the weldment. Drain the water from the weldment.

F. Heat in an oven or heater (Table 101) to 225°F to 250°F (107°C to 121°C). Heat the weldment for one hour or until completely dry.

G. Inspect the weldment (refer to the Check section, paragraph 3).

H. Stamp the hydrostatic test date and DOT identification number next to the pressure stamp on the mounting lug.

6. Pressure Device Functional Tests

A. Pressure Gauge

(1) Install the pressure gauge into the test fitting (Table 101).

(2) Using an adjustable, calibrated source of dry nitrogen (Table 101), apply gradually increasing pressure to the device while monitoring and recording device and source pressure indications.

(3) Accuracy of recorded pressure gauge indications can be found in the Technical Properties table of the appropriate 26-20-202 Supplement.

(4) Failure of the pressure gauge to perform as described in the Technical Properties table of the 26-20-202 Supplement is cause for rejection. Remove and replace gauge (refer to Check section, paragraph 8).

B. Pressure Switch

(1) Install the pressure switch into the test fitting (Table 101).

(2) Attach a digital multimeter (Table 101) to connector pins 1 and 2. The digital multimeter should indicate continuity, showing contacts closed. Attach a digital multimeter (Table 101) to connector pins 2 and 3. The multimeter should indicate no continuity, showing contacts open.

(3) Using the nitrogen source (Table 101), slowly apply pressure until switch contacts 2 and 3 close. The maximum closing pressure is 500 psig at 70°F (3448 kPag at 21°C). The digital multimeter should indicate continuity, showing contacts closed.

(4) Slowly decrease pressure until switch contacts 2 and 3 open. The minimum opening pressure is 230 psig at 70°F (1586 kPag at 21°C). The digital multimeter should indicate no continuity, showing contacts open.

(5) Remove pressure switch from the test fitting. Install the protective covers (Table 101).

C. Pressure Gauge and Switch

(1) Install the pressure gauge and switch into the gauge test fitting (Table 101).

(2) Attach a digital multimeter (Table 101) to connector pins A and B. The digital multimeter should indicate continuity, showing contacts closed.

(3) Using the nitrogen source (Table 101), slowly apply pressure to 500 psig until switch contacts open. The digital multimeter should indicate no continuity, showing contacts open.

(4) Slowly decrease pressure to 300 psig until switch contacts close. The digital multimeter should indicate continuity, showing contacts closed, at low pressure switch point.

(5) Apply pressure to the pressure gauge and switch and compare dial readings for the accuracy the Technical Properties table of the appropriate 26-20-202 Supplement.

(6) Failure of the pressure gauge and switch to perform as described in the Technical Properties table of the 26-20-202 Supplement is cause for rejection (refer to Check section, paragraph 8).

(7) Remove pressure gauge and switch from the gauge test fitting. Install protective covers (Table 101).

D. Temperature Compensated Pressure Switch

(1) Install the temperature compensated pressure switch (TCPS) into the banjo test fitting (Table 101). Tape a thermocouple (Table 101) to the reference chamber of the TCPS. See Figure 102.

(2) Attach a digital multimeter (Table 101) to connector pins 1 and 3. The digital multimeter should indicate continuity, showing contacts closed.

(3) Slowly apply pressure until switch contacts 1 and 3 open, ususally 10 to 20 psig (69 to 138 kPag) above the maximum contacts closed switch point. See Table 102 for the maximum increasing pressure. The multimeter should indicate no continuity, showing contacts open.

(4) Push the Press-to-Test button or apply the magnet (Table 101) on the top of the TCPS. Verify that the multimeter indicates continuity, showing the switch contacts closed. Release the Press-to-Test button or remove the magnet and verify that the multimeter indicates no continuity, showing switch contacts open.

(5) Slowly decrease pressure until switch contacts close. The digital multimeter should indicate continuity, showing contacts closed. The maximum and minimum decreasing pressure switch points are shown in Table 102.

(6) Disconnect the thermocouple and the digital multimeter. Remove TCPS from the banjo test fitting. Install the protective covers (Table 101).

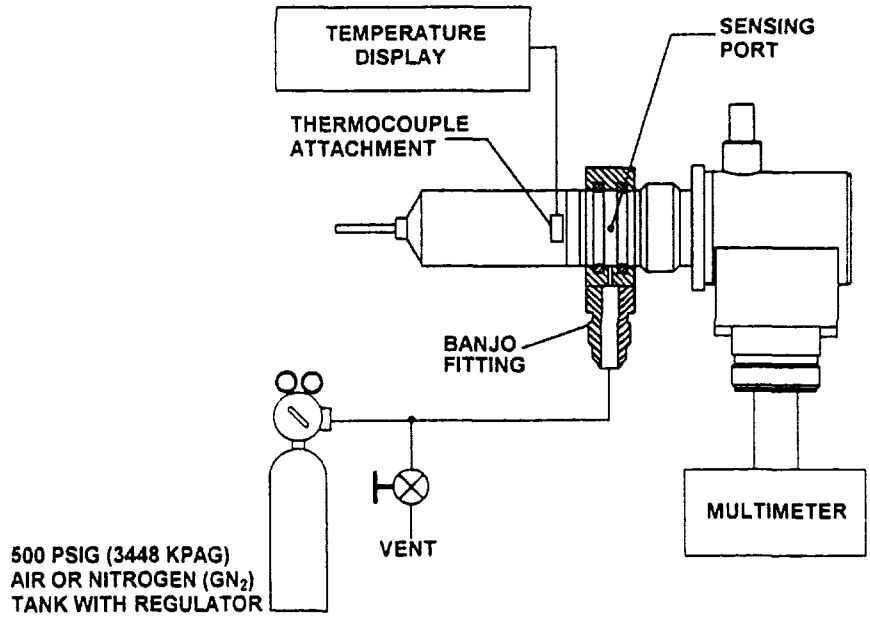

Figure 102. TCPS Test Setup

Table 102. Pressure Versus Temperature

Temperature °F (°C)	Decreasing Pressure Maximum psig (kPag)	Decreasing Pressure Minimum psig (kPag)	Temperature °F (°C)	Decreasing Pressure Maximum psig (kPag)	Decreasing Pressure Minimum psig (kPag)
60 (13)	303 (2089)	243 (1676)	76 (24)	350 (2413)	290 (2000)
62 (15)	308 (2124)	248 (1710)	78 (28)	353 (2434)	293 (2020)

74 (23)	343 (2365)	283 (1951)	90 (32)	397 (2737)	337 (2324)

DISASSEMBLY

1. General

NOTE: Refer to the Testing and Fault Isolation section to establish the condition of the o-ring bottle fire extinguisher or most probable cause of a malfunction. This determines the extent of disassembly required.

CAUTION: REMOVE THE PROTECTIVE CAPS (TABLE 301) ONLY WHEN NECESSARY FOR MAINTENANCE. THE CONNECTORS AND BOSSES MUST BE COVERED AT ALL OTHER TIMES TO PREVENT CONTAMINATION AND DAMAGE.

A. This section contains the o-ring bottle fire extinguisher discharge and disassembly instructions. Skip the unnecessary steps, if only partial disassembly is necessary. Refer to Figure 301 for a disassembly sequence chart.

NOTE: Refer to the Repair section to replace the identification plate or nameplate, caution plate, and data plates.

B. The recommended tools and materials are given in Table 301.

NOTE: Equivalent items can be used.

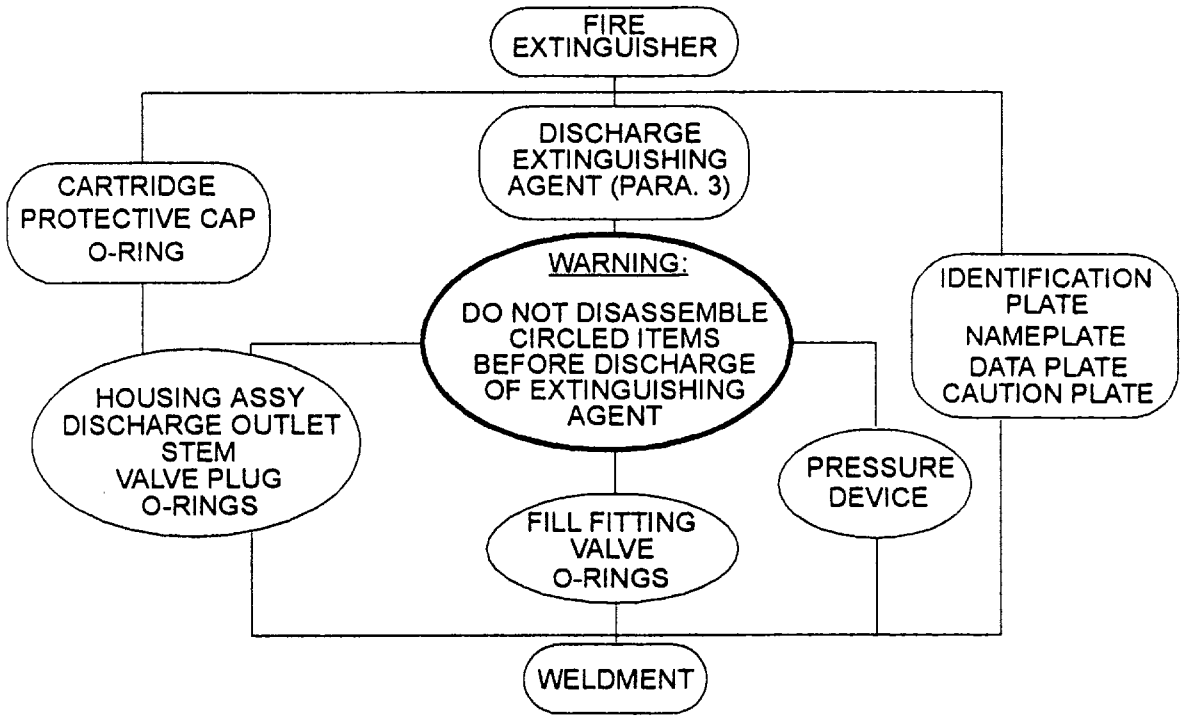

Figure 301. Disassembly Sequence Chart

Table 301. Disassembly Tools and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Bar Tool (4 inch length x 1/2 inch width x 1/8 inch thickness)	---	User furnish
Discharge Recovery Tool	59000059	Pacific Scientific (05167)
Flat File		
Mill Smooth	---	Commercially available
Second Cut	---	Commercially available
Ground Strap and Circuit Tester	WT25	Walter G. Legge Co. (84832)

Stem Holding Tool	13254	Pacific Scientific (05167)
Wrench, Open End 5/8, 11/16, and 1-1/4 inch	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

CAUTION: DO NOT USE METAL TOOLS TO REMOVE THE O-RINGS. METAL TOOLS CAN SCRATCH THE O-RING GROOVES, CAUSING LEAKAGE AND POSSIBLE CORROSION.

C. Note the procedure and locations of safety wiring to help reassembly.

2. Cartridge

WARNING: THE CARTRIDGE IS AN EXPLOSIVE DEVICE. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAP AND SHUNT WIRE/CAUTION TAG MUST BE INSTALLED ON THE ELECTRICAL CONNECTOR.

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 301). Test the ground circuit.

B. Verify the shunt wire/caution tag is installed on the cartridge between the positive and negative terminals.

C. Put the weldment in the cradle. Cut the safety wire and remove the cartridge from the housing assembly.

D. Remove the cartridge from the housing assembly by unscrewing the cartridge, while holding the hexagonal head of the housing assembly with a wrench , to prevent accidental discharge.

E. Put the cartridge in electrostatic safety bags (Table 301).

WARNING: DO NOT DISASSEMBLE THE O-RING BOTTLE FIRE EXTINGUISHER FURTHER UNTIL THE EXTINGUISHING AGENT HAS BEEN DISCHARGED. REFER TO PARAGRAPH 3 BELOW.

3. Discharge Procedure

NOTE: Use this procedure to discharge the extinguishing agent before removing the housing assembly, fill fitting, or pressure device.

WARNING: DO NOT DISCHARGE THE EXTINGUISHING AGENT INTO THE ATMOSPHERE. THE EXTINGUISHING AGENT MUST BE RECLAIMED AND RECYCLED. DO NOT HOLD THE O-RING BOTTLE FIRE EXTINGUISHER DURING DISCHARGE, THE DISCHARGE RECOVERY TOOL, DISCHARGE BOSS, AND WELDMENT WILL ICE OVER.

A. Remove the cartridges (refer to paragraph 2 above).

B. Thread the discharge recovery tool (Table 301) on the fill fitting. Connect the discharge recovery tool to a recovery tank or a Halon recovery system (Table 301). See Figure 302.

C. Turn the plunger in to depress the valve inside the fill fitting. After the extinguishing agent has fully discharged, remove the discharge recovery tool.

4. Discharge Outlet

A. Remove the cartridge (refer to paragraph 2 above).

B. Put the weldment in the cradle.

C. Using the a wrench, remove the housing assembly from the discharge outlet, then lift the discharge outlet from the discharge boss. Remove and discard the o-rings .

NOTE: If the discharge outlet and stems do not separate from the housing assembly, use the stem holding tool (Table 301) fastened to a table.

D. Unscrew and remove the stem, using a bar tool (Table 301) inserted through the largest exposed holes of the stem.

E. Remove the discharge outlets from the discharge bosses.

DISCHARGE SETUP
FOR FILL FITTING
(PREFERRED METHOD)

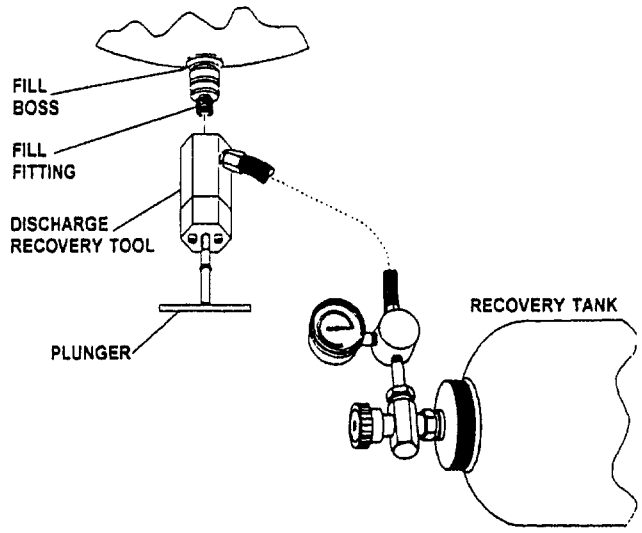

Figure 302. Discharge and Recovery Setup

F. Remove the valve plugs, then remove and discard the o-rings. If the valve plugs and the o-rings are not unseated, remove the valve plugs and the o-rings, as follows:

(1) Hold the o-ring bottle fire extinguisher with the discharge boss downward over an open box containing suitable cushioning material or install the stems before proceeding, for safety purposes.

(2) Connect an external source of compressed air or gaseous nitrogen to the fill fitting.

(3) Slowly pressurize the o-ring bottle fire extinguisher to approximately 50 psig (75 psig maximum) or until the valve plugs and the o-rings are blown out.

(4) Remove external pressure.

5. Fill Fitting

A. Discharge the extinguishing agent (refer to paragraph 3 above).

B. Put the weldment in the cradle.

C. Using a wrench slowly remove the fill fitting from the fill boss. Remove and discard the o-ring from the fill fitting (60).

D. Remove the fusible or rupture disc valve from the fill boss. Remove and discard the o-ring.

6. Pressure Devices

A. Pressure Gauge

(1) Discharge the extinguishing agent (refer to paragraph 3 above).

(2) Put the weldment in the cradle.

(3) To remove the pressure gauge, proceed as follows:

(a) Loosen the pressure gauge using a wrench.

(b) Unscrew the pressure gauge from the weldmen and remove the pressure gauge from within the gauge guard enclosure.

B. Presure Gauge and Switch

(1) Discharge the extinguishing agent (refer to paragraph 4 above).

(2) Attach the cradle to a work surface.

(3) Put the weldment in the cradle.

(4) To remove the pressure gauge, proceed as follows:

WARNING: MAKE SURE THE O-RING BOTTLE FIRE EXTINGUISHER HAS BEEN DISCHARGED BEFORE LOOSENING THE PRESSURE GAUGE.

(a) Loosen the pressure gauge fitting using an 11/16 inch open end wrench (Table 301) across fitting flats.

(b) Unscrew the pressure gauge from the weldment and remove the pressure gauge from within the gauge guard enclosure.

C. Pressure Switch and Gauge

(1) Discharge the extinguishing agent (refer to paragraph 4 above).

(2) Loosen the nut, then turn the pressure gauge and switch from the switch boss. Check the pressure switch using the Testing and Fault Isolation procedure, paragraph 6.

(3) Remove and discard retainer (if any) and o-ring.

D. Temperature Compensated Pressure Switch

(1) Discharge the extinguishing agent (refer to paragraph 4 above).

(2) Attach the cradleto a work surface.

(3) Put the weldment in the cradle.

(4) Install a 0.020 inch (0,51 mm) saw cutter in the spindle of a hand held cutter (Table 301). Align the cutting edge along the circumference of the weld between the switch flange and the switch boss.

NOTE: Use a fixed machine as an alternate for the hand held cutter, if required.

(5) Carefully move the cutter into the weld until it cuts through the weld (approximately 0.060 inch or 1,52 mm).

(6) Turn the weldment around 360 degrees to cut the full circumference of the weld.

(7) Turn off the power to the hand held cutter (Table 301).

(8) Turn the pressure switch from the switch boss. Check the pressure switch using the Testing and Fault Isolation procedure, paragraph 6. If the pressure switch is acceptable, install after successful completion of hydrostatic test of the weldment (75).

(9) Remove burrs and maintain the chamfer, 0.007 to 0.010 inch (0,18 to 0,25 mm) by 45 degrees, inside the switch boss.

NOTE: Limited surface roughness around the switch boss is acceptable.

(10) Remove all unwanted material from the outer surface of the switch boss and machined surface. Use a second cut flat file (Table 301) and smooth the machined surface. Square the edge between the outside of the switch boss and the machined surface using a mill smooth flat file (Table 301).

NOTE: The machined surface must be perpendicular to the inside diameter.

(11) Clean the weldment to remove the chips (refer to Cleaning section, paragraph 3).

(12) Machine the mounting flange of the pressure switch flat, as required.

CLEANING

1. Cleaning Materials

A. The recommended cleaning materials are given in Table 401.

NOTE: Equivalent items can be used.

Table 401. Cleaning Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Alcohol, Isopropyl	Federal Specification TT-I-735	Commercially available
Cloth, Lint-free	---	Commercially available
Light Probe	---	Commercially available
Oven or Heater, 250°F (121°C)	---	Commercially available
Protective Caps		
Cartridge Cover	5/8-SC	CaPlugs (99017)
Cartridge Port	PD-50	CaPlugs (99017)
Cartridge Thread	1/2-SC	CaPlugs (99017)
Discharge Boss	PD-200	CaPlugs (99017)
Discharge Outlet End	CD-22	CaPlugs (99017)
Fill Boss	PD-40	CaPlugs (99017)
Fill Fitting End	CD-4	CaPlugs (99017)

Vacuum Source	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

2. Metal Parts

WARNING: INCORRECT HANDLING OF A CHARGED O-RING BOTTLE FIRE EXTINGUISHER CAN CAUSE ACCIDENTAL DISCHARGE OF THE EXTINGUISHING AGENT AND POSSIBLE INJURY. DO NOT APPLY PRESSURE TO, OR INSERT ANYTHING INTO THE DISCHARGE BOSS. THE CLEANING SOLVENT IS FLAMMABLE AND AN IRRITANT TO THE EYES AND NOSE. USE SOLVENT ONLY IN A WELL VENTILATED AREA AWAY FROM OPEN FLAMES. IF EYES BECOME IRRITATED, FLUSH WITH WATER.

A. Clean all the metal parts with lint-free cloths and isopropyl alcohol (Table 401).

B. Dry all parts thoroughly with clean, lint-free cloths.

3. Weldment

A. Clean the inside of the weldment as follows:

(1) Pour 1/4 to 1/2 cup of isopropyl alcohol (Table 401) into the weldment.

(2) Shake the weldment in a circular movement, and drain the alcohol into a disposal container.

(3) Repeat the procedure until no further metal chips or filings are evident in the alcohol. Use a light probe (Table 401) and inspect the inside of the weldment.

(4) Heat an oven or heater (Table 401) 225°F to 250°F (107°C to 121°C). Heat the weldment for one hour or until completely dry.

B. Vapor hone unwanted discoloration from the outside of the weldment, as follows:

(1) Install the protective caps (Table 401).

(2) Cover the data plates with duct tape (Table 401).

(3) Vapor hone the weldment (wet or dry glass bead). Do not vapor hone the protected threads on the fill, discharge, and switch bosses.

(4) Remove the duct tape and protective caps, then clean the weldment completely (refer to paragraph 3.A above).

CHECK

1. Tools and Equipment

A. The recommended tools and equipment are given in Table 501.

NOTE: Equivalent items can be used.

Table 501. Check Tools and Equipment

Nomenclature	Part or Specification Number	Source (CAGE)*
Cradle, Fire Extinguisher	83000242	Pacific Scientific (05167)
Ground Strap and Circuit Tester	WT25	Walter G. Legge Co. (84832)
Light Probe	---	Commercially available
Power Supply or Battery, 30 VDC, 3.5 Amperes	---	Commercially available
Protective Caps		
Cartridge Cover	5/8-SC	CaPlugs (99017)
Cartridge Port	PD-50	CaPlugs (99017)
Cartridge Thread	1/2-SC	CaPlugs (99017)
Discharge Boss	PD-200	CaPlugs (99017)
Discharge Outlet End	CD-22	CaPlugs (99017)
Fill Boss	PD-40	CaPlugs (99017)
Fill Fitting End	CD-4	CaPlugs (99017)
Pressure Gauge Fitting	WW-O	CaPlugs (99017)
Pressure Switch Boss	PD-100	CaPlugs (99017)
Pressure Switch Connector	RC-14	CaPlugs (99017)
Pressure Switch Sleeve	31670509	Pacific Scientific (05167)
Safety Chamber, Cartridge	83330118	Pacific Scientific (05167)
Weighing Scale, ±0.01 pound (0,005 kg) 0 to 120 pounds (55 kg)	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

2. O-Ring Bottle Fire Extinguisher Weight Check

WARNING: INCORRECT HANDLING OF A CHARGED O-RING BOTTLE FIRE EXTINGUISHER CAN CAUSE ACCIDENTAL DISCHARGE OF THE EXTINGUISHING AGENT AND POSSIBLE INJURY. DO NOT APPLY PRESSURE TO, OR INSERT ANYTHING INTO THE DISCHARGE BOSS OR FILL FITTING.

A. Remove the protective caps (501).

B. Put the cradle (Table 501) on the weighing scale (Table 501). Adjust the weighing scale to zero.

C. Put the o-ring bottle fire extinguisher in the cradle.

D. Weigh the fire extinguisher. Record the weight to the nearest 0.01 pound (0,005 kg).

E. Compare the current weight of the fire extinguisher to the last weight etched on the identification plate or nameplate. Per the requirements above, if the fire extinguisher is more than 0.10 pound (0,05 kg) below the last recorded weight, test the fire extinguisher for leakage (refer to the Testing and Fault Isolation section, paragraph 2).

F. Install the protective caps (Table 501).

3. Container Weldment

A. Inspect the weldment for scratches or dents that could reduce its strength as a pressure vessel. Replace the weldment if the dents are deeper than 1/16 inch/inch (0,06 mm) of average dent diameter, or the scratches are deeper than 0.004 inch (0,10 mm) or longer than 2 inches (5,08 cm).

B. Inspect all welded joints for cracks, breaks, or tears, especially at the mounting lugs.

4. Discharge Outlet

A. Under strong light, and preferably under magnification, inspect the discharge outlet for cracks, corrosion, crossed threads, stripped threads, chafing, scoring, and any other damage that might decrease operation. Dark stains on inside surfaces, caused by previous firing of the cartridge, are acceptable. Replace the discharge outlets that are not acceptable.

5. Fill Fitting

A. Check the fill fitting. Replace the fill fitting if it is not acceptable.

6. Cartridge

WARNING: THE CARTRIDGE IS AN EXPLOSIVE DEVICE. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAP (10) AND SHUNT WIRE/CAUTION TAG (-15) MUST BE INSTALLED ON THE ELECTRICAL CONNECTOR (EXCEPT WHEN SPECIFIED IN THE PROCEDURE).

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 501). Test the ground circuit.

B. Verify the shunt wire/caution tag is connected between the positive and negative terminals of the cartridges.

C. Check the service date (month/year) etched on the wrench flats of the cartridges. Dispose of the cartridge (as specified in paragraph 7, below) if its service life or combined life (service and storage) exceeds the limits.

REQUIREMENT: THE CARTRIDGES HAS A MAXIMUM INSTALLED SERVICE LIFE OF 4 YEARS AND A COMBINED SERVICE/STORAGE LIFE OF 6 YEARS.

7. Cartridge Disposal

WARNING: THE CARTRIDGE MUST BE DETONATED IN A FIXTURE THAT GIVES PROTECTION FOR PERSONNEL. THE SAFETY CHAMBER IS DESIGNED FOR THIS PURPOSE.

A. Ground the safety chamber (Table 501). The ground strap must be connected and grounded.

B. Make sure that the shunt wire/caution tag is installed on the cartridge between the positive and negative terminals.

C. Cut the safety wire and remove the cartridge from the housing assembly. Refer to Disassembly Section, paragraph 2.D. Leave the o-ring installed on the cartridge.

D. Thread the cartridge, with the shunt wire/caution tag installed, tightly into the safety chamber (Table 501). See Figure 501.

E. Remove the shunt wire/caution tag and connect electrical wires terminated with alligator clips to the cartridge terminals.

F. Connect the wire leads to a 30 VDC power supply or battery (Table 501). Stand back five feet (1.5 meters) minimum, and close the switch to detonate the cartridge.

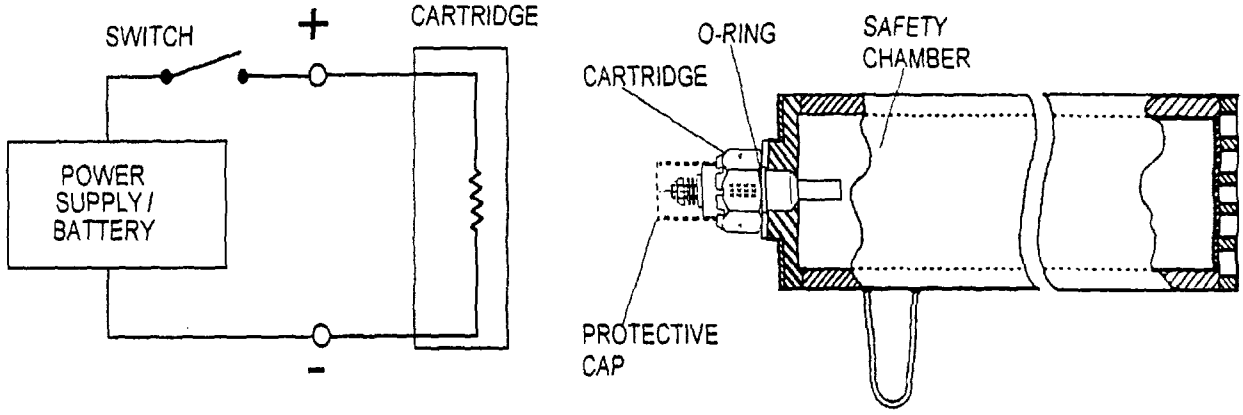

Figure 501. Cartridge Disposal Setup

8. Pressure Devices

A. Verify that the pressure device functional test has been successfully completed (refer to Testing and Fault Isolation section, paragraph 6).

THIS IS A BLANK PAGE

REPAIR

1. General

A. The repair instructions are limited to replacement of a damaged data plate, caution plate identification plate or nameplate. Refer to the Disassembly and Assembly sections to replace all other components.

B. The recommended tools and materials are given in Table 601.

NOTE: Equivalent items can be used.

Table 601. Repair Tools and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Adhesive, Epoxy	Scotchweld 1838 A/B	The 3M Company (04633)
Alcohol, Isopropyl	Federal Specification TT-I-735	Commercially available
Sandpaper, 240 grit	---	Commercially available

* Refer to the IPL, paragraph 2, for the address.

C. Repairs that require welding, except those covered in the Assembly section of this manual, are not permitted unless authorized in writing by Pacific Scientific Company.

D. After Pacific Scientific Company approval, repairs that require welding must be made in accordance with the latest FAA directives and under the supervision of a certified FAA mechanic with an airframe rating. If any doubt exists regarding penetration of the weld, inspect the welded part in accordance with MIL-STD-453.

2. Replacement of Bonded Plates

A. Copy the information from the old identification plate or nameplate to the new identification plate or nameplate.

B. Use 240 grit sandpaper (Table 601) to roughen the face of the old plates and the back of the new plate.

C. Clean the plate using isopropyl alcohol (Table 601). Let dry.

D. Mix the two-part epoxy adhesive (Table 601) 5 parts A to 4 parts B, until the adhesive has a uniform color.

NOTE: The working life of the adhesive is 60 minutes at 75°F (24°C).

E. Apply an even coat of adhesive to the plate, and press the new plate on the old plate from the center out.

F. Remove all excessive adhesive. Make sure the bond line around the plate is smooth and even. Fill any voids along the edge with adhesive.

G. Cure the adhesive for 12 hours at 75°F (24°C). Tape, clamps, or other devices can be used to hold the plate in place until the adhesive cures.

THIS IS A BLANK PAGE

ASSEMBLY (INCLUDING STORAGE)

1. General

A. This section contains the o-ring bottle fire extinguisher reassembly, refill, and storage instructions. Skip unnecessary steps if the o-ring bottle fire extinguisher is partially assembled.

NOTE: Refer to the Repair section, paragraph 2, to replace the data plate, caution plate, identification plate or nameplate.

B. The recommended tools and materials are given in Table 701.

NOTE: Equivalent items can be used.

Table 701. Assembly Tools and Materials

Nomenclature	Part or Specification Number	Source (CAGE)*

* Refer to the IPL, paragraph 2, for the address.

2. Pressure Devices

A. Pressure Gauge

(1) Put the fire extinguisher in the cradle with the gauge boss up. Wrap the pressure gauge thread with the thread tape (Table 701).

(2) Insert the pressure gauge inside the gauge guard on the weldment and screw the pressure gauge fitting into the gauge boss until finger tight.

(3) Using a wrench on the pressure gauge wrench flats, full tighten the pressure gauge in place.

B. Pressure Gauge and Switch

(1) Put the fire extinguisher in the cradle with the switch boss up.

(2) Insert the pressure gaugeinside the gauge guard on the weldment and screw the pressure gauge fitting into the port boss until finger tight.

(3) Using an 11/16 inch open end wrench (Table 701) on the gauge fitting flats, fully tighten the pressure gauge in place.

C. Pressure Switch and Gauge

(1) Put the fire extinguisher in the cradle with the switch gauge boss up.

(2) Install one of the retainers finger tight against the back of the pressure switch and and switch.

(3) Lubricate (Table 701) the o-rings, then install the o-ring, the other retainer, and the second o-ring on the pressure switch and gauge.

(4) Install the pressure switch and gauge finger tight into the switch boss. Orient the electrical connector as shown in Figure 701.

NOTE: Do not turn the pressure switch counterclockwise more than one turn.

(5) Torque the nut 90 to 100 inch-pounds (10 to 11 N·m). Install the safety wire (Table 701) per the specification MS33540.

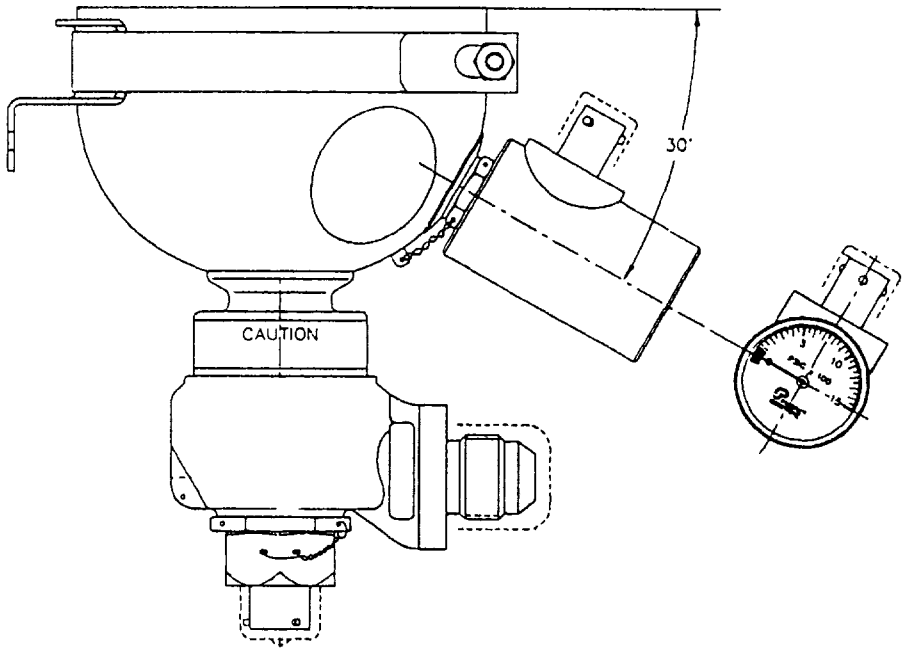

Figure 701. Pressure Switch and Gauge Orientation

D. Pressure Switch

(1) Attach the cradle to a rotary table on a machine tool (Table 701). Put the fire extinguisher in the cradle with the switch boss up.

(2) Clean all surfaces to be welded, the pressure switch and the switch boss. Refer to the Cleaning section, paragraph 2.A.

(3) Turn the pressure switch into the switch boss until tight. See Figure 702.

CAUTION: OVERHEATING THE PRESSURE SWITCH CAN DESTROY ITS PRESSURE SENSING ELEMENT.

(4) Attach a ground wire to the machine tool. Hold the electrode manually, and weld the pressure switch to the switch boss in six rapid pass sections. Cool the pressure switch with shop air to room temperature between each rapid pass section. Convection cooling can be used. Refer to Table 702 for the welding schedule.

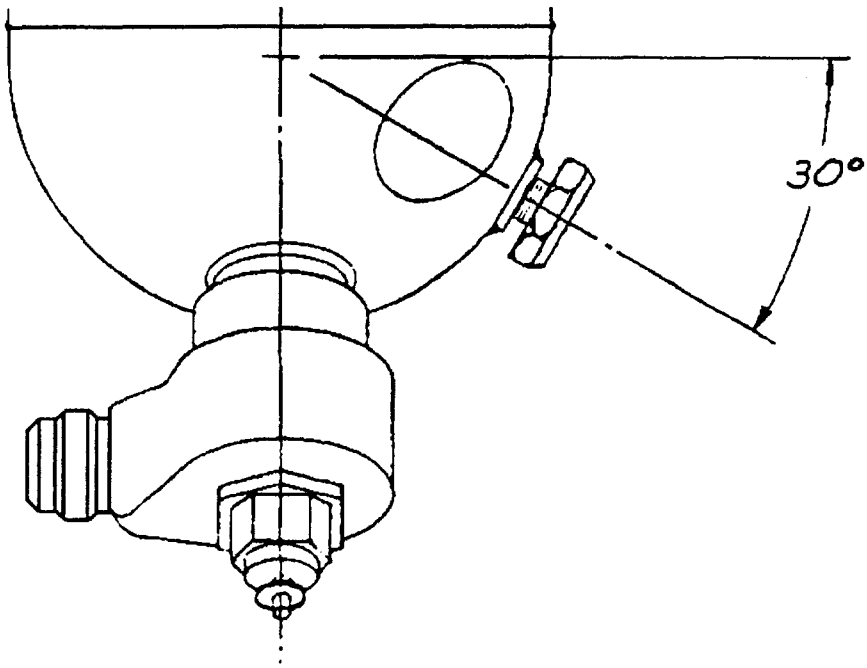

Figure 702. Pressure Switch Orientation

E. Temperature Compensated Pressure Switch

(1) Attach a cradle (Table 701) to a rotary table on a machine tool (Table 701). Put the fire extinguisher in the cradle with the switch boss up.

(2) Clean all surfaces to be welded, the temperature compensated pressure switch and the switch boss. Refer to the Cleaning section, paragraph 2.A.

(3) Turn the temperature compensated pressure switch into the switch boss until tight. See Figure 703.

CAUTION: OVERHEATING THE PRESSURE SWITCH CAN DESTROY ITS PRESSURE SENSING ELEMENT.

F. Attach a ground wire to the machine tool. Hold the electrode manually, and weld the temperature compensated pressure switch to the switch boss in six rapid pass sections. Cool the temperature compensated pressure switch to room temperature with shop air between each rapid pass section. Convection cooling can be used. Refer to Table 702 for the welding schedule.

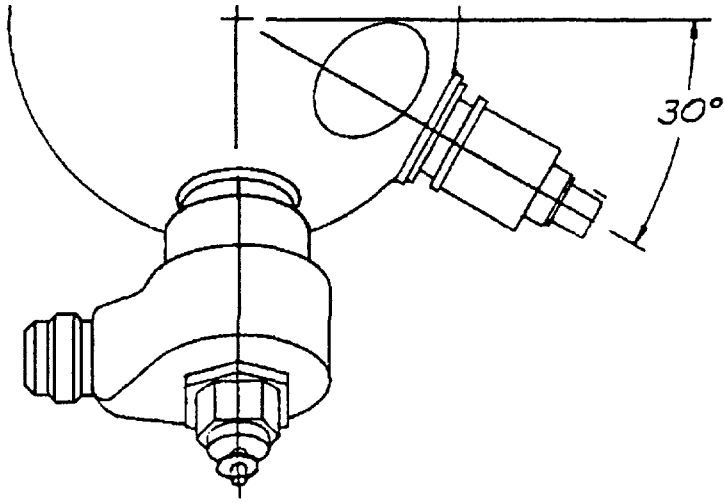

Figure 703. Temperature Compensated Pressure Switch Orientation

G. Specifications for welding the temperature compensated pressure switch are given in Table 702.

Table 702. Welding Schedule

Item	Characteristic
Argon Cup Size	1/4 inch (6,4 mm) ID
Argon Flow Rate	15 cfh (0,425 m^3/hr)
Current Setting	30 to 35 amperes for the temperature compensated pressure switch
Electrode	1/16 inch (1,6 mm) OD tungsten, ground to a sharp, tapered point
Electrode Gap	0.025 inch (0,64 mm)
Turntable Speed	2 rpm approximately (may be decreased down to 1.5 rpm or increased up to 3.5 rpm)

3. Discharge Outlet

A. Using lubricant (Table 701), lubricate the o-rings.

B. Install the o-rings on the valve plug. Position the valve plug in the discharge boss, screw the valve plug insertion tool (Table 701) into the discharge boss to seat the valve plug. Remove the valve plug insertion tool.

C. Install the o-ring on the stem. Lubricate the threads of the stem and install in the discharge boss. Using bar tool (Table 701), tighten the stem into the discharge boss.

D. Position the discharge outlet on the stem.

E. Install the o-ring on the housing assembly. Lubricate the threads of the housing assembly and install in the stem, torque 145 to 155 inch-pounds (16 to 18 N•m).

4. Fill Fitting

A. Using lubricant (Table 701), lubricate the o-rings.

B. Install the o-ring on the fusible or rupture disc valve.

C. Insert the fusible or rupture disc valve into the fill boss.

D. Install the o-ring on the fill fitting.

E. Install the fill fitting into the fill boss.

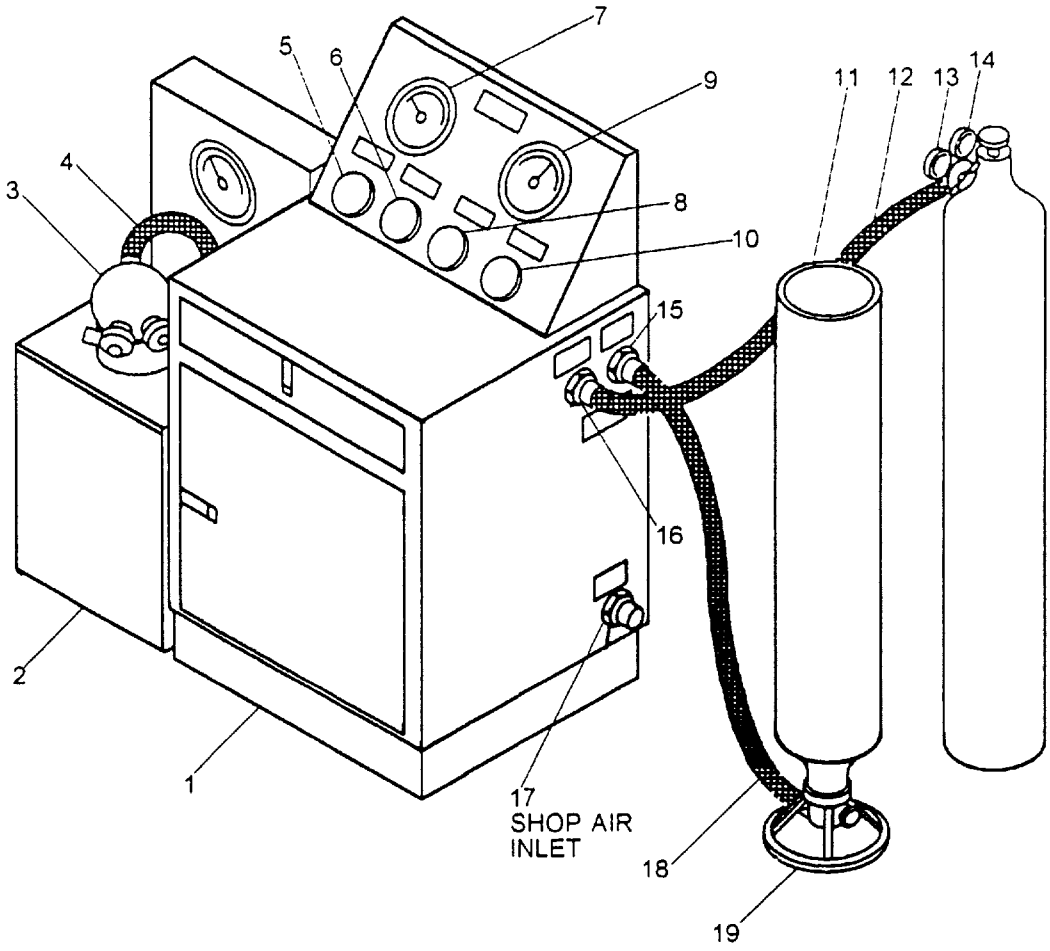
F. Torque the fill fitting 90 to 100 inch-pounds (10 to 11 N•m).

5. Extinguisher Recharge

NOTE: See Figure 704 to set up the recharge stand and related equipment. Write the recharge data on a copy of Table 703.

A. Put the cradle on the weighing scale (Table 701). Adjust the weighing scale to zero.

B. Put the fire extinguisher in the cradle. Write the weight in entry 1 of Table 703.



NOTE: Weigh the fire extinguisher with the cartridge, and shunt wire/caution tags on the weighing scale. Remove the protective caps (Table 701).

C. Thread the charging fixture onto the fill fitting.

D. Add entry 1 of Table 703 to the charge weight given in entry 3. Write the sum in entry 5. Add entry 1 to the charge weight given in entry 2 (refer to Description and Operation, Technical Properties). Write the sum in entry 3.

E. Open the manifold valve (6) and agent valve (10), to allow the fire extinguishing agent to flow from the tank (11) into the fire extinguisher. Do not move the fire extinguisher, cradle, or hose.

F. Close the agent valve (10) at the charge weight given in entry 3. Disconnect the charging fixture and charging hose (4). Write the weight of the filled fire extinguisher in entry 4.

Figure 704. Fire Extinguisher Refill Setup (Sheet 1 of 2)

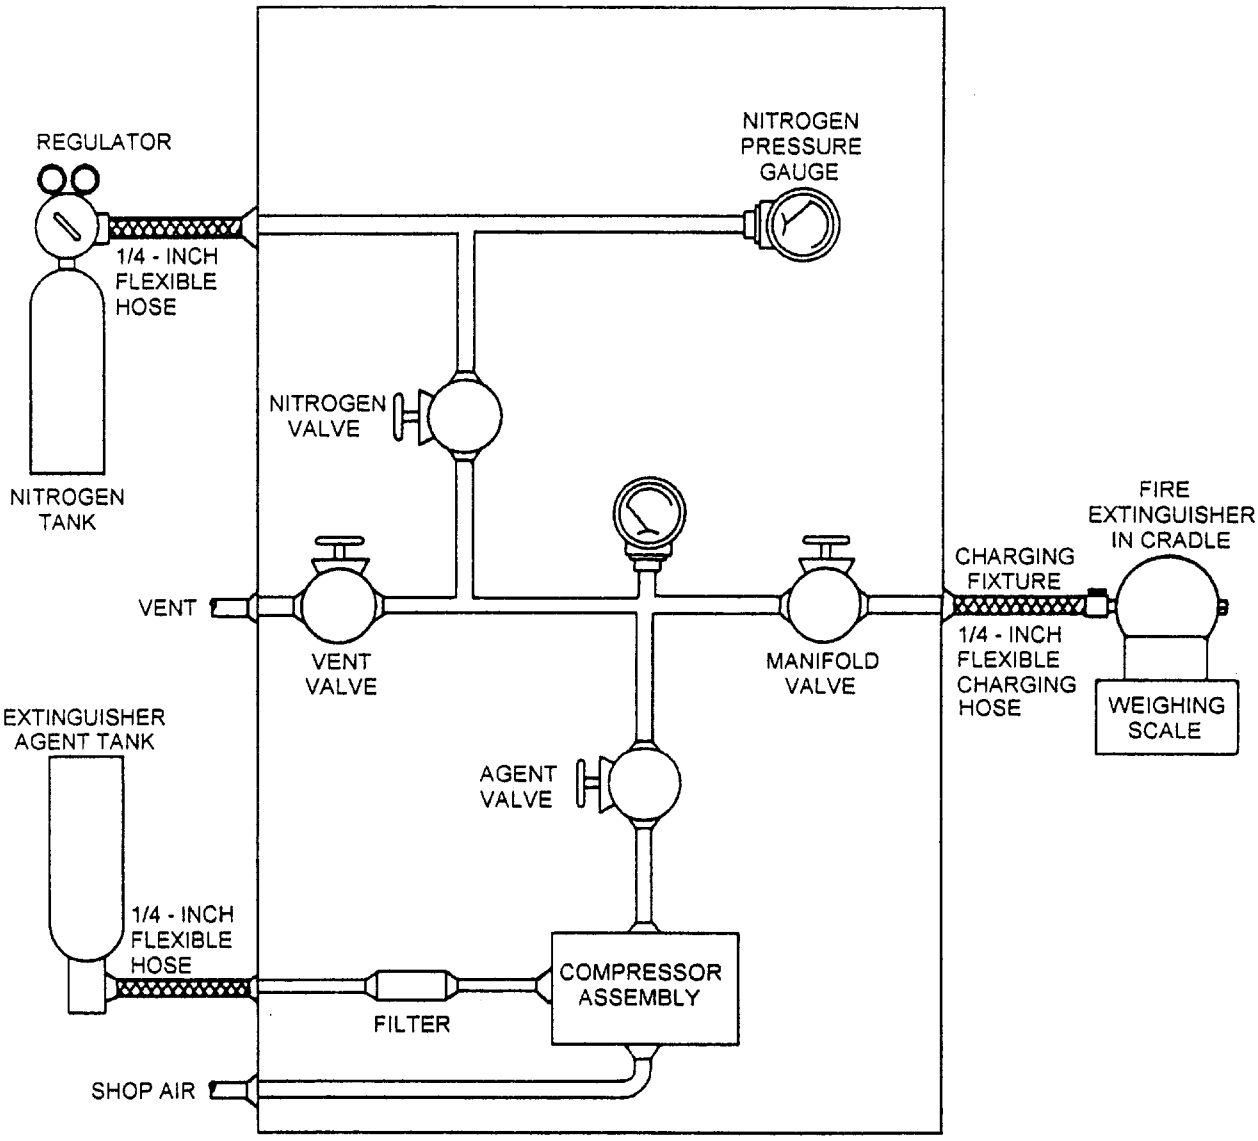

Figure 704. Fire Extinguisher Refill Setup (Sheet 2 of 2)

Table 703. Fire Extinguisher Refill Record

Part Number: _____ **Serial No:** _____	
Date of Refill: _____ **Pressure Switch Ser. No:** _____	
Weight Certified By: _____ **Hydrostatic Test Date:** _____	
Item	As Noted
1. Empty fire extinguisher on cradle (charging hose disconnected)	_____ pounds (kg) Actual
2. Required weight of extinguishing agent	Pounds (kg)
3. Desired fill weight of fire extinguisher on cradle (charging fixture and hose disconnected) (entry 1 plus entry 2)	_____ pounds (kg) (Calculated)
4. Fire extinguisher filled with extinguishing agent on cradle (charging fixture and hose disconnected)	_____ pounds (kg) (Actual. Must meet entry 3 requirement)
5. Thermocouple temperature	_____ °F (°C)
6. Required nitrogen charge pressure at thermocouple temperature	_____ Psig (kPag) Minimum _____ Psig (kPag) Maximum
7. Actual nitrogen charge pressure (from manifold gauge)	_____ Psig (kPag
8. Filled fire extinguisher on cradle after nitrogen charge (charging fixture and hose disconnected)	_____ pounds (kg)
9. Calculated nitrogen weight (subtract entry 4 from entry 10)	_____ pounds (kg) (Calculated)
10. Actual weight of filled fire extinguisher with the cartridges and without the protective caps (Table 701)	_____ pounds (kg)

G. Connect the charging hose (4) and the charging fixture to the fill fitting. Close the vent valve (5).

H. Write the thermocouple temperature in entry 5. Find the minimum and maximum nitrogen charge pressure from Table 704 through Table 710 for the thermocouple temperature recorded in entry 5 of Table 703. Write the minimum and maximum pressure in entry 6.

I. Adjust the regulator (13) on the nitrogen tank (14), using the nitrogen pressure gauge (9), to a pressure within the charge pressure range given in entry 6.

J. Open the nitrogen valve (8) and the charging fixture valve, then charge the fire extinguisher to the required pressure, as shown by the manifold pressure gauge (7, Figure 704).

K. Close the charging fixture valve. Hold the fire extinguisher at arm's length and pressure gauge facing away from body. Shake the fire extinguisher until the nitrogen charge pressure stabilizes. Write the actual charge pressure from the manifold pressure gauge (7) in entry 7. Add nitrogen, if necessary, to raise the pressure to the minimum required pressure, repeat until pressure is stabilized.

L. Close the nitrogen valve (8, Figure 704) and turn the fill fitting into the fill boss. Open the vent valve (5, Figure 701) and disconnect the charging fixture and charging hose (4).

M. Remove the fire extinguisher and the cradle from the weighing scale.

N. Check for leakage (refer to Testing and Fault Isolation section, paragraph 2).

O. Calculate the nitrogen charge weight. Write the result in entry 9.

P. Install the cartridges (refer to paragraph 6 below).

Q. Weigh the charged fire extinguisher (refer to Description and Operation, Technical Properties). Write the weight in entry 10.

R. Vibratech the charge weight (entry 10 of Table 703) and recharge date on the identification plate or nameplate. Do not use an impression or ink stamp.

Table 704. Nitrogen Charge Pressure Versus Temperature (300 to 325 psig)

Temperature (°F)	Pressure		Temperature (°F)	Pressure		Temperature (°F)	Pressure	
	Min	Max		Min	Max		Min	Max
60	272	292	74	315	335	88	363	383

NOTE: If the temperature is not in the table, use the higher temperature listed for the required pressure.

6. Cartridge and Thermal Relief Sensor

WARNING: THE CARTRIDGE IS AN EXPLOSIVE DEVICE. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAP AND SHUNT WIRE/ CAUTION TAG MUST BE INSTALLED ON THE ELECTRICAL CONNECTIONS.

A. Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 701). Test the ground circuit.

B. Make sure the protective cap and shunt wire/caution tag is installed on the cartridge between the positive and negative terminals.

C. Lubricate the o-ring (refer to Table 701). Install the o-ring on the cartridge.

D. Use the shim washers (refer to Table 701) (if needed) to insure the cartridge ground stud does not fall within the discharge area of the cartridge.

E. Install the cartridge in the housing assembly. Torque the cartridge 90 to 100 inch-pounds (10 to 11 N•m).

F. Install safety wire (Table 701) and connect the cartridge to the discharge outlet. Refer to MS33540.

G. Install thermal relief sensor and torque 90 to 100 inch-pounds (10 to 11 N•m).

H. Connect one leadwire of the thermal relief sensor to one leadwire of the housing assembly. Connect the remaining leadwire of the housing assembly to negative terminal of the cartridge. See Figure 1.

7. Storage Instructions

A. The recommended materials are given in Table 711.

NOTE: Equivalent items can be used

Table 711. Storage Materials

Nomenclature	Part or Specification Number	Source (CAGE)*
Cardboard Container 60 to 224 Cubic Inch 378 to 400 Cubic Inch 536 to 1050 Cubic Inch 1400 Cubic Inch	 12 inch x 12 inch x 12 inch (30 cm x 30 cm x 30 cm) 14 inch x 14 inch x 14 inch (36 cm x 36 cm x 36 cm) 18 inch x 18 inch x 18 inch (46 cm x 46 cm x 46 cm) 22 inch x 22 inch x 18 inch (56 cm x 56 cm x 36 cm)	Commercially available
Fibre Drum 1600 to 2500 Cubic Inch	23 inch dia, 26.5 inch high (58 cm dia, 67 cm high)	Commercially available
Packing Material	---	Commercially available
Plastic Bag	18 inch x 12 inch (45 cm x 30 cm)	Commercially available
Safety Bag, Heat Sealable, Electrostatic	22024509	Noland Paper Co. (OAZM2)
Wooden Box	Large enough for each cartridge, compartmented for multiple cartridges if required	User supply

* Refer to the IPL, paragraph 2, for the address.

B. Fire Extinguisher

NOTE: With protective cap and shunt wire/caution tag installed on the cartridge, it is safer to store the fire extinguisher with the cartridge installed in the discharge outlet.

(1) Install the protective caps (Table 701) on the discharge outlets. Make sure the shunt wire/caution tag is installed on the cartridge.

(2) Insert the fire extinguisher into a plastic bag (Table 711). Put the fire extinguisher in a cardboard container or fibre drum (Table 711). Fill the cardboard container or fibre drum with packing material (Table 711), as needed to prevent damage to the components.

(3) Write the fire extinguisher part number, date of last hydrostatic test, and overhaul date on the outside of the cardboard container or fibre drum. Also, write the cartridge part numbers and the dates of their Service/Storage Life.

(4) Attach the following warning/caution stickers to the outside of the cardboard container or fibre drum.

(a) Non-Flammable Gas

(b) Compressed Gases, N.O.S. (Bromotrifluoromethane, Nitrogen), UN1956

(c) Fragile - **DO NOT DROP**

(d) Storage temperatures are +40°F to +100°F (+4°C to +38°C).

C. Cartridge

WARNING: THE CARTRIDGE IS AN EXPLOSIVE DEVICE. ACCIDENTAL DETONATION OF A CARTRIDGE CAN CAUSE INJURY. FOR SAFE HANDLING, PERSONNEL MUST BE GROUNDED AND THE PROTECTIVE CAP AND THE SHUNT WIRE/CAUTION TAG MUST BE INSTALLED.

(1) Wind the ground strap around your wrist, and connect the strap to the circuit tester (Table 701). Test the ground circuit.

(2) Make sure the protective cap and shunt wire/caution tag is installed on the cartridge (5).

(3) Put the cartridge in an electrostatic safety bag (Table 711), then into a correctly sized wooden box (Table 711), and seal.

(4) Write the cartridge part number and the Service/Storage dates on the outside of the wooden box. Mark the wooden box with Pyrotechnic, UN0323.

(5) Storage temperatures are +40°F to +100°F (+4°C to +38°C).

FITS AND CLEARANCES

1. Torque Limits

A. Assembly torque limits are given in Table 801.

Table 801. Torque Limits

Nomenclature	Torque Range
Cartridge	90 to 100 inch-pounds (10 to 11 N·m)
Housing Assembly	145 to 155 inch-pounds (16 to 18 N·m)
Fill Fitting	95 to 105 inch-pounds (11 to 12 N·m)
Switch Gauge (Jam Nut)	210 to 230 inch-pounds (24 to 26 N·m)
Mounting Clamp (Nut)	30 to 35 inch-pounds (3 to 4 N·m)

THIS IS A BLANK PAGE

SPECIAL TOOLS, FIXTURES, AND TEST EQUIPMENT

1. Special Tools, Fixtures, and Equipment

A. The special tools, fixtures, and test equipment recommended for maintenance of the fire extinguishers are given in Table 901. See the IPL for the appropriate item numbers.

NOTE: Equivalent items can be used.

Table 901. Special Tools, Fixtures, and Equipment

Nomenclature	Part No.	Source (CAGE)*	Use
Bar Tool (4 inch length x 1/2 inch width x 1/8 inch thickness)	---	User furnish	To remove and install stem
Cap, Hydrotest	83330165	Pacific Scientific (05167)	To cap the discharge boss for the hydrostatic test
Digital Multimeter	79	John Fluke (89536)	To check the cartridges
Discharge Recovery Tool	59000059	Pacific Scientific (05167)	To connect the fire extinguisher to the recovery tank, and to depress the fusible valve in the fill fitting
Flat File			
Mill Smooth	---	Commercially available	To square the edge of the discharge boss
Second Cut	---	Commercially available	To deburr the discharge boss
Fitting, Hydrotest 0.750-16 UNJF Thread	---	Commercially available	To plug the fill boss for the hydrostatic test
Ground Strap & Circuit Tester	WT25	Walter G. Legge Co. (84832)	To ground the technicians for safe handling of the explosive cartridges
Halon Recovery Recycle System	A6-06-2000-75-0 (Model H 1301)	Neutronics Inc. (5R712)	To recover and recycle Halon
Hydrotest Test Stand	---	Commercially available	To pressurize the weldmentfor the hydrostatic test
Leak Detector	HLD 4000-310 Series C	Inficon (56507)	To check for leakage of the extinguishing agent

* Refer to the IPL, paragraph 2, for the address.

Table 901. Special Tools, Fixtures, and Equipment (Continued)

Nomenclature	Part No.	Source (CAGE)*	Use
Light Probe	---	Commercially available	To check the inside of the weldment for unwanted materials and damage
Magnet	83330001	Pacific Scientific (05167)	To verify the mulitimeter indicates no continuity, showing the switch contacts open on the pressure device
Oven or Heater 250°F (121°C)	---	Commercially available	To dry the weldment after the hydrostatic test and cleaning
Plug, Gauge Boss 1/4-18 NPT Thread	---	Commerically available	To plug the gauge boss for the hydrostatic test
Plug, Hydrotest	83330670-2	Pacific Scientific (05167)	To plug the hydrotest caps for the hydrostatic test
Plug, Switch Boss	MS51840-27	Commerically available	To plug the switch boss for the hydrostatic test
Power Supply or Battery 30 VDC, 3.5 Amperes	---	Commercially available	To detonate cartridges that have exceeded the maximum service and/or storage life
Protective Caps			To prevent contamination and damage
Cartridge Cover	5/8-SC	CaPlugs (99017)	
Cartridge Port	PD-50	CaPlugs (99017)	
Cartridge Thread	1/2-SC	CaPlugs (99017)	
Discharge Boss	PD-200	CaPlugs (99017)	
Discharge Outlet End	CD-22	CaPlugs (99017)	
Fill Boss	PD-40	CaPlugs (99017)	
Fill Fitting End	CD-4	CaPlugs (99017)	
Pressure Gauge Fitting	WW-O	CaPlugs (99017)	
Pressure Switch Boss	PD-100	CaPlugs (99017)	
Pressure Switch Connector	RC-14	CaPlugs (99017)	
Pressure Switch Sleeve	31670509	Pacific Scientific (05167)	

* Refer to the IPL, paragraph 2, for the address.

Table 901. Special Tools, Fixtures, and Equipment (Continued)

Nomenclature	Part No.	Source (CAGE)*	Use
Recharge Stand	8126300	Pacific Scientific (05167)	To fill the weldment with extinguishing agent and Nitrogen
Safety Chamber, Cartridge	83330118	Pacific Scientific (05167)	To safely enclose the cartridges for testing and for detonating before disposal
Stem Holding Tool	13254	Pacific Scientific (05167)	To hold the stem
Tank, Extinguishing Agent with Stand, 150 pounds (68 kg)	---	Commercially available	The extinguishing agent source for fire extinguisher recharge
Tank, Gaseous Nitrogen (GN_2) 2000 psig (13800 kPag)	---	Commercially available	The Nitrogen source for fire extinguisher recharge
Tank, Gaseous Nitrogen (GN_2) 1000 psig (6900 kPag)	---	Commercially available	The source for pressure tests
Tape, Foam Insulated (1/2" wide x 1/4" thick)	---	The 3M Company (04633)	To tape thermocouple to the fire extinguisher
Test Fitting, Banjo	59000015-1	Pacific Scientific (05167)	To connect the test plumbing to the pressure device
Test Fitting, 1/8-27 NPT	---	Pacific Scientific (05167)	To test the pressure device
Thermocouple	---	Commercially available	To test the temperature during recharge
Valve Plug Insertion Tool	13253	Pacific Scientific (05167)	To assemble the valve plugs
Weighing Scale, ±0.01 pound (0,005 kg) 0 to 120 pounds (55 kg)	---	Commercially available	To check the fire extinguisher charge weight and the recharge weight

* Refer to the IPL, paragraph 2, for the address.

Table 901. Special Tools, Fixtures, and Equipment (Continued)

Nomenclature	Part No.	Source (CAGE)*	Use
Wrench, Open End 5/8, 11/16, 1-1/4 inch	---	Commercially available	To remove and install the housing assembly, fill fitting, and pressure device

* Refer to the IPL, paragraph 2, for the address.

ILLUSTRATED PARTS LIST

1. Introduction

A. Purpose

(1) This section of the manual explains the components of an illustrated parts list (IPL). The actual exploded-view and detailed spare parts listing can be found in the 26-20-202 Supplements.

B. Guide to use of the IPL

(1) If the part number is not known:

(a) Find the part in the illustration for the IPL Figure.

(b) Note the item number assigned to the part.

(c) Refer to the parts list and find the item number in the **Fig & Item** column.

(2) If the part number is known:

(a) Refer to the parts list and find the part in the **Part Number** column.

(b) Note the figure number and item number assigned to the part.

(c) Refer to the illustration to find attaching hardware and related assembly parts.

2. Manufacturer Names and Address

A. The CAGE codes for the manufacturers of the parts, materials, special tools, and test equipment which may be referenced in this CMM are given below. The codes are taken from Cataloging Handbook H4/H8. The absence of a code in the **Nomenclature** column of the Detail Parts List means the part is manufactured or modified by the HTL/Kin-Tech Division of Pacific Scientific Company.

Code	Name and Address
OAZM2	Noland Paper Company 6600 Valley View Street Buena Park, California 90620 U.S.A.
03990	The ARO Corporation One ARO Center Bryan, Ohio 43506 U.S.A.
03964	Pennsylvania Scale Company 21 Graybill Road Leola, Pennsylvania 17540 U.S.A.
04633	The 3M Company Adhesives Coatings & Sealers Division 3M Center St. Paul, Minnesota 55101-1428 U.S.A.

Code	Name and Address
05167	Pacific Scientific Company HTL/Kin-Tech Division 1800 Highland Avenue Duarte, California 91010 U.S.A. Tel: (626) 359-9317 (626) 357-2102 FAX (626) 359-7013 SITA LAXPSCR
06186	DriLube Company 711 West Broadway Glendale, California 91204 U.S.A.
09669	Stanley Proto 1764 Oxford Street P.O. Box 5595, Terminal A London, Ontario, Canada N6A 4R6
10836	Greif Bros. Corp. Fibre Drum Division P.O. Box 398 Lindenhurst, New York 11767 U.S.A.
18675	Marking Methods Inc. 301 S. Raymond Ave. Alhambra, California 91803-1531 U.S.A.
3A054	McMaster-Carr Supply Co. 9630 Norwalk Blvd. Whittier, California 90670-2932 U.S.A. Tel: (562) 695-2449
5R712	Neutronics Inc. 456 Creameny Way Exton, Pennsylvania 19341-2532 U.S.A. Tel: (610) 524-8800 FAX (610) 524-8807
54636	Sherwin-Williams Company 101 Prospect Avenue N.W. Cleveland, Ohio 44115 U.S.A.
56507	Inficon, Leybold-Heraeus,Inc. 6500 Fly Road East Syracuse, New York 13057 U.S.A.
84832	Walter G. Legge Co., Inc 444 Central Avenue P.O. Box 591 Peekskill, New York 10566 U.S.A.
89536	John Fluke Mfg. Company 6920 Seaway Boulevard Everett, Washington 98206 U.S.A.
99017	Protective Closures Co., Inc. CaPlugs Division 2150 Elmwood Avenue Buffalo, New York 14207 U.S.A.

3. Explanation of Detail Parts List Entries

A. The Detail Parts List is arranged in general sequence of disassembly. The parts are illustrated in an exploded-view illustration and listed in the related parts list.

(1) **Fig & Item** Column

(a) The first number at the top of each **Fig & Item** column is the figure number of the corresponding illustration. The number given opposite each part number is the item number assigned to the part in the illustration.

(b) A dash (-) in front of an item number means the part is not illustrated.

(c) Alpha-variants A through Z (except I and O) are assigned to item numbers, when necessary to identify:

- Added parts
- Alternate parts
- Service bulletin modified parts

(2) **Part Number** Column

(a) This column contains the manufacturer's part number for each part, as modified to meet the requirements of ATA 200/2000. These modifications can include:

1 Removal of blank spaces and special characters, with the possible exception of dashes. Dashes are permitted only between numeric characters.

2 Insertion of a reference part number compatible with ATA 200/2000 if the manufacturer's part number exceeds 15 characters. In these cases, the manufacturer's part number is given in the **Nomenclature** column.

(3) **Nomenclature** Column

(a) This column contains descriptive nomenclature for each part, the manufacturer's CAGE code (if the part is not manufactured by Pacific Scientific Company, HTL/ Kin-Tech Division), part number (if longer than 15 characters or modified per ATA 200/2000), service bulletins affecting the part, and obsolete part numbers.

(b) The indenture system used in the **Nomenclature** column indicates the relationship of one part to another, as follows:

1 2 3
End Item or Major Assembly
ATTACHING PARTS
Attaching Parts for End Item or Major Assembly
* * *
. Detail Parts for End Item or Major Assembly
. Subassemblies
ATTACHING PARTS
. Attaching Parts for Subassemblies
* * *
. . Detail Parts for Subassemblies
ATTACHING PARTS
. . Attaching Parts for Detail Parts
* * *

(c) Assemblies, subassemblies, and detail parts subject to modification, deletion, addition, or replacement by an issued service bulletin, are annotated to indicate both pre- and post-service bulletin configurations. The term (PRE SB XXXX) in the **Nomenclature** column designates the original configuration, and the term (POST SB XXXX) identifies assemblies and parts after the modification has been completed.

(d) The terms defined below are used when applicable to indicate the interchangeability of parts.

Term	Abbreviation	Definition
Alternate	ALT	The listed part is alternate to, and interchangeable with, other parts within the same item number variant group or other item numbers if designated.
Superseded By	SUPSD BY	The part is replaced by and is not interchangeable with the item number designated in the notation.
Supersedes	SUPSDS	The part replaces and is not interchangeable with the item number designated in the notation.
Replaced By	REPLD BY	The part is replaced by and is interchangeable with the item number designated in the notation.
Replaces	REPLS	The part replaces and is interchangeable with the item number designated in the notation.

(4) **Eff Code** (Effectivity Code) Column

(a) This column contains effectivity codes (A, B, etc) to indicate the alternate models or configurations of the end item to which the parts apply. This column is left blank when the parts apply to all models or configurations, included in the parts list.

(5) **UPA** (Units Per Assembly) Column

(a) The quantity shown in this column represents the units required for one NHA or, when referring to attaching parts, the quantity to attach one such item. The abbreviation RF (reference) indicates that the end item assembly is listed for reference purposes.

DISCHARGE INDICATORS AND CONNECTORS

1. INTRODUCTION

A. This manual provides operational checkout and field maintenance instructions for the discharge indicators and connectors.

B. Verification

Testing and Fault Isolation - January 29, 1991
Disassembly - January 29, 1991
Assembly - January 29, 1991

2. DESCRIPTION AND OPERATION

A. Description and Operation.

System discharge indicators, which are either skin or panel mounted, are connected by tubing to extinguishing systems. When pressure in the system is sufficient to move the piston in the indicator against the force of the spring, a yellow disc is ejected from the face of the indicator to give a visual indication that the system has been discharged.

Thermal discharge indicators are skin mounted and are connected by tubing to the thermal relief ports of extinguisher containers or oxygen cylinders. Pressure in the tubing, caused by the relief of the container safety device, ejects a colored plastic disc from the face of the indicator, which then serves as an overboard discharge outlet for the container contents.

Overboard discharge connectors provide a means of attaching tubing to the thermal relief ports of fire extinguisher containers.

Table 1. Leading Particulars

PART NUMBER	OPERATING TEMPERATURE RANGE	OPERATING PRESSURE	THREADS

3. DISASSEMBLY

A. Part No. 800495, 802681, 841996, 843969, 844674 and 877493. (See Figure 1).

1. Remove split ring (5) and lift out disc and retainer assembly (10).

2. Remove retaining ring (15). Invert the indicator and pull the stem of piston (30) to allow the remaining components to drop out of body (40). Remove washer (20), spring (25), and preformed packing (35) from piston (30).

3. Remove nameplate (45) only if replacement is necessary.

B. Part No. 921937. (See Figure 1A).

1. If it was not removed in dismounting the indicator, remove mounting nut (25) from the indicator.

2. Remove split ring (5) and lift out disc and retainer assembly (10).

3. Pull adhesive-backed gasket (15) out of body and piston assembly (20). Further disassembly of this indicator is not possible.

C. Part No. 424074, 800964, 802504, 802642, 802682, 841520, 841995, 841997, 842203, 843787, 844458, 844673, 875578, 877292 or 877292-01, 922315. (See Figure 1B).

1. Remove split ring (5) and lift out disc (10) from body (15).

D. Part No. 800036, 802722, or 841556. (See Figure 1C).

1. Unscrew adapter (5) from connector (10).

E. Part No. 446398. (See Figure 1D).

1. Remove split ring (5) and lift out disc (10) from body (15).

4. CLEANING

1. Clean components of discharge indicators and connectors.
2. Clean all metallic parts using Chlorethene SM.
3. Dry with lint free cleaning cloth.

NOTE: Equivalent substitutes may be used for listed items.

Table 2. Cleaning and Assembly Materials

MATERIAL	PART NUMBER	SPECIFICATION/SOURCE
Cement	5141	Palm Bros. Decalcomania Co. Cincinnati, Ohio
Grease, Pneumatic, High Temperature		MIL-G-4343
Nitrogen		BB-N-411
Permatex No. 1		Loctite Corporation Automotive and Consumer Group Cleveland, OH
Chlorethene SM		Dow Corning Co.
Alcohol, Isopropyl		Commercial
Cleaning Cloth		CCC-C-46

5. INSPECTION/CHECK

A. Inspect and check components of system discharge indicators (Figure 1) as follows:

1. Check spring (25) for distortion and deformation. Inspect the mating surfaces of piston (30) and body (40) for scoring and wear. Check preformed packing (35) for wear and damage. Replace worn, damaged or deformed components.

B. Inspect and check components of outboard discharge indicators (Figure 1C) as follows:

1. Inspect the threads of adapter (5) and connector (10) for burring or damage. Deburr or replace damaged components.

6. REPAIR

A. Repair of the detail parts of the assemblies is not practical and is not recommended.

B. Replacement of Components

1. In system discharge indicators, replace preformed packing, disc and retainer assemblies and adhesive-backed gasket as applicable.

NOTE: If the indicator is located in the airplane wheel well, replacement disc Part No. 24429 is needed.

2. In thermal discharge indicators, replace disc.

7. ASSEMBLY

A. Part No. 800495, 802681, 841996, 843969, 844674 and 877493 (See Figure 1).

1. Apply grease per MIL-G-4343 to the wall of body (40) and to preformed packing (35).

2. Slip the preformed packing (35) into the external groove in piston (30) and insert both components into body (40).

3. Assemble spring (25) and washer (20) over the stem of piston (30).

4. Assemble retaining ring (15), making certain that it is properly seated in the groove in body (40).

5. Test assembly per paragraph 8.A before proceeding to step 6.

6. Assemble disc and retainer assembly (10) and split ring (5), making certain that the split ring is properly seated in the groove in body (40).

7. If nameplate (45) was removed in disassembly, use Chlorethene SM to clean the surface of the body (40) where the nameplate will be applied. Apply nameplate (45) as follows:

(a) Apply a thin coat of Palm Bros. Decalcomania Co., Cincinnati, Ohio, Cement No. 5141 to the body (40) surface and allow the cement to dry until it will adhere but not transfer to the finger when touched (approximately one to two minutes).

(b) Moisten the nameplate (45) in lukewarm water until it will slide off the backing, then slide it from the backing to the proper position on the body (40).

(c) Use a wet felt roller to roll the nameplate (45) until all water and air have been removed.

(d) Allow the cement to set for five minutes, then use alcohol to clean off the excess cement around the nameplate (45).

B. Part No. 921937. (See Figure 1A)

1. Prior to assembly, test body and piston assembly (Figure 1A, 20) per paragraph 8.B.

2. Assemble adhesive-backed gasket (15) to body and piston assembly (20) with the adhesive side against the body.

3. Assemble disc and retainer assembly (10) and split ring (5) to body and piston assembly (20). Make certain that the split ring is properly seated in the groove in the body and piston assembly.

4. Screw mounting nut (25) on the body and piston assembly (20).

C. Part No. 424074, 800964, 802504, 802642, 802682, 841520, 841995, 841997, 842203, 843787, 844458, 844673, 875578, 877292 or 877292-01, 878210, 922315. (See Figure 1B).

1. Assemble disc (10) and split ring (5) to body (15) making certain that the split ring is properly seated in the groove in the body.

D. Part No. 800036, 802722, or 841556. (See Figure 1C).

1. Apply Permatex No. 1 to the threads of adapter (5) and assemble the adapter to connector (10).

E. Part No. 446398. (See Figure 1D).

1. Assemble disc (10) and split ring (5) to body (15) making certain that the split ring is properly seated in the groove in the body.

8. TESTING

A. Test System Discharge Indicator, Part No. 800495, 802681, 841996, 843969, 844674 and 877493 as follows:

WARNING: PERSONNEL SHOULD BE PROTECTED TO PREVENT INJURY IN THE EVENT THAT THE PISTON SHOULD BE EJECTED FROM THE BODY.

WARNING: PERFORM THE FOLLOWING STEPS IN A PROOF BOOTH OR BEHIND A SUBSTANTIAL BARRICADE.

1. Apply 1800 psi (12411 kPa) air or nitrogen pressure to the inlet for 30 seconds. Check for failure of the retaining ring (15).

2. Apply 30 psi (207 kPa) air or nitrogen pressure to the inlet; check that piston (30) operates. Remove the pressure; check that spring (25) causes piston (30) to return to its original position.

3. Apply 30 psi (207 kPa) air or nitrogen pressure to the inlet and immerse the assembly in water. The maximum permissible leakage from the outlet is 1 cc/minute.

4. Dry assembly with air or nitrogen pressure not to exceed 30 psi (207 kPa).

B. Test System Discharge Indicator, Part No. 921937 as follows:

WARNING: PERSONNEL SHOULD BE PROTECTED TO PREVENT INJURY IN THE EVENT THAT THE PISTON SHOULD BE EJECTED FROM THE BODY.

WARNING: PERFORM THE FOLLOWING STEPS IN A PROOF BOOTH OR BEHIND A SUBSTANTIAL BARRICADE.

1. Apply 30 psi (207 kPa) air pressure to the inlet of body and piston assembly (20); check that the piston in the body and piston assembly operates. Remove the pressure; check that the piston returns to its original position.

2. Apply 30 psi (207 kPa) air pressure to the inlet body and piston assembly (20) and immerse the assembly in water. The maximum permissible leakage from the outlet is 1 cc/minute.

9. ILLUSTRATED PARTS LIST

A. Purpose

1. This section provides illustrations and parts breakdown of all parts of the assembly shown on the title page which can be disassembled, repaired or replaced and reassembled.

B. Explanation and Usage of Section

1. Assembly Order Indenture System

(a) The indenture system used in the parts list shows the relationship of one part to another. For a given item, the number of indentures depicts the relationship of the item to the next higher assembly as follows:

1 2 3 4
Assembly
Attaching parts for assembly
***
. Detail parts for assembly
. Subassembly
. Attaching parts for subassembly
***
. . Detail parts for subassembly
. . Sub-subassembly
. . Attaching parts for sub-subassembly
***
. . . Detail parts for sub-subassembly
(Included only if installation parts may be returned to shop as part of the assembly).

2. Effectivity Code

(a) Reference letters (A, B, C etc.) are assigned in the EFF CODE column to each top assembly. The reference letter of the applicable top assembly is also shown in the EFF CODE for each detail part and subassembly except that no reference letter is shown for detail parts and subassemblies used on all top assemblies.

3. Units Per Assembly

(a) The UNITS PER ASSY column shows the total number of units required per assembly, per subassembly, and per sub-subassembly, as applicable. For bulk items, the letters AR indicate "as required". The letters RF indicate the item is listed for reference purposes.

4. Parts Replacement Data

(a) The interchangeability relationship between parts is identified in the NOMENCLATURE column of the parts list. A list of the terms used to show interchangeability and their definitions is as follows:

TERM	PARTS LIST ABBREVIATION	DEFINITION
Optional	OPT	This part is optional to and interchangeable with other parts in the same item number variant group or other item number if designated.
Superseded by	SUPSD BY	The part in the part number column is replaced by and is not interchangeable with the item number shown in the notation.
Supersedes	SUPSDS	The part in the part number column replaces and is not interchangeable with the item number shown in the notation.
Replaced by	REPLD BY	The part in the part number column is replaced by and interchangeable with the item number shown in the notation.
Replaces	REPLS	The part in the part number column replaces and is interchangeable with the item number shown in the notation.

5. Service Bulletin Incorporation

(a) Except as indicated, the following assemblies, subassemblies and detail parts subject to modification, deletion, addition or replacement by an issued service bulletin are annotated to show both pre- and post- service bulletin configuration, and the term (PRE SB XXXX) in the NOMENCLATURE column designates the original configuration, and the term (POST SB XXXX) identifies assemblies and parts after the service bulletin modification has been completed.

(b) Subassemblies and detail parts used on assemblies bearing the pre- or post-service bulletin notation will not carry the same notation themselves if the use code(s) assigned to them clearly reflects their pre-or post-service bulletin status.

(c) Top assemblies subject to modification by a service bulletin without assignment of a new part number (no production equivalent of the modified assembly) are not annotated with pre-or post-service bulletin information.

6. Items Not Illustrated

(a) Items not illustrated are indicated by a dash (–) preceding the item number in the FIG & ITEM NO. column.

7. Alpha Variant Item Numbers

   (a) Alpha variants A-Z (except I and O) are assigned to existing item numbers when necessary to show:

      1 Added Items

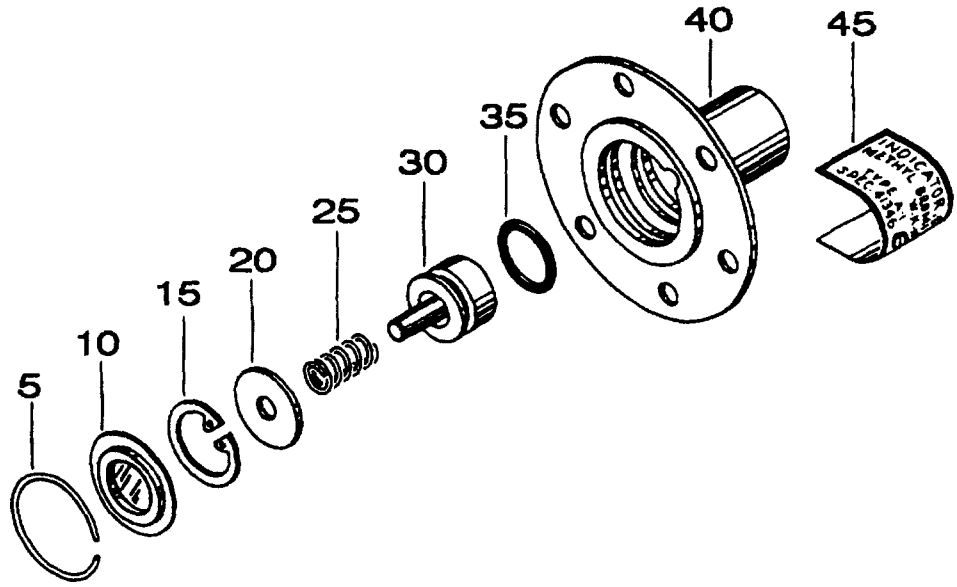
      2 Service bulletin modifications

      3 Configuration differences

      4 Optional parts

      5 Product improvement part (non-service bulletin)

   (b) Alpha variant item numbers are not shown on the exploded view when the appearance and location of the alpha variant item is the same as the basic item.



8. Parts Identification

   (a) When a standard part or another vendor's part number is shown in the PART NO. column, the vendor code, preceded by the letter "V", is shown following the item description in the NOMENCLATURE column. The Walter Kidde part number follows the vendor code. When requesting parts from Walter Kidde, use the Walter Kidde part number.

REVISION NO. 3 DATED SEP15/98

HIGHLIGHTS

This is a complete revision to the manual dated Nov 1/66, with Revision 2, dated Jan 15/73. The purpose of this revision is to improve the complete manual, add Service Bulletin 893229-26-374 data, and to update the Illustrated Parts List. Destroy all previous editions of the manual when you receive this revision.

Chapter/Section and Page No.	Description of Change	Effectivity
26-10-30		All
Title, Page T-1	Revised page date and revision level.	
Record of Revisions, Page RR-1	Entered this revision. Revised page date.	
Record of Temporary Revisions, Page RTR-1	Entered Temporary Revision No. 1. Revised page date.	
Service Bulletin List, Page SBL-1	Added SB 893229-26-374. Revised page date.	
List of Effective Pages, Page LEP-1	Revised to reflect added/changed pages. Revised page date.	
Introduction, Page INTRO-1	Added an introduction page.	
Table of Contents, Page T/C-1	Revised to show changed pages. Revised page date.	
Description and Operation, Pages 1 thru 4	Rewrote text in Simplified English. Revised control unit schematic. Revised page dates.	
Testing and Fault Isolation, Pages 4 thru 18	Added test equipment and materials table. Revised test set schematic. Added tables for test set parts, materials and vendors. Added insulation resistance test cable and test setups. Put test procedures in tables. Updated troubleshooting procedures and test voltage table. Added a control unit wiring diagram. Revised page dates.	
Disassembly, Pages 19 thru 21	Revised procedures and added materials table for disassembly. Revised page dates.	
Cleaning, Pages 22 and 23	Added procedures and materials. Revised page dates.	
Check, Pages 23 and 24	Added procedure. Revised page dates.	

Chapter/Section and Page No.	Description of Change	Effectivity
Assembly, Pages 26 thru 31	Revised procedures, added table for equipment and materials, added figure for evacuation and backfill setup. Revised page dates.	
Special Tools, Fixtures and Equipment, Page 31	Added Table 14 for necessary equipment. Revised page date.	
Illustrated Parts List, Pages 33 thru 45	Revised parts list to add effectivity codes to IPL Figure 1. Added IPL Figure 2. Added and deleted part numbers as necessary. Added part numbers 893229-0350-01, 893229-0450-01, and 893229-0500-01. Revised page dates.	

RECORD OF REVISIONS

Keep this record in the front of this manual. When you receive a revision, put the revised pages into the manual, and write the revision number and date. Then write the date you put the pages in and your initials in the area given below.

Component Board Assembly	IPL 2	40

INTRODUCTION

1. Introduction

   A. This manual gives the necessary maintenance instructions for the control unit.

   B. Section 1 gives control unit data and tells how it operates.

   C. Section 2 gives the instructions to do tests to make sure that the control unit operates satisfactorily and find the defective components.

   D. Section 3 is not used.

   E. Section 4 gives the procedures to disassemble the control unit.

   F. Section 5 gives the instructions and the materials to clean the control unit.

   G. Section 6 gives the inspection and check procedures to examine the condition of the control unit before and after maintenance or repairs are done.

   H. Section 7 gives the instructions to repair the control unit.

   I. Section 8 gives the procedures to assemble and do a leak test of the control unit.

   J. Section 9 is not used.

   K. Section 10 gives the special tools, fixtures and test equipment necessary for maintenance of the control unit.

   L. Section 11 is an illustrated parts list that gives the replacement parts and shows their location on the control unit.

2. Verification

   A. Testing and Fault Isolation - Sep 29/98 (Simulation)

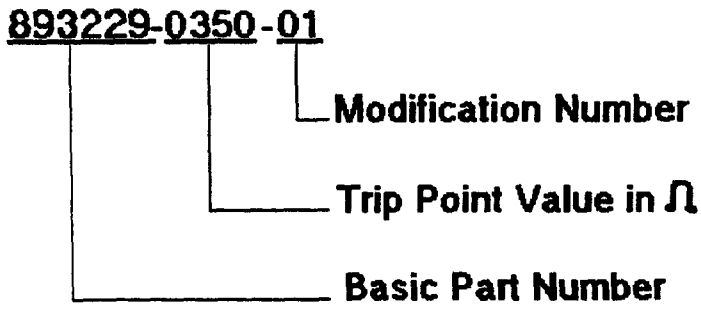
   B. Disassembly - Sep 29/98 (Simulation)

   C. Assembly - Sep 29/98 (Simulation)

1. DESCRIPTION AND OPERATION

A. Description

(1) The Fire Detecting System Control Unit, Continuous Type DC With Short Discriminator Circuit, Figure 1, is called Fire Detecting System Control Unit, control unit, or unit in the pages that follow. The control unit gives a fire warning if an overheat condition or a fire occurs. The unit continuously monitors the resistance of a heat-sensing thermistor element loop. The resistance of the element center conductor to ground decreases as its temperature increases. When the resistance decreases to an approximate specified value, as a result of an overheat condition or a fire, the control unit gives alarm signals to the related equipment.



Fire Detecting System Control Unit
Figure 1

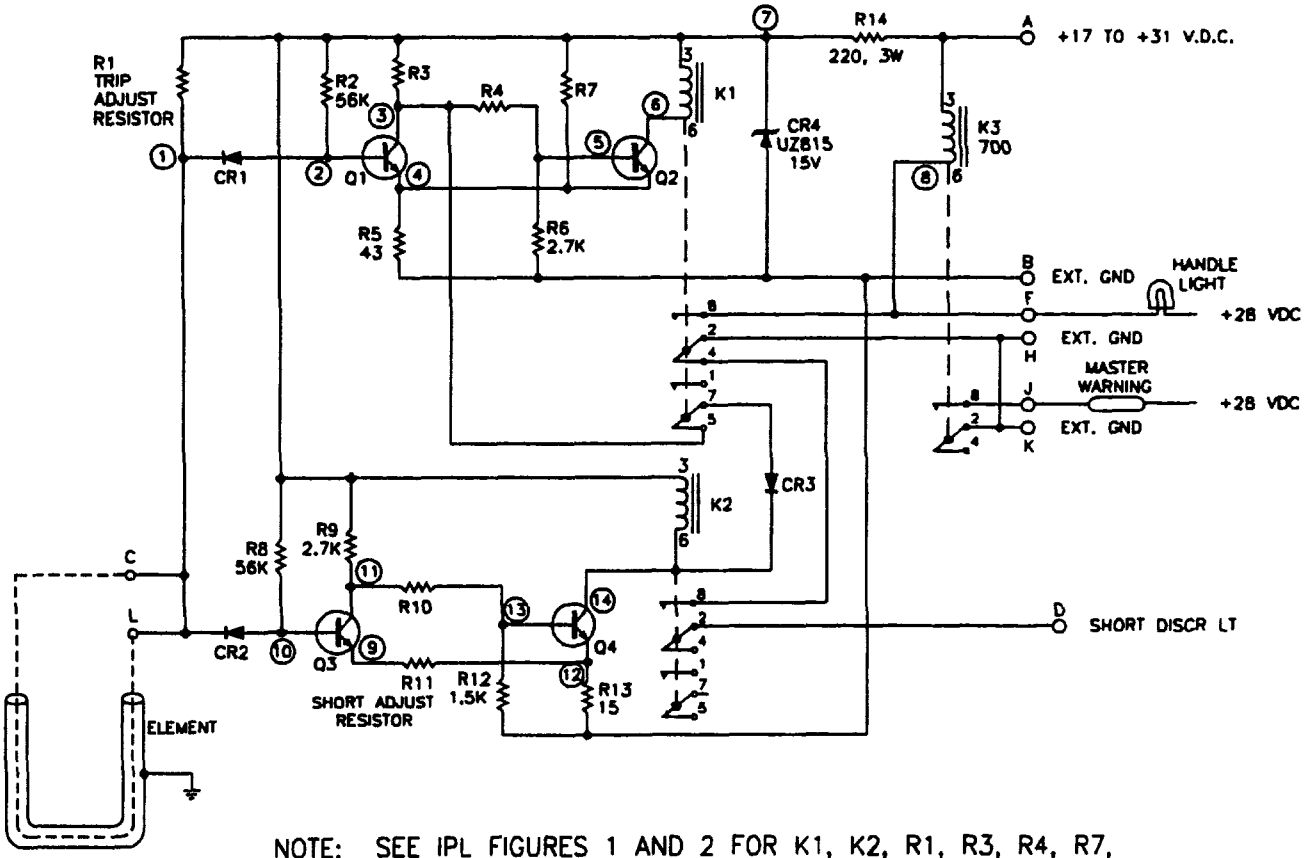
(2) The control unit is a hermetically sealed unit. It has a case with a cover assembly attached to it. A connector is installed in the cover assembly for electrical interface. Inside the control unit is a chassis with relays and a component board assembly installed on it. Electronic components are installed on the component board assembly. Wires are used to connect the electrical connector, relays, and component board assembly.

(3) The control unit can be set to operate at different resistance values for a different type or value of sensing element loop. The specified resistance (or fire trip-point) that the unit operates at is written on the unit nameplate in the

four numbers that follow the basic part number. If there is a modification to the control unit, two more numbers follow the specified trip resistance value. An example is shown below:

(4) Units manufactured before serial number 3618 used a 2.5 KΩ coil K1 and K2 relay. Units, serial number 3618 and subsequent (P/N 893229-XXXX-01) and units changed with Service Bulletin 893229-26-374 contain a 1.03 KΩ coil K1 and K2 relay because the relays with the 2.5KΩ coil were no longer available. The R3, R4, R7, and R10 resistor values changed to adjust for the lower resistance of the relay coil. In addition, transistors Q1 thru Q4 and diodes CR1 thru CR3 were changed. The transistors changed because the ones installed were difficult to get. The new transistors and diodes give a more stable alarm-trip-resistance over the complete temperature range for operation. The specified data for the control unit is given in Table 1.

Table 1. Specified Data



SPECIFIED ITEM/FUNCTION	DATA
Input Voltage Range	+17 to +31 VDC
Standby Power	2.6 Watts Max.
Alarm Power	4.0 Watts Max. (does not include indicators)
Fire Trip Value	Value given after basic part number in Ω; ± 5% at room temperature, ± 20% over ambient temperature operation range
Alarm Relay Contacts	2 Amps resistive
Ambient Temperature Range for Operation	-65°F to +160°F (-54°C to +71°C)
Electrical Connector	Cannon KH02-16-10PN-1
Electrical Interface Connector	Cannon K03-16-10SN
Control Unit Dimensions (approximate)	1.87 in. H x 3.08 in. W x 3.70 in. L (4.75 cm H x 7.82 cm W x 9.40 cm L)
Control Unit Weight	0.40 lb (0.18 kg) max.

B. Operation (See Figure 2)

(1) There are two circuits, that are almost the same, in the control unit. The two circuits operate from the same input signal. The circuits are the fire control circuit and the short discriminator circuit. The input circuit uses the external

sensing element and the fire trip-point adjustment resistor (R1) to make a voltage divider. The fire control circuit and the short discriminator circuit operate from the voltage that changes across the sensing element as its resistance changes.

(2) The fire control circuit contains transistors Q1, Q2, and the K1 relay coil. In the standby (usual) condition, the sensing element resistance is high which lets Q1 conduct (come on) which causes the voltage on the base of Q2 to be low. The low voltage on the base of Q2 keeps Q2 off which keeps K1 in the de-energized condition. The K1 alarm contacts in this condition are open. The other set of contacts are closed, which lets the short discriminator

NOTE: SEE IPL FIGURES 1 AND 2 FOR K1, K2, R1, R3, R4, R7, R10 AND R11 VALUES AND ALL COMPONENT TOLERANCES.

Control Unit Schematic Diagram
Figure 2

operate, if necessary. When the sensing element becomes hot, as in a fire, and the resistance of the element decreases to the fire trip-point value, diode CR1 begins to conduct (come on). This lowers the voltage on the base of Q1 and causes Q1 to not conduct (go off). With Q1 off, a high condition on the base of Q2 lets Q2 conduct (come on). When Q2 is on, it lets K1 energize and give the alarm signal through the closed alarm contacts. This lets the fire handle light come on, lets K3 energize, and gives the master fire warning. The other set of contacts open and stops the short discriminator operation. Diode CR3 does not let relay K2 energize when Q1 is on.

(3) The short discriminator circuit contains Q3 and Q4 and operates almost the same as the fire circuit except that when Q4 is on, it causes a heavy flow of current in the Q1 collector resistor, R3. This keeps Q2 off so that relay K1 cannot energize. When Q4 is on, it also keeps K2 energized which lets the short discriminator light come on through the K2 contacts. The short discriminator circuit is set to operate at approximately one half the resistance value of the fire trip circuit. If the sensing element resistance decreases from a shorted circuit and not from heat or a fire, the resistance decreases almost immediately. This causes the fire circuit and the short circuit to try to operate at the same time, since the resistance is below the two trip-point values. But, the small interval of time for the fire circuit relay to operate lets the short discriminator operate first. This stops the fire circuit operation, energizes relay K2, and lets the short discriminator light come on. If the shorted condition goes away, the short discriminator goes to the standby condition and lets the fire circuit operate again, if a fire condition occurs.

2. TESTING AND FAULT ISOLATION

A. General

(1) This section gives the procedures to do the tests and the data for troubleshooting that is necessary to find malfunctions in the control unit.

(2) You do the test with a test set that simulates operation of the control unit in an aircraft. An insulation resistance test is done after assembly to make sure the control unit wires and circuits do not have a shorted condition.

B. Test Equipment and Materials

(1) The test equipment and materials necessary to do the tests on the control unit are given in Table 2. You can use alternative equivalent items for those given in the table.

Table 2. Test Equipment and Materials

EQUIPMENT OR MATERIAL	RANGE	MANUFACTURER OR SOURCE
Power Supply, Regulated, Adjustable, Model LS30	+17-31 VDC, 1 amp min.	Electrostatics, Inc. (V34538)

Table 2. Test Equipment and Materials (Continued)

EQUIPMENT OR MATERIAL	RANGE	MANUFACTURER OR SOURCE
Helipot, 3400S-1-102 with CT-23 counting dial	0-1000Ω, ±3%	Bourns, Inc. (V32997)
Test Set, Functional	None	Make locally from Figure 3 and Table 3.
Multimeter, Fluke Model 77	100μ VDC to 1000 VDC, 20 KΩ/volt min., 0.1Ω to 20MΩ	Fluke (V89536)
Megohmmeter, Model L-12	10-1000VDC, 0.1-10KMΩ	Rosemount Analytical, Inc.(V30646)
Insulation-Resistance Test Cable		Make locally from Figure 4.
Resistance Substitution (Decade Box), Model 236a	0-1MΩ, ±1%	Phipps & Bird (V7T784)

C. Test Preparation

CAUTION: WHEN YOU TOUCH THE CONTROL UNIT OR COMPONENT BOARD ASSEMBLY, MAKE SURE YOU DO NOT APPLY A VOLTAGE HIGHER THAN THE MAXIMUM PERMITTED VOLTAGES TO DEVICES OR COMPONENTS IDENTIFIED AS ESD SENSITIVE. THESE DEVICES OR COMPONENTS ARE IDENTIFIED BY THE LETTERS (ESDS) THAT FOLLOW THE ITEM DATA IN THE ILLUSTRATED PARTS LIST NOMENCLATURE AREA.

(1) Make a test set from the schematic shown in Figure 3 and the parts given in Table 3.

(2) Make an insulation-resistance test cable as shown in Figure 4.

Table 3. Test Set Parts and Materials

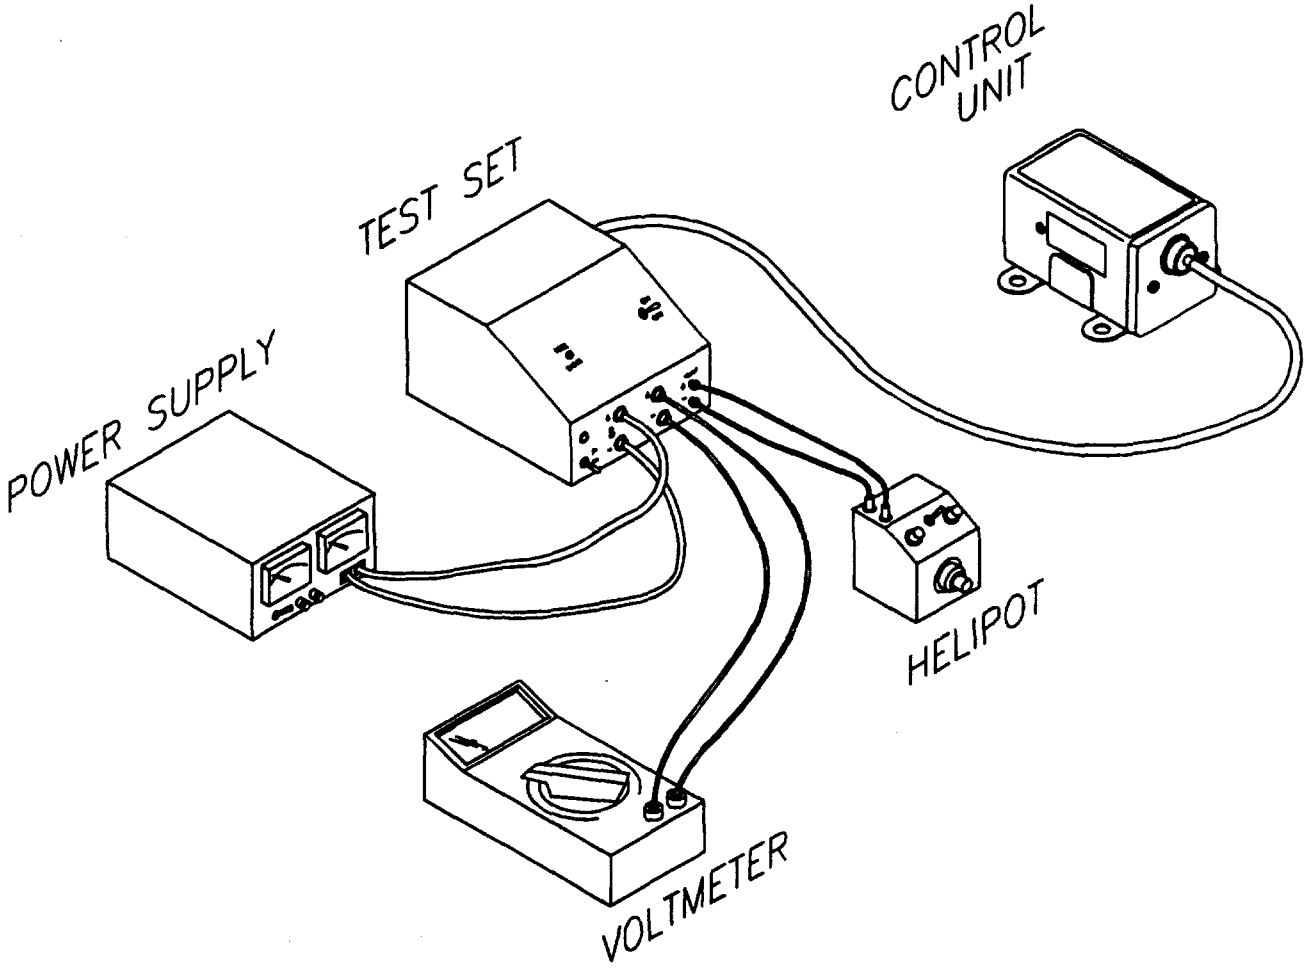
Functional Test Set Schematic
Figure 3

Insulation-Resistance Test Cable
Figure 4

D. Functional Test



(1) You must do the functional test to make sure the control unit operates correctly.

(2) Connect the test equipment as shown in Test Setup No. 1 (Figure 5). Initially, set all ON/OFF switches to OFF. Adjust the helipot to maximum resistance.

(3) Before you apply power to the power supply, make sure that the power switch in the test set is in the OFF position.

(4) Apply 28VDC to the test set with the control unit connected.

(5) Do the functional test in Table 5 at ambient room temperature.

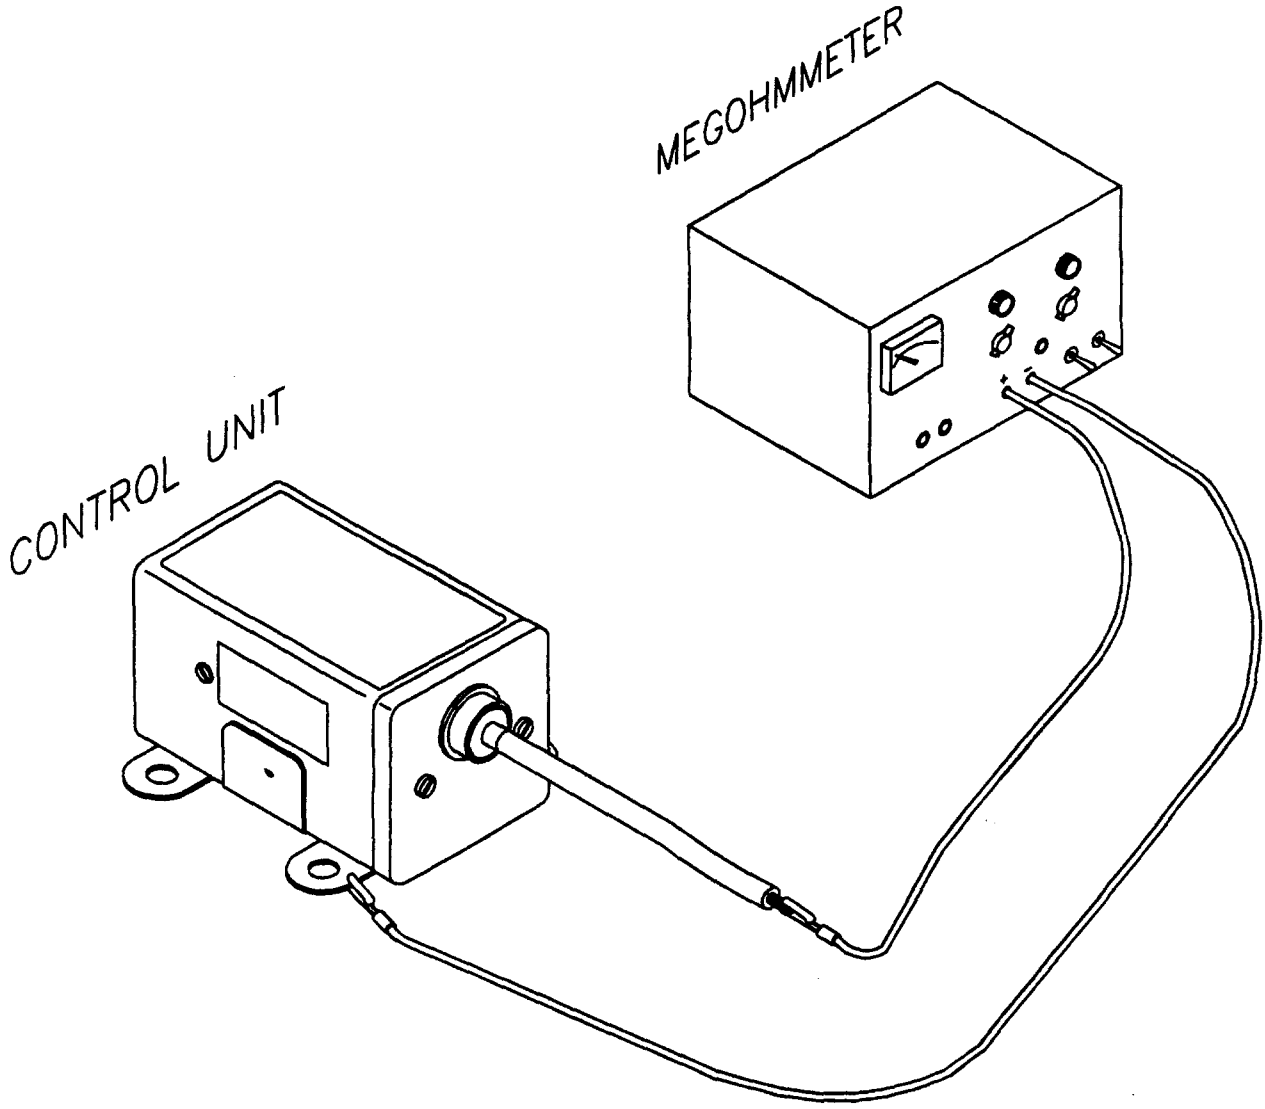
Test Setup No. 1
Figure 5

Table 5. Functional Test

Procedure		Specification	
Switch Pos.	Work Steps	Limits	Test Description
Test Setup No. 1	Do a test of the control unit.		Find if the control unit operates correctly with different conditions made with the test set.
On Test Set:			
S1-ON	Look at the test set power light.	ON	
	Adjust the helipot to maximum resistance.		
S2-ON	NOTE: You must turn the helipot slowly and stop when a light comes on or goes off to make sure of the precision of the helipot value.		
	Slowly decrease the helipot resistance value until the FIRE lights come on. Record the value of the helipot resistance where the lights came on.		This finds the fire trip-point value.
	Look at the control unit nameplate data and find the specified resistance value for the unit. The specified value is the 4 numbers (in ohms) that follow the part number.		
	Multiply the specified trip-point value by 0.05. Add and subtract this value from the specified trip-point value to find the upper and lower limit for the trip-point value. Record the trip-point limits.		
	Compare the helipot resistance where the FIRE lights came on to the trip-point limits.	Resistance must be in the limits.	
	Increase the helipot resistance until the FIRE lights go off. Record the helipot value.	Resistance must be less than 2 times the measured trip-point value.	This is the fire reset-point value.

Table 5. Functional Test (Continued)

Procedure		Specification	
Switch Pos.	Work Steps	Limits	Test Description
	Decrease the helipot resistance to 0.55 times the measured fire trip-point value.		
S2-OFF	Look at the FIRE lights.	OFF	
S2-ON	Look at the FIRE lights.	ON	
	Continue to decrease the helipot resistance while you intermittently open and close S2 until the SHORT light comes on. NOTE: The FIRE lights come on while the element switch S2 is on (closed) until the SHORT light comes on. Record the helipot value.	Resistance must be between 0.45 and 0.55 times the specified fire trip-point value.	This is the short discriminator trip-point value.
	Look at the FIRE lights.	OFF	NOTE: The FIRE lights and the SHORT light must not be on at the same time.
	Increase the helipot resistance until the SHORT light goes off. Record the helipot value.	Resistance must be less than 0.8 times the measured fire trip-point value.	This is the short discriminator reset point.
S2-OPEN S4-OFF S3-To the position for Unit Under Test	Look at the FIRE lights.	ON	This is the Fire Test function.
S3-OFF	Look at the FIRE lights.	OFF	
S4-ON	Look at the SHORT light.	ON	This is the Short Test function.
S4-OFF	Look at the SHORT light.	OFF	
Pwr Sup-Adjust to +17 VDC	Look at the voltmeter while you slowly adjust the power supply voltage from +17 to +31 VDC.	Voltmeter shows between +11 and +17.5 VDC and must not change more than 3 VDC.	This does a test of the control unit voltage regulation.
S1-OFF	End of test.		



(6) Set all switches to OFF after the test.

(7) If the functional test fails, use the procedures in Fault Isolation to do troubleshooting of the control unit. After you repair the control unit, do the functional test again.

E. Insulation Resistance Test

(1) When you have done a repair of the control unit wires or when the control unit has been disassembled and assembled again, do the insulation resistance test.

(2) Set up the test equipment as shown in Test Setup No. 2 (Figure 6).

Test Setup No. 2
Figure 6

(3) Do the insulation resistance test in Table 6.

Table 6. Insulation Resistance Test

Procedure		Specification	
Switch Pos.	Work Steps	Limits	Test Description
Test Setup No. 2	Do an insulation resistance test of the control unit.		Find if the control unit circuitry and wiring has a shorted circuit.
	Connect the insulation-resistance test cable to the control unit.		
	Connect the megohmmeter positive lead to the insulation-resistance test cable and the negative lead to the control unit bracket.		
On Meg-ohmmeter:			
Voltage-500VDC	Look at the megohmmeter resistance value.	Resistance reads 100MΩ minimum.	This does a test of the control unit for shorted circuits.
	Disconnect the megohmmeter and the insulation-resistance test cable from the control unit.		
	End of Insulation Resistance Test.		

F. Fault Isolation

CAUTION: WHEN YOU TOUCH THE CONTROL UNIT OR COMPONENT BOARD ASSEMBLY , MAKE SURE YOU DO NOT APPLY A VOLTAGE HIGHER THAN THE MAXIMUM PERMITTED VOLTAGES TO DEVICES OR COMPONENTS IDENTIFIED AS ESD SENSITIVE. THESE DEVICES OR COMPONENTS ARE IDENTIFIED BY THE LETTERS (ESDS) THAT FOLLOW THE ITEM DATA IN THE ILLUSTRATED PARTS LIST NOMENCLATURE AREA.

(1) Refer to DISASSEMBLY and disassemble the control unit as much as necessary to do troubleshooting.

(2) You can do troubleshooting of malfunctions if you measure the voltage values given in Table 7. Use the control unit schematic diagram, Figure 2, and Illustrated Parts List (IPL) Figure 2 to find the test point locations. Use a digi-

tal multimeter to measure the voltages. If a voltage is incorrect, do a test of the components related to the test point that is unsatisfactory.

(3) Use the wiring diagram shown in Figure 7 and a multimeter to do troubleshooting of wires in the control unit.

(4) When you do troubleshooting and repair a malfunction in the control unit, do the functional test again before you assemble the unit.

(5) Trip-point adjustment is necessary if the trip-point is not correct.

NOTE: A change in the fire trip-point resistor can cause a change in the short discriminator trip-point value. A change in the short discriminator trip-point value can cause a change in the fire trip-point value. Make sure you do a check of each function when a change is made.

(a) Make a selection of a fire trip-point resistor (R1) as follows:

1 Remove resistor R1 (IPL Figure 2, 70) and connect a decade box across the connections where R1 was removed.

2 Adjust the test set helipot to the specified fire trip value.

3 Set the test set S2 to OFF.

4 Adjust the decade box to approximately 5KΩ.

5 Set S2 to ON and slowly increase the decade box resistance until the FIRE lights come on. Record the decade box resistance where the lights came on.

6 Make a selection of a resistor (IPL Figure 2, 70 thru 94) nearest to the value of the decade box resistance and install for R1.

7 Do the Functional Test.

8 It is recommended that you do the Hot and Cold Test.

(b) Make a selection of a short discriminator trip-point resistor (R11) as follows:

1 Remove resistor R11 (IPL Figure 2, 20) and connect a decade box across the connections where R11 was removed.

2 Adjust the test set helipot to a value that is 0.5 times the fire trip-point resistance.

3 Set S2 to OFF.

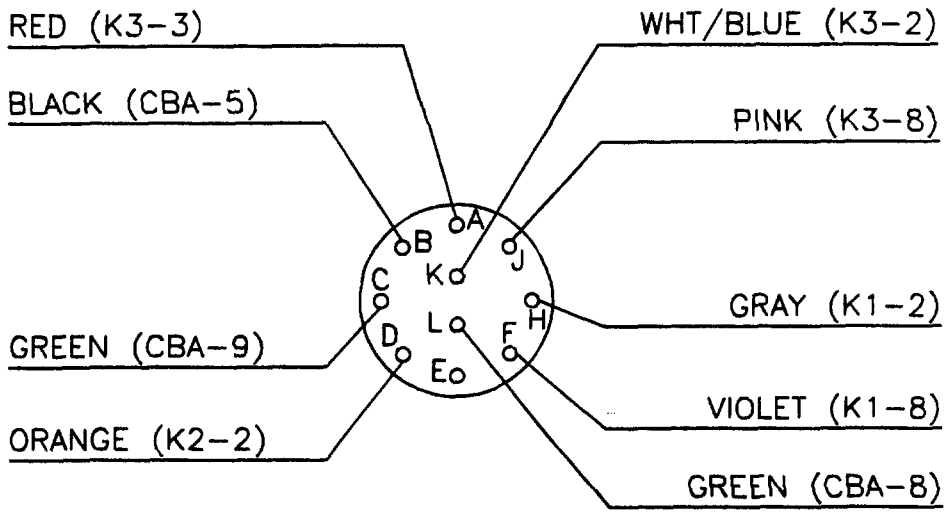
4 Adjust the decade box resistance to approximately 30Ω.

5 Set S2 to ON. The FIRE lights come on.

6 Set S2 intermittently to OFF and then ON, again and again, as you slowly increase the decade box resistance until the SHORT light comes on. Record the decade box resistance where the SHORT light came on.

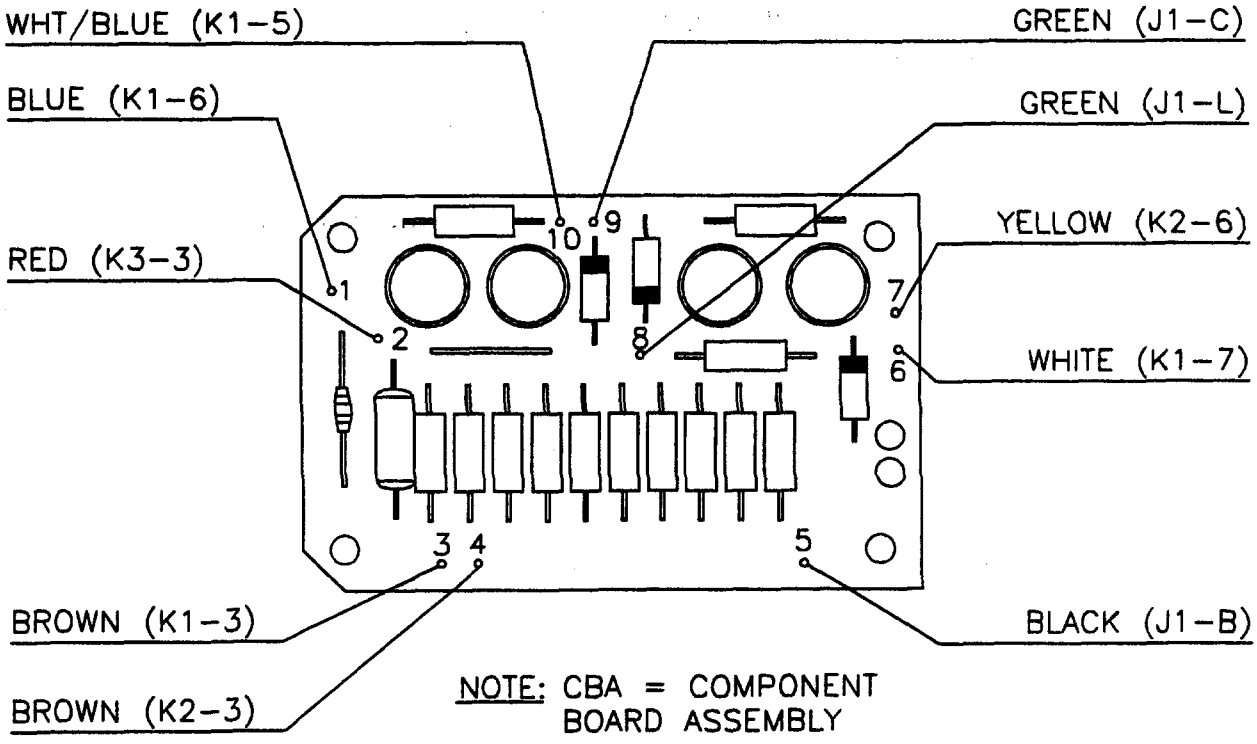
7 Make a selection of a resistor (IPL Figure 2, 20 thru 34) nearest to the value of the decade box resistance and install for R11.

8 Do the Functional Test.



9 It is recommended that you do the Hot and Cold Test.

G. Hot and Cold Test



(1) It is recommended that you do a hot and cold test of the control unit when a trip-point resistor has been replaced or when intermittent malfunctions occur. Do these tests as follows:

(a) Put the control unit in a temperature chamber set from 155 to 160°F (68 to 71°C) for 1 hour. Then do the Functional Test. The fire trip value must be the measured value plus or minus 0.2 times the measured value recorded in the functional test. The short trip value must be between 0.40 and 0.60 times the specified fire trip value and the short reset value must be not less than 0.80 times the specified fire trip value.

(b) Put the control unit in a temperature chamber set from -60 to -65°F (-51 to -54°C) for 1 hour. Then do the Functional Test. The fire trip value and short trip and reset value must be in the limits given in step (a) above.

INPUT VOLTAGE	HELIPOT VALUE	LIGHTS FIRE/SHORT	TEST POINTS						
			TP1	TP2	TP3	TP4	TP5	TP6	TP7
28 VDC	Infinite (Open)	OFF/OFF	11.6 to 17.4	0.89 to 1.41	0.86 to 1.34	0.4 to 0.6	0.136 to 0.144	11.6 to 17.4	11.6 to 17.4
28 VDC	Decreased to trip-point	ON/OFF	0.48 to 0.59	0.85 to 1.27	9.3 to 13.9	0.48 to 0.59	0.94 to 1.40	0.51 to 0.77	11.6 to 17.4
28 VDC	Decreased from trip-point to zero	ON/OFF	0	0.41 to 0.61	9.22 to 13.98	0.42 to 0.62	0.94 to 1.40	0.50 to 0.74	11.6 to 17.4
28 VDC	Shorted from maximum to zero	OFF/ON	0	0.41 to 0.61	0.84 to 1.26	0.2 to 0.3	0.17 to 0.25	11.6 to 17.4	11.6 to 17.4
INPUT VOLTAGE	HELIPOT VALUE	LIGHTS FIRE/SHORT	TEST POINTS						
			TP8	TP9	TP10	TP11	TP12	TP13	TP14
28 VDC	Infinite (Open)	OFF/OFF	22.4 to 28.0	0.28 to 0.42	0.82 to 1.22	0.4 to 0.6	0.09 to 0.13	0.08 to 0.12	11.6 to 17.4
28 VDC	Decreased to trip-point	ON/OFF	0	0.28 to 0.42	0.82 to 1.22	0.4 to 0.6	0.09 to 0.13	0.8 to 0.12	11.6 to 17.4
28 VDC	Decreased from trip-point to zero	ON/OFF	0	0.09 to 0.11	0.43 to 0.65	9.04 to 13.56	0.09 to 0.11	0.62 to 0.92	0.184 to 0.276
28 VDC	Shorted from maximum to zero	OFF/ON	22.4 to 28.0	0.044 to 0.216	0.43 to 0.65	9.04 to 13.56	0.152 to 0.228	0.70 to 1.04	0.288 to 0.432

NOTE: Values are in volts D.C. Measure from the test point to ground.

3. AUTOMATIC TEST REQUIREMENTS (ATLAS)

A. Not Applicable.

4. DISASSEMBLY

A. General

(1) This section gives the disassembly procedure for the control unit. Table 8 gives the necessary materials and equipment.

NOTE: Equivalent alternatives can be used for given items.

Table 8. Disassembly Materials and Equipment

MATERIAL AND EQUIPMENT	PART NO./ SPECIFICATION	SOURCE
Thinner, Cellulose Acetate	TT-T-266	Commercial
Air Source, Low Pressure, 30 psig (207 kPa) max.		Make Locally
Brush, Wire		Commercial
Soldering Iron, 250 watt, Broad Tip		Commercial
Soldering Iron, 40 watt, Fine Tip		Commercial
Torch, Propane		Commercial

NOTE: All equipment and materials are commercially available; thus specified vendors are not given.

CAUTION: WHEN YOU TOUCH THE CONTROL UNIT OR COMPONENT BOARD ASSEMBLY, MAKE SURE YOU DO NOT APPLY A VOLTAGE HIGHER THAN THE MAXIMUM PERMITTED VOLTAGES TO DEVICES OR COMPONENTS IDENTIFIED AS ESD SENSITIVE. THESE DEVICES OR COMPONENTS ARE IDENTIFIED BY THE LETTERS (ESDS) THAT FOLLOW THE ITEM DATA IN THE ILLUSTRATED PARTS LIST NOMENCLATURE AREA.

(2) Do a visual inspection of the external area of the control unit. Refer to CHECK, in Section 6.

(3) When the visual inspection is complete, do a functional test of the control unit as given in TESTING AND FAULT ISOLATION. The control unit is hermetically sealed with solder. Open the control unit only when necessary to do troubleshooting and repair. If the unit has a malfunction, refer to TESTING AND FAULT ISOLATION section to find the cause of the malfunction and make a decision for the level of disassembly necessary. Do a functional test after each repair or replacement to make sure the control unit operates correctly.

B. How to remove the seal and open the control unit (See IPL Figure 1).

NOTE: Disassemble only to the level necessary to make repairs.

(1) Remove the seal and open the control unit as follows:

(a) Record the data from the nameplate (IPL Figure 1, 20) on a tag.

(b) Remove the patent plate (25), ESD nameplate (30), and nameplate (20) from the case assembly (5).

WARNING: PAINT THINNER IS HIGHLY FLAMMABLE. DO NOT USE NEAR HEAT OR OPEN FLAME. USE IN AN AREA THAT HAS A GOOD AIRFLOW.

(c) Soak the control unit in thinner (Specification TT-T-266) to make the paint soft for removal.

(d) Use a wire brush to remove the paint and then flush with clean water.

WARNING: BE CAREFUL WHEN YOU USE COMPRESSED AIR OR GAS. ALWAYS POINT THE FLOW AWAY FROM PERSONS. COMPRESSED GAS AND MATERIAL MOVED BY THE GAS PRESSURE CAN CAUSE BAD INJURIES.

(e) Use compressed nitrogen or dry air at a maximum pressure of 15 psig (103 kPa) to dry the control unit.

(f) After paint removal is complete, temporarily attach the tag with data to the control unit.

(g) Put the control unit in a bench vise so that you can get to all the screws (40).

CAUTION: WHEN YOU REMOVE SOLDER FROM THE CASE ASSEMBLY AND THE COVER ASSEMBLY, ONLY APPLY AS MUCH HEAT AS NECESSARY TO PREVENT DAMAGE TO THE ELECTRICAL COMPONENTS. DO NOT APPLY TOO MUCH PRESSURE WITH THE VISE OR THE CASE CAN BEND AND CAUSE THE SIDES TO TOUCH THE CIRCUITS.

(h) Use a hand-held propane torch or a 250 watt soldering iron to melt the solder from the screw (40) heads. While the solder is melted, remove only the screws (40) from the case assembly (5).

(i) Melt the solder that seals the cover assembly (15) to the case assembly (5) with the torch or soldering iron.

(j) Loosen the cover assembly (15) from the case assembly (5).

NOTE: You can use a block made of phenolic to apply pressure between the case and cover to help loosen the assembly.

(k) Remove the chassis assembly (35) and cover assembly (15) from the case assembly (5).

(l) Cut off the sealed part of the exhaust tube (10) so that there is no flange.

(m)Melt the solder that seals the exhaust tube (10) to the case assembly (5).

(n) Remove and discard the exhaust tube (10).

C. Chassis Assembly Removal

(1) Remove the chassis assembly (35) as follows:

(a) Remove the two screws (40) that hold the cover assembly (15) to the chassis assembly (35). Melt the solder, if necessary.

CAUTION: IN THE PROCEDURE THAT FOLLOWS, THE CASE ASSEMBLY IS ATTACHED TO THE COVER ASSEMBLY BY ONLY THE WIRES. TO MAKE SURE THE WIRES DO NOT BREAK, DO NOT BEND OR TWIST THE WIRES CONNECTED TO THE ASSEMBLIES.

(b) Remove the four screws (115), lock washers (120), and flat washers (125) that attach the component board assembly (110) and insulator (105) to the chassis assembly(35).

(c) Remove the two screws (60), flat washers (65), lock washers (70), and nuts (75) that attach the relays (55) to the chassis assembly (35).

(d) Remove the two screws (85), flat washers (90), lock washers (95), and nuts (100) that attach the relay (80) to the chassis assembly (35).

(e) Remove unwanted solder from the cover assembly (15), refer to CLEANING.

NOTE: More disassembly is necessary only for replacement of parts or components found defective during visual inspection and/or from malfunctions found when you do a test or troubleshooting. Refer to CHECK and TESTING AND FAULT ISOLATION.

5. CLEANING

A. General

(1) This section gives the procedures and materials necessary to clean the control unit.

B. Materials

(1) The materials necessary to clean the control unit are given in Table 9. You can use alternative equivalents for the items given.

Table 9. Cleaning Materials

MATERIAL	PART NO./ SPECIFICATION	SOURCE
Brush, Acid	H-B-643	Commercial
Alcohol, Isopropyl		Commercial
Envi-Ro-Tech 1676		Tech Spray, Inc. P.O. Box 949 Amarillo, TX (V54700)
Nitrogen or Clean, Dry Air	BB-N-411	Commercial

C. Procedure

WARNING: CLEAN WITH SOLVENTS IN AN AREA THAT HAS A GOOD AIRFLOW. DO NOT CLEAN NEAR HEAT OR OPEN FLAME BECAUSE IT IS DANGEROUS.

CAUTION: WHEN YOU TOUCH THE CONTROL UNIT OR COMPONENT BOARD ASSEMBLY, MAKE SURE YOU DO NOT APPLY A VOLTAGE HIGHER THAN THE MAXIMUM PERMITTED VOLTAGES TO DEVICES OR COMPONENTS IDENTIFIED AS ESD SENSITIVE. THESE DEVICES OR COMPONENTS ARE IDENTIFIED BY THE LETTERS (ESDS) THAT FOLLOW THE ITEM DATA IN THE ILLUSTRATED PARTS LIST NOMENCLATURE AREA.

(1) Clean the connector, component board assembly , or internal parts of the control unit as follows:

(a) Use alcohol or Envi-Ro-Tech 1676 with an acid brush to clean the connector pins or components.

WARNING: BE CAREFUL WHEN YOU USE COMPRESSED AIR OR GAS. ALWAYS POINT THE FLOW AWAY FROM PERSONS. COMPRESSED GAS AND MATERIAL MOVED BY THE GAS PRESSURE CAN CAUSE BAD INJURIES.

(b) Use compressed nitrogen or dry air at a maximum pressure of 15 psig (103 kPa) to dry the connector, component board assembly, or other parts to remove unwanted materials.

(2) Remove all remaining unwanted solder.

(3) Use a soldering iron to melt and remove unwanted solder from the inside of the cover assembly (15) and the case assembly (5).

(4) When you have cleaned the control unit, put an ESD protection cap (CEC-16) on the connector.

6. CHECK

A. General

(1) This section gives the inspections necessary to find the condition of the control unit before and after disassembly, repairs, and assembly.

B. Inspection

CAUTION: WHEN YOU TOUCH THE CONTROL UNIT OR COMPONENT BOARD ASSEMBLY, MAKE SURE YOU DO NOT APPLY A VOLTAGE HIGHER THAN THE MAXIMUM PERMITTED VOLTAGES TO DEVICES OR COMPONENTS IDENTIFIED AS ESD SENSITIVE. THESE DEVICES OR COMPONENTS ARE IDENTIFIED BY THE LETTERS (ESDS) THAT FOLLOW THE ITEM DATA IN THE ILLUSTRATED PARTS LIST NOMENCLATURE AREA.

(1) External Inspection Before Disassembly and After Assembly

(a) Examine the connector on the cover assembly (15) for signs of damage such as bent or broken pins. If pins are lightly bent, make them straight with a pin that engages correctly with them. If pins are badly bent or broken, replace the cover assembly (15).

(b) Examine the case assembly (5) for bends, large dents and damage. Repair or replace as necessary.

(c) Make sure that all hardware is in position and tightened.

(2) Internal Inspection

(a) Examine all components for damage, and all solder connections for loose or cold solder joints. Repair or replace as necessary.

(b) Examine the wires for breaks, cracks in the insulation, burned areas or damaged sleeving. Repair or replace as necessary.

(c) Make sure that all unwanted solder has been removed. If not, remove as necessary.

7. REPAIR

A. General

(1) This section gives procedures to do repairs on the control unit.

(2) Materials and equipment that are necessary to make repairs on the control unit are given in Table 10. You can use alternative equivalents for the items given.

Table 10. Repair Materials and Equipment

MATERIALS AND EQUIPMENT	PART NO./ SPECIFICATION	SOURCE
Soldering Iron, Fine Tip, 40 watt		Commercial
Wire Stripper, Thermal		Commercial
Solder, SN60	QQ-S-571	Commercial
Tape, Lacing, Waxed Nylon	MIL-T-43435	Gudebrod, Inc. 33 W. Hawthorne Ave. Valley Stream, NY 11580 (V1B372)
Enamel, Red Glyptal	MIL-E-22118	Glyptal Inc. Chelsea, MA 02150-3344 (V65313)
Sleeving, Teflon	MIL-I-22129 or ASTM D 3295	Commercial
Wire, No. 22	MIL-W-16878, Type E	Commercial

B. Procedure

CAUTION: WHEN YOU TOUCH THE CONTROL UNIT OR COMPONENT BOARD ASSEMBLY, MAKE SURE YOU DO NOT APPLY A VOLTAGE HIGHER THAN THE MAXIMUM PERMITTED VOLTAGES TO DEVICES OR COMPONENTS IDENTIFIED AS ESD SENSITIVE. THESE DEVICES OR COMPONENTS ARE IDENTIFIED BY THE LETTERS (ESDS) THAT FOLLOW THE ITEM DATA IN THE ILLUSTRATED PARTS LIST NOMENCLATURE AREA.

(1) Cover Assembly

(a) The only repair you can do to the cover assembly is to make bent pins in the connector straight.

(b) Make bent pins straight with a pin that engages correctly with them.

(2) Wires

(a) Do a repair of wires that have been broken and moved from the soldered component board assembly (IPL Figure 1, 110), relays (55, 80), or cover assembly () electrical connector as follows:

1 Remove the solder and wire end from the printed-circuit-board eyelet (IPL Figure 2, 125) or electrical connector pin or relay (IPL Figure 1, 55, 80).

2 Remove approximately 0.125 in. (0.32 cm) of insulation from the end of the wire with a thermal wire stripper.

3 Tin the wire end with solder. Make sure a piece of AWG 14 teflon sleeving 0.375 in. (0.95 cm) long is installed on wires that connect to the connector and AWG 11 teflon sleeving 0.375 in. (0.95 cm) long is installed on wires that connect to the relays (55, 80).

4 Put the wire end into the eyelet or connector pin, or the relay terminal and solder. Move the sleeving over the connection, if applicable.

(b) If a broken wire becomes too short or if a wire is damaged, replace as follows:

1 Disconnect the wire. Carefully remove it.

2 Tie a new wire, with color the same as the removed wire, to the location where the wire was removed.

3 Use lacing tape and tie the new wire in as many locations as necessary.

4 Apply red enamel (Glyptal) to the lacing tape knots.

5 See Figure 7 for connection locations of wires. Make sure a piece of sleeving 0.375 in. (0.95 cm) long is installed on the wire to put over the soldered connection at the connector end or relay terminal. Solder the replacement wire in position.

6 Move the sleeving over the soldered connection, if applicable.

(c) Make sure the wires are held to the component board assembly (IPL Figure 1, 110) with lacing tape attached through the two holes in the printed-circuit-board.

(3) Component Board Assembly

(a) Use standard electronic shop repair procedures to replace components. Follow ESD precautions and procedures.

(b) When you must replace the K1 or K2 relay on units serial number 3617 and below, it is recommended that you complete SB 893229-26-374.

(c) When you must replace a transistor (Q1 thru Q4) or diode (CR1 thru CR3) on control units serial number 3617 and below, use the parts listed in IPL Figure 2 and replace them all as a group. A mixture of components does not operate correctly together. It is recommended that you complete Service Bulletin 893229-26-374.

(4) Chassis Assembly

(a) You can replace the standoffs (IPL Figure 1, 50) or self-clinching fasteners (45). You must push out a defective or damaged self-clinching fastener and push in a replacement.

8. ASSEMBLY

A. General

(1) This section gives the assembly procedures, the sequence of assembly, and a list of materials necessary to assemble components of the control unit. Always assemble components in specified sequence. Ignore assembly instructions for components that have not been disassembled or removed. See IPL Figure 1 for parts location.

B. Materials and Equipment

(1) Materials and equipment necessary for assembly are given in Table 11. You can use equivalent alternatives for the items given in the list.

Table 11. Assembly Materials and Equipment

DESCRIPTION	PART NO./ SPECIFICATION	SOURCE
Evacuation and Backfill Setup		Make locally from Figure 8.
Air Source, Low Pressure	30 psig (207 kPa)	Commercial
Wire Brush		Commercial
Propane Torch		Commercial
Soldering Iron	250 watt, Broad Tip	Commercial
Soldering Iron	40 watt, Fine Tip	Commercial
Solder, Resin Flux Core, Composition SN60	QQ-S-571	Commercial
Cap, Protection, ESD	CEC-16	Protective Closures Co., Inc. Buffalo, NY 1240 (V99017)
Primer, Paint, Zinc, Chromate	TT-P-1757	Commercial
Paint, Charcoal Gray, Wrinkle	Federal Std. 595, Color No. 26044	Randolph Products Co. Carlstadt, NJ (V77672)
Nitrogen	BB-N-411	Commercial
Helium		Commercial
Cleaner	Diversey 909	Commercial
Tape, Masking		Commercial
Trichloroethylene	O-T-6346	Commercial

C. Procedure

CAUTION: WHEN YOU TOUCH THE CONTROL UNIT OR COMPONENT BOARD ASSEMBLY, MAKE SURE YOU DO NOT APPLY A VOLTAGE HIGHER THAN THE MAXIMUM PERMITTED VOLTAGES TO DEVICES OR COMPONENTS IDENTIFIED AS ESD SENSITIVE. THESE DEVICES OR COMPONENTS ARE IDENTIFIED BY THE LETTERS (ESDS) THAT FOLLOW THE ITEM DATA IN THE ILLUSTRATED PARTS LIST NOMENCLATURE AREA.

CAUTION: IN THE OPERATION THAT FOLLOWS, THE COMPONENT BOARD ASSEMBLY IS ATTACHED TO THE COVER ASSEMBLY BY ONLY THE WIRING. TO MAKE SURE THE WIRES DO NOT BREAK, DO NOT BEND OR TWIST THE WIRES THAT CONNECT THE ASSEMBLIES.

(1) Assemble to Chassis

(a) Put the relays (IPL Figure 1, 55) on the chassis assembly(35) and attach with two screws (60), flat washers (65), lock washers (70), and nuts (75).

(b) Put the relay (80) on the chassis assembly (35) and attach with two screws (85), flat washers (90), lock washers (95), and nuts (100).

(c) Install the component board assembly (110) and insulator (105) to the chassis assembly (35) and attach with screws (115), lock washers (120), and flat washers (125).

(d) Position the cover assembly (15) to the chassis assembly (35) and attach with screws (40).

(e) Put the exhaust tube (10) into the rear of the case assembly (5) from the inside.

(f) Solder the exhaust tube (10) in position with a propane torch or a 250 watt soldering iron. Make sure the soldered joint is an air tight seal.

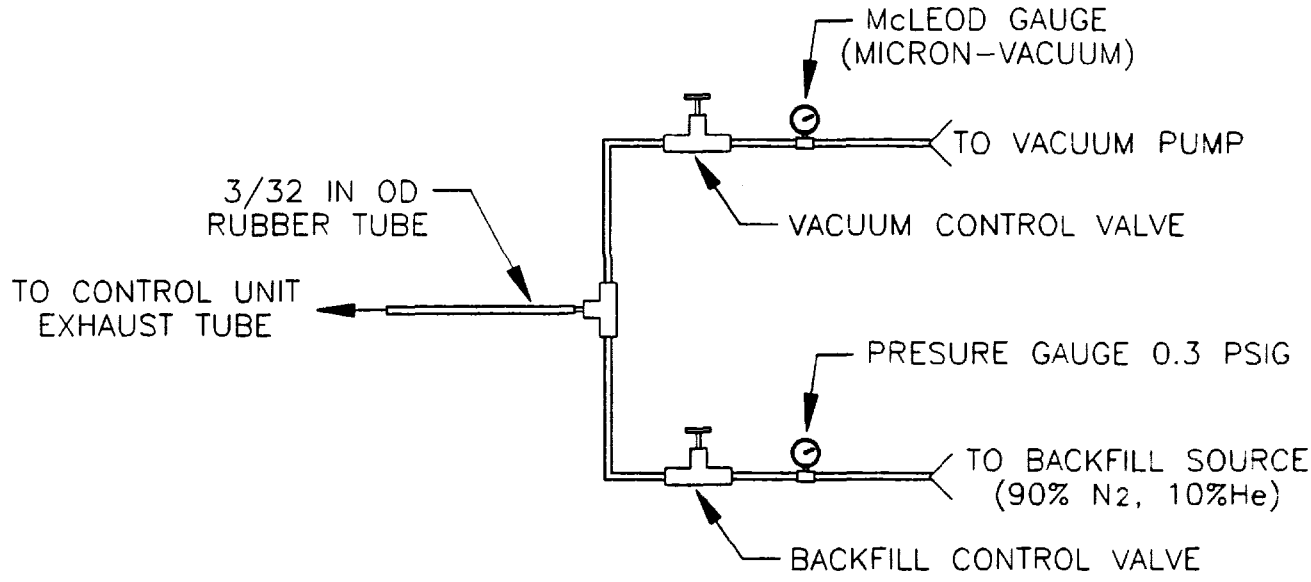
(g) Move the chassis assembly (35) with component board assembly (110) and cover assembly (15) into the case assembly (5) and attach with screws (40).

(h) Do a test of the control unit before you seal it with solder. Refer to TESTING AND FAULT ISOLATION.

(i) Use a propane torch or 250 watt soldering iron and solder the cover assembly (15) to the case assembly (5). Make sure the soldered joint has an airtight seal.

(j) Seal the screw (40) heads with melted solder.

(2) Control Unit Evacuation and Backfill



(a) Connect the exhaust tube (10) to the evacuation and backfill setup (Figure 8).

(b) Remove the air from the control unit at 70°F to 100°F (21°C to 38°C) to an absolute pressure of 1 micron maximum for no less than 15 minutes. Then, backfill the control unit to a pressure of 0.5 to 0.8 psi (3.45 to 5.5 kPa) above atmosphere with a mixture of 90% nitrogen and 10% helium by volume.

NOTE: Each gas must be dry with a maximum dew point of -65°F (-54°C). The two gases (nitrogen and helium) can come from different containers or from one container with the gases mixed.

(3) Control Unit Leak Test and Seal

(a) Use trichloroethylene, Federal Specification O-T-6346 or an equivalent, in a container for the leakage test.

Evacuation and Backfill Setup
Figure 8

(b) Let the air go out of the liquid for the test. Let it stand (approximately 30 minutes) at room temperature until all bubbles are gone or put the liquid for the test in an ultrasonic bath in a test chamber.

(c) Put the pressurized control unit fully into the liquid for test. There must be no signs of leakage.

(d) When you complete the test for leakage, while the control unit is pressurized, tightly compress the exhaust tube (IPL Figure 1, 10) closed to keep the control unit pressurized. Compress the exhaust tube 0.125 in. (0.32 cm) away from the rear of the case assembly (5) with vise grip pliers or an equivalent tool.

(e) Remove the control unit from the evacuation and backfill setup.

(f) Let the tool stay on the exhaust tube (10) and cut off the exhaust tube outside the tool.

(g) Use melted solder to seal the area of the exhaust tube (10) that you cut.

(h) Remove the tool from the exhaust tube (10).

(i) Do the test for leakage again. A visual sign of leakage shows that the seal is defective.

(j) If there is no leakage, remove and fully dry the control unit.

(4) Painting

(a) Clean the control unit with Diversey 909 cleaner or equivalent and flush with clean water.

(b) Dry the control unit fully.

(c) Apply masking tape to the connector and the bottom of the brackets that attach the control unit.

(d) Apply zinc chromate primer (TT-P-1757) to the control unit. Let the unit dry.

(e) Make the control unit warm from 75°F to 80°F (24°C to 27°C) and then paint with charcoal gray wrinkle paint, Federal Standard 595, Color No. 26044.

(f) Let the control unit air dry for 40 minutes.

(g) Make the control unit warm from 140°F to 150°F (60°C to 66°C) for approximately 90 minutes.

(h) Then, let the control unit air dry for 12 hours minimum before you touch it.

(i) Remove the masking tape.

(j) Put an ESD protection cap (CEC-16) on the control unit connector.

D. Final Assembly

(1) Nameplate, Patent Plate, ESD Nameplate

(a) Use a metal stamp and put the serial number and data on the nameplate (20).

(b) Remove the protection cover from the back of each nameplate (20, 25, 30) and push each nameplate tightly in position on the case assembly (5).

(c) Do a functional test and an insulation resistance test of the control unit. Refer to TESTING AND FAULT ISOLATION.

NOTE: You can do a functional test and an insulation resistance test before you apply primer or paint to the control unit.

(d) Put an ESD protection cap (CEC-16) on the control unit connector again after you do the tests.

E. Storage and Movement

(1) Protect the control unit with ESD protection materials.

(2) Put the control unit in an approved container.

(3) Keep the control unit in a cool, dry area that has no contamination.

(4) If you must move the control unit to another location, make sure it has sufficient protection to prevent damage.

9. FITS AND CLEARANCES

A. Not Applicable.

10. SPECIAL TOOLS, FIXTURES AND EQUIPMENT

A. General

(1) This section gives the special tools, fixtures, and equipment necessary to do maintenance on the control unit.

(2) Special tools, fixtures and equipment are given in Table 12. You can use alternative equivalents for the items given.

Table 12. Special Tools, Fixtures and Equipment

TOOL, FIXTURE, OR EQUIPMENT ITEM	PART NO.	SOURCE
Power Supply, Regulated, Adjustable, 0-50 VDC	Model LS30	Electrostatics, Inc. (V34538)
Helipot, 0-1000Ω	3400S-1-102 with CT-23 counting dial	Bourns Inc. (V32997)
Multimeter	Model 77	Fluke (V89536)
Megohmmeter	L-12	Rosemount Analytical Inc. (V30646)
Test Set, Functional		Make locally from Figure 3 and Table 3.
Test Cable, Insulation-Resistance		Make locally from Figure 4.
Soldering Iron, 40 watt, Fine Tip		Commercial
Soldering Iron, 250 watt, Broad Tip		Commercial
Propane Torch		Commercial
Evacuation and Backfill Setup		Make locally from Figure 8.
Air Source, Low Pressure		Commercial
Resistance Substitution (Decade Box)	Model 236a	Phipps & Bird (V7T784)

11. ILLUSTRATED PARTS LIST

A. Purpose

(1) This list of parts shows the location and identifies the parts used to make each assembly shown on the title page. These parts can be disassembled, repaired or replaced, and assembled again.

B. How To Read And Use The Illustrated Parts List (IPL)

(1) Assembly Order Indenture System

(a) The system used to write the parts list shows the relation of one part to a different part. For a given item, the number of spaces before the item shows the relation of the item to the next higher assembly (NHA) as follows:

1 2 3 4
Assembly
Attaching parts for assembly
***
. Detail parts for assembly
. Subassembly
. Attaching parts for subassembly
***
. . Detail parts for subassembly
. . Sub-subassembly
. . Attaching parts for sub-subassembly
***
. . . Detail parts for sub-subassembly

(2) Effectivity Code

(a) The EFF CODE area shows a letter (A, B, C, etc.) to refer to for each top assembly. The letter for the applicable top assembly is also shown in the EFF CODE area for each detail part and subassembly. No letter is shown for detail parts and subassemblies used on all top assemblies.

(3) Units Per Assembly

(a) The UNITS PER ASSY area shows the total number of units necessary for each assembly, for each subassembly, and for each sub-subassembly, as applicable. For large quantity items, the letters AR are for "as required". The letters RF show that the item is given to refer to.

(4) Parts Replacement Data

(a) The NOMENCLATURE area of the parts list gives the interchangeable relation between parts. The data and how it is written to show how the parts are interchangeable is as follows:

DATA	WRITTEN AS	SPECIFICATION
Optional	OPT	This part is optional to and interchangeable with other parts in the same item number variant group or other item number if written.
Superseded by	SUPSD BY	The part in the part number area of the parts list is replaced by and is not interchangeable with the item number written in the NOMENCLATURE area of the parts list.
Supersedes	SUPSDS	The part in the part number area of the parts list replaces and is not interchangeable with the item number that is written in the NOMENCLATURE area of the parts list.
Replaced by	REPLD BY	The part in the part number area of the parts list is replaced by and interchangeable with the item number that is written in the NOMENCLATURE area of the parts list.
Replaces	REPLS	The part in the part number area of the parts list replaces and is interchangeable with the item number that is written in the NOMENCLATURE area of the parts list.

(5) Service Bulletin Incorporation

(a) Assemblies, subassemblies and detail parts that can be changed, deleted, added or replaced by an issued service bulletin are written to show both pre- and post-service bulletin configuration. The data (PRE SB XXXX) in the NOMENCLATURE area of the parts list identifies the initial assemblies and parts and the data (POST SB XXXX) identifies assemblies and parts after the service bulletin has been completed.

(b) Subassemblies and detail parts used on assemblies that have the pre- or post- service bulletin identification do not have the same identification themselves if the use code(s) given to them clearly shows their pre- or post-service bulletin use.

(c) Top assemblies changed by a service bulletin and not given a new part number (no production equivalent of the modified assembly) are not identified with pre- or post-service bulletin data. But the subassemblies and detail parts effected by the service bulletin, when necessary, are identified with the pre- or post-service bulletin data.

(6) Items Not Illustrated

(a) A dash (-) before the item number in the FIG & ITEM NO. area of the parts list shows the item is not shown.

(7) Alpha Variant Item Numbers

(a) Alpha variants A-Z (does not include I and O) are given to item numbers used before when it is necessary to show:

1 Added items

2 Service bulletin modifications

3 Configuration differences

4 Optional parts

5 Product improvement part (not from a service bulletin)

(b) The exploded view does not show alpha variant item numbers when the appearance and location of the alpha variant item is the same as the basic item.

C. Electrostatic Discharge Sensitivity

(1) If the letters (ESDS) follow the item data in the NOMENCLATURE area of the parts list, the identified item can be damaged by electrostatic buildup and generation of electric fields.

D. Equipment Designator Index

(1) The equipment designator index is an alpha-numerical list of names or symbols assigned to identify each item of electrical and electronic equipment and gives a location for the part number and figure/item number. A hyphen between two names or symbols (example: A1-A5) shows one name or symbol that includes the names or symbols between the two.

E. Part Number Identification

(1) When the PART NO. area of the parts list shows a standard part number or another vendor's part number, the vendor code, which starts with the letter "V", is shown in parenthesis after the item data in the NOMENCLATURE area of the parts list. The Walter Kidde part number, in parenthesis, follows the vendor code. When you send an order for parts from Walter Kidde, use the Walter Kidde part number.

WALTER KIDDE Aerospace
ABBREVIATED COMPONENT MAINTENANCE MANUAL (ACM)
POWER DEVICE CARTRIDGES

TO: HOLDERS OF FIRE EXTINGUISHER CARTRIDGE AND ACTUATOR SERVICE MANUAL

REVISION 6 DATED MAY 15/96

HIGHLIGHTS

This is a complete revision to the manual dated Apr 30/91. The purpose of the revision was to add data and schematics for additional part numbers and rewrite the text in Simplified English as an Abbreviated Component Maintenance Manual (ACM) in accordance with ATA100 requirements. Discard any earlier editions of this manual when you receive this revision.

POWER DEVICE

CARTRIDGES

ABBREVIATED COMPONENT

MAINTENANCE MANUAL

SAFETY SUMMARY

Power device cartridges are explosive devices used to operate safety equipment installed in aircraft are considered Safety of Flight equipment and must operate correctly the first time. Malfunction or failure of the power device cartridge to fire can cause material loss, damage to equipment and the possible injury or death to persons.

Power device cartridges are carefully designed by the maker. The maker does a test to make sure they operate as designed. You must correctly maintain the power device cartridge to make sure it operates correctly.

The following safety precautions are general in nature and are not applicable to any specific procedure. The precautions are recommended safety procedures that must be obeyed by maintenance persons each time they touch, move or keep power device cartridges.

KEEP AWAY FROM LIVE CIRCUITS

Electrically operated power device cartridges must be kept away from stray electrical currents, and must be correctly shunted. Under certain conditions, dangerous currents can stay in circuits after the power source has been disconnected. Make sure that you disconnect the power source and grounded the circuit before you touch it.

DO NOT SERVICE OR ADJUST ALONE

A person must never enter an enclosure alone, without an assistant, to maintain an item of equipment that has a power device cartridge. Make sure assistance is immediately available.

RESUSCITATION

Persons who do work with or near fire extinguishing equipment must know the methods of artificial respiration.

SUPERVISORY RESPONSIBILITY

Familiarity with work can cause carelessness. Therefore, a person who supervises or does work where it is necessary to touch and maintain power device cartridges must do the following:

Make sure that all applicable safety regulations and instructions are obeyed.

Carefully supervise the activities of all maintenance persons.

Inform all persons it is necessary that they use precaution when they do their work.

TOUCH, KEEP AND MOVE

To avoid injuries, prevent accidents and damage to equipment, make sure explosive devices are touched, kept or moved as specified by governmental regulations for Class "C"

explosives. You must also follow the maker's recommended safety guidelines and obey all warnings and cautions.

INSPECTION

Power device cartridges must be examined when you get them to make sure that the container, or its contents, are not damaged. You must do a check for the following:

Make sure the power device cartridge containers are correctly identified.

Make sure the sealed containers have not been opened.

NOTE: If a container is found open, the power device cartridge must be examined for corrosion, dents, cracks and other damage that can make it dangerous or not reliable.

IDENTIFICATION AND MOVEMENT

Power device cartridges removed from a device for examination must be identified for installation again in the same device from which it was removed.

Power device cartridges without identification, or with identification that you cannot read, must not be installed in a device. It must be made unserviceable as specified in Section 9.

Power device cartridges must be touched as little as possible and only when correctly shunted.

Do not drop or deform power device cartridges. Damaged or deformed power device cartridges must be made unserviceable as specified in Section 9.

No changes, modifications, or repairs are approved for power device cartridges.

INTERCHANGABILITY

Power device cartridges are designed for use in specific devices and though many power device cartridges have the same dimensions and look the same, they must not be installed in other devices.

DEFINITIONS

The following definitions apply to terms used in this publication.

Actuator. A mechanical device that changes chemical energy into mechanical motion.

All Fire. Minimum stimulus which must be applied to a device for it to correctly function.

Ambient. Local meteorological conditions such as temperature, humidity and pressure.

Bridgewire. A relatively fine resistance wire built into an ignition element attached to the electrical leads of an electro-explosive device.

Electro-Explosive Device (EED). Any power device cartridge, squib, igniter, etc., which is started electrically.

Hermetic Seal. A seal that keeps out to air and fluids. Hermetically sealed devices are generally welded or solder sealed rather than sealed with epoxy resin, etc.

No-Fire Current. Maximum current which can be applied to a bridgewire circuit without igniting the prime material.

One-Amp/One-Watt Device. An electro-explosive device (EED) which will not fire or change when one ampere and/or one watt is passed through the bridgewire circuit (usually for a five minute period).

Recommended Firing Current. The current which must be applied to a bridgewire circuit to operate of the device in a specified time.

Recommended Test Current. The maximum current that can be applied to a bridgewire circuit for a period of time without a change to the prime material.

Shunt. A shielding device used to protect an electro explosive device (EED) from accidental electrical ignition. A shunt device is a correctly sized threaded or press fit protection cap, which is assembled over the component's electrical contact(s). Two types are usually used:

1. A faraday shield is a conductive cap, usually threaded, which is put over the electro explosive device's ignition lead contacts.

2. A shunt plug made of conductive material, usually a press fit device, which completes a grounding circuit between contact pins and prevents any accidental flow of current through the EED's bridgewire circuit.

Squib. A small size pyrotechnic or explosive device. Specifically, a small explosive device similar in appearance to a detonator, but loaded with low explosive, so that its output is primarily heat (flash). Usually electrically started and used to initiate action of pyrotechnic devices and rocket igniters.

Total Life. The power device cartridge is a "lifed item" and Walter Kidde defines its useful life as "Total Life". Total Life starts on the day the cartridge is made and you must replace it at a specific time. Refer to Table 1, Specified Data for Total Life of a specific power device cartridge. Total life cannot be extended and includes any mix of time the power device cartridge is kept "on the shelf" **and/or** installed in a fire extinguisher.

Non-hermetic power device cartridges have the lowest Total Life. The Total Life can be decreased if it is kept for a long time at ambient temperatures in excess of 100°F (38°C). See Figure 3 for Temperature Exposure Limits graph.

NOTE: The graph is given to help you calculate the life limits of a non-hermetic power device cartridge that is exposed to high temperatures.

POWER DEVICE CARTRIDGES

Every possible example in which a power device cartridge is exposed to high temperatures cannot be discussed in this manual. Maintenance management must make decisions about the removal and replacement of power device cartridges that have been exposed to high temperatures. Maintenance management persons must carefully monitor the operating environment of the power device cartridges.

The following WARNINGS can be repeated throughout the manual.

WARNING: BEFORE YOU INSTALL OR REMOVE A POWER DEVICE CARTRIDGE MAKE SURE ALL ELECTRICAL CIRCUITS IN THE ACTUATING SYSTEM ARE OPEN.

WARNING: MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!

WARNING: DO NOT INSTALL A POWER DEVICE CARTRIDGE IN A VALVE BODY OR DISCHARGE HEAD UNTIL THE VALVE BODY, OR DISCHARGE HEAD IS ASSEMBLED TO THE CONTAINER. WHEN YOU INSTALL THE POWER DEVICE CARTRIDGE, THE CONTAINER MUST BE INSTALLED IN THE AIRCRAFT, OR AN APPLICABLE ANTI-RECOIL DEVICE MUST BE INSTALLED ON THE VALVE BODY OR DISCHARGE HEAD OUTLET.

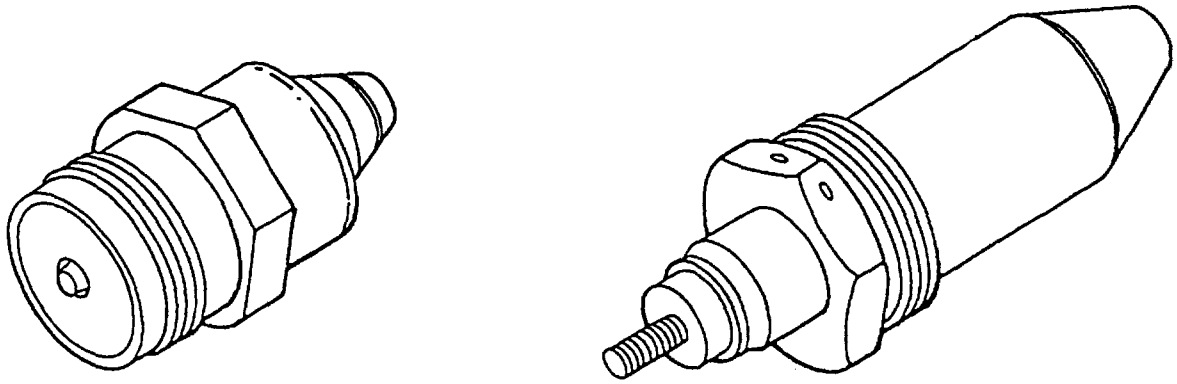
1. DESCRIPTION AND OPERATION

A. Description

Cartridges, squibs or actuators are called power device cartridges in the pages that follow. Power device cartridges are explosive devices that are used to start a fire extinguisher. There are two general groups of power device cartridges; slug and shock wave devices.

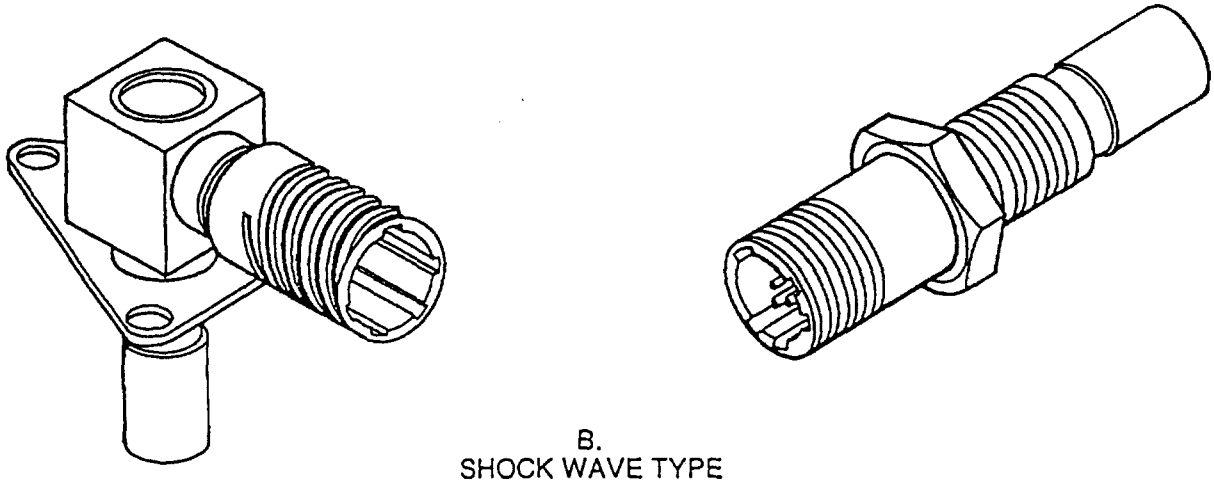
The slug device (Figure 1A) fires a slug to break the closure (disc). Slug devices have a non-hermetic design and high temperatures can decrease their life. Slug type devices are usually used with non-hermetic fire extinguishers that have segmented closures (discs).

The shock wave device (Figure 1B) makes a shock wave to break the closure (disc). Shock wave type devices have a hermetic design and high temperatures do not decrease their life. Shock wave devices are used with hermetic fire extinguishers that have formed metal closures (discs).



NOTE: Some non-hermetic fire extinguishers have formed metal discs.

B. Operation



1. When the fire extinguisher circuit operates, an electric current goes through the power device cartridge makes the bridgewire hot and ignites the powder contained in the device. The ignition of the powder gives the energy to fire a slug through the frangible disc in the container, or to break the disc with the shock wave made by the explosion. This lets the extinguishing agent flow from the fire extinguisher, see Figure 2.

C. Refer to Table 1, Specified Data for the applicable data for a specified power device cartridge.

2. TESTING AND FAULT ISOLATION

A. Electrical Tests

1. Tests for resistance and "No-Fire" are done on the power device cartridges when they are made. Walter Kidde does not recommend regular tests of the bridgewire resistance.

2. Table 2 gives the test equipment necessary.

CAUTION: YOU MUST USE ELECTRICALLY EQUIVALENT ITEMS.

Table 2. Test Equipment

NOMENCLATURE	PART NUMBER/ SPECIFICATION	SOURCE
Multimeter	Fluke 75	Fluke Corp. (V89536)

WARNING: MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!

WARNING: MAKE SURE THE POWER DEVICE CARTRIDGE IS INSTALLED IN AN APPLICABLE TEST FIXTURE. MAKE SURE THE TEST AREA IS CORRECTLY BARRICADED TO PREVENT INJURY TO PERSONS. PERSONS MUST STAY AWAY FROM THE TEST FIXTURE DURING THE TEST.

WARNING: WHEN YOU DO A TEST OF A POWER DEVICE CARTRIDGE, USE A MULTIMETER THAT ELECTRICALLY LIMITS THE TEST CURRENT TO 0.040 AMPS MAXIMUM WITH THE SELECTOR SWITCH IN ALL POSITIONS. TOO MUCH AMPERAGE WILL FIRE THE CARTRIDGE AND CAUSE BAD INJURIES OR DEATH.

NOTE: When you do a test of the power device cartridge, do a test of each bridgewire circuit separately to the ground pin.

3. Install the power device cartridge in an applicable safety test fixture.

4. Connect a Fluke 75 multimeter, or the electrical equivalent, to applicable pins and check the circuit. Refer to Table 1, Specified Data for the applicable bridgewire resistance value and the applicable electrical schematic.

3. AUTOMATIC TEST REQUIREMENTS (ATLAS)

A. Not Applicable.

4. DISASSEMBLY/REMOVAL

A. Disassembly of the power device cartridge is not necessary.

B. Removal of a Used Power Device Cartridge from a Discharge Head

It can be necessary to use special procedures to remove a used power device cartridge from a discharge head. When the power device cartridge device fires, the design of the power device cartridge can make the part of the cartridge that is inside the discharge head body become larger and it is not possible to remove the power device cartridge from the discharge head with the usual procedure.

1. Loosen the power device cartridge to give sufficient clearance for a hacksaw blade.

CAUTION: WHEN YOU USE THE HACKSAW, USE PRECAUTION NOT TO DAMAGE THE SURFACE OF THE DISCHARGE HEAD.

2. Fully cut through the body of the power device cartridge at the point it comes out of the discharge head body.

3. Remove all unwanted material from the part of the power device cartridge that remains in the discharge head.

4. Turn the discharge head so you can see the part of the power device cartridge that is inside the discharge head.

5. Use pliers or a similar tool to hold the part of the power device cartridge inside the discharge head. Turn the power device cartridge counterclockwise until it comes out of the discharge head.

5. CLEANING

A. Not Applicable.

6. CHECK

A. General

1. Inspections are limited to visual checks only and electrical tests are limited to bridgewire continuity tests only. Do all inspections and electrical checks before you install the power device cartridge in the component. You must do electrical tests in an applicable safety fixture or safety chamber (proof booth).

B. Inspection

POWER DEVICE CARTRIDGES

WARNING: MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!

NOTE: Walter Kidde recommends that you keep the power device cartridge in the hermetic sealed envelope until you install it. If you do a test on a power device cartridge that is not installed, you must vacuum seal the envelope again, or install the power device cartridge immediately.

1. Examine the power device cartridge as follows:

   (a) Visually examine the case for cracks, dents, or distortions. Make damaged power device cartridges unserviceable as specified in Section 9.

   (b) Examine threaded surfaces for distortion or damage. Make power device cartridges with damaged or distorted threads unserviceable as specified in Section 9.

   (c) Examine crimped areas on the power device cartridge and make sure crimped parts do not move. Make power device cartridges with loose parts unserviceable as specified in Section 9.

   (d) The examples below give you the necessary data to find the date made the power device cartridge was made:

   The date the power device cartridge was made is etched, metal stamped or electroplated on the power device cartridge barrel or flats. Examples of typical power device cartridge date marks are given below.

   Some power device cartridges used in commercial applications can be marked as follows:

   61423 - 446283 A = shows the maker's CAGE code and part number. The letter "A" gives the revision of the drawing used to make the power device cartridge
   12/91 = shows the Month/Year the power device cartridge was made
   05350 = shows the Lot Number, 1st two digits, and Serial Number, last three digits. These are written on the hex flats.

   Some power device cartridges used in commercial applications can be marked as follows:

   61423 - 446283 F = gives the maker's CAGE code and part number. The letter "F" gives the revision of the drawing used to make the power device cartridge

1-89 2/89 = gives the Lot Number and Month/Year the power device cartridge was made. These are written on the hex flats.

Power device cartridges used in military applications are marked as follows:

61423 424030 = gives the maker's CAGE code and Part Number
WKD 91A001-001 = gives an abbreviation for the maker's company name "WKD = Walter Kidde", the year the cartridge was made "91", the month is shown by a letter "A", the Lot Interfix Number (001) and the Lot Number (001).

NOTE: Months are identified a letter; "A" for January, "B" for February, etc.

The power device cartridge has a limited life and must be removed from service in a specified period of time. Refer to Table 1, Specified Data for total life.

(e) Examine the solder contact for damage. Make power device cartridges with damaged solder contacts unserviceable as specified in Section 9.

(f) Examine terminal connector pins for deformed, damaged, or loose pins. Make power device cartridges with damaged, deformed or loose pins unserviceable as specified in Section 9.

7. REPAIR

A. Not Applicable.

8. ASSEMBLY

A. There are no assembly procedures applicable to power device cartridges.

B. Installation

WARNING: **DO NOT INSTALL A POWER DEVICE CARTRIDGE IN A VALVE BODY OR DISCHARGE HEAD UNTIL THE VALVE BODY OR DISCHARGE HEAD IS ASSEMBLED TO THE CONTAINER.THE CONTAINER MUST BE INSTALLED IN THE AIRCRAFT, OR AN APPLICABLE ANTI-RECOIL DEVICE MUST BE INSTALLED ON THE VALVE BODY OR DISCHARGE HEAD OUTLET.**

WARNING: **MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. *IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT* DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!**

WARNING: **BEFORE YOU INSTALL OR REMOVE A POWER DEVICE CARTRIDGE, MAKE SURE ALL ELECTRICAL CIRCUITS *IN THE ACTUATING SYSTEM ARE OPEN.***

1. Install power device cartridges as specified in the applicable aircraft maintenance manual.
2. Refer to Table 1, Specified Data for the applicable torque value.
3. You must not use force when you install a power device cartridge.

C. Keep, Move, and Touch Instructions

1. Keep Instructions

WARNING: **MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. *IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT* DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!**

(a) Use a shunt device to prevent accidental discharge of the power device cartridge because of stray static electrical charges that can occur.

(b) Keep the power device cartridges in their sealed envelopes or containers.

(c) Keep the power device cartridges at temperatures below 100°F (38°C). Temperatures less than 70°F (21°C) are recommended.

(d) Keep the power device cartridges in a dry location.

(e) Keep the power device cartridges away from possible fire hazards.

(f) Keep the power device cartridges as specified in local regulations for Class "C" explosives. Keep them in an area specified for explosives.

2. Touch Instructions

WARNING: MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!

(a) Power device cartridges are dangerous because they are explosive devices. Usually, you can touch a power device cartridge and it is not dangerous if you use care to prevent exposure to shock, high temperatures and stray electrical charges.

(b) You must not drop, or throw the power device cartridges.

(c) Touch the power device cartridges under usual, ambient temperatures, temperatures less than 70°F (21°C) are recommended. Do not touch power device cartridges that have been in very high temperatures.

3. Movement Instructions

WARNING: MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!

(a) If a shunt device is not installed on the power device cartridge, you must install a shunt device on it before you move it.

(b) Identify and move the power device cartridges as specified in Table 3, Identification and Movement Regulations.

(c) Keep the power device cartridges away from shock, high temperatures, and electrical charges.

(d) Do not drop, throw, or incorrectly touch the power device cartridges.

(e) Touch the power device cartridges in usual ambient temperatures; temperatures less than 70°F (21°C) are recommended.

Table 3. Identification and Movement Regulations

SHIPPING METHOD	APPLICABLE REGULATION(S)	
	U.S. DOMESTIC	INTERNATIONAL
Air	International Air Transport Association (IATA) Dangerous Goods Regulations	International Air Transport Association (IATA) Dangerous Goods Regulations and International Civil Aviation Organiza-tion (ICAO) Doc 9284-AN/905

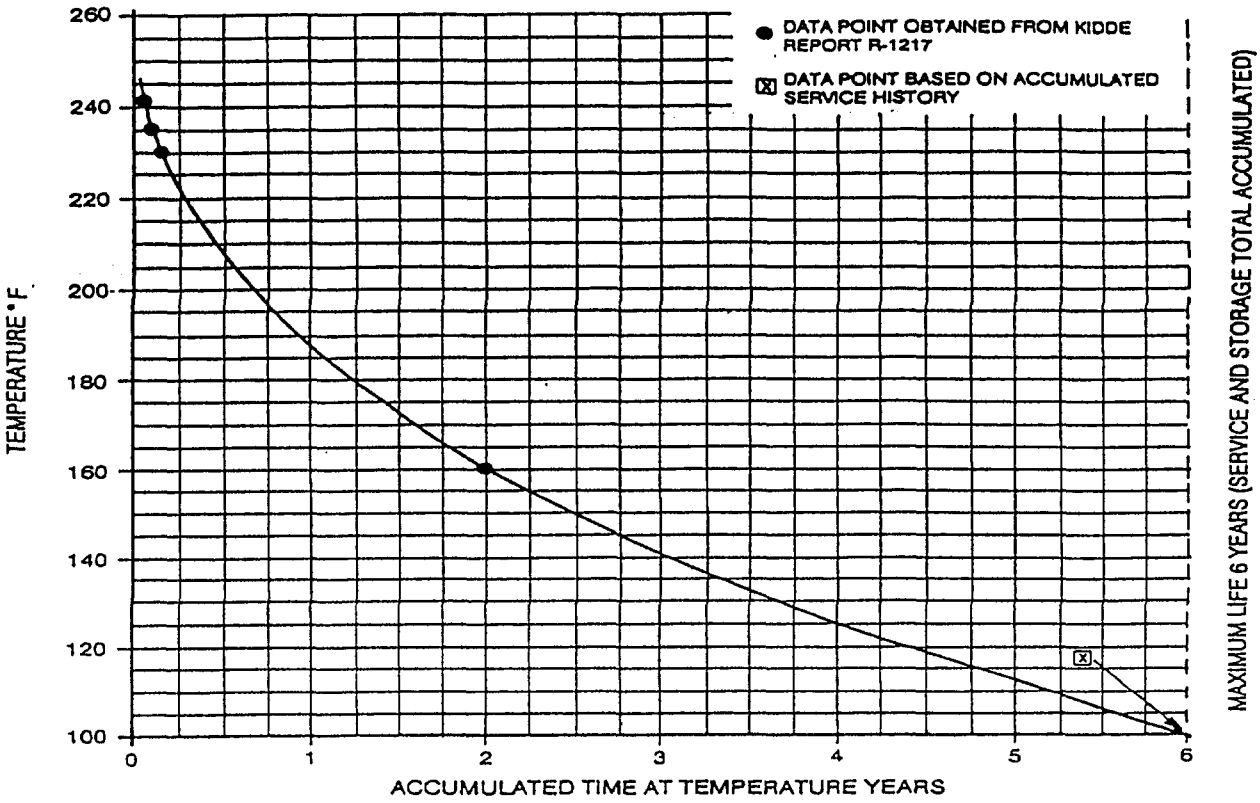
Ocean	International Maritime Organization (IMO)	International Maritime Organization (IMO)

D. Calculation of Total Life for Non-Hermetic Power-Device-Cartridges

NOTE: The graph and calculation are not applicable to power device cartridges with a 10 year total life.



1. Non-hermetic power-device-cartridges are not sealed. If they stay for a long time in an area that has a high temperature, the total life can decrease and you must calculate the total life for the applicable temperature and operating hours. A high temperature is more than 100°F (38°C). Hermetic power-device-cartridges are sealed devices and high temperatures do not decrease their life.

2. If a non-hermetic power device cartridge operates at ambient temperatures less than 100°F (38°C), the total life of the power device cartridge life is 6 years, unless a shorter life is given in Table 1. Specified Data.

3. Figure 3 is a graph that has the data necessary to calculate the total life of a non-hermetic power device cartridge if the ambient temperature is more than 100°F (38°C). The vertical axis shows temperatures, in °F, and the horizontal axis shows the collected (accumulated) time at temperature years. The temperature curve on the graph shows the total life, in years, for power-device cartridges at given temperatures. To do a correct calculation of total life, you must also know the operating hours each year for the power device cartridge.

NOTE: Maintenance persons must make an estimate of the maximum ambient temperature and the operating hours for a specific power device cartridge.

4. If the collected time for a power device cartridge at the ambient temperature is more than 100°F (38°C), you must do the calculation to find the total life for the power device cartridge. The result is the calculated service life, in years.

Temperature Exposure Limits for Power Device Cartridges
Figure 3

When you know the calculated service life, you must compare it to the total life specified in Table 1, Specified Data. Two examples to calculate the life for power device cartridges are given below.

(a) Maintenance persons made an estimate that aircraft "A" has a maximum ambient temperature of 140°F (60°C) collected at a rate of 3,000 operating hours a year. Calculate the total life as follows:

1 *Find 140°F on the vertical axis of the graph.*

2 Read across the graph until the line for 140°F goes through the temperature curve.

3 Read the time in years shown on the horizontal axis of the graph below the point where the line for 140°F goes through the temperature curve.

4 *At 140°F (60°C), the graph shows that the collected life of the power* device cartridge is 3 years. Write this number.

5 Multiply the number of days in a year (365) by the number of hours in a day (24); then multiply the result by the number of years you wrote in step 4. The result shown below is the total operating hours.

365 x 24 x 1.27 = 11,125 total operating hours

6 Divide the total operating hours you got in step 5 by the number of hours the power device cartridge operates each year (3000). The result is the calculated service life, in years. Do the calculation as follows:

$$\frac{26280}{3000} = 8.76$$

7 This example shows that the calculated service life for this power device cartridge is 8.76 years. Compare the calculated total life to the total life specified in Table 1. If the calculated life is **more** than the total life specified in Table 1, you must use the total life given in the table; therefore, for this example, the maximum total life of this power device cartridge is 6 years.

(b) Maintenance persons made an estimate that aircraft "B" has a maximum ambient temperature 180°F (82°C) collected at a rate of 3,000 operating hours a year. Calculate the service life as follows:

1 Find 180°F on the vertical axis of the graph.

2 Read across the graph until the line for 180°F goes through the temperature curve.

3 Read the time in years shown on the horizontal axis of the graph below the point where the line for 180°F goes through th temperature curve.

4 At 180°F (82°C), the graph shows that the collected life life of the power device cartridge is 1.27 years. Write this number.

5 Multiply the number of days in a year (365) by the number of hours in a day (24); then multiply the result by the number of years you wrote in step 4. The result shown below is the total operating hours.

365 x 24 x 1.27 = 11,125 total operating hours

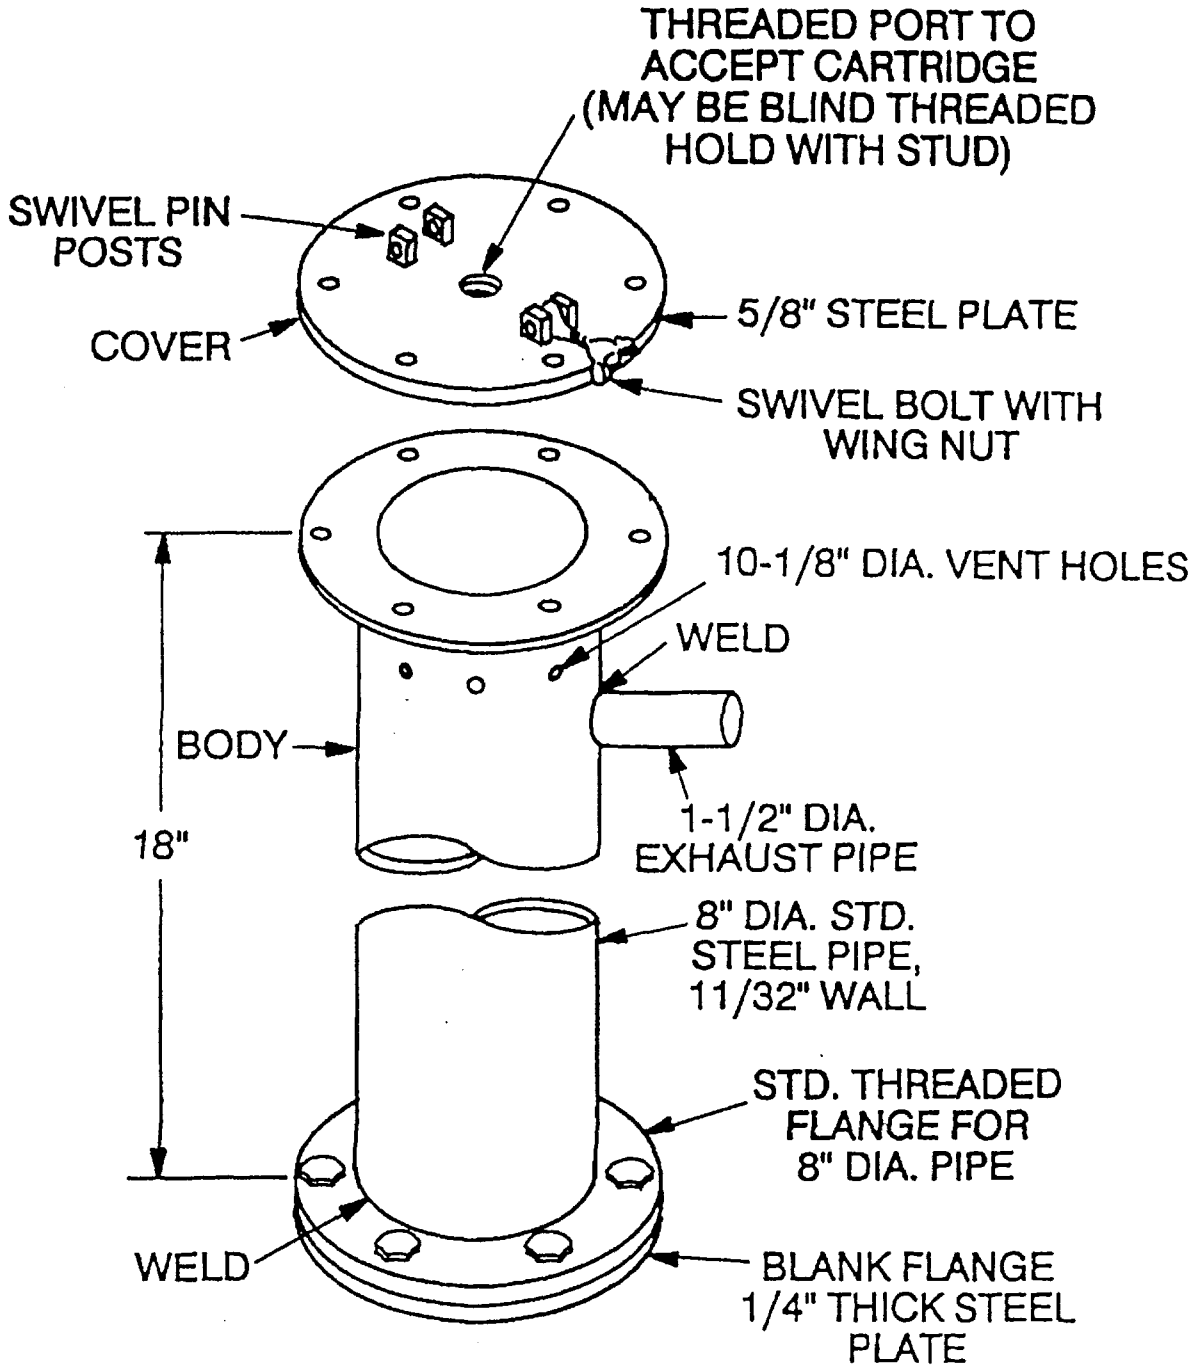
6 Divide the total operating hours you got in step 5 by the number of hours the power device cartridge operates each year (3000). The result is the calculated service life, in years. Do the calculation as follows:

$$\frac{11125}{3000} = 3.71$$

7 This example shows that the calculated service life for this power device cartridge is 3.71 years. Compare the calculated total life to the total life specified in Table 1. If the calculated life is less than the total life specified in Table 1, you must use the total life you calculated; therefore, for this example, the maximum total life of this power device cartridge is 3.71 years.

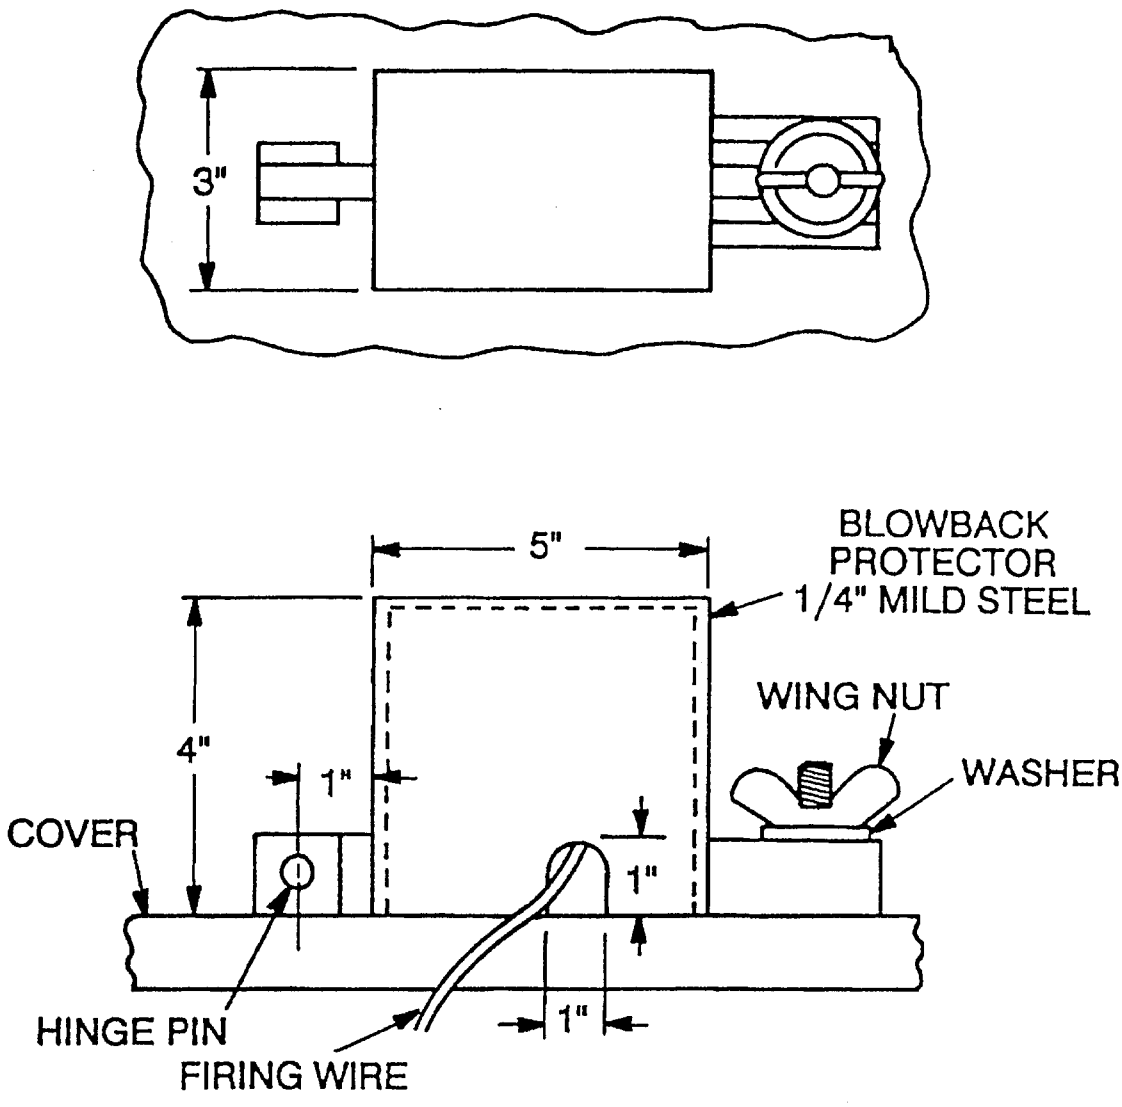
NOTE: The maximum life includes the time you keep the power device cartridge "on the shelf".

9. DISCARD



Make defective or old power device cartridges unserviceable before you discard them. If you discard a power device cartridge incorrectly, it can cause hazards to persons and the environment. Walter Kidde recommends that you use a disposal fixture to make the power device cartridge unserviceable.

A. Make the fixture as follows:



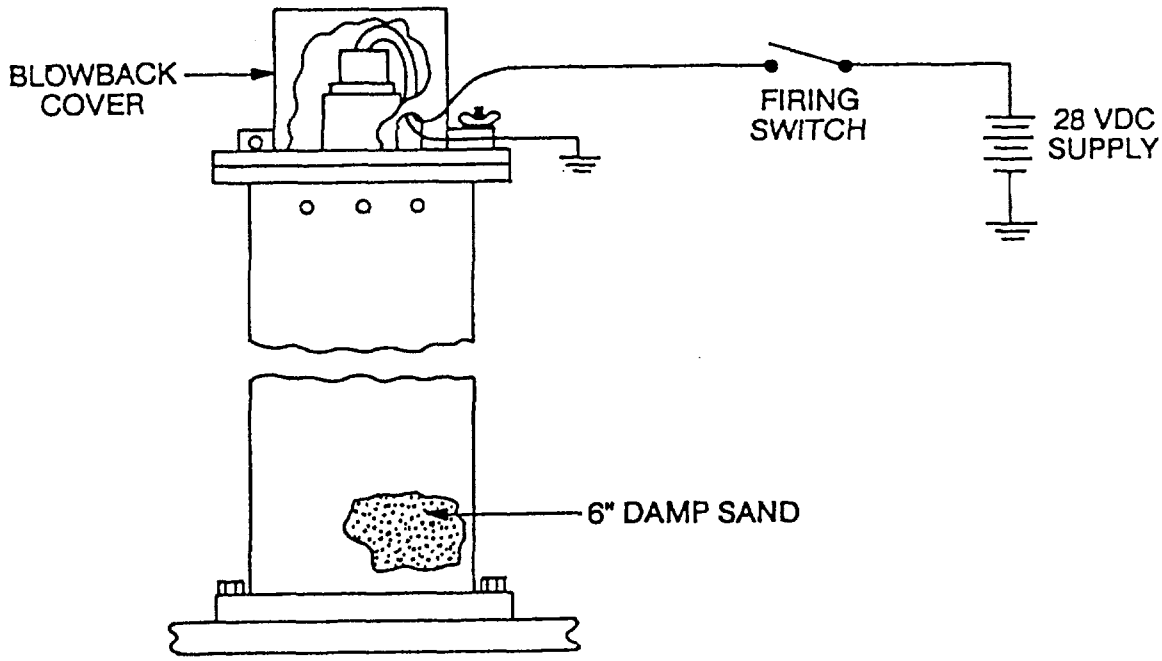
1. Use the dimensions and materials shown in Figure 4 to make the fixture.
2. Connect a blower (Transvector air flow amplifier) or equivalent to the exhaust pipe.
3. Make the outlet of the blower open to the air.
4. Connect the vacuum line to the exhaust pipe on the fixture.

B. Preparation

1. Loosen and remove the screws, nuts, and washers that hold the cover on the fixture.
2. Remove the cover from the fixture.
3. Fill the fixture with approximately six inches (15 cm) of moist sand. The moist sand will keep the amount of dust caused when you operate the fixture to a minimum.
4. Loosen and remove the wing nut on the blowback protector.
5. Open the blowback protector.

Cartridge Disposal Fixture
Figure 4 (Sheet 1 of 2)

Cartridge Disposal Fixture
Figure 4 (Sheet 2)



WARNING: **MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!**

6. Install the power device cartridge in the cover.

WARNING: **MAKE SURE THE FIRING CIRCUIT SWITCH IS OPEN (OFF) BEFORE YOU CONNECT THE POWER DEVICE CARTRIDGE TO THE FIRING CIRCUIT.**

7. With the firing circuit switch in the open (Off) position, remove the shunt plug.

8. Connect the power device cartridge to the firing circuit (Figure 5).

Firing Circuit Hookup
Figure 5

9. Close the blowback protector and install the wing nut.

10. Install the cover on the fixture body and install the screws, nuts, and washers to hold the cover on the fixture.

WARNING: VAPORS CAN CAUSE INJURY TO PERSONS. MAKE SURE ALL GASES ARE SUFFICIENTLY BLED TO THE AIR.

WARNING: THE EXPLOSIVE DEVICE GIVES OUT SUBSTANTIAL ENERGY WHEN IT OPERATES. MAKE SURE THE FIXTURE IS INSTALLED BEHIND AN APPLICABLE BARRICADE AND ALL PERSONS STAY AWAY FROM THE FIXTURE.

WARNING: PERSONS WHO DISCARD THE EXPLOSIVE DEVICES MUST KNOW THE SAFETY PROCEDURES FOR THE MOVEMENT OF EXPLOSIVE DEVICES.

C. Procedure

1. Start the vacuum system.

2. Close the firing switch. You can hear the power device cartridge operate. A power device that does not operate is defective. Incinerate any defective power device cartridges as specified in Paragraph D.

3. Open the firing circuit switch.

WARNING: IF THE POWER DEVICE CARTRIDGE DOES NOT OPERATE, IT IS DANGEROUS AND YOU MUST INSTALL A SHUNT BEFORE YOU REMOVE IT OR MOVE IT.

CAUTION: THE FIXTURE CAN KEEP THE HEAT MADE BY THE EXPLOSION. MAKE SURE YOU WEAR CORRECT HAND PROTECTION WHEN YOU TOUCH THE FIXTURE.

4. Remove the power device cartridge from the fixture.

5. Loosen the wing nut and open the blowback protector.

6. Disconnect the electrical connector.

WARNING: IF THE POWER DEVICE CARTRIDGE DID NOT OPERATE, IT IS DANGEROUS AND YOU MUST INSTALL A SHUNT BEFORE YOU REMOVE IT OR MOVE IT.

7. If the power device cartridge did not operate, install a shunt cap you before you remove it from the fixture.

8. Incinerate the power device cartridge as specified in paragraph D.

9. If power device cartridge operated, remove the it from the fixture and discard as scrap metal.

   NOTE: Regular removal of unwanted material from the sand in the fixture is necessary.

D. Incineration

1. Incinerate any power device cartridge that fails to fire electrically in an enclosed device that will prevent injury to persons.

2. The minimum temperature necessary to incinerate the power device cartridge is 700°F (371°C). Heat the power device cartridge for a minimum of one (1) minute, or until you hear the power device cartridge fire.

3. Incinerate the power device as follows:

WARNING: MAKE SURE YOU INSTALL A SHUNT DEVICE ON THE POWER DEVICE CARTRIDGE BEFORE YOU TOUCH IT. IF YOU TOUCH A POWER DEVICE CARTRIDGE THAT DOES NOT HAVE A SHUNT INSTALLED, IT CAN CAUSE BAD INJURIES TO YOU. DO NOT USE FOIL TO SHUNT THE PINS!

(a) Put the power device cartridge, with the shunt installed, in the incinerator.

(b) Ignite the incinerator and take shelter behind a protective barrier until power device cartridge fires.

(c) Shutdown the incinerator and let it become cool.

CAUTION: THE FIXTURE AND CASING KEEP HEAT MADE BY THE INCINERATION AND EXPLOSION. WEAR CORRECT HAND PROTECTION WHEN YOU TOUCH THE CASING.

(d) Remove and discard the casing.

POLICY STATEMENT

1. This manual has been prepared to the requirements of ATA Specification 100.

2. The Overhaul Instructions contained in this manual provide descriptive information, specific procedures, and data pertaining to work done on the units identified on the title page. These instructions pertain to the units after they have been removed from the airplane. The manual has been prepared for the experienced shop mechanic who normally performs shop work and not for the aircraft service mechanic who normally works on units while installed in the aircraft.

3. These instructions are not intended to cover all details and variations in equipment nor is it possible to cover every situation which may arise during overhaul. For further specific information or in case a particular problem cannot be solved using these instructions, contact the Product Support Manager, ELDEC Corp., Lynnwood, Washington, 98036.

DESCRIPTION AND OPERATION

1. Description

A. The ELDEC Proximity Switch PC Assembly, Part No. 8-060, is an all solid-state switch which works together with an ELDEC Proximity Sensor to detect the presence or absence of metal structure. ELDEC switches operate either normally open or normally closed (selected by jumpers at the switch card connector). Switch outputs can be connected in parallel for a logic OR function. Up to 6 switches may be connected in series for a logic AND function.

B. IPL Figure 1 illustrates this element of the basic system. The sensor (located remotely) appears as an inductance to the switch card. The switch card senses a change of inductance, caused by the proximity of a metal target. The switch card then completes (or, in the case of a normally closed switch, interrupts) the circuit to an external load. Table 1 lists specific test actuation distances and sensors that are applicable to switch card configurations.

C. For a given card and sensor system (8-060 used with a 1-899-15 sensor) any 8-060-02, -07, or -10 will operate with any -15 sensor. A particular pair (8-060 and 1-899-15) has a specific actuation point, but the actuation point of any pair will fall within the test limits specified in Table 1. Differential travel distances are given in Table 1. Differential travel is defined as the distance moved by the actuator away from the actuation point which results in deactuation.

D. The proximity switch is designed so that open or shorted sensor leads inhibit switch actuation, regardless of target position. Loss of power causes the switch output to fail, resulting in an open circuit to the load.

E. Power input 28 Vdc per MIL-STD-704A, Category C. Maximum power input at 28 Vdc: 1.8 watts, actuated; 1.4 watts deactuated.

NOTE: Part No. 8-060-02, -07, and -10 are the same except for different values of R26, R15, and R19. Refer to IPL Figure 1 and the schematic diagram.

2. Operation

A schematic diagram of the 8-060-02 proximity switch, divided into sections, is shown in Figure 802. Refer to the schematic diagram in conjunction with the following discussion.

A. Voltage Regulator. The voltage regulator provides stable voltage, free of large transient variations, to the remaining switch circuitry. Diodes CR1 and CR2 provide regulator input protection. CR1 protects against reverse voltage connection, and Zener CR2 provides high-voltage transient protection. CR3 and CR4 provide base voltages for emitter follower Q1, the series pass transistor. Q1 output voltage is approximately 18 volts, measured across C1. Diode CR4 also provides the common mode voltage required by the operational amplifiers. The combination of L1 and C1 prevents large current spikes from the oscillator circuit being impressed on the DC line.

B. Power Oscillator (1100 Hz). Sensor excitation is provided by a power oscillator including A1, Q3, Q4, T2 and associated components. Amplifier A1 is connected as an astable multivibrator and drives emitter followers Q3 and Q4. The emitters of Q3 and Q4 show an 1100 Hz square wave swinging between ground and the regulated voltage. Capacitor C4 provides dc isolation. Transformer T2 steps the voltage up to the level required for bridge excitation.

C. Bridge Circuit. The internal portion of the bridge circuit includes resistive arm R8, R9, R10, and capacitive arm R7, C3. The other two arms of the bridge (one inductive and one resistive) are located remotely in the sensor. The red and blue sensor leads are also connected to the primary side of transformer T1. Any bridge circuit unbalance is reflected as a change in voltage between the red and blue leads.

D. Synchronous Demodulator. T1 acts as a balanced input to the synchronous demodulator. The balanced input greatly increases common-mode rejection of unwanted signals on the sensor lines. The demodulator (Q5, C7, and R13) samples bridge unbalance every half cycle of sensor excitation. The drive signal for the demodulator is provided by C5 and R12. The bridge output signal charges capacitor C7 every half cycle. C7 is charged and discharged randomly by any non-synchronous noise. CR9 provides reverse voltage protection for C7. The voltage level developed across C7 is applied to the comparator circuit. Demodulator transistor Q5 is a junction FET acting as a switch.

E. Comparator. Amplifier A2 acts as a high-gain feedback amplifier with its bias point set by biasing resistors R17 and R18 and feedback resistor R19. Exceeding the threshold voltage causes the amplifier output (Pin 6) to change state. The comparator output is in the low state when the sensor target is at infinity and in the high state when the sensor is actuated. The comparator is isolated from switch driver Q6 by diode CR7. R21 and R22 are biasing components for switch driver transistor Q6.

F. Failsafe Circuit. The failsafe circuit consists of A3, CR5, CR6, and associated components. The failsafe circuit senses the peak voltage developed across T1 when demodulator switch Q5 is closed. The voltage across C6 is compared by amplifier A3 against a reference voltage determined by resistor R15 and R16. When the bridge is operating normally, the output of A3 (Pin 6) is near ground potential. In the event of a failure resulting in a high voltage across C6, the R15- R16 reference voltage is exceeded, causing the output of A3 (Pin 6) to change from ground potential to the reference voltage potential. A3 output (Pin 6) is applied through diode CR6 into the output stage of comparator amplifier A2 (Pin 5), biasing A2 to the low state. A2 output clamps to ground, simulating a deactuated sensor.

G. Output Switch. The output switch Q7, R24, C10, and CR8 is externally jumpered for normally open or normally closed operation. When the connector is wired for normally open operation, emitter current of Q6 provides base drive for Q7.

In the normally closed condition, Q7 is driven through R23. Zener diode CR8 across Q7 protects against transients. Capacitor C10 provides EMI suppression.

Weight	2.5 ounces
Power Requirements	28V dc, 1.8W
Temperature Range	-40°C to 85°C
Switch Range	0.500 ampere
Test Actuation Point for ELDEC AT10-1 Target and Center-Point Sensor	0.290 to 0.315 inch for 8-060-02 0.132 to 0.158 inch for 8-060-07 0.285 to 0.315 inch for 8-060-10
Differential Travel	0.005 to 0.025 inch for 8-060-02 0.005 to 0.020 inch for 8-060-07 0.004 to 0.010 inch for 8-060-10
Card Interchangeability	2-899-111 for 8-060-02 2-899-113 for 8-060-07 2-899-111-3 for 8-060-10
Recommended Sensor/Fixture for calibration/testing	1-899-15-CP-02 with AT10-1 target. Calibration Test Stand P/N 3-455-35

Leading Particulars
Table 1

DISASSEMBLY

The switch card is to be disassembled only to the extent necessary to remove defective components. Component identification is shown in IPL Figure 1. Refer to ILLUSTRATED PARTS LIST for part values.

CLEANING

1. General

This section contains instructions for cleaning the Proximity Switch Card after disassembly or repair. No special tools are required. Equivalent substitutes for cleaning agents may be used.

MATERIAL	USED ON
Stoddard Solvent (Commercial)	Electrical Components

2. Components and Assemblies

Clean printed circuit board with vacuum cleaner (preferred method) or low-pressure compressed air (optional method). Use a small-size soft nonmetallic bristle brush to dislodge foreign particles from the crevices and surfaces. Dip brush in Stoddard commercial solvent and wash parts as necessary to remove oily film. Dry circuit board with low-pressure compressed air.

WARNING: VENTILATE WORK AREAS THOROUGHLY WHEN SOLVENT IS USED. AVOID CONTACTING SOLVENT WITH BARE SKIN. OBSERVE ALL SAFETY AND FIRE PRECAUTIONS.

INSPECTION/CHECK

1. Check for evidence of physical damage due to mishandling.

2. Visually examine circuit board for broken components, defective solder joints and broken circuit traces.

3. Visually inspect connector for security of mounting and for bent, broken or corroded connector pins.

   NOTE: On some switch cards, resistor R8 of a certain type has shown a higher failure rate than expected. During maintenance, the resistor should be examined and replaced with the type given in the IPL, item 29. Details of the change are given in Service Information Letter 27-01, ELDEC Document No. 740222.

REPAIR

1. General

Replace components indicated to be faulty by inspection and functional test. For part locations and descriptions refer to IPL Figure 1 and accompanying parts list. Refer to DISASSEMBLY and ASSEMBLY.

2. Required Material

A. Trichlorethane -1, 1, 1 (Methylchloroform), O-T-620

B. Deionized/Distilled Water (1 Megohm or better purity)

C. Isopropyl Alcohol, TT-I-735

D. Solder, QQ-S-571D, Core Flux (WRAP-2 or WRAP-3)

E. Coating, Humiseal 1A20 (V99109)

3. Required Equipment

A. Nylon Brush

B. Soldering Iron, 40 watt

C. Dry, Low-Pressure Air (40 to 80 psi)

D. Hot-Air Dryer (190 to 220°F)

4. Procedure

CAUTION: LIMIT SOLDER OPERATIONS TO LESS THAN 5 SECONDS. LONGER SOLDERING PERIODS WILL DAMAGE PRINTED WIRING BOARD.

A. Unsolder and remove defective component(s). If necessary, use soldering iron to burn coating away from component.

WARNING: METHYLCHLOROFORM AND ALCOHOL ARE TOXIC. WEAR GOGGLES AND GLOVES AND USE GOOD VENTILATION. AVOID CONTACT WITH SKIN AND CLOTHING AND AVOID BREATHING VAPOR.

B. Clean repair area and solder surfaces using a nylon brush and methylchloroform, followed by spray rinse with fresh, virgin grade methylchloroform. Flush debris clear of board using deionized or distilled water followed by spray rinsing with alcohol.

C. Install and solder replacement component(s).

D. Repeat step B.

E. Dry board using low-pressure air followed by forced-air drying at 190 to 200 degrees F for 2 to 3 minutes using a hot air dryer.

F. Allow board to cool to room temperature and then apply protective coating. Nominal thickness shall be 1 to 3 mils on flat surfaces.

G. Air cure protective coating for 2 hrs at room temperature.

NOTE: Protective coating is fully cured after approximately 24 hours. Curing, however, requires a condition of at least 30% relative humidity.

H. Proceed with TESTING.

ASSEMBLY

1. General

Reassemble the switch card after repair. Refer to IPL Figure 1 and accompanying parts list for part locations and descriptions. Calibrate the switch card using the following procedure prior to TESTING.

2. Calibration

A. Equipment Required

(1) Calibration Test Stand. A special fixture, PN 3-455-16 (ref. Figure 501) is required to calibrate 8-060-02, -07, and -10 switch cards after repair. The fixture must be constructed so that the sensor is mounted on a non-metallic surface with sensing face of the sensor a minimum of 0.75 inch from any non-magnetic metal (aluminum) and a minimum of 2 inches from any magnetic material other than the target. The movable target must be parallel to the sensing face and cover 100 percent of sensing face. Target must be able to move from zero gap to a minimum of 1.0 inch from sensing face.

(2) Center Point Sensor Kit, Part No. 1-899-15-CP-01. Calibrating the switch card with a 1-899-15 sensor selected at random potentially broadens the actuation tolerance by a factor of two because of tolerance build-up. Therefore, it is recommended that the 1-899-15-CP-02 sensor with accompanying AT10-1 Target be used or the switch card be returned to the manufacturer for calibration.

NOTE: Target, Part No. AT10-1 included with 1-899-15-CP-01 Kit.

(3) Decade Resistor, General Radio Type 1434-N or equivalent.

B. Refer to Figure 502 for test setup.

C. Selection of R9 and R10.

(1) Make the equipment connections shown in Figure 502.

(2) Adjust calibration test stand target position until contact is made with target and sensor face. Set calibration test stand dial scale to zero.

(3) Remove R9 and R10 from switch card. Connect the decade resistor across the R9 terminals (connector pins A and C). See Figure 502.

(4) Turn on power supply and set its output to 28(± 1)V dc.

(5) Move target to the nominal gap (0.300 inch for the 8-060-02 and -10, or 0.145 inch for the 8-060-07).

(6) Adjust decade resistor to 100 ohms or greater. Indicator lamp loads should be off. Carefully decrease the decade resistor until the lamps illuminate.

(7) Select a standard resistor value (see ILLUSTRATED PARTS LIST for type) that is equal to or slightly greater than the decade resistor setting.

(8) Temporarily install the resistor in the R9 position. Adjust the decade box to 10K.

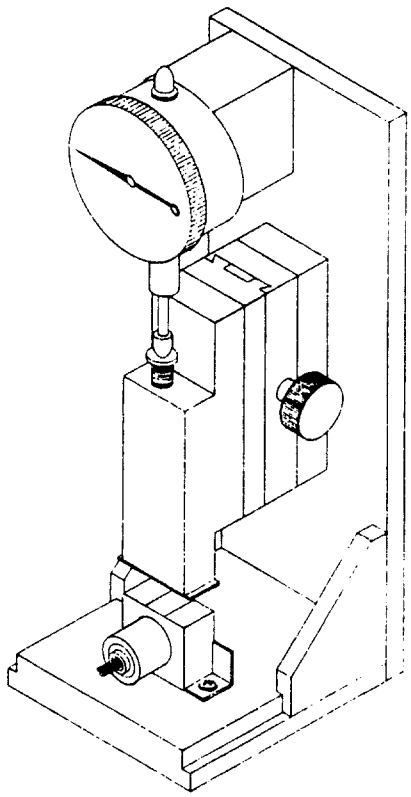
(9) Move target away from sensor beyond deactuation point.

(10) Slowly move target toward sensor until lamps illuminate.

(11) Measure distance of target from sensor face. If gap is greater than the nominal distance (0.300 inch for the 8-060-02 and -10, or 0.145 inch for the 8-060-07) use the next higher value of resistor for R9, and proceed to step (12). If the gap is nominal, select a 10K resistor and proceed to step (15). If the gap is less than nominal, proceed to step (12).

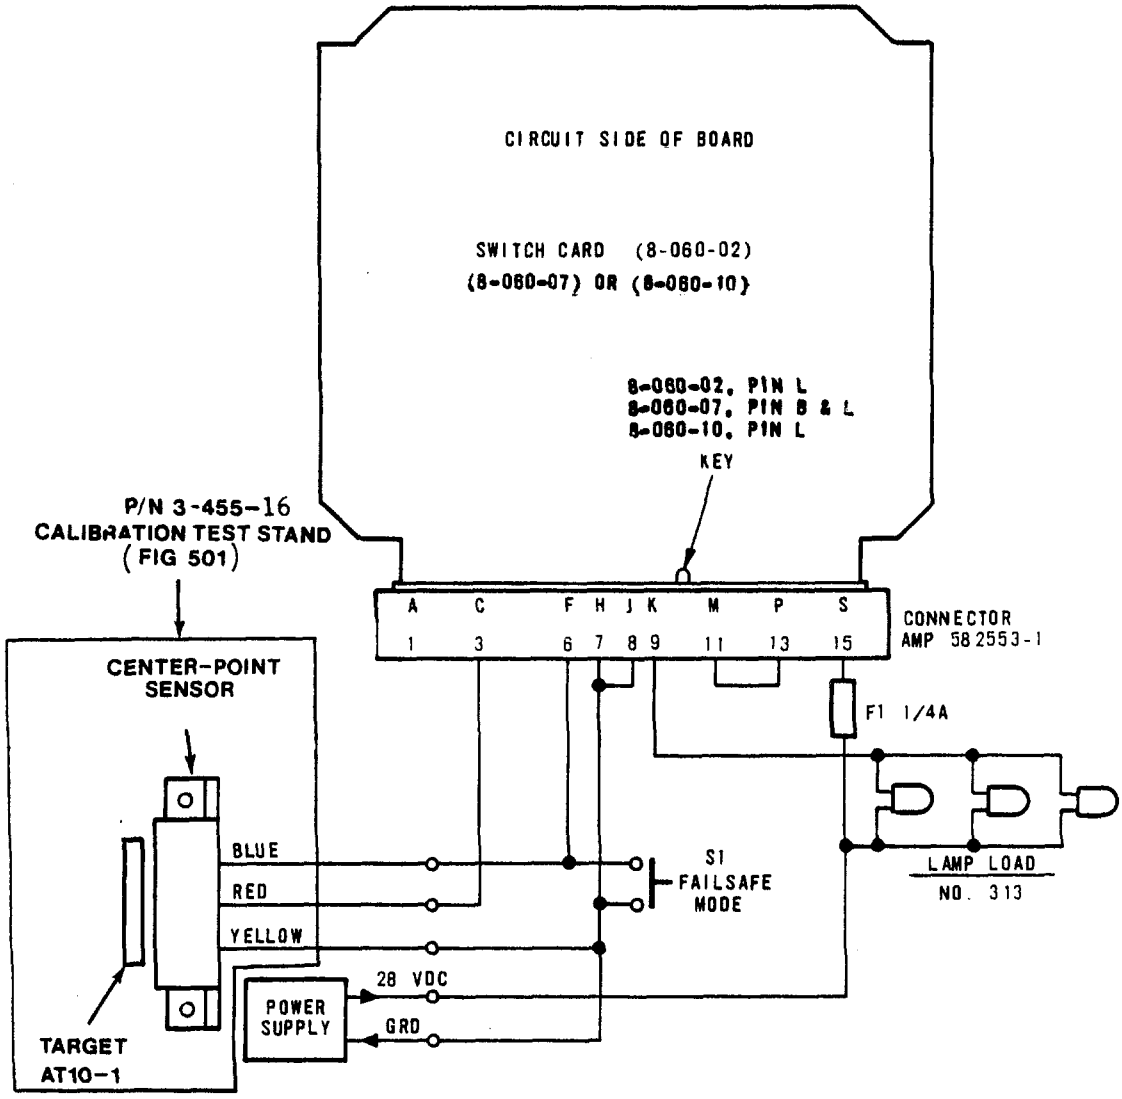
(12) Increase the target gap until the lamps turn off. Move the target to the nominal gap. Lamps should be off.

(13) Adjust the decade resistor for actuation at the nominal actuation point (0.300 inch for 8-060-02 and -10, or 0.145 inch for the -07).



(14) Select a resistor that is closest to the decade box value. (See ILLUSTRATED PARTS LIST for type).

(15) Disconnect decade box and temporarily install selected resistor in parallel with R9.



NOTE: If the actuation point is not within ±0.003 of nominal, select another resistor for R10. When the calibration is within ±0.003, install both R9 and R10 into the card. When the above steps have been performed, calibration is complete.

(16) After calibration, retest as described in TESTING.

(17) Apply conformal coating to calibration resistors and solder areas. (Ref. REPAIR.)

Part No. 3-455-16
Calibration Test Stand
Figure 501

NOTE: This Figure illustrates the requirements for testing and calibration.

Switch Card Test Set-Up
Figure 502

FITS AND CLEARANCES

No special fits and clearances are required.

TESTING

1. Test Equipment

   A. Test Set-up per Figure 502, Switch Card Test Set-up, or equivalent.

   B. Calibration Test Stand, P/N 3-455-16 (ref. Fig. 501).

   C. Center-Point Sensor Kit P/N 1-899-15-CP-01.

   D. Oscilloscope, Tektronix 531 or equivalent.

2. Test Procedure

   A. Install center-point sensor and target in calibration test stand. Adjust calibration test stand target position until contact is made with target and sensor face. Set calibration test stand dial scale to zero. Move target away from sensor to maximum distance.

   B. Make the equipment connections shown in Figure 502. Set power supply output to 28(±1)V dc.

   C. Verify waveform frequency at pin F (blue sensor lead) is 1100(±65)Hz. See TROUBLE SHOOTING, 3.0 for alignment.

   D. Slowly move calibration test stand target toward sensor until indicator light just turns on. Target position shall be as follows:

8-060-02	0.290 to 0.315 inch
8-060-07	0.132 to 0.158 inch
8-060-10	0.285 to 0.315 inch

   NOTE: See ASSEMBLY 2.0 for gap calibration.

   E. Record calibration test stand target position.

   F. Slowly move calibration test stand target away from sensor until indicator light just turns off. Target position shall be greater than that recorded in step C as follows:

8-060-02	0.005 to 0.025 inches
8-060-07	0.005 to 0.020 inches
8-060-10	0.004 to 0.010 inches

   G. Repeat steps C thru E with power supply set to 21.05V dc and 30V dc.

   H. Set power supply output to 28(±1)V dc.

   I. Repeat step D.

J. Close FAIL SAFE MODE switch, observing indicator light turns off. See TROUBLE SHOOTING, 2.0 for alignment.

K. Open FAIL SAFE MODE switch. Indicator light shall turn on.

L. Adjust calibration test stand target flush against sensor (zero gap). Indicator light shall be on.

M. Move calibration test stand target away from sensor, turn off power supply, and disconnect equipment. Testing is complete.

TROUBLESHOOTING

1. General

The following troubleshooting chart (Figure 801) and a schematic diagram (Figure 802) are provided to assist in isolating and correcting switch card malfunctions. Refer to IPL Figure 1 for location of parts.

MALFUNCTION	PROBABLE CAUSE	CORRECTIVE ACTION
1. Indicator lamp fails to light when test gage is in ON position.	A. Defective comparator (does not switch)	A. Check A2 and associated components. Replace defective parts.
	B. R17 open.	B. Replace R17
	C. T1 primary open.	C. Replace T1.
	D. Defective Synch demodulator	D. Check Q5 and associated components. Replace defective parts.
	E. Defective output switch.	E. Check Q7 and associated components. Replace defective parts.
	F. Defective Failsafe circuit.	F. Check A3 and associated components. Perform R16 Selection Procedure, 2.A. thru 2.G.
2. Indicator lamp fails to go out or lights when test gage is placed in OFF position.	A. Defective voltage regulator	A. Check Q1, CR2, CR3, CR4, and associated components. Replace defective parts.
	B. Defective output switch.	B. Check Q7, CR8 and associated components. Replace defective parts.
3. Correct waveform not present at Blue sensor lead terminal (Pin F)	A. Defective oscillator.	A1. Check A1 and associated components. Replace defective parts. A2. Check Q3, Q4, and associated components. Replace defective parts.
	B. Defective voltage regulator.	B. Check Q1 and associated components. Replace defective parts.
	C. Incorrect frequency.	C. Perform R5 Selection Procedure, para. 3.

Troubleshooting Chart
Figure 801 (Sheet 1 of 2)

MALFUNCTION	PROBABLE CAUSE	CORRECTIVE ACTION
4. Indicator lamp lights when Failsafe push-button is pressed.	A. Defective Failsafe circuit.	A1. Check A3, CR5, CR6, and associated components. A2. Perform R16 Selection Procedure 2.A. thru 2.G.
5. Indicator lamp fails to light when Target AT10-1, or piece of Carpenter Hi Mu 80 Steel) is placed against sensitive face.	A. See Malfunction No. 1.	A. See Malfunction No. 1.

Troubleshooting Chart
Figure 801 (Sheet 2 of 2)

2. R16 Selection Procedure

If the switch card fails the fail-safe test, a different value of R16 may be required. Proceed as follows:

A. Install the switch card in a temperature test chamber so that the card may be operated as in the Switch Card Test Setup, Figure 502.

NOTE: Use of heat guns is not recommended.

B. Apply power to test chamber and allow temperature to stabilize at 85°C (185°C).

C. Open the red lead to the sensor. Indicator lamp shall be off. A momentary flash of light is acceptable.

D. If the switch card fails step 2.C., increase the value of R16 to the next higher value.

E. Adjust the temperature of the test chamber to -40°C

F. Place the A10-1 Target against the sensitive face of the sensor (zero gap condition). The indicator lamp shall be illuminated.

G. If the switch card fails step 2.F, decrease the value of R16 to the next lower value.

H. Upon completion of R16 selection procedure, perform procedure given in TESTING.

3. R5 Selection Procedure

A. Make the equipment connections shown in Figure 502. Set power supply output to 28(±1) Vdc.

B. Verify frequency of waveform at pin F (blue sensor lead) is 1100(±65)Hz. If not, select value of resistor R5 as follows:

(1) Turn off dc power supply.

(2) Remove resistor R5.

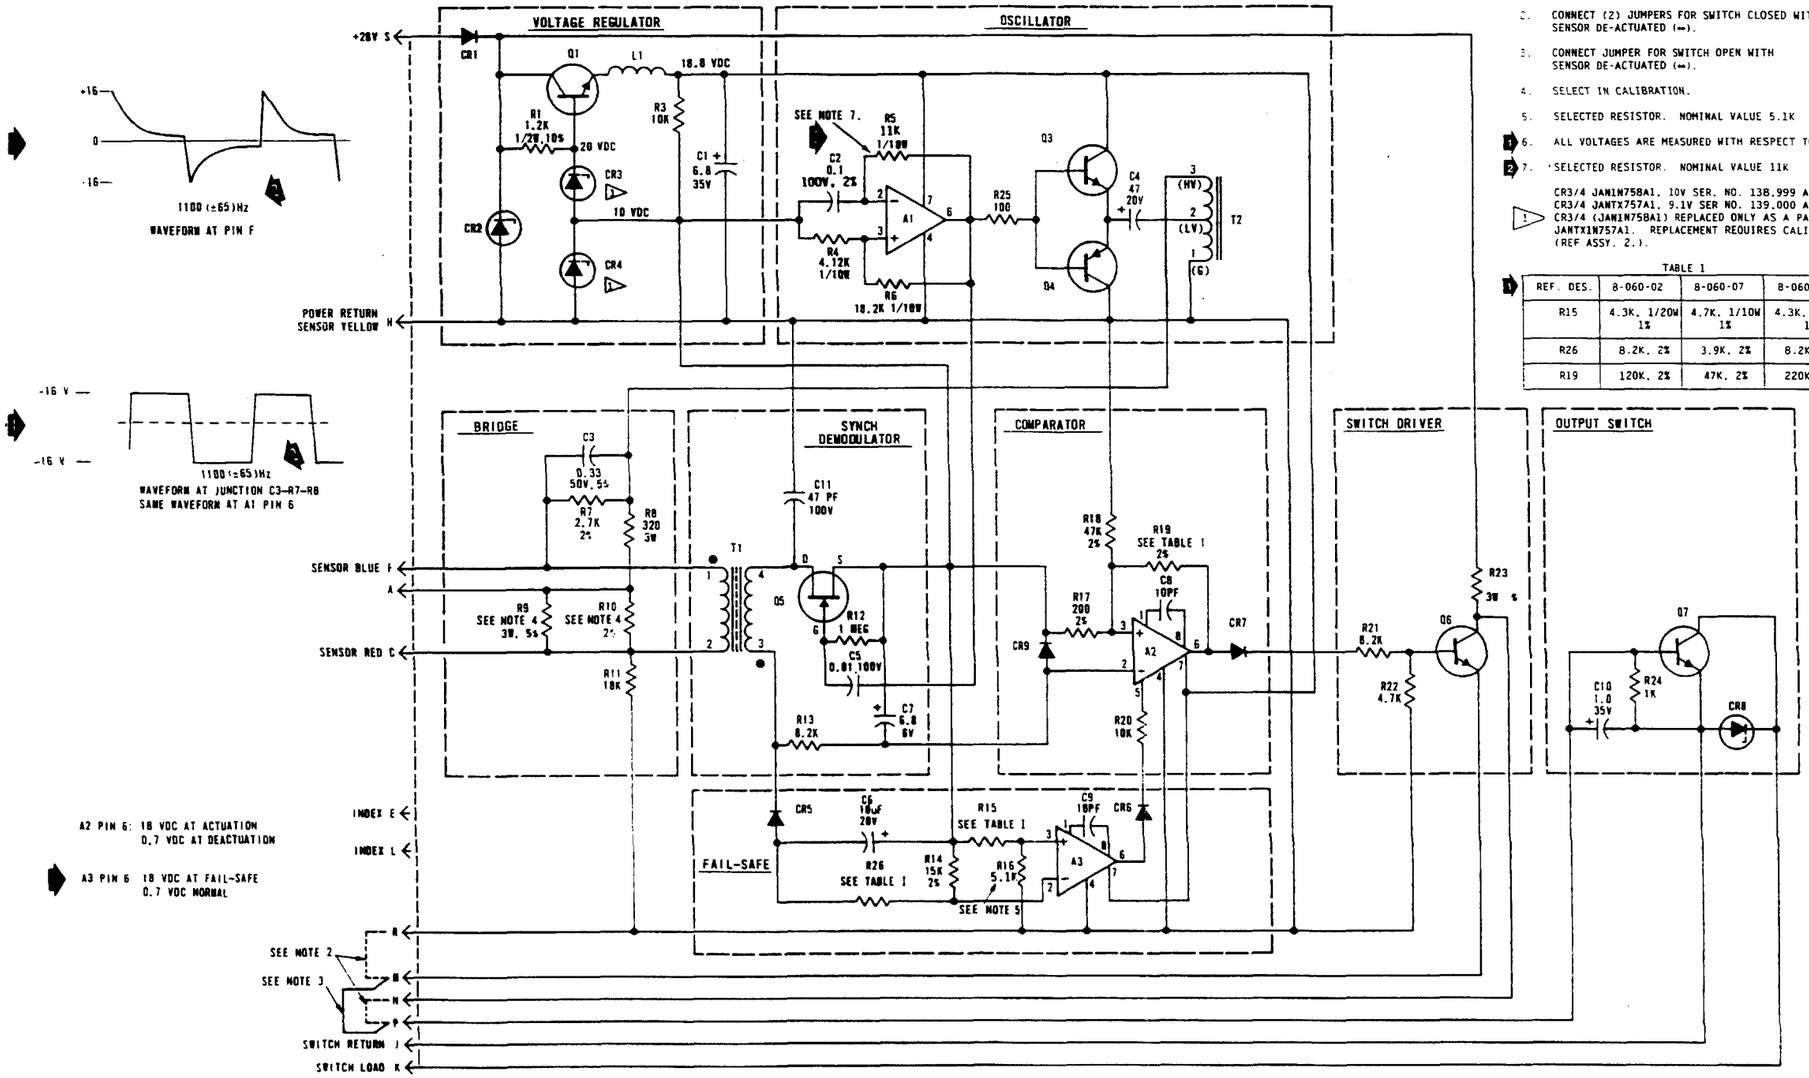
(3) Connect decade resistance box set to 11.5K ohms as R5.

(4) Turn on dc power supply and set its output to 28(±1) Vdc.

(5) Adjust decade resistance box setting to obtain 1100(±30)Hz signal at pin F.

(6) Record decade resistance box setting. Resistance value shall be 9.75K to 12.7K ohms.

(7) Turn off dc power supply and disconnect decade resistance box.



(8) Install a RN55C----F resistor having a value as near as possible to that recorded in step (6) as R5.

(9) Repeat step A and B.

C. Perform procedure given in TESTING.

REVISION CODE	REVISION DESCRIPTION	SERIAL NO. EFFECTIVITY
1	Revised values C1, C6, R16, R19 and Table I. Revised figure title. Added voltages and waveforms. Added Notes 5 and 6.	
2	Revised value of R5. Added tolerances to waveforms. Added Note 7.	
None	Revised values of C2, R9, R15, and R23. Revised tolerances in Note 1. Revised values in Notes 5 and 7.	
None	Added flagnote 1 for CR3 and CR4.	
None	Clarified flagnote 1.

STORAGE INSTRUCTIONS

Package the Proximity Switch Card in a polyethylene bag. Seal in a commercial carton and store in a dry place. Recommended storage temperature 0^{o} to 50^{o}C.

SPECIAL TOOLS, FIXTURES AND EQUIPMENT

Special tools, fixtures and equipment required for overhaul of the 8-060 Switch Card are listed below.

A. Calibration Test Stand, Part No. 3-455-16 (Figure 501).

B. Center-Point Sensor Kit, Part No. 1-899-15-CP-01. Kit includes:

(1) Center Point Sensor, Part No. 1-899-15-CP-02.
(2) Target, Part No. AT10-1.
(3) Actuation Gap data sheet.
(4) Packing material and container.

C. Environmental Test Chamber (-40°C to 85°C) capable of operating switch card as shown in Figure 502.

ILLUSTRATED PARTS LIST

1. Introduction

A. The Illustrated Parts List provides a breakdown of the equipment covered by this manual. All parts are listed in order of disassembly, showing relationships of higher and lower assemblies, and are identified by corresponding item numbers on the equipment illustration.

B. All parts are assigned an item number. Parts listed but not illustrated are identified by a hyphen (-) preceding the item number.

C. For identification of detail parts and assemblies, the nomenclature employs the indenture system. Each assembly is listed with its detail parts listed in the next indenture below and to the right. Conversely, the next higher assembly of any detail part may be determined by its location in the indenture above and to the left.

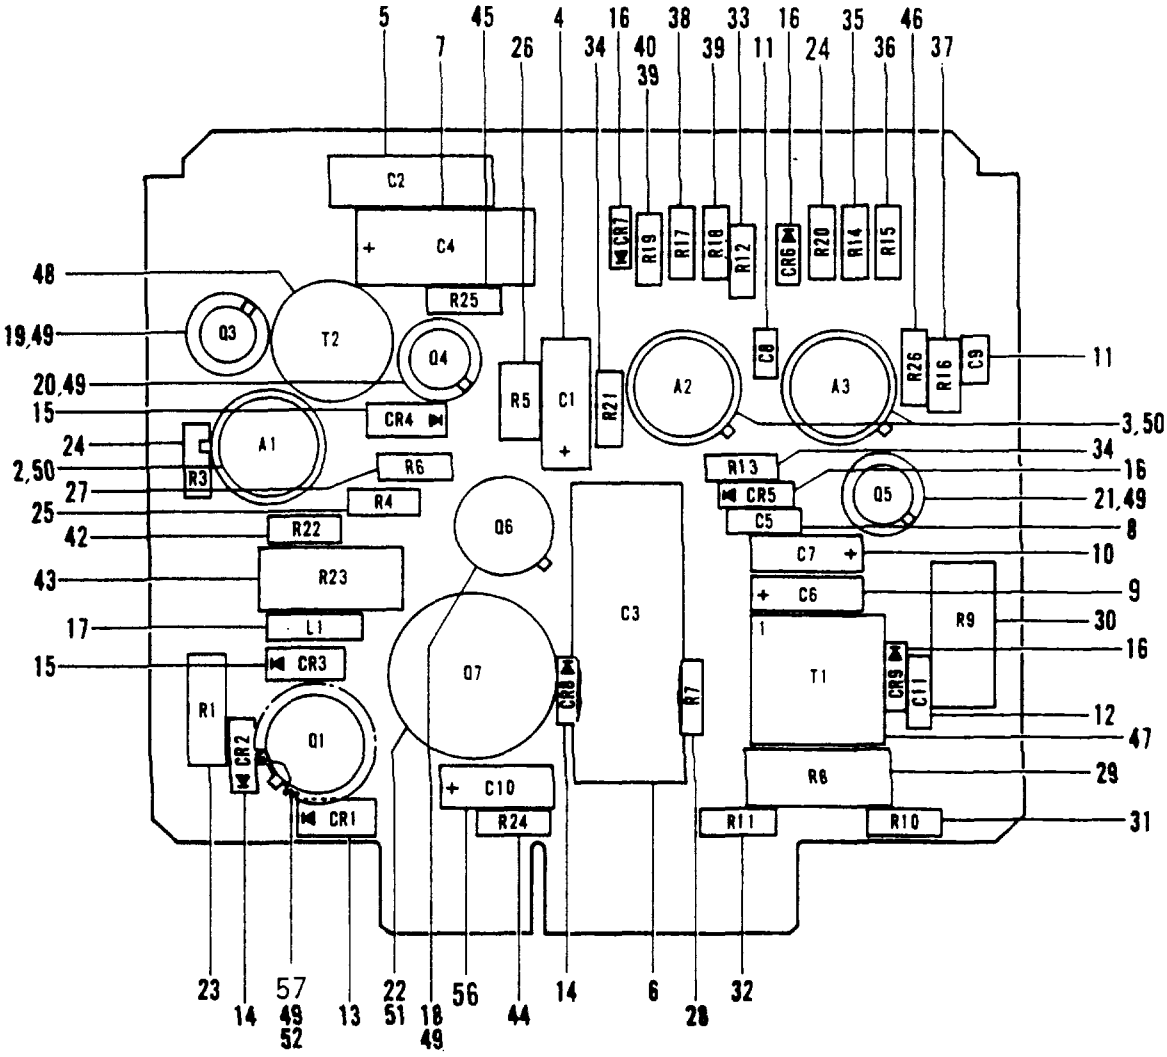
D. Attaching parts immediately follow the part or assembly which they attach, and have the same indenture. They are introduced by the words, ATTACHING PARTS, and their conclusion is indicated by the symbol ***.

E. The letters appearing in the Effect Code column denote the configuration in which the applicable part is used. Where no letter appears, the part is used in all configurations.

The configuration of the unit can be determined by checking the part number and serial number on the identification label. Applicability of components to units and units to part numbers is indicated by the following codes:

EFFECT CODE	CONFIGURATION
A	8-060-02, SN 138,999 and below
B	8-060-07, SN 138,999 and below
C	8-060-10, SN 138,999 and below
D	8-060-02, SN 139,000 and above
E	8-060-07, SN 139,000 and above
F	8-060-10, SN 138,999 and above

F. Unless otherwise indicated by a vendor's code number in parentheses following the part name in the parts list, all parts are either commercial standard, military standard, or ELDEC (V08748) parts.



VENDOR CODE	NAME/ADDRESS
V04713	MOTOROLA INC. Semiconductor Products 5005 E. Mc Dowell Rd. Phoenix, AZ 85008-4229
V07047	THE ROSS MILTON CO. 511 Second Street Pike Southampton, PA 18966
V07256	SILICON TRANSISTOR CORP Katrina Rd. Chelmsford, MA 01824
V13103	THERMALLOY Dallas, TX

2. Numeric Index

The numeric index includes a complete listing of all parts in the Illustrated Parts List arranged in alphanumeric order.-

3. Equipment Designation Index

The equipment designation index contains the reference designations for the components shown on the schematic diagram. The designations are arranged in alphanumerical order.

SERVICE INFORMATION

SECONDARY CALIBRATION STANDARD KIT
ELDEC PART NO. 1-899-15-CP
SERVICE INFORMATION LETTER NO. 27-02, ELDEC DOCUMENT NO. 750222

1. General

This Service Information Letter serves to clarify the identification of the Secondary Calibration Standard Kit referenced in ELDEC overhaul manuals 24-09-01, dated April 1, 1969, Document Number 660630 and 27-09-01, dated February 1, 1973, Document Number 700606. It also notifies customers of ELDEC's requirements for returning center-point sensors for annual recertification.

2. Description

There has been some confusion involving part numbers on ELDEC's Secondary Standard Calibration Kit, 1-899-15-CP. The part number of the entire kit is 1-899-15-CP-01. This kit includes a center-point sensor, 1-899-15-CP-02; a target AT10-1; a data sheet; and various packing materials, all contained in a plastic box.

Some customers have ordered by the number from the sensor, 1-899-15-CP-02, believing they were ordering the entire kit. The center-point sensor is not sold as a separate item, since the close calibration of this item is done with a particular target, and that sensor must be used with that particular target for the calibration data to be valid.

3. Corrective Action

Customers desiring a center-point sensor should order the entire kit, 1-899-15-CP-01. Orders for 1-899-15-CP-02 will be filled with the entire kit. Similarly, when returning center-point sensors for annual recertification, the entire kit must be returned. If partial kits are received for recertification, a charge must be made for the missing parts, in addition to the normal recertification charge.

4. Further Information

For further information please contact ELDEC Product Support Office:

MODEL L10-20 ELECTRO-MECHANICAL LINEAR ACTUATOR

1. DESCRIPTION AND OPERATION.

A. General. This handbook contains descriptive data, overhaul instructions and test procedures for Linear Actuator Model L10-20. The linear actuator is manufactured by Airborne Accessories Corporation, Hillside, New Jersey.

B. The Model L10-20 Electro-Mechanical Linear Actuator converts electrical energy into mechanically controlled linear motion of an output shaft. The actuator is used on the DeHavilland DHC-6 Aircraft, designated as an Aileron Trim Actuator.

C. The actuator incorporates a permanent magnetic motor operated by 26 V DC driving through 3 stages of gear reduction to a 1/4-28 drive screw. The motor has sufficient magnetic cogging effect (detent effect) so that it effectively acts as both a holding and overtravel brake without resorting to the usual friction braking devices. Internal limit switches limit output shaft movement.

D. Table of Leading Particulars

Operating Voltage	18 to 30 volts dc
Operating Temperature	-65°F (-54°C) to +160°F (+71°C)
Operating Duty Cycle	1 minute on, 9 minutes off
Maximum Operating Load	50 pounds (opposing or aiding)
Normal Operating Load	20 pounds (opposing)
Maximum Static Load	100 pounds
Maximum Operating Load Current	0.50 amperes
Maximum Normal Load Current	0.25 amperes
Altitude Range	Sea level to 50,000 feet
Weight	7 ounces

CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

2. DISASSEMBLY

ACTUATOR ASSEMBLY. Disassemble the actuator assembly as follows: (Ref. 27-10-12, Fig. 1.) Note that attaching parts are listed following the parts that they attach. Record thickness of shims removed during disassembly to facilitate reassembly. (Ref. 27-10-11 for special tools and fixtures.) Unsolder all leadwires from components during disassembly.

(1) Cut and remove lockwire from all drilled-head screws.

(2) Remove nut (2) and rubber "O" ring (3).

(3) Remove cover (1) with attached parts.

(4) Do not remove identification plate (8) , identification trademark plate (9) from cover (1) unless they are illegible or otherwise damaged and require replacement.

(5) Do not remove screw (6) washers (4 and 5) and nut (7) from cover (1).

(6) Using a suitable pin punch, remove pin (10) from nut tube (56).

(7) Remove jack end fitting (11) and shims (12) from nut tube (56).

(8) Remove clip retainer (13) from guide housing (63) by removing screws (14). Remove shims (15).

(9) Remove switch actuator block (17) with attached parts from guide housing (63). Do not remove set screws (16) from switch actuator block (17) unless they are damaged and require replacement.

(10) Remove switches (18) from guide housing (63) by removing nuts (19), screws (20) switch actuators (21 and 22), clip retainer (23), terminals (24) and filter coil assembly (25). Remove capacitors (62).

(11) Remove insulation sleeving from external leadwires of actuator assembly and using SPECIAL WRENCH AT3794, remove screw (26), shim (27) and grommet (28) from flanged cover (29).

(12) Remove flanged cover (29) from main housing (31) by removing screws (30).

(13) Remove main housing (31) with attached roller needle bearing (33) by removing screws (32). Do not remove roller needle bearing (33) unless damaged.

CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

2. DISASSEMBLY (continued)

(14) Remove spur gear (38) with attached parts from intermediate housing (46) and remove shims (34) and ball bearings (37).

(15) Remove spur gear (36) with attached parts from intermediate housing (46) and remove shims (34) and ball bearing (35).

(16) Remove motor assembly (39) from intermediate housing (46) by removing screws (40) and clamps (41).

(17) Using a suitable pin punch, remove pin (42) from nut (43) and remove nut (43), shims (44) and spur gear (45).

(18) Remove intermediate housing (46).

(19) Remove screw and nut assembly (59), with attached parts, from guide housing (63) and disassemble as follows:

(a) Remove keys (47 and 48), shim (49) ball bearing (50), shims (51), ball bearing (50), shims (52 and 51) from positive dog stop (53).

(b) Remove positive dog stop (53) from screw and nut assembly (59).

(c) Remove key (58), nut tube (56) and shim (57) from screw and nut assembly (59).

CAUTION: Use extreme care in removing key (58) to prevent damage to nut tube (56) or acme nut, portion of screw and nut assembly (59).

(d) Remove nut (54) and positive dog stop (55) from acme screw portion of screw and nut assembly (59).

NOTE: Acme nut and acme screw portions of screw and nut assembly (59) must be maintained as a matched set.

(20) Remove bushing (60) and seal washer (61) from guide housing (63).

CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

3. CLEANING

Actuator Assembly (Ref. 27-10-12 Fig. 1.)

(1) Clean all electrical parts and non-metallic parts using a stiff non-wire brush. Blow the loose foreign particles from the parts using dry, filtered, low pressure, compressed air. Wipe the parts with a clean, dry, lint-free cloth.

CAUTION: DO NOT USE A CLEANING SOLVENT OF ANY KIND TO CLEAN ANY ELECTRICAL PARTS OR NON-METALLIC PARTS.

(2) Clean all other parts using an ultrasonic cleaner or vapor liquid degreaser with spray attachments. Use a cleaning solvent which conforms to Federal Specification O-T-634, Type II.

PLESSEY DYNAMICS DIVISION, PLESSEY INDUSTRIES, INC.
1414 CHESTNUT AVENUE • HILLSIDE, NEW JERSEY 07205
(201) 688-0250 • TWX 710-985-4667 • TELEX 138353
CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

4. INSPECTION/CHECK

Actuator Assembly (Ref. 27-10-12, Fig. 1.)

(1) Visually examine all parts for damage or corrosion.

(2) Inspect all gear teeth for tooth deformation, stress cracks and scored teeth.

(3) Inspect all tapped holes and threaded parts for stripped or crossed threads.

(4) Inspect all leadwires for cracked insulation and test for continuity with an ohmmeter.

(5) Check inductance of filter coil assembly (25) using Impedence Bridge #1650-A. Inductance when measured between red and red/wht leadwires and green and green/wht leadwires shall be 60 uh to 70 uh.

(6) Inspect switches (18) for damaged cases and malfunction. Check electrical operation with an ohmmeter.

PLESSEY DYNAMICS DIVISION, PLESSEY INDUSTRIES, INC.

(201) 688-0250 • TWX 710-985-4667 • TELEX 138353
CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

5. REPAIR AND REPLACEMENT

(1) Replace all defective parts that do not meet the inspection criteria of 27-10-4.

(2) It is recommended that all ball bearings be replaced at each overhaul.

(3) Do not attempt to repair individual parts.

PLESSEY DYNAMICS DIVISION, PLESSEY INDUSTRIES, INC.
1414 CHESTNUT AVENUE • HILLSIDE, NEW JERSEY 07205
(201) 688-0250 • TWX 710-985-4667 • TELEX 138353
CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

6. ASSEMBLY

NOTE: Test motor assembly (38) (Ref. 27-10-8 Para. B.) before assembling the actuator.

Actuator Assembly. (Ref. 27-10-12, Fig. 1.) Assemble the actuator as follows: Initially install the same thickness of shims as removed and recorded during disassembly, unless otherwise specified. Refer to list of bulk materials and Ref. 27-10-11 for special and standard tools and fixtures.

(1) General

(a) Coat all gears and working parts lightly with grease conforming to Military Specification MIL-G-23827, unless otherwise specified.

(b) Coat screw and nut assembly (59) lightly with a mixture of Molykote Powder Type Z conforming to Military Specification. MIL-M-7866 and Aero-Lubriplate mixed half and half by volume.

(c) Apply anti-seize compound conforming to Military Specification MIL-T-5544 to all aluminum screw parts and to all steel screws that anchor into aluminum, unless otherwise specified.

(d) Make all electrical solder connections per Military Specification MIL-S-6872 using solder conforming to Federal Specification QQ-S-571.

(e) Lockwire all drilled head screws with wire conforming to Military Standard MS20995 using practices conforming with Military Standard MS33540.

(2) Assemble screw and nut assembly as follows:

(a) Install positive stop (55) onto screw and nut assembly (59) and adjust for maximum stop face engagement with acme nut portion of screw and nut assembly (59).

(b) Install self locking nut (54) and secure.

PLESSEY DYNAMICS DIVISION, PLESSEY INDUSTRIES, INC.

(201) 688-0250 • TWX 710-985-4667 • TELEX 138353
CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

6. ASSEMBLY (continued)

(c) Install shim (57) and nut tube (56) onto screw and nut assembly (59) and tighten hand tight. Thickness of shim (57) required shall result in alignment of nut tube slot with screw and nut assembly slot.

NOTE: When shimming requirement has been obtained, remove acme nut portio of screw and nut assembly (59) from nut tube (56) and lightly coat threads using adhesive GLYPTAL #ZV903 and reassembly.

(d) Install key (58) and secure using adhesive CEMENT #910.

WARNING: USE EXTREME CAUTION IN USING ADHESIVE CEMENT #910. REFER TO MANUFACTURES INSTRUCTIONS.

(e) Install shim (51), ball bearing (50), shim (51), ball bearing (50) and shim (49) onto positive stop (53).

(f) Install positive stop (53) with attached parts onto screw and nut assembly (59) and adjust for maximum stop face engagement with acme nut portion of screw and nut assembly (59).

(g) Install key (48).

(3) Install screw and nut assembly (59) with attached parts into guide housing (63) engaging guide housing slot with nut tange and install intermediate housing (46

(4) Install spur gear (45), keys (47), shims (44) and nut (43) onto screw and nut assembly (59). Add or remove shims (44) as necessary to align nut slot with hole in acme screw portion of screw and nut assembly (59).

(5) Using a suitable arbor press or pin punch install spring pin (42).

(6) Using a suitable magnetically mounted dial indicator, measure the end play of screw and nut assembly (59). Add shims (52) as necessary to remove all end play Air gap between intermediate housing (46) and guide housing (63) shall not exceed 0.002 in. maximum (Ref. Fig. 1).

CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

6. ASSEMBLY (continued)

(7) Install ball bearings (35 and 37) into applicable bores of intermediate housing (46) and main housing (31).

(8) Install motor assembly (39) onto intermediate housing (46) using clamps (41) and screws (40).

NOTE: Motor leadwires must face downward towards guide housing (63) before securing motor.

(9) Install spur gear (36) into intermediate housing (46) ensuring that spur gear (36) is fully seated and engaged with motor assembly pinion.

(10) Install spur gear (38) into intermediate housing (46) ensuring that spur gear (38) is fully seated and engaged with spur gear (36) and spur gear (45).

(11) Install ball bearings (35 and 37) on spur gear (36 and 38).

(12) If roller needle bearing (33) was removed from main housing (31) re-install, using suitable arbor press. Using a suitable depth micrometer, dimension from roller needle bearing face to main housing face shall be 0.31 to 0.33 maximum. (Ref. Fig. 1).

(13) Install shims (34) into applicable bores of main housing (31). Add or remove shims (34) as necessary to obtain 0.002 to 0.004 in end play of spur gears (36 and 38).

(14) Install main housing (31) with attached parts onto intermediate housing (46) and secure using screws (32).

NOTE: Ensure ball bearings (35 and 37) are fully seated in main housing (31).

6. ASSEMBLY (continued)

(15) Coat seal washer (61) lightly with Beacon grease #325 and install into main housing (63).

(16) Install resilient bushing (60) into main housing (63) and temporary install nut (2).

(17) Install switches (18), switch actuators (21 and 22), capacitors (62), clip retainer (23), filter coil assembly (25) and terminals (24) onto guide housing (63) using screws (20) and nuts (19).

NOTE: Lightly coat both sides of switch actuators (21 and 22) using adhesive GLYPTAL #1276.

NOTE: Wrap capacitors (62) effeciently using mylar tape 0.62 or 0.50 in. wide to insure clamping with clamp (23).

(18) Secure nuts (19) using adhesive GLYPTAL #ZV903.

(19) Install switch actuator block (17) onto guide housing (63) engaging nut tang, portion of screw and nut assembly (59).

(20) Install set screws (16) into switch actuator block (17) sufficiently to make contact with switch actuators (21 and 22).

(21) Install shims (15) as necessary to obtain 0.001 to 0.003 in. clearance between clip retainer (13) and switch actuator block (17) Ref. Fig. 2). Install clip retainer (13) using screws (14).

6. ASSEMBLY (continued)

(22) Secure screws (14) using adhesive GLYPTAL #ZV903.

(23) Install insulation, electrical paper 0.010 thk. X 0.50 in. w X 1.12 in. lg. (type "F") per Military Specification MIL-I-695 to motor assembly (39) to insulate switches (18). Secure insulation, electrical paper using adhesive GLYPTAL #1276.

(24) Install jack end fitting (11) and shims (12) into nut tube (56). Add or remove shims (12) as necessary to obtain 4.25 in. ± .03 dimension from center of hole in main housing (31) to end of jack end fitting (11).
NOTE: Unit in full mechanical retract position at this time.

(25) Ref. Fig. 3 for wiring connections.

MODEL L10-20 ELECTRO-MECHANICAL LINEAR ACTUATOR

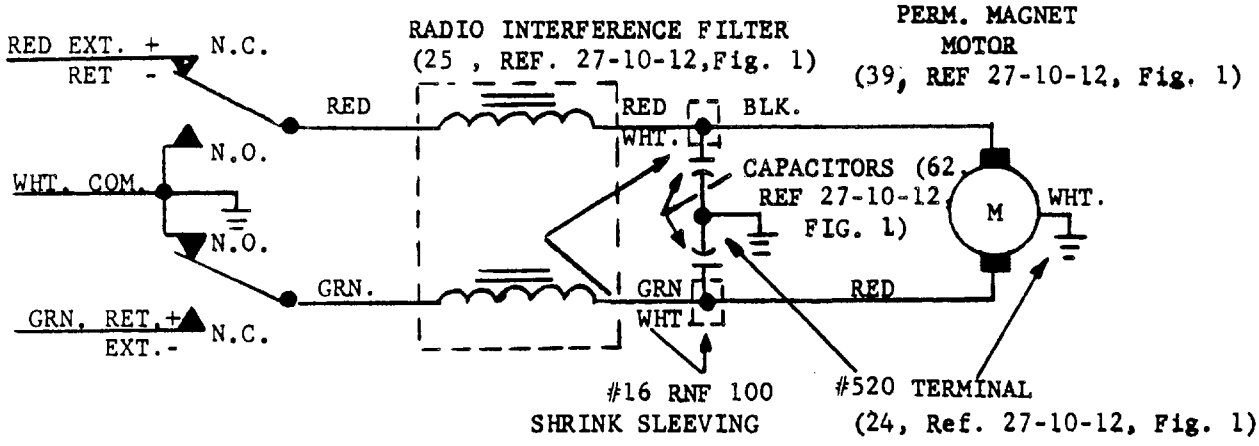

Figure 3 Wiring Diagram

MODEL L10-20 ELECTRO-MECHANICAL LINEAR ACTUATOR

6. ASSEMBLY (continued)

NOTE: After wiring has been completed, route external leadwires, green, white and red thru exit hole in main housing (31). At approximately 0.250 in. from face of main housing (31), single knot each leadwire.

(26) Install flanged cover (29) onto main housing (31) using screws (30).

(27) Install grommet (28), shim (27) and screw (26).

NOTE: Secure grommet using adhesive GLYPTAL #ZV903. SPECIAL WRENCH AT3794 to tighten screw (26).

(28) Install insulation sleeving #9 10.00 in. lg. per Military Specification MIL-I-7444 over external leadwires.

(29) Upon satisfactory completion of test procedures (Ref. 27-10-8 Para. A.), lockwire motor screws (40) with wire conforming to Military Standard MS20095 using practices conforming to Military Standard MS33540.

NOTE: Lockwire to route over roller needle bearing (33).

(30) Remove nut (2) temporary installed and apply SEALER #EC-1126 0.125 in. diameter to inside surface to main housing (31).

(31) If identification plates (8 and 9) were removed, secure new identification plates to cover (1).

(32) Install screw (6), washers (4 and 5) and nut (7) to cover (1) and secure using sealent per Military Specification MIL-S-22473 GRADE A.

NOTE: It may be necessary to install only one washer under head of screw (6) to provide clearance between filter coil assembly (25) and screw (6).

(33) Install cover (1) with attached parts, "O" ring (3) and nut (2) onto guide housing (63) and remove excess Sealer #EC-1126.

NOTE: Tighten nut (2) hand tight only.

(34) Using DRILLING AND PINNING FIXTURE AT3796, drill a 0.625 $^{+.0015}_{-.0000}$ inch diameter hole thru nut tube (56) and jack end fitting (11). Press in and centrally locate pin (10). Stake to secure. (Ref. Fig. 1).

(35) Lockwire all remaining screws and nuts with wire conforming to Military Standard MS20005 using practices conforming to Military Standard MS33540.

7. FITS AND CLEARANCES.

Actuator Assembly (Ref. 27-10-12 Fig. 1.)

PARTS	METHOD	FIT/CLEARANCE
Nut Tube (56) and screw and nut assembly (59).	Use shim (57) as required.	Obtain alignment of slot of nut tube (56) with slot of acme screw, portion of screw and nut assembly (59).
Nut (43) and screw and nut assembly (59).	Use shims (44) as required.	Obtain alignment of slot of nut (43) with hole in acme screw portion of screw and nut assembly (59).
Intermediate housing (46), guide housing (63) and screw and nut assembly (59).	Use shims (52) as required.	Eliminate all end play of screw and nut assembly (59) and to obtain 0 to 0.002 in. max. air gap between guide housing (63) and intermediate housing (46).
Roller needle bearing (33).	Press in roller needle bearing as required.	Obtain 0.31 to 0.33 in. dimension from face of main housing (31).
Spur gears (36 and 38) and main housing (31).	Use shims (34) as required.	Obtain 0.002 to 0.004 in. end play of spur gears (36 and 38).
Clip retainer (13) and switch actuator block (17).	Use shims (15) as required.	Obtain 0.001 to 0.003 in. clearance between clip retainer (13) and switch actuator block (17).
Jack end fitting (11) And Nut Tube (56).	Use shim (12) as required	Obtain 4.25 ± .03 in. dimension from center of hole in main housing (31) to extreme end of jack end fitting (11).

8. TESTING.

A. Actuator Assembly. (Ref. 27-10-12, Fig. 1) Ref. 27-10-11 for Special Tools, Fixtures and Test Equipment.

(1) General.

(a) Mount the actuator assembly in Load Test Fixture AT1390 using Pins AT1390-1 and Bushings AT1390-6. Use applicable adapter when mounting actuator assembly (Ref. 27-10-12 (**)).

(b) Mount the Dial Indicating Attachment AT3138 to Load Test Fixture AT1390.

(c) Use DC Test Panel AT3256 to provide necessary control of electrical power to operate the actuator assembly and to check current draw during operational tests.

NOTE: All operational tests are made at 26 volts dc.

(2) End Play: Using Push-Pull Scale #767, apply a 5 pound reversing axial load to the load support arm of Load Test Fixture AT1390. End play when measured under the applied load shall not exceed 0.005 inches.

(3) Mechanical Stops: Operate into each stop two times at no load speed. Damage or jamming must not occur at either stop. Check stop locations.

(4) Electrical Limits:

(a) Adjust Extend set screw (16) as required to obtain electrical extend stroke limit. (Ref. Fig. 1).

(b) Adjust Retact set screw (16) as required to obtain electrical retract stroke limit (Ref. Fig. 1).

NOTE: After final limit setting has been obtained, apply sealent per Military Specification MIL-S-22473 GRADE B. to the exposed threads of set screws (16).

CABLE ADDRESS: PLESSEY HILLSIDE (NJ USA)

8. TESTING (continued)

(5) Maximum Load:

(a) Apply a 50 pound opposing load and operate actuator thru one complete cycle. Current shall not exceed 0.5 amperes.

(b) Apply a 50 pound aiding load and operate actuator thru one complete cycle. Current shall not exceed 0.5 amperes.

(6) Normal Load: Apply a 20 pound opposing load and operate actuator thru one complete cycle. Time shall be 7.43 to 13.81 seconds for a 0.87 in. stroke. Current must not exceed 0.25 amperes

B. Motor Assembly (Ref. 27-10-12 Fig. 1) Ref. 27-10-11 for Special Tools, Fixtures and Test Equipment.

(1) General

(a) Mount the motor assembly in the Bischoff-Sub-Fractional Dynamometer #10-B and mount Load Test Pulley AT3792 onto motor pinion.

(b) Use DC TEST PANEL AT3256 to provide necessary control of electrical power to operate the motor assembly and to check current draw during operational tests.

NOTE: All operational tests are performed at room temperature.

(2) Maximum Load: With 18 volts dc applied, the motor assembly shall operate against a 0.4 oz. in. load.

(3) Maximum Current: With 26 volts dc applied, the motor assembly shall operate against a 0.4 oz. in. load and the current draw shall not exceed 0.50 ampere.

(4) Rated Load: With 26 volts d.c. applied, the motor assembly shall operate against a 0.15 oz. in. load and the current draw shall not exceed 0.25 maximum ampere.

(5) Load Speed: With 26 volts dc applied and using STROBOTAC #1531-A, measure the motor assembly output shaft speed. Speed shall be 8,000 to 10,400 RPM with a 0.15 oz. in. rated load applied.

MODEL L10-20 ELECTRO-MECHANICAL LINEAR ACTUATOR

9. TROUBLE SHOOTING

Actuator Assembly (Ref. 27-10-12, Fig. 1)

TROUBLE	PROBABLE CAUSE	REMEDY
INOPERATIVE, NO CURRENT	Open circuit	(Ref. 27-10-8, Fig. 1) Check continuity with an ohmmeter. Correct or replace motor assy. (39, Ref. 27-10-12, Fig. 1).
	Defective Limit Switches	Replace switches (18, Ref. 27-10-12, Fig. 1).
LOW SPEED HIGH CURRENT	Insufficient end play.	Disassemble and correct. (Ref. 27-10-6 steps (6) and (13)).
	Mechanical Binding	Disassemble, locate and correc
NOISY OPERATION	Excessive end play, improper shimming.	Disassemble and correct. (Ref. 27-10-6 steps (6) and (13)).
INOPERATIVE, EXCESSIVE CURRENT	Short Circuit	Remove motor assy, (39) and replace (Ref. 27-10-12, Fig. 1)
ERRATIC OPERATION OF LIMIT SWITCHES	Improper shimming	Disassemble and correct (Ref. 27-10-6 step (21)).

MODEL L10-20 ELECTRO-MECHANICAL LINEAR ACTUATOR

1. SPECIAL TOOLS, FIXTURES AND TEST EQUIPMENT

TOOL NUMBER	NOMENCLATURE	APPLICATION
AT1390 to include AT1390-1 Pin (2-Req'd) AT1390-6 Bushing (4-Req'd)	FIXTURE, Load Test	Used with Dial Indicating Attachment AT3138 and DC Test Panel AT3256 to check load, end play, mechanical stops and electrical limits of actuator assembly. Actuator shall use fitting assy. (Ref. 27-10-12(**) for tests.
AT3138	ATTACHMENT, Dial Indicating	Used with Load Test Fixture AT1390 and DC Test Panel AT3256 to check and measure load, end play and electrical limit requirements of actuator assembly.
AT3256	PANEL, Test, DC	Used to provide necessary control of electrical power to operate the actuator and/or motor assembly and to check current draw during operational testing.
AT3794	WRENCH, Special	Used to tighten nut (26) (Ref. 27-10-12, Fig. 1).
AT3796	FIXTURE, Drilling and Pinning	Used to support actuator assembly when drilling hole thru nut tube (56) and jack end fitting (11) (Ref. 27-10-12, Fig. 1). Also used to Press in groove pin (10). & stake (Ref. 27-10-12, Fig. 1).

11. SPECIAL TOOLS, FIXTURES AND TEST EQUIPMENT (continued)

THE FOLLOWING STANDARD EQUIPMENT IS REQUIRED AND MAY BE PURCHASED FROM VENDORS OTHER THAN AIRBORNE ACCESSORIES CORPORATION.

TOOL NUMBER	NOMENCLATURE	APPLICATION
#500 Rayclad Tubes Inc. Redwood City, Calif.	THERMOGUN	Used to shrink fit heat shrinkable tubing over applicable leadwires on actuator assembly.
#767 John Chatillon and Sons, Inc. New York, N.Y.	SCALE, Push-Pull	Used with Load Test Fixture AT1390 to apply necessary load when checking end play requirement of actuator assembly.
#1650-A	BRIDGE, Impedence	Used to measure inductance of filter coil assembly (25, Ref. 27-10-12 Fig. 1).

FLAP/ELEVATOR INTERCONNECT BALL SCREW JACK

PART NO. C6CF1080

REASON FOR ISSUE:

This Temporary Revision introduces Part no. C6CF1080–3 according to Modification 6/1866.

ACTION:

1. Ignore existing page 1 and substitute new page 2 of 6 as shown on this Temporary Revision.
2. Ignore existing page 4 and substitute new page 3 of 6 as shown on this Temporary Revision. Insert page 3 of 6 facing existing page 4.
3. Ignore existing page 6 and substitute new page 5 of 6 as shown on this Temporary Revision. Insert page 5 of 6 facing existing page 6.
4. Page 7, ignore existing table List of Parts in paragraph B. and substitute new table as shown on page 6 of 6 on this Temporary Revision.

– Continued overleaf –

RECORDING INSTRUCTIONS:

Record this Temporary Revision No. and the relevant information in the appropriate columns of the TEMPORARY REVISION INDEX provided at the front of the manual.

FLAP/ELEVATOR INTERCONNECT BALL SCREW JACK

PART NO. C6CF1080

1. Description and Operation (Figure 1)

   The flap/elevator interconnect ball screw jack converts flap system linear motion into rotary motion. The ball screw jack consists of a ball screw assembly, a spindle, an end plate and boss, or an end support assembly. The ball screw assembly consists of a threaded shaft which engages ballbearings enclosed in a tube integral with a ball cage. The ball cage is keyed into the spindle and integral cable drum; both rotate on a bearing mounted on the end plate support bracket. Linear movement of the ball screw assembly causes the spindle to rotate together with the integral cable drum.

2. Disassembly

   A. Disassemble Flap/Elevator Interconnect Ball Screw Jack (Figure 2)

      (1) Cut lockwire and remove headless bolts (1) and spring pin (2) from spindle (22).

      (2) Remove nut (3) and withdraw ball screw assembly (4) from spindle.

      (3) Tape ends of ball screw assembly screw, to prevent ball cage and balls from rotating off screw.

      (4) Remove cotter pin (5), nut (6), washer (7) from end of ball screw assembly.

      (5) Remove end fitting (8) from ball screw assembly, by removing bolt (9).

      (6) Remove end plate retaining nut, cotter pin (10), nut (11) and washer(s) (12).

      (7) Remove end plate (13) and boss (14), or end support assembly (15).

      (8) Remove cable guard pins retaining nuts (16), washers (17) and guard pins (18) from end plate, or end support assembly.

      (9) Remove bearing retaining ring (19), bearing (20) and bolt (21) from spindle (22).

3. Cleaning

   A. General

      (1) Clean components, except bearing (20), (Figure 2), by washing or spraying with a dry–cleaning solvent.

      (2) Dry with compressed, filtered, dry air or a lint–free cloth.

4. Inspection /Check

   A. General

      (1) Inspect metal components using the fluorescent penetrant method, or an approved dye penetrant method.

FLAP/ELEVATOR INTERCONNECT BALL SCREW JACK

PART NO. C6CF1080

1. Description and Operation (Figure 1)

The flap/elevator interconnect ball screw jack converts flap system linear motion into rotary motion. The ball screw jack consists of a ball screw assembly, a spindle, an end plate and boss, or an end support assembly. The ball screw assembly consists of a threaded shaft which engages ball bearings enclosed in a tube integral with a ball cage. The ball cage is keyed into the spindle and integral cable drum; both rotate on a bearing mounted on the end plate support bracket. Linear movement of the ball screw assembly causes the spindle to rotate together with the integral cable drum.

2. Disassembly

A. Disassemble Flap/Elevator Interconnect Ball Screw Jack (Figure 2)

(1) Cut lockwire and remove headless bolts (1) and spring pin (2) from spindle (22).

(2) Remove nut (3) and withdraw ball screw assembly (4) from spindle.

(3) Tape ends of ball screw assembly screw, to prevent ball cage and balls from rotating off screw.

(4) Remove cotter pin (5), nut (6), washer (7) from end of ball screw assembly.

(5) Remove end fitting (8) from ball screw assembly, by removing bolt (9).

(6) Remove end plate retaining nut, cotter pin (10), nut (11) and washers (12).

(7) Remove end plate (13) and boss (14), or end support assembly (15).

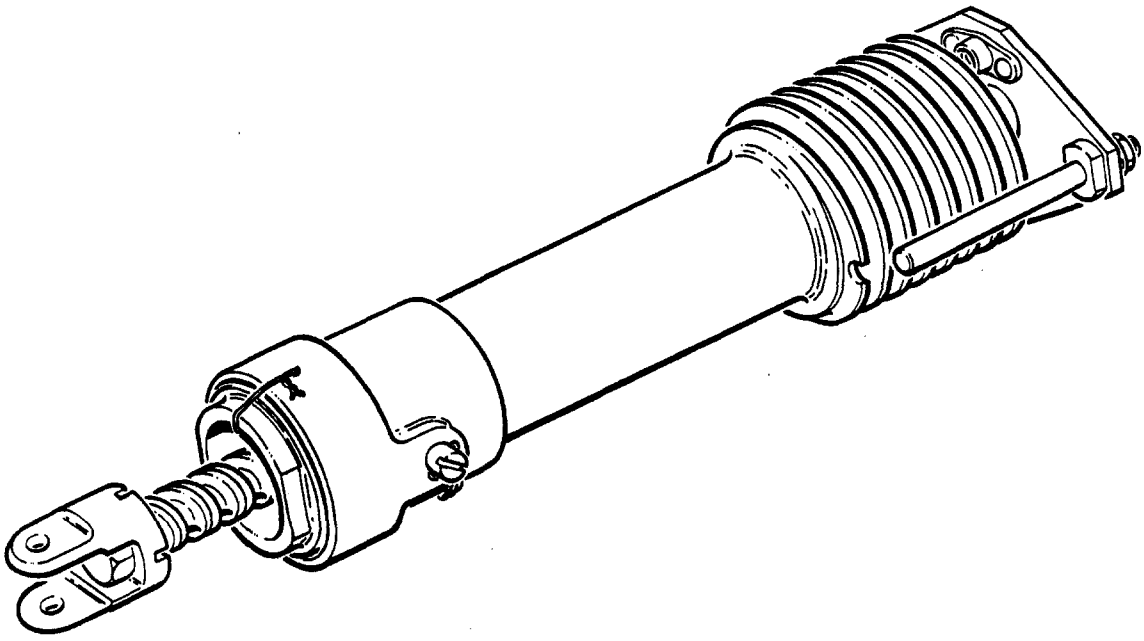
(8) Remove cable guard pins retaining nuts (16), washers (17) and guard pins (18) from end plate, or end support assembly.

(9) Remove bearing retaining ring (19), bearing (20) and bolt (21) with washers (12) from spindle (22).

3. Cleaning

A. General

(1) Clean components, except bearing (20), (Figure 2), by washing or spraying with a dry-cleaning solvent.



(2) Dry with compressed, filtered, dry air or a lint-free cloth.

4. Inspection/Check

A. General

(1) Inspect metal components using the fluorescent penetrant method, or an approved dye penetrant method.

NOTE: Please see the TEMPORARY REVISION that revises this page

Flap/Elevator Interconnect Ball Screw Jack

Figure 1

(2) Inspect all parts visually for signs of fatigue and cracks, and for damage such as galls, scores, scratches, excessive wear, and corrosion.

(3) Inspect all threads for damage and deformity.

(4) Refer to Table 1 for original tolerances and service limits. Repair or replace parts worn in excess of service limits as prescribed in Table 1. Replace all defective parts not listed in table.

Table 1

Original Tolerances and Service Limits

FIGURE 2 ITEM NO.	NAME	DISCREPANCY LOCATION	ORIGINAL DIMENSION (INCHES)	SERVICE LIMITS (INCHES)	DISPOSITION
8	End Fitting	Keyway Attachment holes	0.090 - 0.095 0.1897 - 0.1903	0.097 0.1913	Replace Replace
22	Spindle	Bearing housing	0.8998 - 0.9006	0.9007	Replace
4	Ball screw assembly	Key	0.087 - 0.085	0.083	Replace
20	Bearing	OD ID	0.9014 - 0.9009 0.2495 - 0.2500	0.9008 0.2510	Replace Replace

(5) Cycle ball nut of ball screw assembly (4) along screw shaft from end to end and check for smooth operation.

5. Repair

A. General

(1) Replace all defective parts.

(2) Replace cadmium-plated parts which have had coating damaged or removed, or replate the part.

(3) When anodized parts have had protective surface treatment removed, apply a protective coating of Alodine solution No. 1200 to affected area(s) or reanodize the part.

(4) Replace standard parts such as cotter pins, washers, and lockwire.

Insert facing page 4

6. Assembly

List of Materials

Material	Specification
Corrosion Preventative Compound	MIL–C–16173 Grade 2
Grease	MIL–G–23827
Grease	Aeroshell 7
Loctite Grade H Sealant	MIL–S–22473
Corrosion Resistant Lockwire 0.032	MS20995C32

A. Assemble Flap/Elevator Interconnect Ball Screw Jack (Figure 2)

(1) Apply corrosion preventive compound MIL–C–16173 Grade 2 to bolt (21) and insert bolt through bearing (20).

(2) Apply grease MIL–G–23827 through holes in outer race of bearing (20) and install bearing in spindle (22).

(3) Install bearing retaining ring (19).

(4) Install cable guard pins (18), washers (17) and retaining nuts (16) to end plate (13), or end support assembly (15).

(5) Install boss (14) and end plate (13), or end support assembly (15), to bolt (21).

(6) Install washer(s) (12), nut (11) and cotter pin (10).

(7) Assemble end fitting (8) to bolt (9).

(8) Insert bolt (9) through ball screw assembly (4), engaging ball screw key in one of the two slots in end fitting. Lightly lubricate ball screw assembly with Aeroshell 7 grease or equivalent.

(9) Install washer (7) and nut (6). Remove tape from ends of ball screw assembly.

NOTE: The installation of a one washer (7) and nut (6) (AN310–3), is a requirement of modification 6/1168, which should be followed if the modification has not been incorporated.

NOTE: When ball screw assembly (4) is installed in spindle (22), the dimension between the bolt hole in the end fitting (8) to the outside face of cable drum of spindle (22) should be 7. 28 to 7.40 inches, with cable slots of drum in line with bolt hole in end fitting.

(10) Carry out trial installation of ball screw assembly to insure conditions detailed in NOTE are met. If not, engage other slot in end fitting with ball screw key.

(11) Tighten nut (6) and install cotter pin (5).

(12) Apply Loctite Grade H to ball screw assembly (4) mating face and install in spindle (22). Line up holes in ball screw nut with headless bolt (1) holes in spindle.

(13) Install headless bolts (1).

THIS PAGE INTENTIONALLY LEFT BLANK

. Assembly

List of Materials

Material	Specification
Corrosion Preventative Compound	MIL-C-16173 Grade 2
Grease	MIL-G-23827
Loctite Grade H Sealant	MIL-S-22473
Corrosion Resistant Lockwire 0.032	MS20995C32

A. Assemble Flap/Elevator Interconnect Ball Screw Jack (Figure 2)

(1) Apply corrosion preventive compound MIL-C-16173 Grade 2 to bolt (21) and install two washers (12) under head, insert bolt through bearing (20).

(2) Apply grease MIL-G-23827 through holes in outer race of bearing (20) and install bearing in spindle (22).

(3) Install bearing retaining ring (19).

(4) Install cable guard pins (18), washers (17) and retaining nuts (16) to end plate (13), or end support assembly (15).

(5) Install boss (14) and end plate (13), or end support assembly (15), to bolt (12).

(6) Install two washers (12), nut (11) and cotter pin (10).

(7) Assemble end fitting (8) to bolt (9).

(8) Insert bolt (9) through ball screw assembly (4), engaging ball screw key in one of the two slots in end fitting. Lightly lubricate ball screw assembly with oil MIL-L-7870A.

(9) Install washer (7) and nut (6). Remove tape from ends of ball screw assembly.

NOTE: The installation of a one washer (7) and nut (6) (AN310-3), is a requirement of modification 6/1168, which should be followed if the modification has not been incorporated.

NOTE: When ball screw assembly (4) is installed in spindle (22), the dimension between the bolt hole in the end fitting (8) to the outside face of cable drum of spindle (22) should be 7.28 to 7.40 inches, with cable slots of drum in line with bolt hole in end fitting.

(10) Carry out trial installation of ball screw assembly to insure conditions detailed in NOTE are met. If not, engage other slot in end fitting with ball screw key.

(11) Tighten nut (6) and install cotter pin (5).

(12) Apply Loctite Grade H to ball screw assembly (4) mating face and install in spindle (22). Line up holes in ball screw nut with headless bolt (1) holes in spindle.

(13) Install headless bolts (1).

NOTE: Please see the TEMPORARY REVISION that revises this page

(14) Install nut (3) and tighten.

(15) Using hole in spindle as guide, drill 0.65 - 0.62 inch diameter hole through nut. (Not required if hole in nut lines up with hole in spindle.)

(16) Insert spring pin (2) into hole and lockwire nut (3) to spindle (22).

(17) Lockwire headless bolts (1).

(18) Operate assembly through full range and check for free and smooth movement.

7. Fits and Clearances

Refer to Table 1.

8. Testing

Not Applicable.

9. Trouble Shooting

Not Applicable.

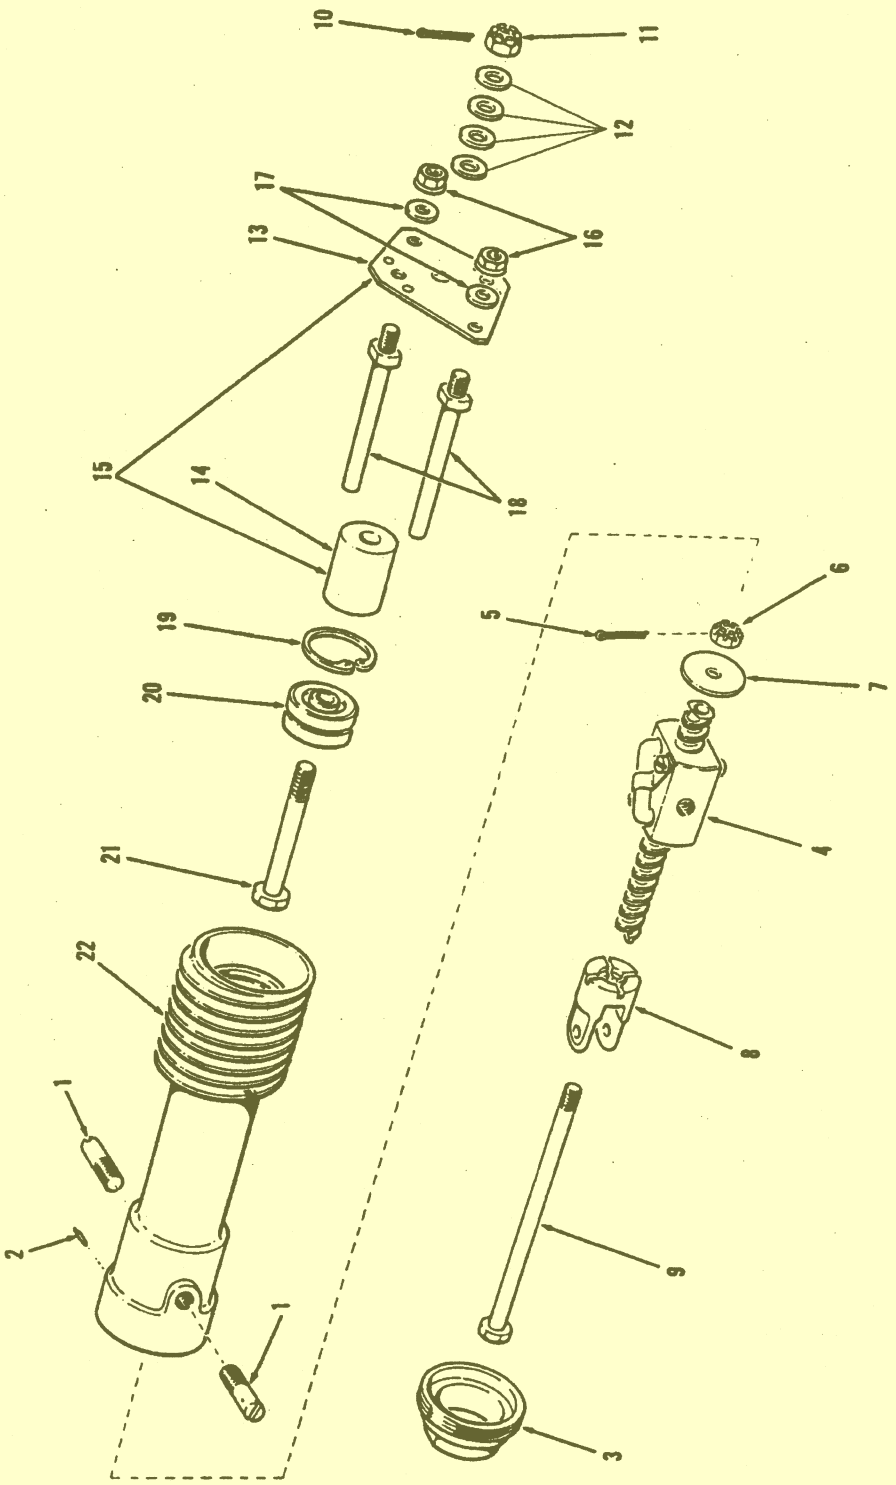
10. Storage Instructions

A. Preparation

(1) Completely wrap component in water vapor resistant barrier material.

(2) Affix label to package, giving following information:

(a) Part and serial numbers.



(b) Date of overhaul.

(c) Inspection.

11. Special Tools

No special tools are required.

Subject: Revision 2 to the Twin Otter Component Maintenance Manual, PSM 1-6-6A, Bombardier Aerospace/de Havilland Inc., Geared Tab Gearing Mechanism Assembly CMM, Part Number C6CF1147, ATA 27-26-11 dated December 17, 2001

This Revision is to PSM 1-6-6A, De Havilland Canada Component Maintenance Manual, Geared Tab Gearing Mechanism Assembly CMM, ATA 27-26-11, Revision No. 1 dated January 21, 1977.

An asterisk next to the specific page number in the List of Effective Pages and in the left hand margin of the revised pages indicates the new material added by this Revision.

Incorporate this Revision as follows:

1. Insert Technical Publications Manual Change Request (MCR) form following Volume one, frontispiece page.
2. Remove and destroy the following pages; List of Effective Pages, Record of Revisions, page 7 and 8 and insert the following revised pages; List of Effective Pages, Record of Revisions, & page 7 and 8 in their place.
3. Insert the new and revised documents as follows. Refer to the Revision Highlights section of this transmittal letter to identify the Component Maintenance Manual into which this document is to be inserted.
4. Record the incorporation of the Revision in the Record of Revision pages in the front of the CMM for Bombardier Aerospace/de Havilland Inc., Geared Tab Gearing Mechanism Assembly CMM, Part Number C6CF1147, ATA 27-26-11.

Revision Highlights:

This Revision 2 to the Twin Otter Component Maintenance Manual PSM 1-6-6A, Bombardier Aerospace/de Havilland Inc., Geared Tab Gearing Mechanism Assembly CMM, Part Number C6CF1147, ATA 27-26-11 dated December 17, 2001 substitutes locally approved solvents for 1-1-1 Trichlorethylene, incorporates revised Assembly procedures and expanded IPC numbering allocation within the text of the Assembly procedures section.

NOTE: We recommend that this letter of transmittal be retained for record purposes and inserted in the front of the manual.

INTRODUCTION

This manual contains instructions for the overhaul of the De Havilland Geared Tab Gearing Mechanism Assembly Part No. C6CF1174-1 and C6CF1174-3.

GEARED TAB GEARING MECHANISM ASSEMBLY

PART NO. C6CF1174-1 AND C6CF1174-3

1. Description and Operation (Figure 1)

   A. Description

      The geared tab gearing mechanism assembly consists of a mounting plate, support assembly, gear quadrant and pinion, gearing lever assembly, and operating lever assembly. Top and bottom covers are provided to protect the gearing mechanism.

   B. Operation

      Movement of the control surface is transmitted by the operating lever, through the gearing mechanism, to change the ratio of movement of the tab to control surface as it moves the tab in the opposite direction to the control surface.

2. Disassembly

   A. Disassemble Geared Tab Gearing Mechanism Assembly (Figure 2)

      (1) Cut and remove lockwire from two screws securing top cover and remove two screws (1), two washers (2) and top cover (3).

      (2) Remove cotter pin (4), nut (5), washer (6), and operating lever (7) from bolt (14).

      (3) Remove two nuts (8), two washers (9), two screws (10), and remove bottom cover (11) complete with felt ring (12) and felt strip (13).

      (4) Withdraw bolt (14) and remove gear quadrant (15) with bushing (16), and shim washer (17).

      (5) Remove cotter pin (18), nut (19), washer (20), then remove pinion (21), key (22), and shim washer (23) from lever assembly (25).

      (6) Withdraw lever assembly (25) from support assembly (42) and remove countersunk washer (24) from shaft of lever assembly.

      (7) Remove cotter pin (29), nut (30), washer (31), and withdraw bolt forked end (32) from lever assembly (25).

         NOTE: Removal of rivets (26), plate (27), and bearing (28) from lever assembly is only necessary on replacement of bearing (Ref paragraph 5).

      (8) Remove four nuts (33), four washers (34), four screws (35), and remove mounting plate (36) from support assembly (42).

         NOTE: Removal of ring (37), bearing (38), rivets (39), plate (40), and bearing (41) from support assembly (42) is only necessary on replacement of bearings (Ref paragraph 5).

Geared Tab Gearing Mechanism Assembly

Figure 1

3. Cleaning

A. General

(1) Do not immerse sealed bearings ((28), (38) and (41), Figure 2) in solvent. Clean lever assembly and support assembly with bearings installed using a cloth moistened with solvent.

(2) Clean remaining parts by washing or spraying with a dry-cleaning solvent. Dry with moisture-free compressed air or a lint-free cloth.

4. Inspection/Check

A. General

(1) Inspect all threads for damage and deformity.

(2) Inspect all parts visually for signs of fatigue and cracks, and for damage such as galls, scores, scratches, excessive wear and corrosion.

(3) Refer to Table 1 for original tolerances and service limits. Replace parts worn in excess of service limits. Replace all defective parts not listed in table.

Table 1

Original Tolerances and Service Limits

FIGURE 2 ITEM NO.	NAME	DISCREPANCY LOCATION	ORIGINAL DIMENSION (INCHES)	SERVICE LIMITS (INCHES)	DISPOSITION

BOMBARDIER – Temporary Revision

PSM NO. 1–6–6A AIRCRAFT DHC–6 Twin Otter SERIES ALL

PUBLICATION COMPONENT MAINTENANCE MANUAL TEMPORARY REVISION NO. 27–2

Insert in 27–26–11, facing page 4

GEARED TAB GEARING MECHANISM ASSEMBLY

PART NO. C6CF1174–1 AND C6CF1174–3

REASON FOR ISSUE:

This Temporary Revision adds information for locktite MIL–S–22473.

ACTION:

Ignore existing List of Materials on page 4, paragraph 5. and substitute new List of Materials as shown on this Temporary Revision.

5. Repair

List of Materials

MATERIAL	SPECIFICATION OR MANUFACTURER
Alodine 1200S	MIL–C–5541
Loctite Grade H Sealant	MIL–S–22473
Grease	MIL–G–3278
Lockwire, Corrosion Resistant	MS20995C32
Bostik 1142	B.B. Chemical Co., Montreal, P.Q.

RECORDING INSTRUCTIONS:

Record this Temporary Revision No. and the relevant information in the appropriate columns of the TEMPORARY REVISION INDEX provided at the front of the manual.

B. Detail Parts (Figure 2)

(1) Inspect teeth of gear quadrant (15) and pinion (21) for correct meshing, excessive wear, and distortion.

(2) If damaged, replace felt ring (12) and felt strip (13) on bottom cover (11) (Ref paragraph 5).

(3) If bushing (16), bearings (28), (38) or (41) are damaged or worn in excess of service limits, replace as detailed in paragraph 5.

5. Repair

List of Materials

MATERIAL	SPECIFICATION OR MANUFACTURER
Alodine 1200S	MIL-C-5541
Loctite	MIL-S-22473
Grease	MIL-G-3278
Lockwire, Corrosion Resistant	MS20995C32
Bostik 1142	B.B. Chemical Co., Montreal, P.Q.

A. General

(1) Replace all defective parts.

(2) Replace all standard parts such as cotter pins, washers and nuts.

(3) Replate cadmium-plated parts which have had coating damaged or removed, or replace the part.

(4) When anodized parts have had protective surface treatment removed, apply a protective coating of Alodine solution No. 1200S to affected area(s), or reanodize the part.

B. Detail Parts (Figure 2)

(1) If damaged, replace felt ring (12) and felt strip (13) on bottom cover (11) as follows:

(a) Remove felt ring, felt strip, and adhesive from bottom cover using toluol or methyl ethyl ketone.

WARNING: ADEQUATE VENTILATION MUST BE PROVIDED AND THE USE OF PROTECTIVE CLOTHING STRICTLY ADHERED TO AT ALL TIMES DUE TO THE TOXIC NATURE OF THE SOLVENTS.

(b) Cut felt ring (1/16-inch thick) to 1.88 inch outer diameter. Cut internal diameter of 1.25 inch to suit gear quadrant.

(c) Cut felt strip (1/16-inch thick) 1.25 inch long x 0.50 inch wide.

NOTE: Please see the TEMPORARY REVISION that revises this page

(d) Clean bond area of bottom cover using a napthol spirits soaked cloth, and wipe dry with a clean cloth before solvent evaporates.

(e) Apply two or more coats of Bostik 1142 to felt ring and felt strip until sufficient adhesive remains on contact surface. Apply a thin even coat of Bostik 1142 to contact surface of bottom cover.

(f) Allow adhesive to dry so that when lightly touched it adheres but does not transfer to finger.

(g) Join parts together and press down firmly with the fingers to insure intimate contact throughout.

(h) Allow 2 to 4 hours for bond to dry.

(2) If damaged, or worn in excess of limits specified in Table 1, replace bushing (16) in gear quadrant (15) as follows:

(a) Remove bushing and adhesive from gear quadrant using toluol or methyl ethyl ketone.

WARNING: ADEQUATE VENTILATION MUST BE PROVIDED AND THE USE OF PROTECTIVE CLOTHING STRICTLY ADHERED TO AT ALL TIMES DUE TO THE TOXIC NATURE OF THE SOLVENTS.

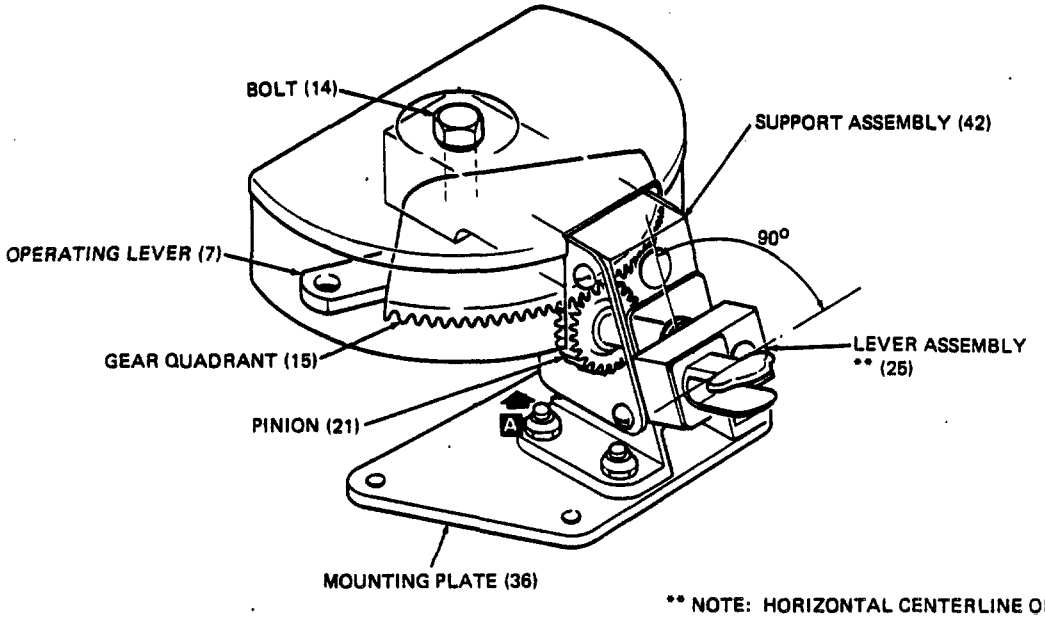
(b) Insure housing for bushing in gear quadrant is within the limits specified in Table 1.

(c) Clean contact surfaces of gear quadrant and new bushing using a napthol spirits soaked cloth, and wipe dry with a clean cloth before solvent evaporates.

(d) Apply an even coat of Bostik 1142 to contact surfaces of bushing, and gear quadrant, and join parts together immediately. Press bushing firmly into gear quadrant.

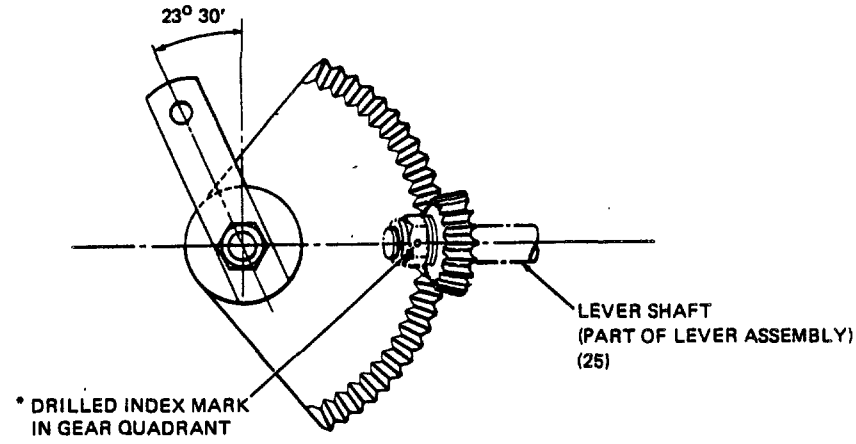
(e) Allow 2 to 4 hours for bond to dry. Carefully remove excess adhesive using toluol or methyl ethyl ketone.

(3) If damaged, or worn in excess of limits specified in Table 1, replace bearing (28) in lever assembly as follows:



(a) Remove four rivets (26) and remove plate (27) from lever assembly.

(b) Remove defective bearing using a suitable arbor press or similar tool.



(c) Insure housing for bearing is within the limits specified in Table 1.

(d) Install bearing (28) in housing on lever assembly; position plate (27) on lever assembly and squeeze install four rivets (26) to secure plate over bearing.

(4) If damaged, or worn in excess of limits specified in Table 1, replace bearings (38) and (41) in support assembly (42) as follows:

** NOTE: HORIZONTAL CENTERLINE OF LEVER ASSEMBLY POSITIONED AT AN ANGLE OF 90 DEGREES TO VERTICAL CENTERLINE OF SUPPORT ASSEMBLY.

'NOTE: DRILLED INDEX MARK MUST BE ALIGNED WITH LEVER SHAFT CENTER LINE,WITH PINION ENGAGING QUADRANT GEAR.

VIEW ON ARROW 'A'

Gear Quadrant Alignment

Figure 1A

(a) To remove bearing (38), first remove ring (37) from support assembly.

(b) To remove bearing (41), first remove rivets (39) and plate (40) from support assembly.

(c) Remove defective bearing using a suitable arbor press or similar tool. Remove hardened Loctite on housing by gently scraping with a hard fibre scraper.

(d) Insure housing for bearing is within the limits specified in Table 1.

(e) Clean the housing thoroughly with locally approved solvent and insure that solvent does not enter the sealed bearing and contaminate the lubricant.

WARNING: ADEQUATE VENTILATION MUST BE PROVIDED AND THE USE OF PROTECTIVE CLOTHING STRICTLY ADHERED TO AT ALL TIMES DUE TO THE TOXIC NATURE OF THE SOLVENTS.

(f) Apply an even coating of Locquic activator, Grade C to contact surfaces of housing and bearing. Allow the activator to dry for 5 minutes minimum.

(g) Apply a film of Loctite to contact surfaces of housing and bearing. Assemble bearing in housing. Carefully remove excess Loctite.

(h) Install ring (37) to secure bearing (38) in support assembly.

(i) Position plate (40) on support assembly and squeeze install four rivets (39) to secure plate over bearing (41).

(j) Allow the assembly to cure for a minimum of two hours before further installation.

6. Assembly

A. Assemble Geared Tab Gearing Mechanism Assembly (Figure 2)

(1) Position mounting plate (36) on support assembly (42), and secure with four screws (35), four washers (34) and four nuts (33).

(2) Position bolt forked end (32) in lever assembly (25), and secure with washer (31), nut (30) and cotter pin (29).

(3) Position countersunk washer (24) on shaft of lever assembly (25). Insure countersink faces shoulder on shaft. Position lever assembly (25) in support assembly (42).

(4) Install shim washer (23), key (22), and pinion (21) on shaft of lever assembly (25) and secure with washer (20) and nut (19). Leave cotter pin (18) until completion of backlash check.

(5) Install gear quadrant (15) in support assembly (42) and insure correct alignment of bearing mechanism using the following procedure (Refer to Figure 1. A.):

(a) Position and maintain lever assembly (25) with its horizontal centerline at 90 degrees to vertical centerline of support assembly (42).

(b) Position shim washer (17) and gear quadrant (15) in support assembly (42). Mesh gear quadrant (15) with pinion (21) on lever assembly (25), with index mark in undersurface of quadrant in line with center of shaft lever assembly (25), insuring that lever assembly (25) is correctly positioned (Refer to step (a)). Insert bolt (14).

(c) Install operating lever (7), washer (6) and nut (5) onto bolt (14). Do not safety with cotter pin (18) at this step. Check that operating lever (25) is displaced approximately 23.5 degrees from transverse centerline of bolt (14) and away from support assembly (42), with lever assembly (25) positioned as in step (a). This insures correct mid-travel position of gearing mechanism.

(d) Maintaining the position of gearing mechanism set in step (c) mark an index line on top surface of gear quadrant (15) in line with one edge of the support assembly (42).

(6) Check backlash between gear quadrant (15) and pinion (21) is not more than 0.002 inch maximum. If required adjust thickness of shim washers (17) and (23) to achieve this condition.

NOTE: **If shims are adjusted, insure that gear quadrant (15) and pinion (21) are remeshed and aligned correctly as described in step (5).**

(7) Remove nut (5), washer (6), operating lever (7), gear quadrant (15) and shim washer (17) from bolt (14).

(8) Install cotter pin (18) to nut (19) securing pinon (21).

(9) Hand lubricate gear quadrant (15) and pinion teeth (21) lightly with grease MIL–G–3278.

(10) Lift bolt (14) to a position where it does not protrude below bottom of bearing (38) in support assembly (42).

(11) Install shim washer (17), gear quadrant (15), and bottom cover (11) together into support assembly (42) with index line on top of gear quadrant (15) in line with the same edge of support assembly (42) as used in step (5) (d). Ensure that the shaft lever assembly (25) is correctly positioned (Refer to step (a)).

(12) Release bolt (14) and insert through shim washer (17) and bushing (16), gear quadrant (15) and bottom cover (11).

(13) Secure bottom cover (11) with two screws (10), two washers (9) and two nuts (8).

(14) Install operating lever (7) on bolt (14) and secure with washer (6), nut (5) and cotter pin (4).

NOTE: **Check that operating lever (7) is displaced approximately 23.5 degrees from transverse centerline of bolt (14) and away from support assembly (42), with lever washer (7) assembly positioned as in step (a). This ensures correct mid–travel position of gearing mechanism.**

(15) Install top cover (3), and secure with two washers (2), and two screws (1). Lockwire two screws (1) using MS20995C32 lockwire.

7. Fits and Clearances

See Table 1.

8. Testing

Not Applicable.

9. Trouble Shooting

Not Applicable.

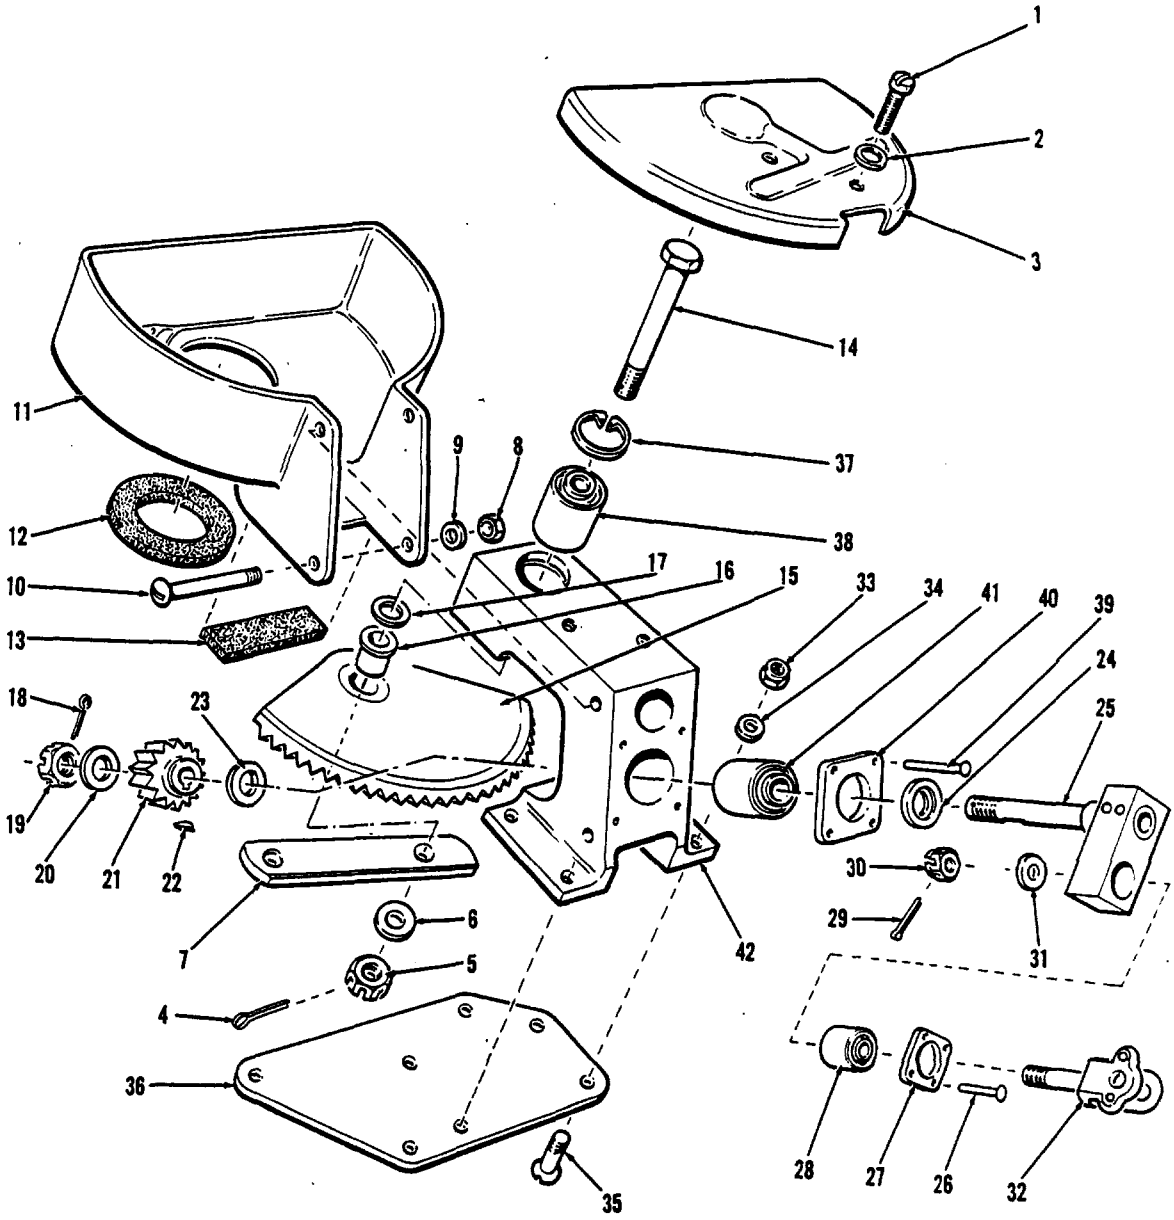
10. Storage Instruction

A. Preparation

(1) Tie operating lever to bolt forked end to prevent free movement of gear quadrant and pinion assemblies.

(2) Wrap the unit in water vapor resistant barrier material.

(3) Affix label giving following information:



(a) Part and serial numbers.

(b) Date of overhaul.

(c) Inspection.

11. Special Tools

No special tools are required.

BOEING

Subject: Revision No. 4 dated Dec 1/86 to De Havilland CMM 27-09-01 for Screw Jack P.N. C6CT1010

This revision contains minor changes to the original dimensions and service limits for the cover and bearing. All pages are included in this revision. Incorporate this revision by destroying the existing manual, 27-09-01 and substituting this revised manual.

Customer Support Department.

INTRODUCTION

This manual contains instructions for the overhaul of the De Havilland Screw Jack Assembly Part No. C6CT1010.

SCREW JACK ASSEMBLY PART NO. C6CT1010-1 and -3

1. Description and Operation (Figure 1)

Screw jack assembly C6CT1010 converts rotary input motion into linear output motion, and is used in the operation of aircraft trim control systems. The screw jack consists of a cable drum drive assembly, a screw drive with a rod end, a plate for mounting, and a cover.

2. Disassembly

A. Disassemble Screw Jack (Figure 3)

(1) Remove roll pin (1) (rivet on earlier assemblies), and unscrew rod end (2) from screw drive (6).

(2) Remove loosely attached cable guard (3) and cover (4). Remove bearing (5) from cable drum drive (11).

(3) Unscrew screw drive (6) from cable drum drive (11).

(4) Remove retainer (7), unscrew nut (8) and remove bearing (9) and plate (10) from cable drum drive (11).

3. Cleaning

A. General

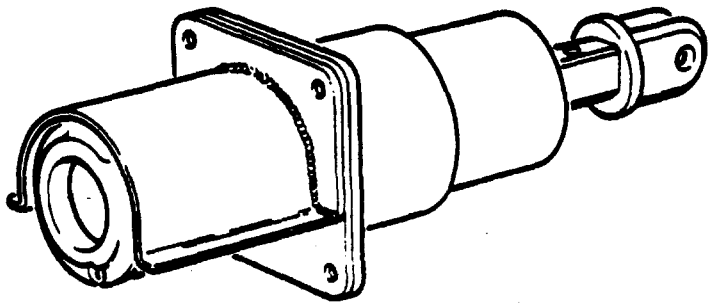
(1) Do not immerse sealed bearings (5 and 9 , Figure 3) in solvent. Wipe clean, externally only, with a cloth moistened with solvent.

(2) Clean components by washing or spraying with a dry-cleaning solvent. Dry with moisture-free compressed air or a lint-free cloth.

4. Inspection/Check

A. General

(1) Carry out a magnetic particle inspection of all magnetic metal components, where practicable.



(2) Inspect non-magnetic metal components using the fluorescent penetrant method, or an approved dye penetrant method.

(3) Inspect all parts visually for signs of fatigue and cracks, and for damage such as galls, scores, scratches, excessive wear, and corrosion.

(4) Inspect all threads for damage and deformity.

(5) Refer to Table 1 for original tolerances and service limits. Repair or replace parts worn in excess of service limits specified in Table 1. Replace all defective parts not listed in table.

(6) Install (dry) screw drive into cable drum drive (6 and 11, Figure 3); check that end float between screw and drive is 0.002 to 0.005 inch. Disassemble parts.

Screw Jack Assembly

Table 1

Original Tolerances and Service Limits

FIGURE 3 ITEM NO.	NAME	DISCREPANCY LOCATION	ORIGINAL DIMENSION (INCHES)	SERVICE LIMIT (INCHES)	DISPOSITION
2	Rod End	Control Rod Attachment Hole	0.2500 - 0.2505	0.251	Replace
4	Cover	ID Bearing Surface	1.500 - 1.501	1.502	Replace
		ID Bearing Surface	1.750 - 1.751	1.752	Replace
		Square Shaft Hole	0.640 - 0.645	0.650	Replace
5	Bearing	OD	1.5000 - 1.4990	1.4980	Replace
		ID	1.0618 - 1.0632	1.0639	Replace
6	Screw Drive	Square Shaft	0.600 - 0.597	0.594	Replace
9	Bearing	OD	1.7500 - 1.7490	1.7480	Replace
		ID	1.3118 - 1.3132	1.3139	Replace
11	Cable Drum Drive	OD Bearing Surface	1.3118 - 1.3108	1.3101	Replace
		OD Bearing Surface	1.0618 - 1.0608	1.0601	Replace

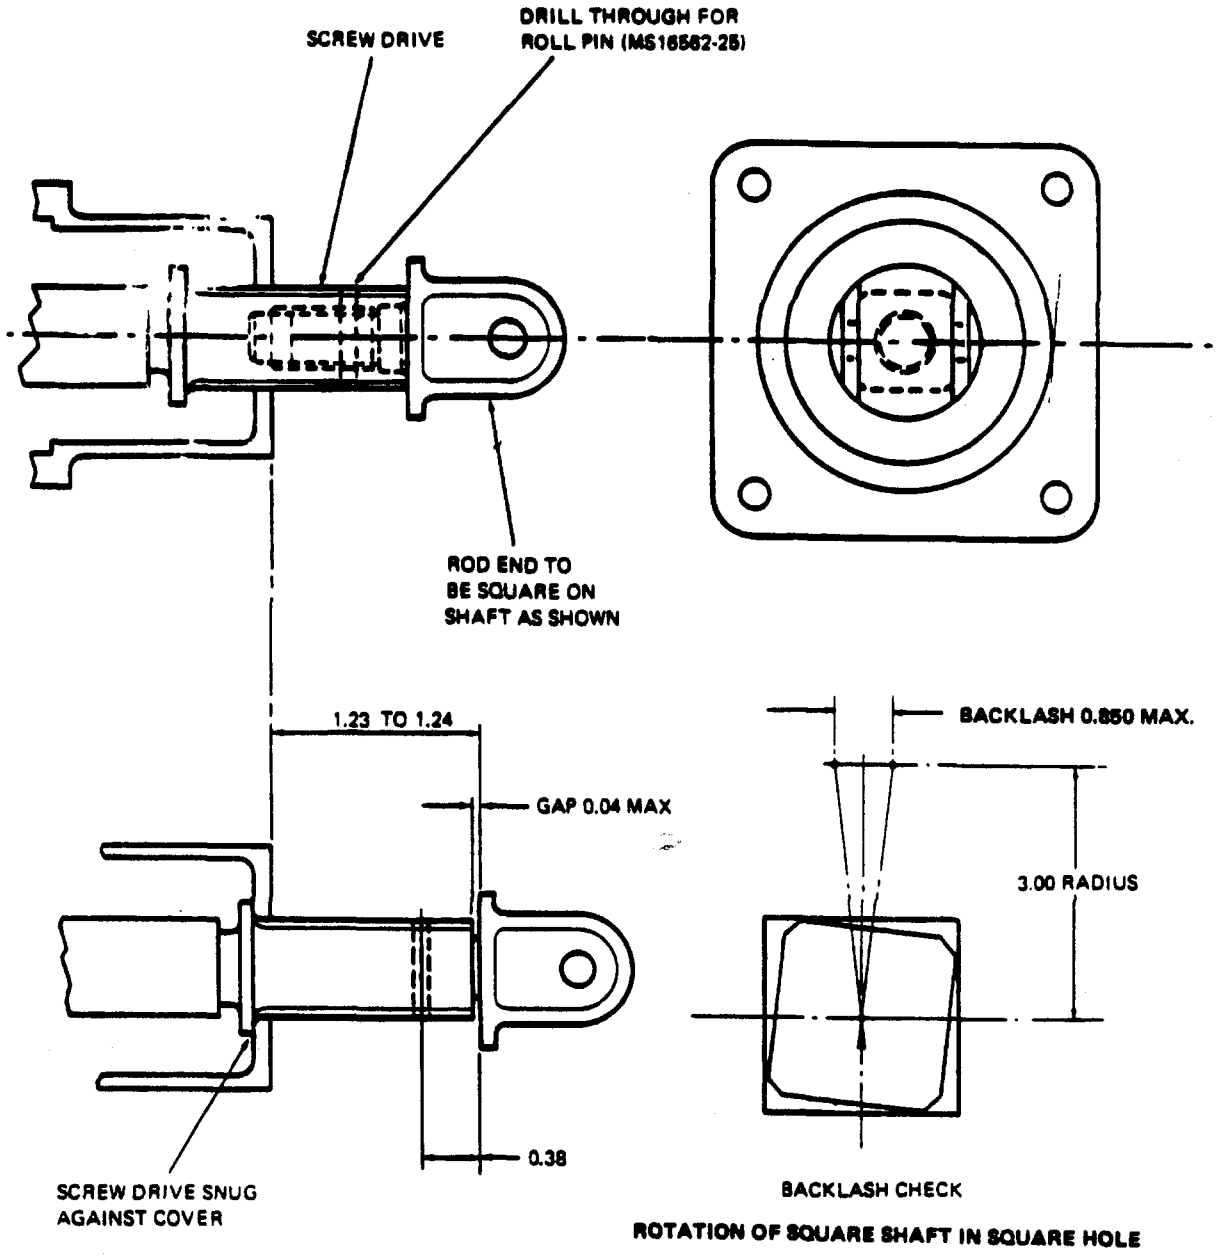
5. Repair

A. General

(1) Replace all defective parts.

(2) Replace cadmium-plated parts which have had coating damaged or removed, or replate the part.

(3) When anodized parts have had protective surface treatment removed, apply protective coating of Alodine solution No. 1200S to affected area(s), or reanodize the part.



6. Assembly

List of Materials

Material	Specification
Grease	MIL-G-21164
Loctite Grade AA Sealant	MIL-S-22473

A. Assemble Screw Jack (Figure 3)

(1) Position plate (10) and bearing (9) on cable drum drive (11). Install nut (8) on cable drum drive and tighten to secure bearing (9). Lock nut (8) to cable drum drive with retainer (7).

ALL DIMENSIONS IN INCHES

Assembly of Rod to Screw Drive and Backlash Check

Figure 2

NOTE: If new cable drum drive (11) is a replacement, drill one No. 51 (0.067-inch diameter) hole through cable drum drive from nut (8) to accommodate retainer (7). Remove swarf.

(2) Thread screw drive (6) into cable drum drive (11). Install bearing (5) and cover (4).

(3) Temporarily install (dry) cable guard (3) and secure cable guard plate (10) and cover (4), together with four bolts AN3-5A and nuts MS21042-3.

(4) Check that end float between screw drive (6) and cover (4) does not exceed 0.008 inch.

(5) See Figure 2 and check that backlash between square shaft and square hole in cover does not exceed 0.850 inch measured at a radius of three inches.

(6) Disassemble parts installed in steps (2) and (3).

(7) Apply grease MIL-G-21164 to threads of screw drive (6) and thread screw drive into cable drum drive. Install bearing (5) and cover (4).

(8) Temporarily install cable guard (3) and secure cable guard plate (10) and cover (4), together with wire.

NOTE: Items are secured with bolts and washers when screw jack assembly is installed in aircraft.

(9) Thread rod end (2) into screw drive (6) and install roll pin (1) coated with Loctite Grade AA Sealant. See Figure 2 when installing a new rod end or screw drive.

7. Fits and Clearances

See Table 1.

8. Testing

Not Applicable.

9. Trouble Shooting

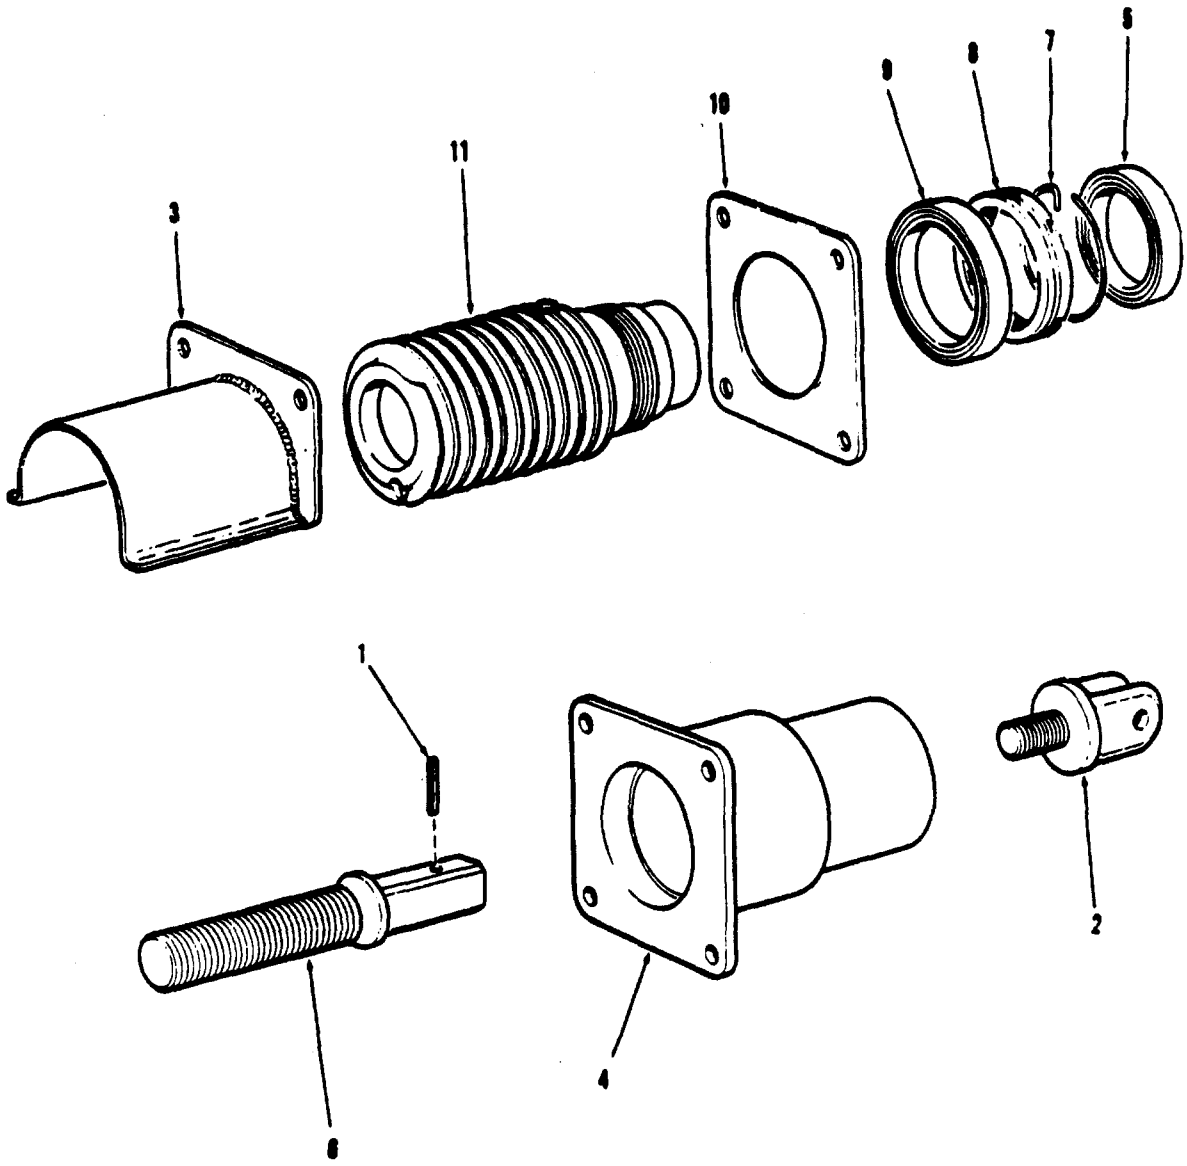
Not Applicable.

10. Storage Instructions

A. Preparation

(1) Completely wrap component in water vapor resistant barrier material.

(2) Affix label to package, giving following information.



(a) Part and serial numbers.

(b) Date of overhaul.

(c) Inspection.

11. Special Tools

No special tools are required.

INTRODUCTION

This manual contains instructions for the overhaul of the de Havilland Trim Control Assembly Part Numbers C6CF1053-1, C6CF1053-3 and C6CF1053-5.

TRIM CONTROL ASSEMBLY PART NO. C6CF1053

1. Description and Operation

A. Description (Figure 1)

The twin control assembly consists of two side plates which support individual handwheel installations, cable drums, cables, and operating lever and pointer assemblies, for rudder and elevator trim control.

B. Operation

Rotation of each handwheel winds one cable on and one cable off the respective cable drum, depending on direction of rotation. A plate with a spiral recess revolves with the cable drum, and operates a lever which moves a connected pointer through a distance relative to the amount of handwheel movement. When the assembly is installed in the aircraft, the cables operate screwjacks installed in the rudder and elevator trim control systems.

2. Disassembly

A. Disassemble Trim Control Assembly C6CF1053-1 (Figure 5)

(1) Withdraw rollpin (1) and remove handwheel (2) from shaft assembly (3) or (7).

(2) Remove four screws (11), and four screws (12), washers (13) and nuts (14) securing rudder trim control assembly to side plate assemblies (15) and (23).

(3) Remove rudder trim control assembly from side plate assemblies (15) and (23).

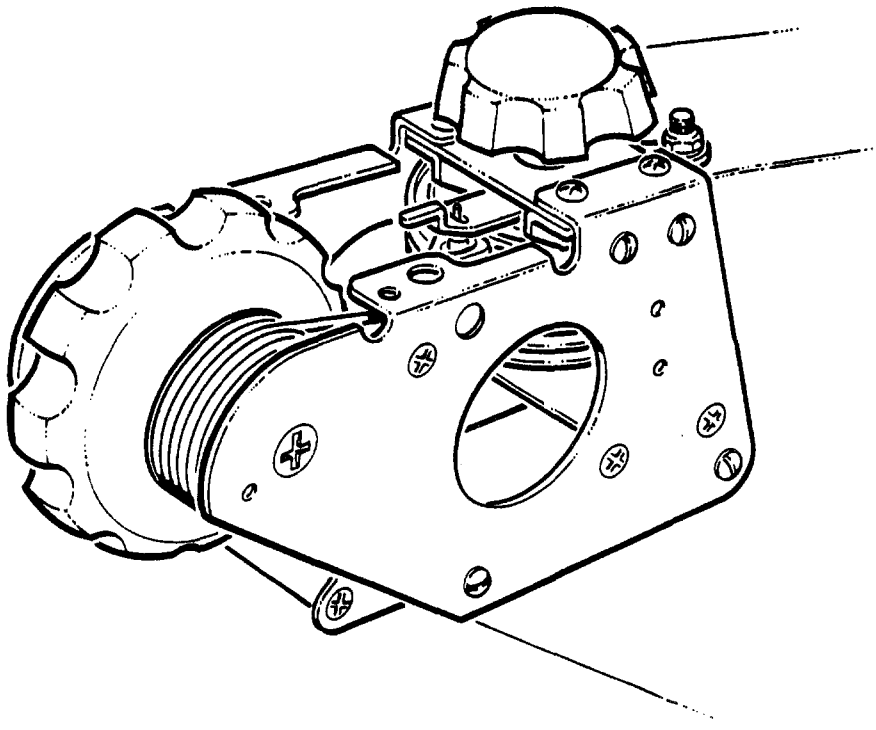
(4) Remove bearing assembly (33) complete with bearing (35) and housing (34), from shaft assembly (3) or (7).

NOTE: Removal of bearing (35) from housing (34) of bearing assembly (33) is only necessary on replacement of bearing.

(5) Remove pointer (36) complete with bush (37), washer (38), lever (39) and hinge plate assembly (40) from shaft assembly (3) or (7).

(6) Separate hinge plate (41) from lever (39) by removing cotter pin (43), nut (44) and two washers (45) and (46). Lift pointer (36) off lever (39).

(7) Withdraw bush (37) from pointer (36) and remove washer (38).



(8) Remove washer (47) and spiral plate (48) from shaft assembly (3) or (7).

(9) Remove cotter pin (49), nut (50) and washer (51), and withdraw channel assembly (52) from shaft assembly (3) or (7).

NOTE: Removal of bearing (53) from channel assembly (52) is only necessary on replacement of bearing.

(10) Remove cable drum (54) from shaft assembly (3) or (7).

NOTE: Removal of disc (55) from cable drum (54), or key sleeve (5) from shaft (4) of shaft assembly (3), is only necessary on replacement of these parts.

Trim Control Assembly

Figure 1

(11) Remove cables (56) and (57) from cable drum (54).

NOTE: Identify cables to assist assembly.

(12) Remove cotter pin (58), nut (59) and washer (60) securing lever (61) to hinge bracket (17) of side plate assembly (15).

(13) Remove rollpin (62) securing screw (63) in threaded boss (19) of side plate assembly (15).

(14) Loosen screw (63) from threaded boss (19) of side plate assembly (15). Do not withdraw screw at this stage. Support trim control assembly on outer face of side plate assembly (23) and remove side plate assembly (15).

(15) Remove washer (64), pointer (65), bush (66), lever (61), washer (67), spiral plate (68), handwheel (69) with cable drum (71), washer (72), and spacer (73) from screw (63). Remove washer (74) from lever (61).

NOTE: Removal of cable drum (71) or bush (70) from handwheel (69) is only necessary on replacement of these parts.

(16) Remove cables (75) and (76) from cable drum (71).

NOTE: Identify cables to assist assembly.

(17) Remove screw (63) from side plate assembly (23).

NOTE: Disassembly of parts from side plate assemblies (15) and (23) is only necessary on replacement of parts.

B. Disassemble Trim Control Assembly C6CF1053-3 and -5 (Figure 6)

(1) Withdraw rollpin (1) and remove rudder trim handwheel (2) from shaft assembly (3) or (7).

(2) Remove four screws (11), and four screws (12), washers (13) and nuts (14) securing rudder trim control assembly to side plate assemblies (15) and (23).

(3) Remove rudder trim control assembly from side plate assemblies (15) and (23).

(4) Remove bearing assembly (33), complete with bearing (35) and housing (34) from shaft assembly (3) and (7).

NOTE: Removal of bearing (35) from housing (34), of bearing assembly (33) is only necessary on replacement of bearing.

(5) Remove pointer (36) complete with spacer (37), washer (38), lever (39) and hinge plate (41) from shaft assembly (3) or (7).

(6) On C6CF1053-3

Separate pointer (36) from spacer (37), washer (38), lever (39) and hinge plate (41) as follows:

(a) Remove cotter pin (43), nut (44) and washer (45) which secures lever (39) to hinge plate (41). Remove hinge plate (41) and washer (46) from lever (39).

(b) Lift pointer (36) from lever (39).

(c) Remove spacer (37) and washer (38) from pointer (36).

(d) Remove washer (38) from spacer (37).

(7) On C6CF1053-5

Separate pointer (36) from spacer (37), washer (38), lever (39) and hinge plate (41), as follows:

(a) Remove cotter pin (43), nut (44) and washer (45) which secures lever (39) to hinge plate (41). Remove hinge plate (41) and washer (46) from lever (39).

(b) Remove nut (47), two washers (48) and bolt (49) which secures pointer (36) to lever (39). Remove pointer (36) from lever (39).

(c) Remove spacer (37) and washer (38) from pointer (36).

(d) Remove washer (38) from spacer (37).

(8) Remove washer (50) and spiral plate (51) from shaft assembly (3) or (7).

(9) Remove cotter pin (52), nut (53) and washer (54) and withdraw bracket (56), complete with bearing (57), and spacer (58), from shaft assembly (3) or (7).

NOTE: Removal of bearing (57) from bracket (56) is only necessary on replacement of bearing.

(10) Remove spacer (58) from bearing (57).

(11) Remove cable drum (59) from shaft assembly (3) or (7).

NOTE: Removal of disc (60) from cable drum (59), or key sleeve (9) from shaft (8) of shaft assembly (7), is only necessary on replacement of these parts.

(12) Remove cables (61) and (62) from cable drum (59).

NOTE: Identify cables to assist assembly.

(13) Remove cotter pin (63), nut (64) and washer (65) which secure lever (66) to hinge bracket (17) of side plate assembly (15).

(14) Remove rollpin (67) which secures screw (68) in threaded boss (19) of side plate assembly (15).

(15) Loosen screw (68) from threaded boss (19) (do not withdraw), support trim control assembly on outer face of side plate assembly (23), and remove side plate assembly (15).

(16) Remove washer (69) from lever (66).

(17) Remove washer (70), pointer (71), bush (72), lever (66), washer (73), spiral plate (74), washers (75) and (76), handwheel assembly (77) with cable drum (80), and washer (81), from screw (68).

NOTE: Removal of cable drum (80) from handwheel (78) is only necessary on replacement of these parts.

NOTE: Do not remove bushes (79) from handwheel (78). If bushes are defective, replace handwheel assembly (77).

(18) On C6CF1053-5

Remove washer (70), pointer (71), bush (72), lever (66), washer (73), spiral plate (74), washers (75) and (76), handwheel assembly (77) with cable drum (80), and washer (81), from screw (68). Separate lever (66) from pointer (71) by removing nut (82), bolt (83), and two washers (84).

NOTE: Removal of cable drum (80) from handwheel (78) is only necessary on replacement of these parts.

NOTE: Do not remove bushes (79) from handwheel (78). If bushes are defective, replace handwheel assembly (77).

(19) Remove cables (85) and (86) from cable drum (80).

(20) Remove screw (68) from side plate assembly (23).

NOTE: Disassembly of side plate assemblies (15) and (23) is only necessary on replacement of parts.

3. Cleaning

Table 1

Cleaning Materials and Compounds

MATERIAL	SPECIFICATION OR MANUFACTURER
Solvent	P-D-680

A. General

(1) Do not immerse sealed bearing (35) (Figure 6) in solvent. Clean with a clean cloth moistened in solvent.

(2) Clean remaining components by washing or spraying with solvent. Dry using moisture free compressed air or lint free cloth.

WARNING: USE SOLVENT IN A WELL VENTILATED AREA. AVOID SKIN CONTACT AND KEEP AWAY FROM FIRE.

4. Inspection/Check

A. General

(1) Inspect all parts for obvious wear, damage and corrosion.

(2) Inspect threaded parts for damaged, stripped or crossed threads.

(3) Inspect anodized surfaces for scratches and abrasions.

(4) Check that bearings (35) and (53) (Figure 5) can be moved with fingers through a 10° misalignment angle, and bearing (35) (Figure 6) through an 8° misalignment angle, and that all rotate with no binding or roughness.

(5) Refer to Table 2 for original tolerances and service limits. Replace parts worn in excess of service limits. Replace all defective parts not listed in table.

(6) Inspect trim cables for wear, kinks, flattening, fraying, corrosion and security of terminals.

NOTE: Excessive surface shine denotes wear.

(7) Inspect nylon stop on spiral plate (48) and (68) (Figure 5), for security.

Table 2

5. Repair

Table 4

Repair Materials and Compounds

MATERIAL	SPECIFICATION OR MANUFACTURER
Alodine Solution 1200S	MIL-C-5541 (Amchem Products)
Bostik 1142	B. B. Chemical Co., Montreal, P.Q.
Loctite Grade A. A.	MIL-S-22473
Trichlorethylene	MIL-T-7003

A. General

(1) Replace all defective parts.

(2) Replace all standard parts such as cotter pins, rollpins, washers and nuts.

(3) Touch up alumimum alloy surfaces with Alodine 1200S in accordance with manufacturer's instructions.

B. Detail Parts C6CF1053-1 (Figure 5)

(1) If loose, secure nylon stop on special plate (48) and (68) using Bostik 1142. Nylon stop is positioned in perimeter recess with stop face at an angle of 90° to slot in opposite face of spiral plate.

(2) If damaged or worn in excess of limits specified in Table 2, replace bush (70) in handwheel (69) as follows:

(a) Remove defective bush from handwheel using a suitable arbor press or extractor.

(b) Insure that housing for bush is within limits specified in Table 2.

(c) Clean faying surfaces of housing and bush using trichlorethylene. Dry with a lint-free cloth before solvent evaporates.

WARNING: USE SOLVENT IN A WELL VENTILATED AREA. AVOID SKIN CONTACT AND KEEP AWAY FROM FIRE.

NOTE: Avoid handling faying surfaces of housing and bush. The use of clean cotton gloves is recommended.

(d) Coat faying surfaces of housing and bush with Locquic N activator. Allow to air dry for 5 minutes.

(e) Apply even coat of Loctite Grade A. A. sealant to faying surfaces of housing and bush, and install bush in housing.

NOTE: If bush is a loose fit in housing, support until Loctite cure is effected.

(f) Immediately after installation of bush remove excess Loctite using a cloth moistened with trichlorethylene.

(g) Heat cure assembly for 30 minutes at a temperature of 120 - 150°F, using an air circulating oven or a heat lamp.

CAUTION: DO NOT SUBJECT ASSEMBLY TO UNNECESSARY MECHANICAL STRAIN UNTIL A FURTHER TWO HOURS HAVE ELAPSED.

(3) If damaged, or worn in excess of limits specified in Table 2, replace bearing (35) in housing (34), and bearing (53) in channel assembly (52), as follows:

(a) Remove defective bearing using a suitable arbor press or extractor. Remove hardened Loctite from housing by gently scraping with a hard fibre scraper.

(b) Insure housing is within the limits specified in Table 2.

(c) Clean faying surfaces of housing and bearing using trichlorethylene. Dry using a lint-free cloth before solvent evaporates.

WARNING: USE SOLVENT IN A WELL VENTILATED AREA. AVOID SKIN CONTACT AND KEEP AWAY FROM FIRE.

NOTE: Avoid handling faying surfaces of housing and bearing. The use of clean cotton gloves is recommended.

(d) Proceed as in step (2), (d) through (g).

(4) Replace cables if wear, flattened portions, fraying, kinks, corrosion or loose terminals exist.

(5) If replaced, cable drum (71), must be concentric to within 0.010-inch with center shaft of handwheel (69), and cable terminal barrel housings must align with slot in handwheel. Secure using rivets MS20470AD4.

(6) If replaced, disc (55) must be installed in cable drum (54) with slot aligned with cable terminal barrel housings. Secure using rivets MS20470AD4.

C. Detail Parts C6CF1053-3 and -5 (Figure 6)

(1) If damaged or worn in excess of limits specified in Table 3, replace bearing (35) in housing (34), as follows:

(a) Remove defective bearing using a suitable arbor press or extractor. Remove hardened Loctite from housing by gently scraping with a hard fibre scraper.

(b) Insure housing is within the limits specified in Table 3.

(c) Clean faying surfaces of housing and bearing using trichlorethylene. Dry with a lint-free cloth before solvent evaporates.

CAUTION: INSURE SOLVENT DOES NOT ENTER THE BEARING AND CONTAMINATE THE LUBRICANT.

WARNING: *USE SOLVENT IN A WELL VENTILATED AREA. AVOID* SKIN CONTACT AND KEEP AWAY FROM FLAME.

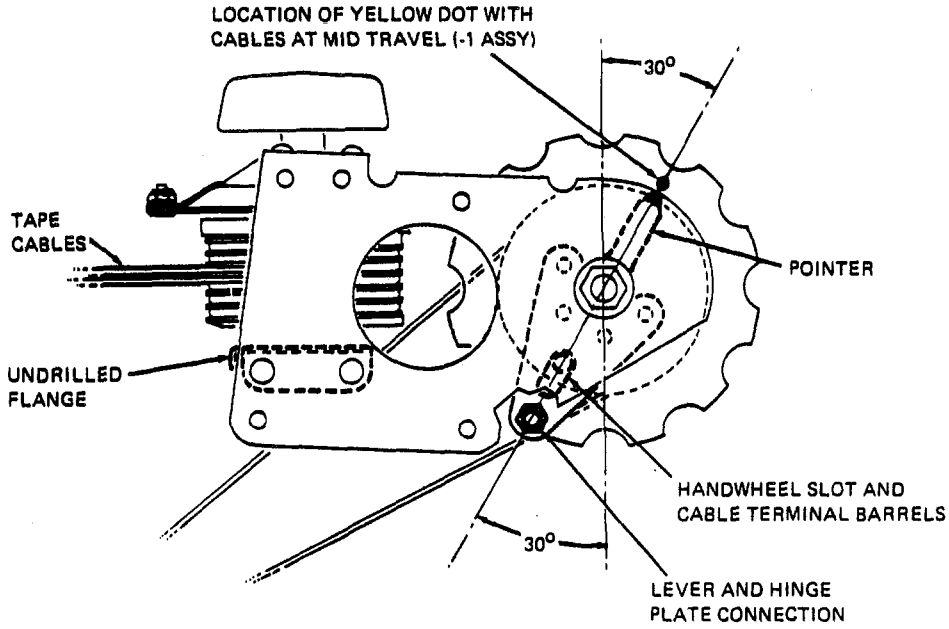
NOTE: Avoid handling faying surfaces of housing and bearing. The use of clean cotton gloves is recommended.

(d) Proceed as in paragraph 5. B. (2), steps (d) through (g).

(2) Replace cables if wear, flattened portions, fraying, kinks, corrosion or loose terminals exist.

(3) If replaced, cable drum (80) must be concentric to within 0.010-inch with center shaft of handwheel, and cable terminal barrel housings must align with slot in handwheel. Secure using six rivets MS20470AD4.

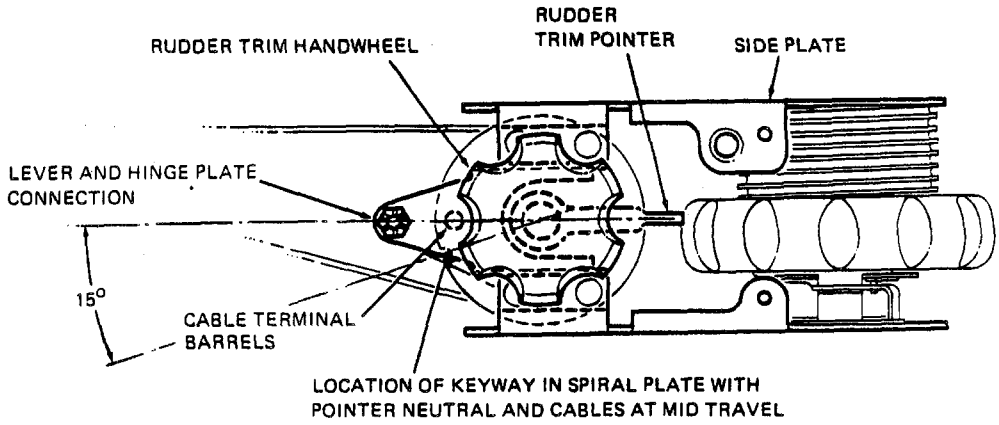
(4) If replaced, disc (60) must be installed in cable drum (59) with slot aligned with cable terminal barrel housings. Secure using six rivets MS20470AD4.



(5) If replaced, rollpins (6) of shaft assembly (3) are secured using Loctite Grade A. A. Refer to paragraph 5. B. (2), steps (c) through (g) for Loctite application.

(6) If defective, bushes (79) must not be replaced. Replace handwheel assembly (77).

6. Assembly



A. Assemble Trim Control Assembly C6CF1053-1 (Figures 2, 3 and 5)

(1) Install elevator trim cables (75) and (76) on cable drum (71) by inserting terminal barrels in appropriate housings in cable drum. Wrap each cable a

C6CF1053-1 and -3 Elevator Trim Handwheel - Neutral Position

Figure 2

C6CF1053-1, -3 and -5 Rudder Trim Pointer - Neutral Position

Figure 3

minimum of two and one half turns in opposite directions around the cable drum until all cable drum recesses are occupied. Adjust cables until both leave the cable drum from opposite sides, at points approximately 90° from, and in the same direction as, the cable terminal barrels and handwheel slot. Tape cables together adjacent to cable drum to prevent unwrapping (Refer to Figure 2.)

NOTE: Cables (75) and (76) are not interchangeable.

(2) Install screw (63) in side plate assembly (23). Tape flush head to outboard face of side plate to assist in preventing withdrawal during assembly procedure.

(3) Install spacer (73) and washer (72) on screw (63).

(4) Install cable drum (71) with handwheel (69) on screw (63), with cable drum adjacent to side plate assembly (23).

NOTE: Position handwheel (69) with yellow dot 30° forward from top dead center. Route cables (75) and (76) under guard sleeves (25) and (26) aft towards lightening hole in side plate assembly (23). (Refer to Figure 2.)

(5) Install spiral plate (68) on screw (63) with slot engaged with key in shaft of handwheel (69), and nylon stop adjacent to cable barrel terminal in cable drum (71).

(6) Install washer (67) on screw (63).

(7) Install bush (66) in pointer (65), and assemble pointer (65) and lever (61) by inserting outer plain pin of lever in slot of pointer.

(8) Install pointer (65) and bush (66) on screw (63) and engage center plain pin of lever (61) in spiral recess of spiral plate (68).

NOTE: Position pointer (65) at an angle of 30° forward of top dead center and aligned with yellow dot on handwheel (69) (Refer to Figure 2.)

(9) Install washer (74) on threaded pin of lever (61), and washer (64) on screw (63).

(10) Install side plate assembly (15) with threaded boss (19) engaged with screw (63). Insure that threaded pin of lever (61) is aligned with lug hole of hinge bracket (17), and handwheel slot and cable terminal barrels are located 30° aft of bottom dead center. (Refer to Figure 2.)

(11) Turn screw (63) into threaded boss (19) until 0.010 to 0.020-inch end float exists between inner face of threaded boss (19) and outer face of washer (64), and threaded pin of lever (61) is inserted into lug hole of hinge bracket (17).

(12) Lock screw (63) to threaded boss (19) using rollpin (62).

(13) Secure lever (61) to hinge bracket (17), using one washer (60), nut (59) and cotter pin (58). Insure that lever has easy hinge action but remains parallel to spiral plate (68).

(14) Install rudder trim cables (56) and (57) on cable drum (54) by inserting terminal barrels of cables in appropriate housings in cable drum. Wrap each cable a

minimum of two and one half turns in opposite directions around cable drum until all cable recesses are occupied. Adjust cables until both leave the cable drum from opposite sides at points 90° from, and in the same direction as, the cable terminal barrels. Tape cables together adjacent to cable drum to prevent unwrapping. (Refer to Figure 3.)

NOTE: Cables (56) and (57) are not interchangeable.

(15) Insert threaded end of shaft assembly (3) or (7) through cable drum (54) until key of shaft assembly key sleeve (5), or rollpin (10), as applicable, engages in slot of cable drum disc (55).

(16) Install channel assembly (52) on shaft assembly (3) or (7). Secure in position using washer (51), nut (50), and cotter pin (49).

(17) Install spiral plate (48) on shaft assembly (3) or (7) with slot of spiral plate engaged with key of shaft assembly (3) or rollpin (10), as applicable.

(18) Install washer (38) on bush (37). Insert bush (37) into pivot hole of pointer (36) until washer (38) rests on blade of pointer.

(19) Install washer (46) on threaded pin of lever (39). Assemble hinge plate (41), lever (39) and pointer (36) by inserting outer plain pin of lever in pointer slot, and threaded pin in lug hole of hinge plate assembly. Secure lever to hinge plate using washer (45) and nut (44).

NOTE: Do not install cotter pin (43) at this stage.

(20) Install washer (47) on shaft assembly (3) or (7).

(21) Install pointer (36) on shaft assembly (3) or (7) and engage center pin of lever (39) in spiral recess of spiral plate (48). Position hinge plate assembly (40) to allow shaft assembly (3) or (7) to project through cutout in hinge plate (41).

NOTE: Position pointer (36) diametrically opposite cable terminal barrels in cable drum (54). (Refer to Figure 3.)

(22) Tighten nut (44) on threaded pin of lever (39) until lever has easy hinge action but remains parallel to spiral plate (48). Lock nut (44) using cotter pin (43).

(23) Install bearing assembly (33) on shaft assembly (3)or (7) with bearing (35) resting on flange of bush (37).

(24) Install rudder trim tab control subassembly (less handwheel (2) and rollpin (1)) between side plate assemblies (15) and (23), with bearing assembly housing (34) under top rear flanges of side plate assemblies. Place pointer in neutral position.

NOTE: Pointer neutral position is centrally between side plate assemblies and facing elevator trim tab handwheel, with rudder cables positioned as in step (14). (Refer to Figure 3.)

(25) If alternative spiral plate (48) is installed, insure that keyway in perimeter is 15° off center, (Figure 3). Insure that undrilled flange of channel assembly (52) faces away from elevator trim tab cables. (Refer to Figure 2.)

(26) Secure rudder trim tab control assembly to upper flanges of side plate assemblies (15) and (23) using four screws (11) into anchor nuts on hinge plate (41) and four screws (12), washers (13) and nuts (14) through side plates (15) and (23) and channel assembly (52).

(27) Install handwheel (2) on shaft assembly (3) or (7). Secure using rollpin (1).

B. Assemble Trim Tab Control Assembly C6CF1053-3 and -5 (Figures 2, 3, 4 and 6)

(1) Insert terminal barrels of elevator trim cables (85) and (86) in appropriate housings of cable drum (80).

(2) On C6CF1053-3

Wrap each cable a minimum of two and one half turns in opposite direction around cable drum (80) until all cable drum recesses are occupied. Tape cables together at cable drum to prevent unwrapping.

(3) On C6CF1053-5

Wrap cable (85) three turns, and cable (86) a minimum of two turns, in opposite direction around cable drum (80), until all cable drum recesses are occupied. Tape cables together at cable drum to prevent unwrapping.

NOTE: Cables (85) and (86) are not interchangeable.

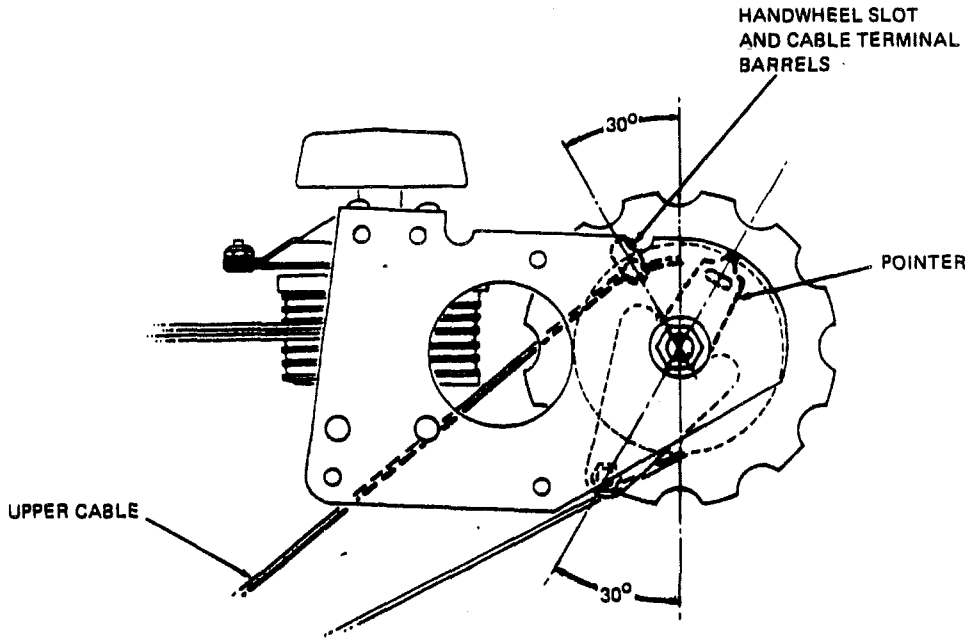
(4) Install screw (68) in side plate assembly (23). Tape screw flush head to outboard face of side plate assembly (23) to prevent withdrawal during assembly procedure.

(5) Install washer (81) on screw (68).

(6) Install handwheel assembly (77) and cable drum (80) on screw (68), with cable drum adjacent to side plate assembly (23). Route cables (85) and (86) under guard sleeves (26) and (25), and aft towards lightening hole in side plate (23).

(7) On C6CF1053-3

Turn handwheel assembly (77) until handwheel slot and cable terminal barrels are 30° aft of bottom dead center. (Refer to Figure 2.)



(8) On C6CF1053-5

Turn handwheel assembly (77) until handwheel slot and cable terminal barrels are 30° aft of top dead center. Insure cable (85) retains three turns around cable drum (80). (Refer to Figure 4.)

(9) Install washers (76) and (75) on screw (68).

(10) Install spiral plate (74) on screw (68) with spiral recesses facing out. Align cutout in perimeter of spiral plate with key on perimeter of handwheel open face. Press spiral plate into handwheel until spiral plate butts washer (75), and outer faces of spiral plate and handwheel are flush.

NOTE: Washers (76) and (75) may be added or discarded to obtain this condition.

C6CF1053-5 Elevator Handwheel - Neutral Position
Figure 4

(11) Install washer (73) on screw (68).

(12) Install bush (72) in pointer (71).

(13) On C6CF1053-3

(a) Assemble lever (66) and pointer (71) by inserting outer plain pin of lever (66) in slot of pointer.

(b) Install pointer (71) on screw (68) and insert center pin of lever (66) in spiral recess of spiral plate (74).

(14) On C6CF1053-5

(a) Assemble lever (66) and pointer (71) by aligning slots, and secure using bolt (83), one washer (84) on both sides of pointer, and nut (82).

(b) Install pointer (71) on screw (68) and insert center pin of lever (66) in spiral recess of spiral plate (74).

(15) Adjust lever center pin position in spiral plate until pointer (71) is 30° forward of top dead center.

(16) Install washer (70) on screw (68), and washer (69) on threaded pin of lever (66).

(17) Install side plate (15) with threaded boss (19) engaged with screw (68). Insure that threaded pin of lever (66) is aligned with lug hole of hinge bracket (17).

(18) Turn screw (68) into threaded boss (19) until 0.010 to 0.020-inch end float exists between inner face of threaded boss (19) and outer face of washer (70), and threaded pin of lever (66) is inserted into lug hole of hinge bracket (17). Secure screw (68) using cotter pin (67) through screw and threaded boss (19).

(19) Secure lever (66) to hinge plate (17) using washer (65), nut (64) and cotter pin (63). Insure lever (66) has easy hinge action but remains parallel to spiral plate (73).

(20) Install rudder trim cables (61) and (62) on cable drum (59) by inserting terminal barrels of cables in appropriate housings in cable drum. Wrap each cable a minimum of two and one half turns in opposite direction around cable drum until all cable reel recesses are occupied. Adjust cables until both leave cable drum at points 90° from, and in the same direction as, the cable terminal barrels. (Refer to Figure 3.) Tape cables together at cable drum to prevent unwrapping.

NOTE: Cables (61) and (62) are not interchangeable.

(21) Insert threaded end of shaft assembly (3) or (7) through cable drum (59) until rollpin (6) or key sleeve (9), as applicable, of shaft assembly engages in slot of cable drum disc (60).

(22) Install spacer (58) in bearing (57) of bracket assembly (55).

(23) Install bracket assembly (55) on shaft assembly (3) or (7) with bearing adjacent to cable drum (59). Secure using washer (54), nut (53) and cotter pin (52).

(24) Install spiral plate (51) on shaft assembly (3) or (7) until slot engages with rollpin (6) or key sleeve (9), as applicable.

(25) Install washer (38) over long end of spacer (37). Insert spacer into pivot hole of pointer (36) until washer (38) butts blade of pointer.

(26) On C6CF1053-3

Install washer (46) on threaded pin of lever (39). Assemble hinge plate (41), lever (39) and pointer (36) with outer plain pin of lever inserted in pointer slot, and threaded pin inserted in lug hole of hinge plate assembly. Secure lever to hinge plate assembly using washer (45) and nut (44).

NOTE: Do not install cotter pin (43) at this stage.

(27) On C6CF1053-5

Install washer (46) on threaded pin of lever (39). Assemble hinge plate (41), lever (39) and pointer (36), with threaded pin of lever inserted in hinge plate lug hole, and slots of lever and pointer aligned. Secure lever to pointer through slots of lever and pointer using bolt (49), one washer (48) on both sides of pointer, and nut (47). Secure lever to hinge plate using washer (45) and nut (44).

NOTE: Do not install cotter pin (43) at this stage.

(28) Install washer (50) on shaft assembly (3) or (7). Install pointer (36), with bush (37) and washer (38), on shaft assembly (3) or (7), and insert center pin of

lever (39) in spiral recess of spiral plate (51). Position hinge plate (41) to allow shaft assembly to project through hinge plate cutout.

NOTE: Position pointer diametrically opposite cable terminal barrels in cable drum (59). (Refer to Figure 3.)

(29) Tighten nut (44) on threaded pin of lever (39) until lever has easy hinge action but remains parallel to spiral plate (51). Lock using cotter pin (43).

(30) Install bearing assembly (33) on shaft assembly (3) or (7) with bearing (35) resting on short end of bush (37).

(31) Install rudder trim tab control subassembly (less handwheel (2) and rollpin (1)) between side plate assemblies (15) and (23), with bearing assembly housing (34) under top rear flange of side plate assemblies. Place pointer in neutral position.

NOTE: Pointer neutral position is centrally between side plate assemblies and facing elevator trim tab handwheel, with rudder cables positioned as in step (21). (Refer to Figure 3.)

(32) If alternative spiral plate (51) is installed, insure that keyway in perimeter is 15° off center (Figure 3.) Insure that undrilled flange of bracket (56) faces away from elevator trim tab cables. (Refer to Figure 4.)

(33) Secure rudder trim tab control subassembly to side plate assemblies (15) and (23) using four screws (11) through top rear flange of side plates, and four screws (12), washers (13) and nuts (14) through side plates and bracket (56).

(34) Install handwheel (2) on shaft assembly (3) or (7). Secure using rollpin (1).

7. Fits and Clearances

Refer to Tables 2 and 3.

8. Testing

A. Rudder Trim Control C6CF1053-1, -3 and -5

(1) Hold cables in tension and remove tape.

(2) Set rudder trim control handwheel in neutral position i. e. pointer centrally between side plates and facing elevator trim control handwheel, and cables evenly distributed about cable drum. (Refer to Figure 3.)

(3) Turn handwheel through full movement in both directions from neutral. Handwheel must turn a minimum of two full revolutions in both directions.

(4) Retape cables together to prevent unwrapping from cable drum.

B. Elevator Trim Control C6CF1053-1, -3 and -5

(1) Hold cables in tension and remove tape.

(2) On C6CF1053-1 and -3 (Refer to Figure 2)
Set elevator trim control handwheel in neutral position, i. e. pointer 30° forward

of top dead center, cable terminals and handwheel slot 30° aft of bottom dead center, and cables evenly distributed about cable drum.

(3) On C6CF1053-5 (Refer to Figure 4)

Set elevator trim control handwheel in neutral position, i. e. pointer 30° forward of top dead center, cable terminals and handwheel slot 30° aft of top dead center, and upper cable wrapped three turns around the cable drum.

(4) Turn handwheel through full movement in both directions from neutral. Handwheel must turn a minimum of two full revolutions in both directions.

(5) Retape cables together to prevent unwrapping from cable drum.

9. Trouble Shooting

A. If rudder or elevator trim control units fail to meet the requirements of the functional test procedure, refer to Table 5 to determine possible cause and correction of the malfunction.

Table 5

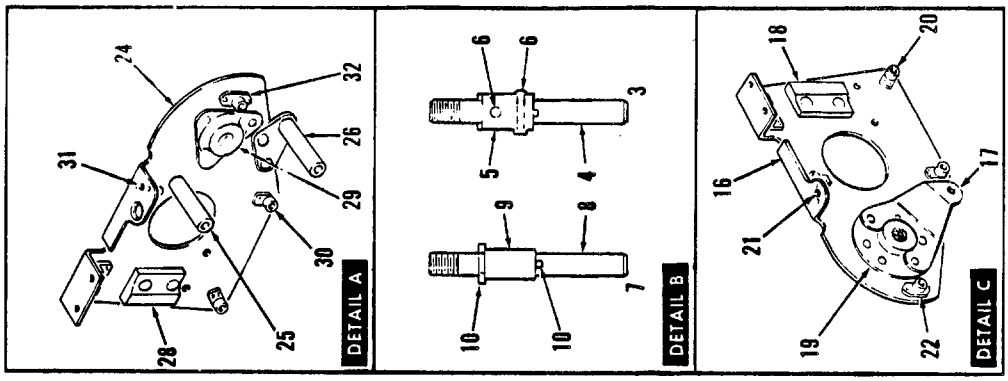
Trouble Shooting Information

TROUBLE	POSSIBLE CAUSE	CORRECTION
1. Handwheel does not turn a minimum of two revolutions in both directions from neutral.	Cables not correctly distributed around cable drum.	Redistribute cables as detailed in paragraph 6.

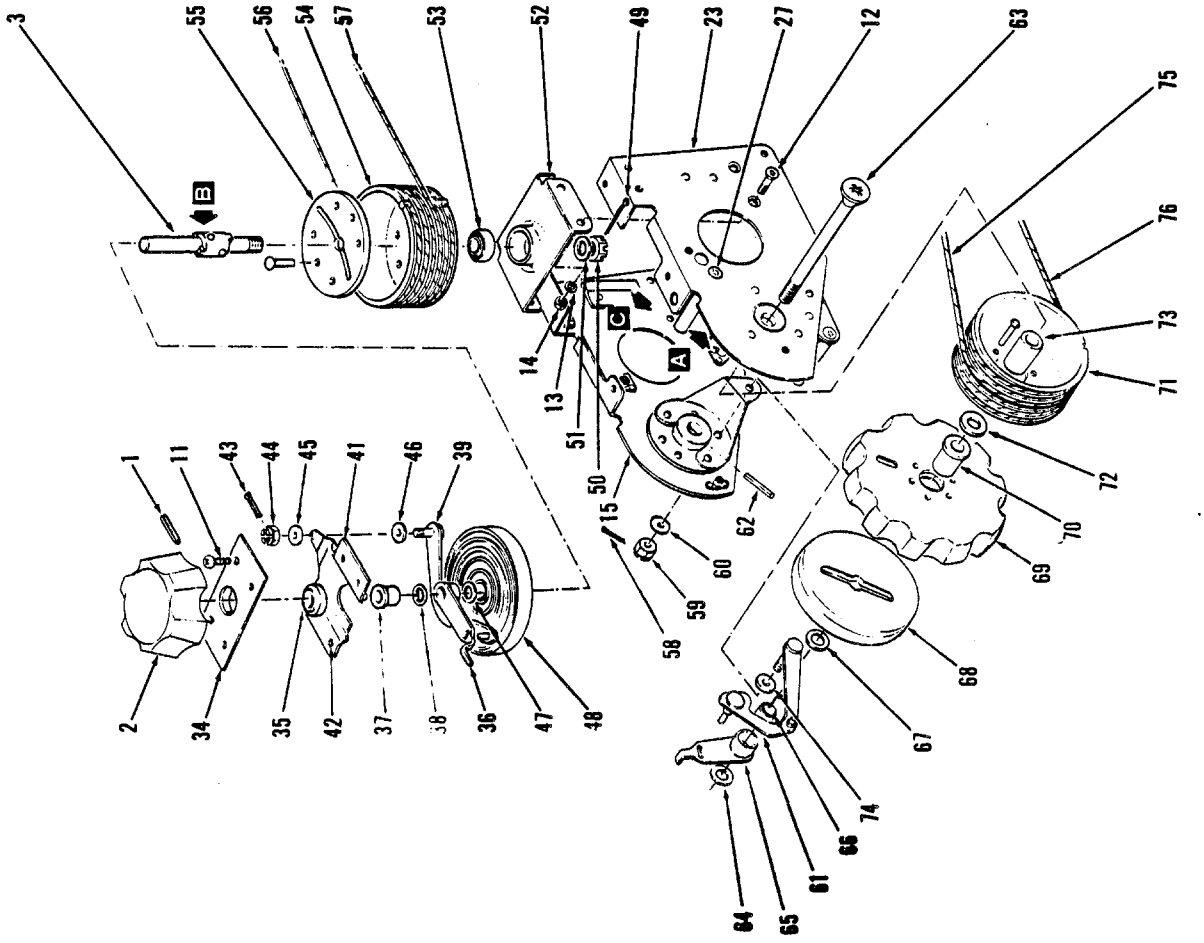
10. Storage Instructions

Table 6

Storage Materials and Compounds



MATERIAL	SPECIFICATION OR MANUFACTURER
Barrier Material	MIL-B-121
Desiccant	MIL-D-3464



A. Preparation

(1) Loop rudder and elevator trim cables and tape to facilitate stowage.

(2) Wrap rudder and elevator trim control assembly in water vapor resistant barrier material, including a desiccant.

(3) Affix label giving following information:
(a) Identification
(b) Date of Overhaul
(c) Inspection

Exploded View - Trim Control Assembly C6CF1053-1

Figure 5

11. Special Tools

No special tools are required.

INTRODUCTION

This manual contains instructions for the overhaul of the De Havilland Wing Flap Actuator Assembly Part No. C6HF1020.

WING FLAP ACTUATOR

PART NO. C6HF1020-1, -3 and -5

1. Description and Operation

A. Description (Figure 1)

The wing flap actuator consists of a cylinder containing a sliding piston. The cylinder has two ports with restrictors installed which are not interchangeable; each port is used for inlet hydraulic pressure and return, as selected. The outer end of the piston rod is threaded internally to allow installation of the end fitting, which connects the piston to the flap operating mechanism. Provision is made on the cylinder end cap for the attachment of a rotary selector valve.

B. Operation

The piston is cycled in the cylinder by the application of hydraulic oil under pressure to the appropriate port through the rotary selector valve. The amount of piston travel is controlled by a follow-up system within the selector valve.

C. Data

Hydraulic Fluid	MIL-H-5606
Operating Pressure	1500 PSI
Proof Pressure	2300 PSI
Stroke	3.4 inches

2. Disassembly

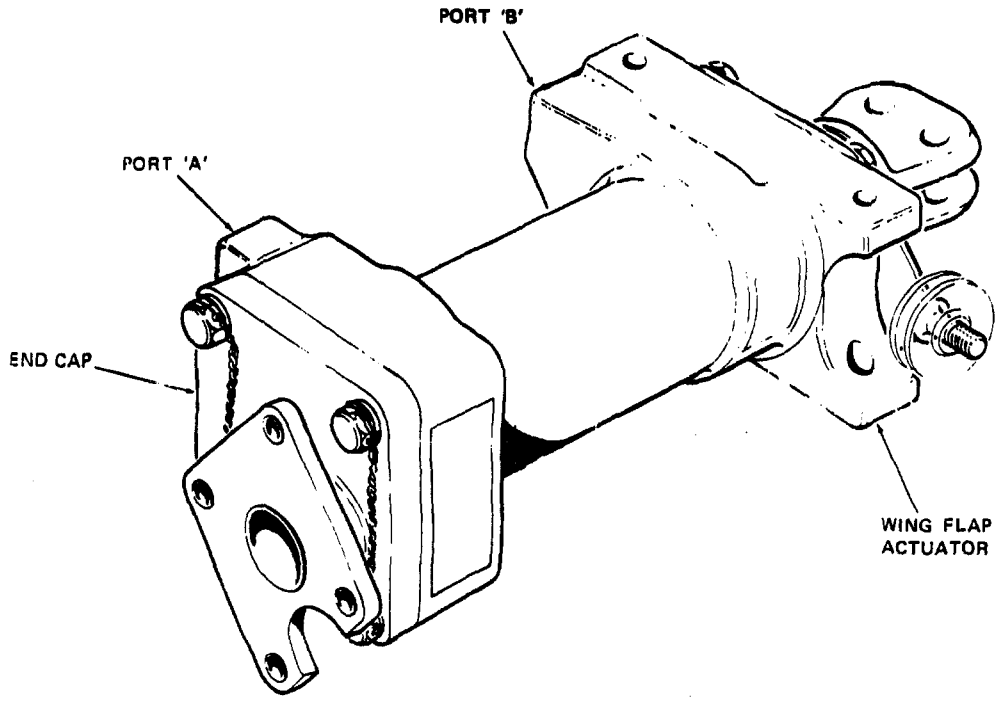
A. Disassemble Wing Flap Actuator (Figure 2)

CAUTION: ADEQUATE PRECAUTIONS MUST BE TAKEN TO PREVENT DAMAGE TO HIGHLY POLISHED SURFACES.

(1) Remove four bolts, washers and rotary selector valve from cylinder end cap. Remove elbows from cylinder hydraulic ports, if fitted. For overhaul data of rotary selector valve refer to Chapter 27-50-1, FLAP SELECTOR VALVE SKA104.

(2) Remove bolts (2), washers (3) and remove end cap (1) from cylinder (7).

(3) Remove O-ring (4) from end cap (1).



(4) Remove lockring(16) and unscrew end fitting (15) from piston rod (8).

(5) Withdraw piston rod (8) from cylinder (7).

(6) Remove O-ring (6) or seal set (6A) from piston rod (8).

(7) Remove bolts (11), washers (12), and remove retaining plate (10) from cylinder (7).

(8) Remove scraper ring (14) and O-ring (13A) or seal set (13) from cylinder (7).

Wing Flap Actuator

Figure 1

NOTE: No further disassembly is necessary unless jet assembly restrictors (5) and (9) are found to be damaged or obstructed (refer to Inspection/Check), in which case, remove using special tool No. 187-1.

Jet assembly restrictors (5) and (9) are not interchangeable. If removed identify each to assist in assembly of actuator.

3. Cleaning

A. General

(1) Clean components by washing or spraying with a dry-cleaning solvent.

WARNING: USE SOLVENT IN A WELL VENTILATED AREA. AVOID SKIN CONTACT. KEEP AWAY FROM FLAME.

(2) Reverse flush through jet assembly restrictors (5) and (9) in both directions to clean screens, using dry-cleaning solvent.

(3) Dry using moisture-free compressed air or lint-free cloth.

4. Inspection/Check

A. General

(1) Carry out a magnetic particle inspection of all magnetic metal components, where practicable.

(2) Inspect non-magnetic components using the fluorescent penetrant method, or an approved dye penetrant method.

(3) Inspect all parts visually for signs of fatigue and cracks, and for damage such as galls, scores, scratches, excessive wear and corrosion.

(4) Inspect all threads for damage and deformity.

(5) Check label (18) and name plate (17) for security and legibility.

(6) Refer to Table 1 for original tolerances and service limits. Check internal and external diameters of items listed for wear, concentricity and taper.

B. Restrictors

(1) Inspect restrictors (5) and (9) for damage.

(2) Inspect restrictors for obstruction and screens for cleanliness.

Table 1

Original Tolerances and Service Limits

FIGURE 2 ITEM NO.	NAME	DISCREPANCY LOCATION	ORIGINAL DIMENSIONS (INCHES)	SERVICE LIMIT (INCHES)	DISPOSITION
1	End cap	O. D.	2. 117 - 2. 115	2. 114	Replace
		O. D. (Groove)	1. 875 - 1. 873	1. 872	Replace
7	Cylinder	I. D. (Piston head bore)	2. 120 - 2. 122	2. 123	Replace
		I. D.	1. 751 - 1. 753	1. 754	Replace
15	End fitting	Attachment Holes	0. 3765 - 0. 3775	0. 3785	Replace
		Attachment Lug Gap	0. 573 - 0. 576	0. 578	Replace
8	Piston rod	O. D.	1. 748 - 1. 746	1. 745	Chrome plate to original dimension (surface finish 16) or replace.
		O. D. (Piston head)	2. 117 - 2. 115	2. 114	Chrome plate to original dimension (surface finish 32) or replace.

5. Repair

List of Materials

MATERIAL	SPECIFICATION OR MANUFACTURER
Alodine Solution 1200S	MIL-C-5541 (Amchem Products)
Soft Film Compound	MIL-C-16173 Grade 2 (Shell CG929)

A. General

(1) Repair or replace parts worn in excess of service limits (see Table 1).

NOTE: Where indicated in Table 1, parts may be repaired by hard chrome plating the affected surface, then grinding and honing the surface to the original dimension shown in the table. Where originally chrome plated, strip the original plating before repair.

(2) Replace all defective parts not listed in Table 1.

(3) Replace cadmium plated parts which have had coating damaged or removed.

(4) Where anodized parts have had protective surface treatment removed, apply a coating of Alodine Solution 1200S to affected area, or reanodize part.

(5) Replace tee-section seal sets (6A) and (13), if fitted.

(6) Replace all standard parts, such as O-rings, washers and lockwire.

(7) If protective compound on inner surface of piston rod (8) has deteriorated or has been removed, refinish with Soft Film Compound MIL-C-16173 Grade 2.

6. Assembly

List of Materials

MATERIAL	SPECIFICATION OR MANUFACTURER
Hydraulic Oil	MIL-H-5606
Corrosion Resistant Lockwire	MS20995C32

CAUTION: ADEQUATE PRECAUTIONS MUST BE TAKEN DURING HANDLING OF HIGHLY POLISHED SURFACES TO PREVENT DAMAGE, OR CONTAMINATION, BY BODY MOISTURES OR OTHER AGENTS WHICH MAY INITIATE CORROSION AFTER LUBRICANT IS APPLIED.

A. Assemble Wing Flap Actuator (Figure 2)

(1) Install jet assembly restrictors (5) and (9) in cylinder (7), if removed, using special tool No. 187-1.

CAUTION: JET ASSEMBLY RESTRICTORS (5) AND (9) MUST NOT BE INTERCHANGED. ITEM (9) HAS 0.030-INCH DIAMETER ORIFICE AND ITEM (5) HAS A 0.050-INCH ORIFICE.

(2) Lubricate O-ring (13A) or seal set (13) and scraper ring (14) with clean hydraulic oil MIL-H-5606 and install in cylinder (7).

CAUTION: ENSURE RADIUS ON EACH BACK-UP RING IS MATED WITH RADIUS AT ROOT OF T-SECTION SEALING RING OF SEAL SET.

NOTE: On actuator Part No. 6HF1020-1 (13A) is a standard O-ring and may be replaced by a seal set 327FR160 A-T (13). This is required by modification 6/1205 which, if incorporated, updates the actuator to Part No. 6HF1020-3. The identifying label must be marked accordingly.

(3) Position retaining plate (10) on cylinder (7) with pulley spigot diagonally opposite ports on actuator. Install washers (12) and bolts (11).

(4) On actuators Part No. C6HF1020-1 and C6HF1020-3, lubricate O-ring (6) with clean hydraulic fluid MIL-H-5606 and install in groove in piston rod (8). On actuator Part No. C6HF1020-5, install seal set (6A) in groove in piston rod (8), this is a requirement of modification 6/1650. When this modification is embodied, the actuator is up-dated to C6HF1020-5 and the identifying label must be marked accordingly.

CAUTION: ENSURE RADIUS ON EACH BACK-UP RING IS MATED WITH RADIUS AT ROOT OF T-SECTION SEALING RING OF SEAL SET.

(5) Coat internal surface of cylinder (7) with clean hydraulic fluid MIL-H-5606 and insert piston rod (8) with assembled seals into cylinder (7).

(6) Lubricate O-ring (4) with clean hydraulic oil MIL-H-5606 and install on end cap (1).

(7) Position end cap (1) in cylinder (7) with flange cutout in line with spigot (10), and install washers (3) and bolts (2).

(8) Screw end fitting (15) into piston rod (8) and install lockring (16). If new end fitting is used, drill a 0.086-inch diameter hole (No. 44 drill) in end fitting through hole in piston rod (8) to a depth of 0.35-inch. If a new piston is used with existing end fitting (15), and the locking holes on the piston rod and end fitting do not align, a new hole may be drilled in the end fitting through the pre-drilled hole in the piston rod, providing a distance of 0.1-inch is maintained between edges of the new and existing lockring holes in the end fitting.

(9) Lockwire bolts (2) and (11) using MS20995C32.

(10) If actuator is required for immediate service, position rotary selector valve on cylinder endcap (1) with pulley aligned with pulley spigot of retaining plate (10). Install four washers and bolts, and lockwire using MS20995C32. Install elbows in cylinder hydraulic ports, if removed.

7. Fits and Clearances

Refer to Table 1.

8. Testing

NOTE: Use only clean oil conforming to specification MIL-H-5606.

A. Pressure Test (Figure 1)

(1) Using a suitable test rig and, with port A open and piston rod retracted, apply 2300 psi hydraulic pressure for three minutes; there must be no external leakage or leakage from open port A. With port B open and piston rod fully extended, repeat test applying pressure at port A. There must be no leakage from open port B or cylinder. Release hydraulic pressure and check cylinder for permanent deformation.

(2) Using a suitable cycling rig, and with piston rod unrestrained, operate the piston rod in the cylinder for at least two cycles, raising pressure to 1500 psi at end of each stroke. Piston must move smoothly in both directions.

9. Trouble Shooting

Not applicable.

10. Storage Instructions

List of Materials

MATERIAL	SPECIFICATION OR MANUFACTURER
Hydraulic Oil	MIL-H-5606
Preservative Oil	MIL-H-6083
Barrier Material	MIL-B-121

A. Preparation

(1) Retract piston rod fully.

(2) Fill both ends of actuator with clean oil MIL-H-5606 or MIL-H-6083. Fit cap plugs to cylinder ports.

(3) Wrap unit in water vapor resistant barrier material.

(4) Affix label giving following information:

(a) Part and serial numbers.

(b) Date of overhaul.

(c) Type and specification of oil in actuator.

(d) Inspection.

SYNCRO DEVICES INCORPORATED

OVERHAUL INSTRUCTIONS

FLAP SELECTOR VALVE SKA104-1, SKA104-3 and SKA104-3A

1. DESCRIPTION AND DATA

A. DESCRIPTION
(Refer to Fig. 1)

The selector is a four way poppet type valve operated by a two lobe center camshaft to which is attached, at one end, an epicyclic gear mechanism. Input signals cause rotation of a gearwheel which transmits this motion, with a reduction ratio of 2, through a planetary gear system to the camshaft. The flap actuator output causes a signal of magnitude equal to the input, but of opposite sense, to cancel the input signal so that the valve is returned to its neutral position.

B. DATA

Operating Fluid - MIL-H-5606.
Operating Pressure - 1500 psi.
Operating Temperature - 65°F to 160°F.
Flow - 1.2 G.P.M.
Max Operating Torque - 15 pound-inches.

2. DISASSEMBLY

A. PROCEDURE
(Refer to Fig. 2)

(1) Cut and remove lockwire from plugs (1), (9), (17) and (25).

CAUTION: BECAUSE OF THE CRITICAL FACTORY SET ADJUSTMENT OF THE POPPET TO CAMSHAFT RELATIONSHIP, FOLLOW EACH STEP AS LISTED WHEN CARRYING OUT A COMPLETE OVERHAUL OF THE VALVE. IF ALL HARDWARE IS NOT REPLACED IN THE SAME CAVITIES OF THE VALVE BODY, THE UNIT WILL NOT FUNCTION AS REQUIRED.

NOTE: Observe the correct orientation of camshaft with respect to valve body. (In neutral position, the indexing notch of camshaft is at "6 o'clock position" when viewed from the input end, with the valve ports pointing towards the right). The camshaft must be reassembled in this position.

(2) Unscrew plug (1) and remove valve spring (2).

(3) Using special pliers (see figure 4), remove poppet and seat assembly (3) by inserting prongs of tool into holes in seat face until tool lip engages bottom face of seat. Apply a firm pressure on tool, slightly twist tool back and forth while pulling straight out, and remove assembly from cavity.

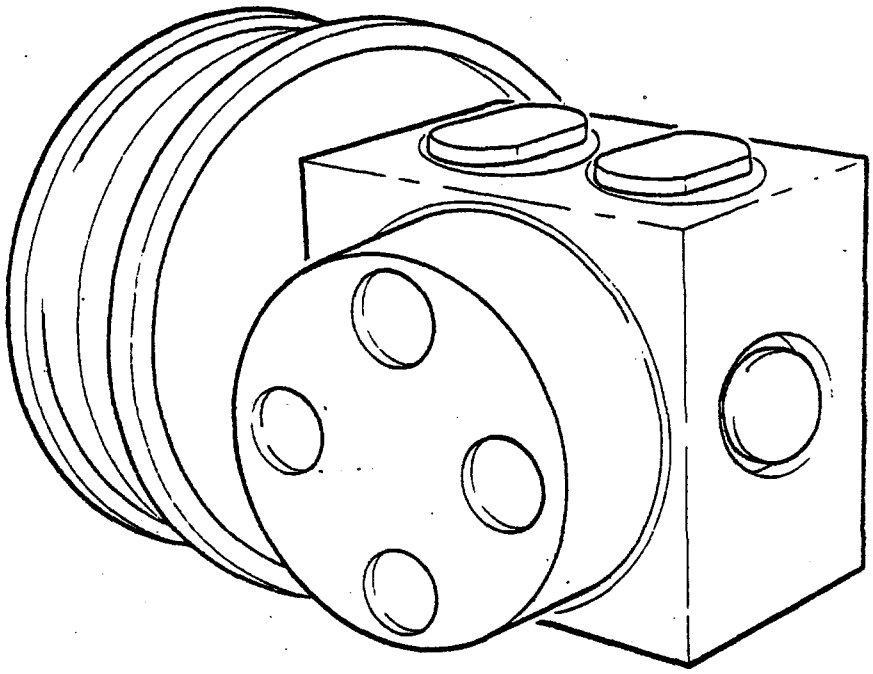

Figure 1. Selector Valve SKA 104

CAUTION: DO NOT REMOVE POPPET FOR PURPOSE OF REMOVING SEAT ASSEMBLY THROUGH CENTER HOLE.

(4) Remove O-ring (4) from top face and O-ring (5) from bottom face of seat assembly. Pull poppet (6) out of seat with a straight motion, and remove O-ring (7) from poppet.

CAUTION: DO NOT USE ANY FORM OF PLIERS TO REMOVE POPPET FROM SEAT.

(5) Remove shim (8) from body cavity. Ensure all parts are noted relative to body cavity.

(6) Remove plug (9), valve spring (10), poppet and seat assembly (11), O-ring (12), O-ring (13), poppet (14), O-ring (15) and shim (16) as detailed in steps (2) through (5).

(7) Remove plug (17), valve spring (18), poppet and seat assembly (19), O-ring (20), O-ring (21), poppet (22), O-ring (23) and shim (24) as detailed in steps (2) through (5).

(8) Remove plug (25), valve spring (26), poppet and seat assembly (27), O-ring (28), O-ring (29), poppet (30), O-ring (31) and shim (32) as detailed in steps (2) through (5).

(9) Remove circlip (33) from end of camshaft remote from gearing, and remove washer (34).

(10) Carefully withdraw camshaft assembly (35) complete with gearing from valve body (36) with light pressure and a twisting motion.

CAUTION: IF CAMSHAFT IS REMOVED IN A ROUGH MANNER, LINEAR SCRATCHES WILL CAUSE SHAFT LEAKAGE.

(11) Remove three O-rings (37) and on -3 and -3A assemblies, remove three back-up rings (38) from camshaft. Disassembly of gear assembly (under pulleys) is not necessary unless binding is evident. Check for binding by holding one pulley and rotating the other in turn. Both pulleys should roll freely.

(12) If binding is evident due to contamination, remove circlip (33) and washer (34) from pulley end of camshaft. Cut lockwire, remove screws (39), pulleys (40), gear (41) and gear (42). Remove four screws (43) and remove spider assembly (44) from camshaft.

3. CLEANING

A. PROCEDURE

(1) Clean all parts from one valve cavity at a time to ensure no chance of mixing shims and poppet and seat assemblies.

(2) Clean all parts using a dry cleaning solvent. Dry with lint-free dry cloth.

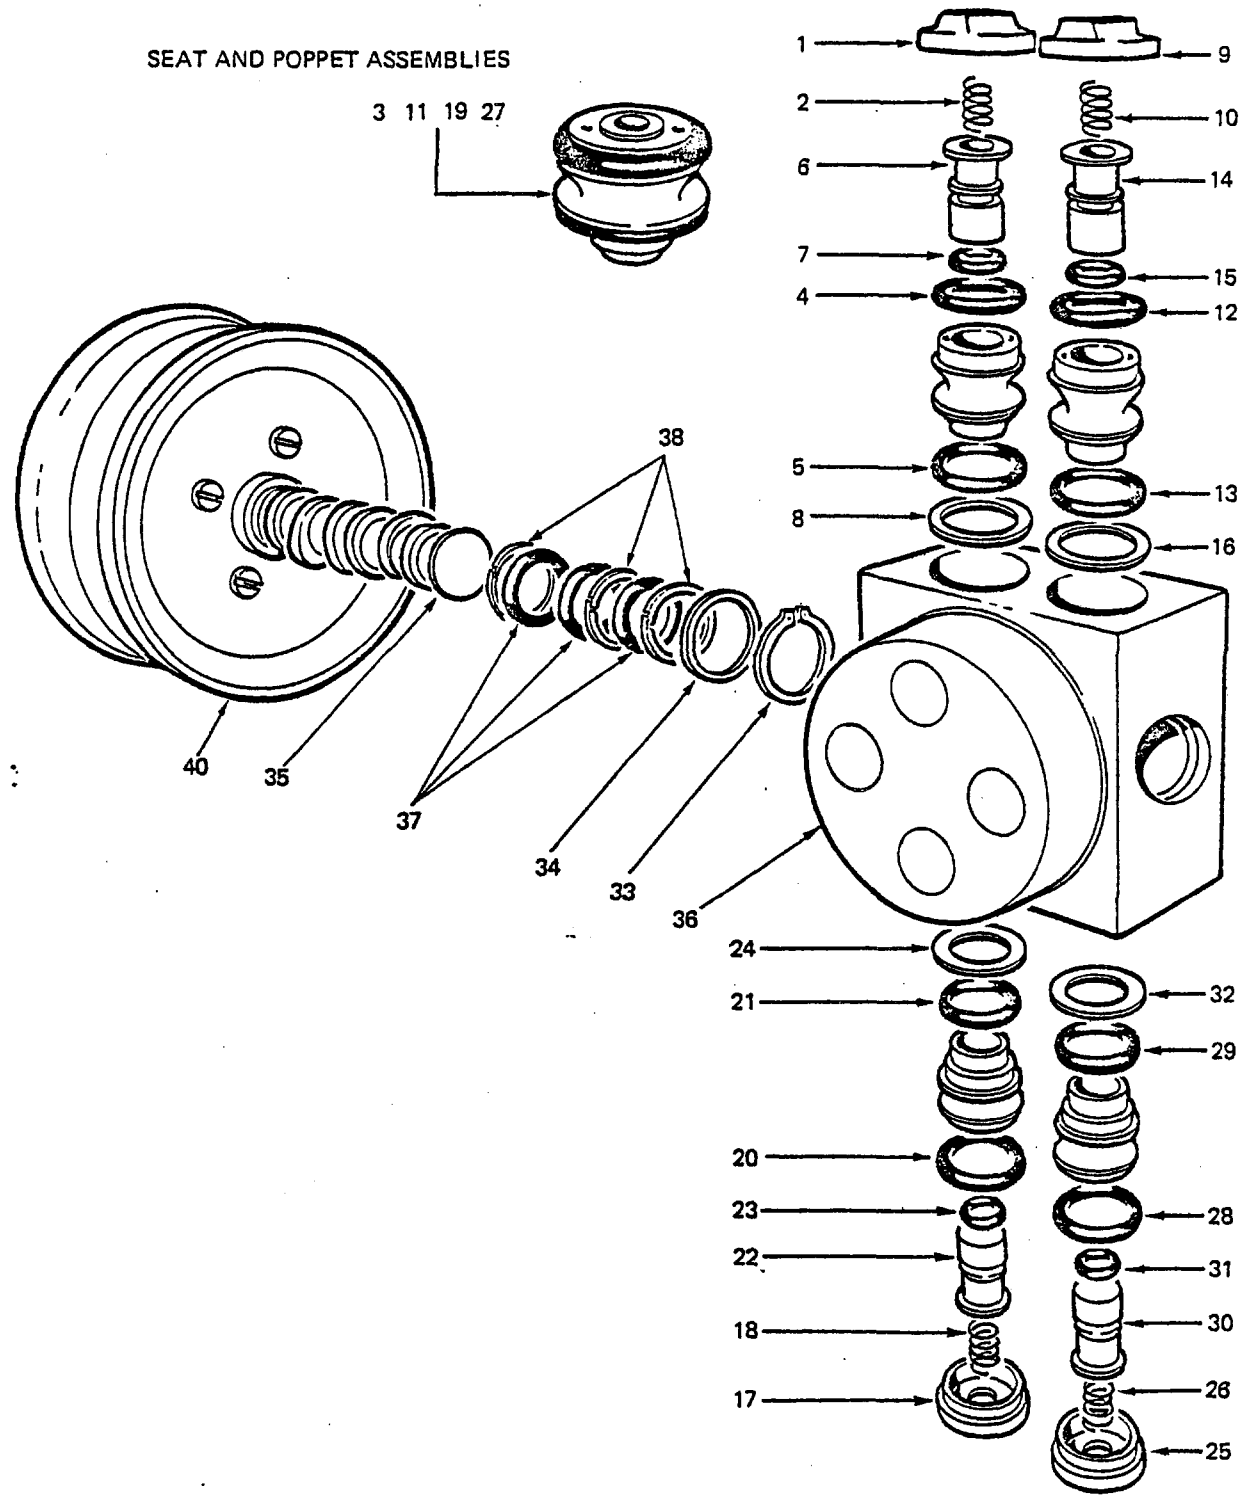

Figure 2. Selector Valve Assembly (Sheet 1)

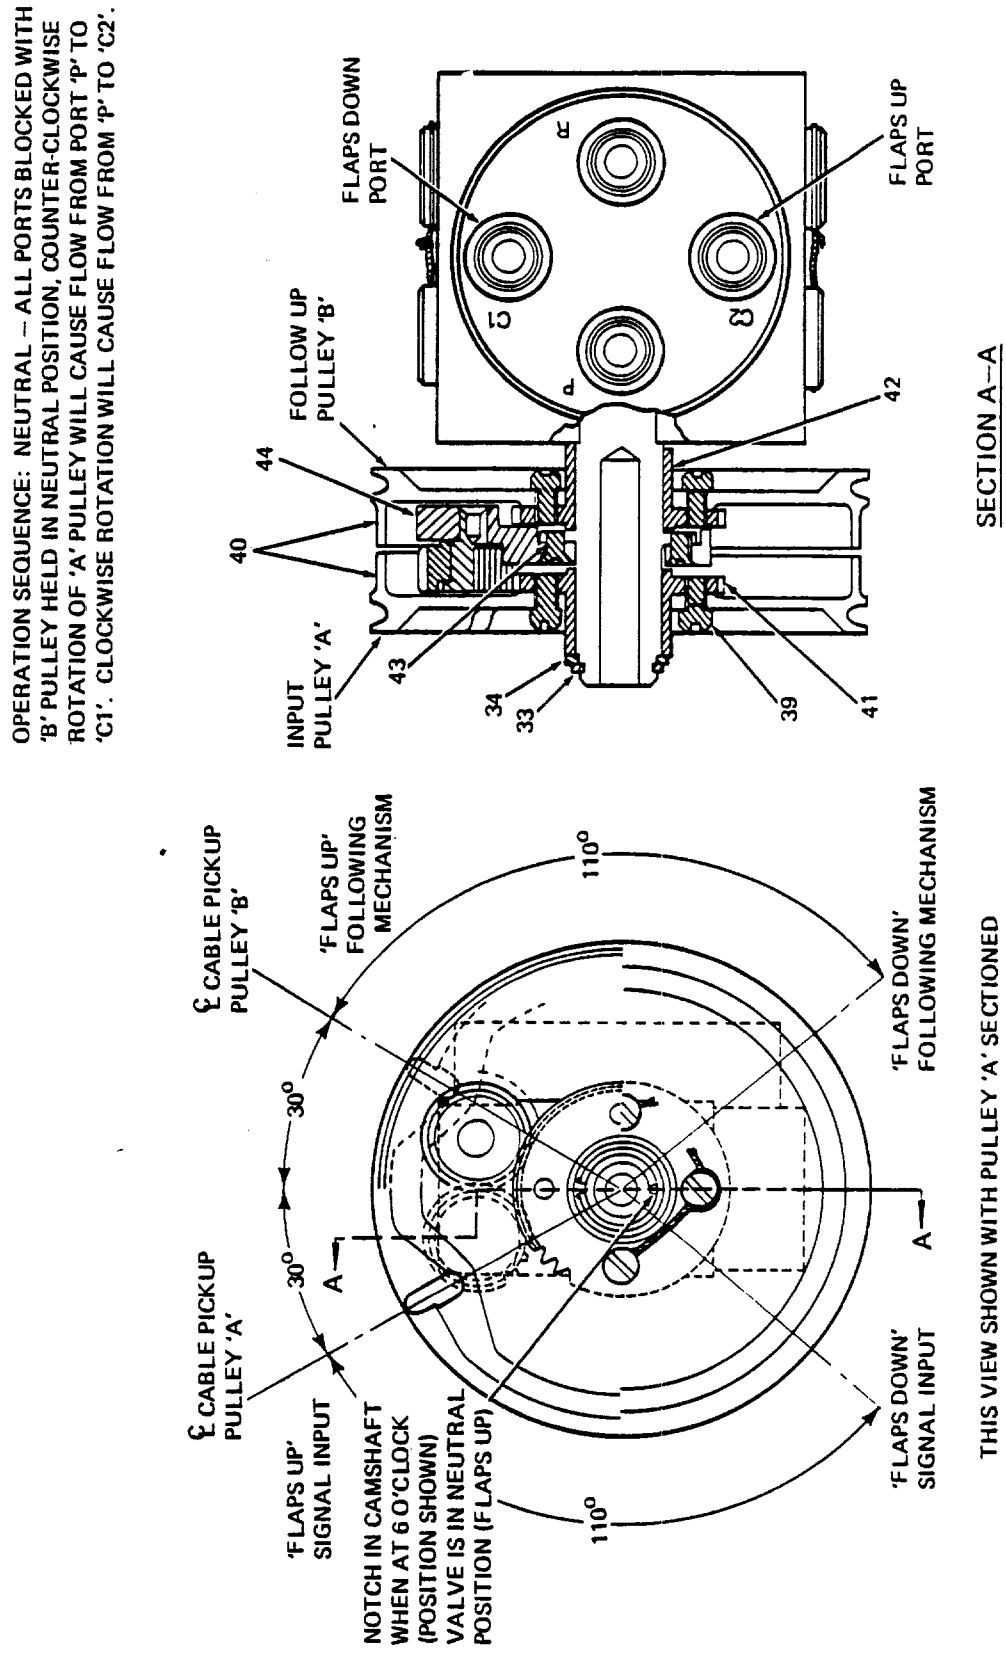

Figure 2. Selector Valve Assembly (Sheet 2)

4. INSPECTION

A. PROCEDURE

(1) Valve body should be free of scratch marks relative to the three O-ring areas. Minor radial scratch marks or burnishing of bore from camshaft bearing (6 places) is acceptable. Bore diameter should be between 0.562 and 0.565 inch. If bore is badly scored or outside allowable limits, it will be necessary to replace entire unit.

(2) Camshaft bearing journals should be free of scratch marks.

NOTE: Burnishing of black oxide is not cause for rejection. Diameter of journals should be between 0.561 and 0.5657 inch. If camshaft shows definite scratches, or bearing journals are beyond allowable limits, the selector valve should be replaced.

NOTE: Wear on cam lobes will be evident at and adjacent to corners, and is not cause for rejection as it only affects dead band. (Refer to TESTING.)

(3) Check gear assembly for freedom of movement. Hold one pulley and rotate the other. Both should roll freely without evidence of binding.

(4) Inspect large hole in seat (poppet and seat assemblies) for nicks. If evident, internal leakage of valve will occur, and selector valve should be replaced. If in doubt, reassemble unit and test for internal leakage. (Refer to TESTING.)

5. REPAIR

A. Not applicable

6. ASSEMBLY

A. PROCEDURE

(1) During assembly, lubricate all O-rings with petroleum jelly. If not available, lubricate using hydraulic fluid listed in 7. TESTING. Refer to Figure 2, position spider assembly (44) on camshaft (35) and install four screws (43). Position gear (42), gear (41), pulleys (40) and install screws (39). Install washer (34) and circlip (33) at pulley end of camshaft (35).

(2) Install three new O-rings (37), and on -3 and -3A assemblies install three back-up rings (38) on camshaft. Ensure back-up rings are installed opposite pressure side of O-ring. Wet bore of valve body (36) with test fluid (refer to paragraph 7) and assemble camshaft assembly into bore of valve body taking care not to pinch O-rings as they enter and continue through bore.

(3) Install washer (34) and circlip (33) to lock camshaft to valve body. Rotate camshaft notch to correct position. (Refer to paragraph 2.A. (1).)

(4) Install shim (32) to its relative cavity in valve body.

(5) Install new O-ring (31) to poppet (30) of poppet and seat assembly (27) and reinstall poppet in seat.

(6) Install new O-ring (29) to bottom face of poppet and seat assembly. Reinstall poppet and seat assembly (27) to its relative cavity in valve body taking care not to cut O-ring as it passes flow holes. Ensure that seat is at bottom of cavity.

(7) Install new O-ring (28) on top face of poppet and seat assembly. Push O-ring into position firmly.

CAUTION: DO NOT USE SHARP TOOLS OF ANY KIND TO POSITION O-RING.

(8) Install spring (26) and plug (25) to cavity.

(9) Install shim (24), O-ring (23), poppet (22), O-ring (21), poppet and seat assembly (19), O-ring (20), valve spring (18) and plug (17) to its relative cavity in valve body in a similar manner as detailed in steps (4) through (8).

(10) Install shim (16), O-ring (15), poppet (14), O-ring (13) poppet and seat assembly (11), O-ring (12), valve spring (10) and plug (9) to its relative cavity in valve body in a similar manner as detailed in steps (4) through (8).

(11) Install shim (8), O-ring (7), poppet (6), O-ring (5), poppet and seat assembly (3), O-ring (4), valve spring (2) and plug (1) to its relative cavity in valve body in a similar manner as detailed in steps (4) through (8).

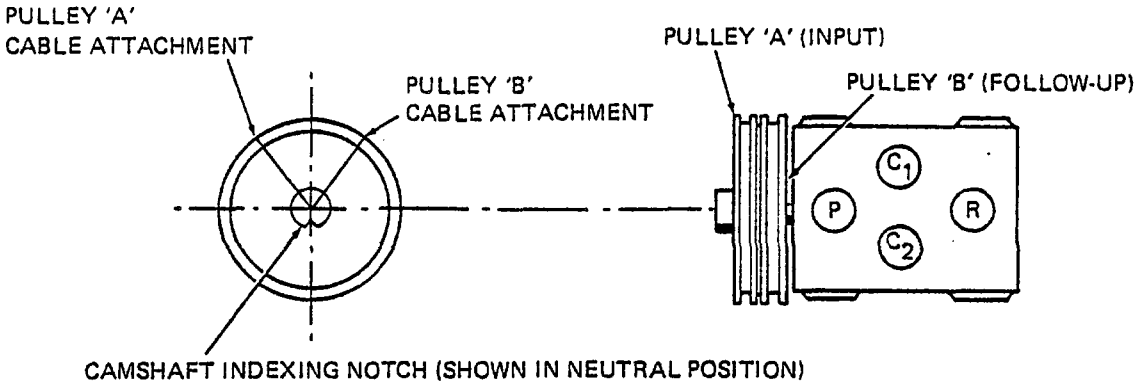
(12) Using a torque wrench, tighten plugs (1), (9), (17) and (25) to 20-25 pounds-feet. Wirelock plugs with lockwire MS20995NC32.

7. TESTING

A. PROCEDURE

(1) Use hydraulic fluid to US specification MIL-H-5606A, "Esso Univas J43". "Shell Aeroshell Fluid 4".

(2) Connect selector valve as shown in Fig. 3.



(3) Refer to Fig. 3 and carry out sequence of tests as detailed in Table 1.

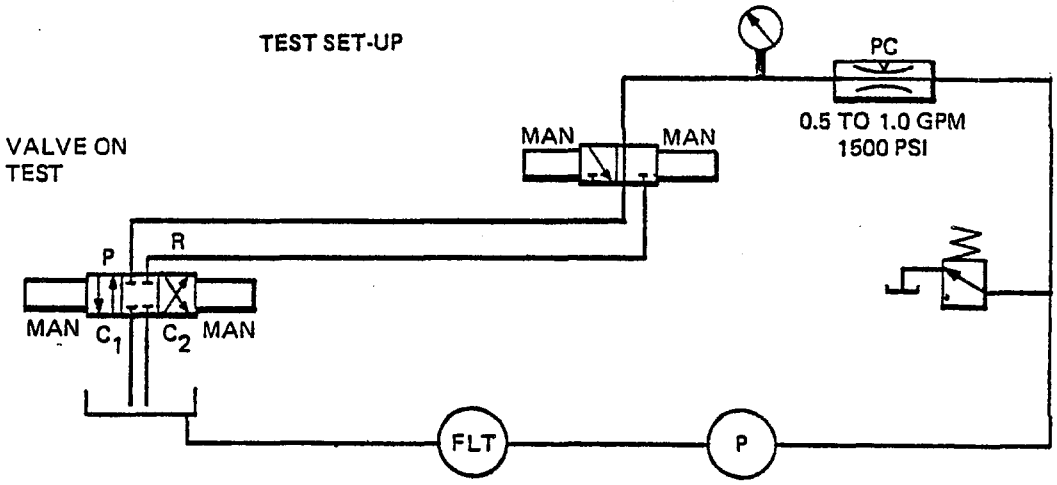


TABLE 1

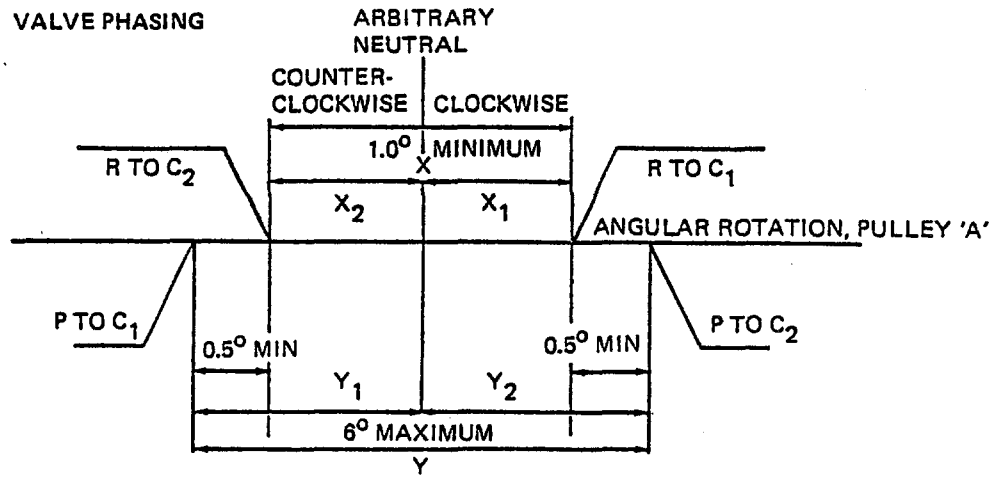

TEST REQUIREMENTS

Test No.	To Test	Apply Pressure at Port	Cap Ports	Initial Applied Pressure PSI	Pulley Position	Requirements and Observations
1.	Proof Pressure	P	R	2250 (Static)	Rotate A & B together	Ports C1 and C2 joined by shorting line. Apply pressure for 2 min-

VALVE PORT ORIENTATION

NOTE: THIS FIGURE SHALL BE $\left(\frac{Y-X}{2}\right)^{\circ} \pm .5^{\circ}$ EXAMPLE: $Y = 6^{\circ}$, $X = 1^{\circ}$, $\left(\frac{6-1}{2}\right)^{\circ} \pm .5^{\circ}$, $2.5^{\circ} \pm .5^{\circ}$

Figure 3. Rotary Control Valve Test Set-Up

Test No.	To Test	Apply Pressure at Port	Cap Ports	Initial Applied Pressure PSI	Pulley Position	Requirements and Observations
						utes, release and re-apply. There shall be no external leakage, permanent set or deformation.
2.	Low Pressure, External Leakage	P	None	10 (Static)	Neutral	As for Test 1, no external leakage.
3.(a)	Internal Leakage	P for a settling period of 9 min.	None	1500 at 0.5 to 1.0 gpm.	Neutral	Leakage rate from Port C1, C2 or R after settling period not to exceed 1 drop per minute Retest at 500 psi. No leakage from Ports C1 C2 or R (see Note 2).
(b)	Internal Leakage	R for a settling period of 9 min.	None	1500 at 0.5 to 1.0 gpm	Neutral	Leakage rate from Port C1, C2 or P after settling period not to exceed 1 drop per minute Retest at 50 psi. No leakage from Ports C1, C2 or P (see note 2).
4.(a)	Valve Phasing	R (Rigged as in Fig. 3)	None	1500 at 0.5 to 1.0 gpm	Pulley B locked, rotate A clockwise from arbitrary neutral.	Note angular displacement of Pulley A from arbitrary neutral until oil commences to flow from Port C1 (Angle X1 Without disturbing Pulley A setting, continue to test 4 (b).
(b)		P			Pulley B locked, rotate A clockwise from position determined at 4 (a).	Continue turning Pulley A until oil commences to flow from Port C2. Note total angular displacement of Pulley A (Angle Y2). Return Pulley to original neutral position.
(c)		R			Pulley B locked, rotate A counterclockwise from arbitrary neutral.	Note angular displacement of Pulley A from arbitrary neutral until oil commences to flow from Port C2 (Angle X2 Without disturbing Pulley A position continue to test 4 (d).

Test No.	To Test	Apply Pressure at Port	Cap Ports	Initial Applied Pressure PSI	Pulley Position	Requirements and Observations
(d)	Valve Phasing	P	None	1500 at 0.5 to 1.0 gpm.	Pulley B locked, rotate A counter-clockwise from arbitrary neutral	Continue turning Pulley A until oil commences to flow from Port C1. Note total angular displacement of Pulley A (Angle Y1). The sum of Angles X1 + X2 and Y1 + Y2 shall lie within the bands shown by Fig. 3.

NOTES: (1) "Neutral" position defined as Camshaft Notch at 6 o'clock position.
(2) "No Leakage" defined as 1 drop in 3 minutes. Tests 3 (a) and 3 (b) only.
(3) "Commences to Flow" defined as the first steady oil stream.

8. TROUBLE SHOOTING

Trouble	Probable Cause	Correction
Internal Leakage	Nicks or scratches on seat of poppet and seat assembly or cut O-ring.	Remove poppet and seat assemblies (paragraph 2A steps (1) through (8)). Clean and inspect seat. Reassemble (paragraph 6A steps (4) through (8)) and test. (Refer to Table 1, test 3 (a) and (b)).
Camshaft external leakage.	Scratches on camshaft or cut O-rings.	Remove plugs and valve springs. Reinstall plugs and hand tighten only. NOTE: It is not necessary to remove poppet and seat assemblies Holding both pulleys, rotate camshaft 360° to lift poppets. Remove camshaft assembly (paragraph 2A steps (9) through (11)). Examine valve body bore and camshaft for accessive scratches and loose pieces of O-rings. Clean and reassemble camshaft (paragraph 6A steps (1) through (3)). Remove plugs. Reinstall springs and plugs. Tighten plugs 20-25 pounds-feet. Carry out tests 1 and 2 of Table 1.

Plug external leakage.	Cut 0-ring on top face of poppet and seat assembly.	Remove leaking plug and valve spring. Note condition of 0-ring on top face of seat, then remove 0-ring. Ensure seat is bottomed and area free of contamaination or loose pieces of 0-ring. Lubricate and install new 0-ring. Push 0-ring into position firmly. CAUTION: DO NOT USE SHARP TOOLS OF ANY KIND TO POSITION 0-RING ON SEAT. Replace valve spring and plug. Tighten plug to 20-25 pounds-feet and wirelock. Test valve for external leakage (Refer to Table 1, tests 1 and 2).

9. STORAGE INSTRUCTIONS

A. Cap all ports, and enclose selector valve in polythene bag.

10. SPECIAL TOOLS

A. Pliers - (Local manufacture see figure 4.)

11. ILLUSTRATED PARTS LIST

A. General

Part variations between flap selector valve models are indicated by letter symbols placed under "Usage on Code" column of the Detailed Parts List. "Usage on Code" letter symbols are applicable as follows:

USAGE ON CODE	PART LIST NUMBER
A	SKA 104-1 (Serial Nos. 1 thru 126)
B	SKA 104-3 (Serial Nos. 1 thru 605)
C	SKA 104-3A (Serial Nos. 606 and sub)

GENERAL

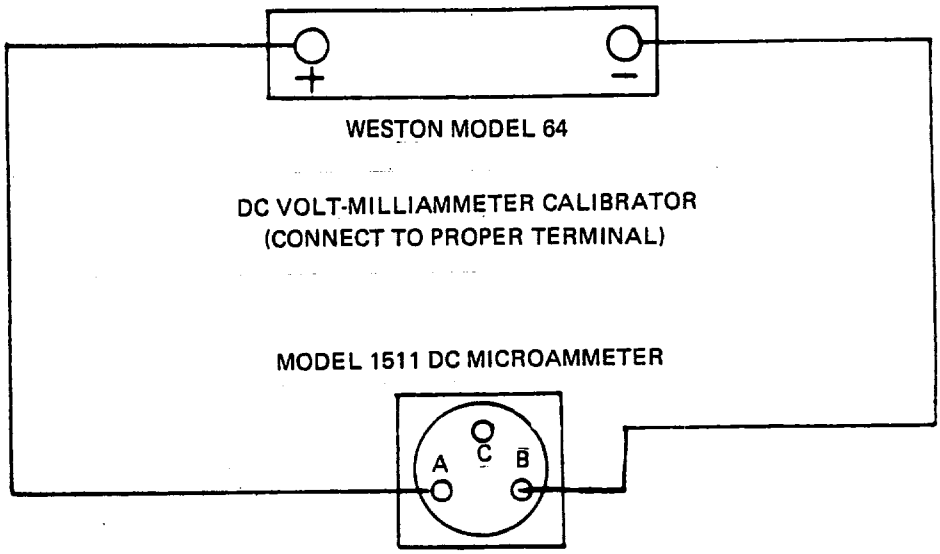
This manual contains operating, maintenance, testing and calibration instructions with replacement parts list for the Weston Model 1511 DC Microammeter, part number 253607, manufactured by Weston Instruments Division, Weston Instruments, Inc., Newark, N. J.

This microammeter is a sealed, ruggedized, permanent magnet, moving coil type instrument designed for use in the vicinity of shock or vibration. It is provided with a special slotted bezel to allow for external edge lighting.

The meter is calibrated and tested as a microammeter but indicates aileron trim information.

TABLE OF SPECIFICATIONS

Range	500/0/500 Microamperes DC
Scale	LW DN (left) / 0 (center) / RW DN (right) Caption: Ail Trim
Resistance . . .	37.5K ± 235 ohms between pins A & B, and between pins B & C.
Accuracy	±3% of full scale
Case	1.5 inch dia. steel barrel with rubber shock mountings.



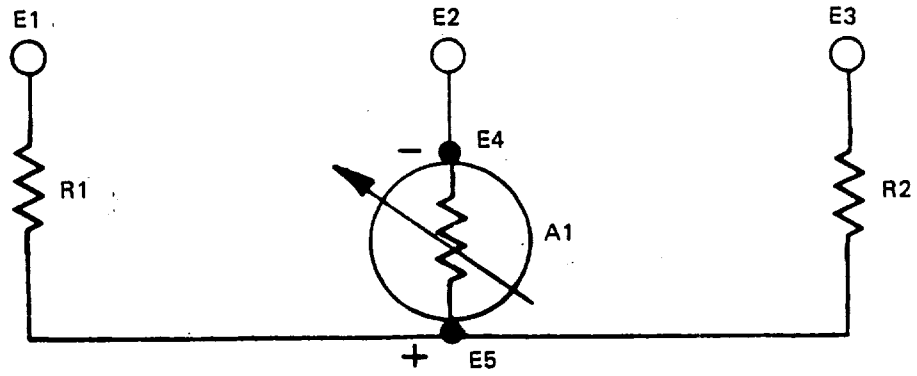


Figure 1. Calibration Circuit.

A1 = Moving Element Assembly (36.8 ohms ± 20%)
E1 = Back Connection Terminal (Pin A)
E2 = Back Connection Terminal (Pin B)
E3 = Back Connection Terminal (Pin C)
E4 = Bracket Bottom Solder Abutment
E5 = Bracket Top Solder Abutment
R1, R2 = Resistor, wire wound, 37.5K ± 1/2%, 0.1 watt

Figure 2. Internal Wiring Diagram.

OPERATING AND INSTALLATION INSTRUCTIONS

a. Mount the instrument on a vertical panel prepared in accordance with the drilling plan. (See Figure 3.) The panel material may be steel or a nonmagnetic material since the case provides magnetic shielding.

b. Connect the circuit lead wires to the back connection terminals, observing proper polarity.

MAINTENANCE INSTRUCTIONS

a. It is recommended that the instrument be tested for proper performance at twelve month intervals. It should always meet the requirements as stated in the Test Procedure and Calibration Check.

b. No lubrication is required of this instrument.

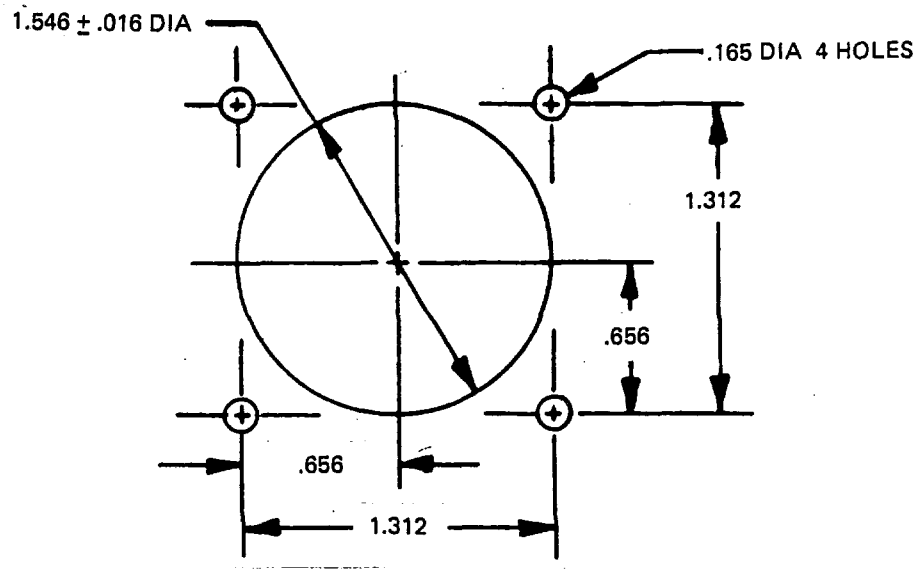

Figure 3. Panel Drilling Plan.

CALIBRATION CHECK

a. Connect the instrument in the circuit as shown in Figure 1.

b. Apply end scale current and note pointer deflection. The pointer must deflect to the RW end scale mark. (Tolerance is ± 3% of full scale.

c. Reverse polarity and note pointer deflection. The pointer must deflect to the LW end scale mark (within tolerance).

d. Repeat steps b and c with positive lead to terminal B, negative to A.

e. If the indications are not within the accuracy limits refer to the following trouble shooting chart and test procedures to determine the probable cause of calibration error.

TEST PROCEDURES

If the instrument does not meet the requirements of each of the following tests it is considered defective and should be repaired. Tests should be conducted at ambient room temperature 25°C (77°F). The instrument must be baked and resealed if opened. The instrument should be tapped lightly when test readings are taken.

Balance Test

a. With the instrument in its normal operating position, scale vertical and upright, pivot axis horizontal, the pointer shall rest at the center of the zero mark on the scale.

b. Tilt the instrument from this position 60 degrees to the left, to the right, and forward or backward. The pointer shall not deviate more than one-half the pointer tip width from its original position when checked in any of the aforementioned positions. If it does it will be necessary to rebalance the moving element assembly.

Dielectric Test

a. Gradually apply 1500 Volts RMS, sinusoidal 60 cycles, for five seconds between the three back connection terminals, connected together, and the case. Gradually reduce the voltage at the end of the five second test.

b. If breakdown occurs check the instrument internally for loose metal particles.

Watertightness

a. Immerse the instrument in water and apply a vacuum equivalent to an absolute pressure of two inches of mercury for two minutes. There shall be no stream of bubbles from the instrument. Bubbles from the water or clustered around the instrument may be ignored.

b. After releasing the vacuum and removing the instrument from the water there shall be no evidence of water within the case.

c. If moisture is found within the case replace the gasket and reseal.

Resistance

The resistance, as measured across the back connection terminals, must be as stated in the Table of Specifications.

ADJUSTMENT PROCEDURES

Final Jewel Adjustment

a. Make the final jewel adjustment under open circuit conditions. Alternately adjust the top and bottom jewel screws until the distance from the core to the top and bottom of the moving coil is equal.

TROUBLE SHOOTING CHART

TROUBLE	PROBABLE CAUSE	REMEDY
FRICTION	Damaged pivots or jewel screws. Foreign particle in air gap. Fuzz on moving coil. Moving coil touching core. Distorted spring. Jewel screws too tight.	Replace pivots or jewel screws. Remove particle. Remove fuzz. Readjust jewel screws for proper moving coil clearance. Replace moving coil if it is bent or distorted. Realign spring with fine tweezers or replace it entirely. Readjust jewel screws.
NO INDICATION	Open moving coil. Poor solder connection.	Replace moving coil. Resolder connection.
VARIABLE READING	Poor connections. Friction. Loose balance weight. Distorted spring in moving element.	Tighten or resolder connections. See FRICTION section above. Replace balance weight and rebalance. Realign spring with fine tweezers or replace it entirely.
INDICATES	Friction. Loose connections. Spring test too high. Shorted turns on moving coil or incorrect moving coil. Incorrect resistance. Insufficient magnet strength.	See FRICTION above. Tighten or resolder connections. Replace springs. Replace moving coil. Replace or adjust resistor. Recharge and treat magnet.
INDICATES HIGH	Spring test too low. Incorrect moving coil. Excessive magnet strength. Incorrect reistance.	Replace springs. Replace moving coil. Treat magnet. Replace resistor.
CALIBRATION ERROR IN EXCESS	Moving element poorly balanced. Distorted spring.	Rebalance moving element. Realign spring with fine tweezers or replace it entirely.

b. Deflect the pointer from its original rest position and let the pointer oscillate. Tighten the top jewel screw slowly until a slight damping is detected. Back off from this point one-eight to one-quarter of a turn.

c. Apply red butyl methacrylate cement, Weston SND 23317-001, to the top and bottom jewel screws.

Magnet Charging

a. If the mechanism assembly was disassembled the magnet must be recharged on a suitable magnet charger having a capacity of at least 33,000 ampere turns DC.

b. After charging, the pointer must deflect in a clockwise direction with positive polarity applied to the bracket top insulated solder abutment.

c. If the pointer deflects to the opposite direction, reverse the charge on the magnet.

Balancing Moving Element

Before attempting to balance the moving element make sure that the pointer is straight and swings parallel to and between 0.05 and 0.10 inch from the scale plate. The moving element must be well balanced about the axis of rotation in order that the calibration will check in the normal operating position as well as when tilted. Adjustable balance weights are provided on the pointer arms for balancing purposes. The general procedure for balancing the instrument moving element is as follows:

a. Hold the instrument so that the scale palate is in horizontal position and adjust the pointer to 0 by means of the bracket top abutment.

b. Turn the instrument so that the scale is in a vertical position and the pointer is parallel to the floor.

c. Adjust the tail weight, in or out, until the pointer rest at the 0 mark and is parallel to the floor.

d. Rotate the instrument until the pointer is perpendicular to the floor.

e. Adjust the side arm weights until the pointer rests at the 0 mark and is perpendicular to the floor.

f. Repeat steps b thru e until proper balance is achieved. (See Balance Test.)

CALIBRATION PROCEDURE

a. Prior to instrument calibration check the resistance across the back connection terminals. The resistance must be within the tolerance as stated in the Table of Specifications.

b. Connect the instrument to the standard calibrator as shown in Figure 1.

c. Apply end scale current. If the pointer does not go beyond the end scale mark the spring test is too high, the moving coil has an insufficient number of turns, or the magnet is not fully charged.

d. Position the instrument between the jaws of an energized demagnetizing coil. Increase the voltage to the demagnetizing coil slowly until the pointer rests at the end scale mark with end scale current applied to the instrument.

e. Exercise care not to over-treat as the magnet will then have to be recharged.

f. Reverse the polarity and check pointer deflection in the other direction.

INSTRUMENT SEALING

a. The instrument window, flange, gasket, and bezel must be clean before sealing. Never use alchols, petroleums, or similar solvent on the window.

b. Dampen a soft cotton pad with Weston anti-static solution Statnul® and apply to the inside and outside surfaces of the window. Allow a slight haze to form by air drying. Polish with a soft clean cotton pad until haze is just visible.

c. Insert a dirt free metal spacer (such as a paper clip) between case flange and window for ventilation during next step.

d. Bake instrument in an oven, free of dirt and lint, for 2 hours at 145° - 165°F.

e. Upon removal from oven, remove metal spacer and immediately press window tightly against case flange with palm of hand to provide temporary seal while completing following steps.

f. Place the instrument with the bezel and window face down on a flat soft surface and align the holes on the bezel with the holes of the case flange.

g. Tighten all four case to bezel screws lightly initally to hold bezel in place, then proceed to tighten screws at a torque of 5 to 6 in. lbs. When tightening screws, tighten screws directly opposite one previously tightened.

h. When sealed, the instrument must pass the aforementioned watertightness test.

MODEL 1511

REPLACEMENT PARTS LIST

ITEM NO.	PART NUMBER	DESCRIPTION	QTY PER ASSY
1	253607	Instrument Assembly, Model 1511, 500/0/500 Microamperes DC	-
2	133340-172	Screw (Case to bezel)	4

FUEL

– Temporary Revision

PSM NO.: 1–6–6A **AIRCRAFT:** DHC-6 **SERIES:** ALL

PUBLICATION: COMPONENT MAINTENANCE MANUAL **TEMPORARY REVISION NO.:** 28–1

Insert in Chapter 28 – CONTENTS, before page 1

CHAPTER 28 – FUEL

REASON FOR ISSUE:

This Temporary Revision adds Section 28–10–1, Tank Filler Cap Assembly Part Number 38040–1 to the Table of Contents and updates part numbers for the Uniroyal Bladder Type Fuel & Oil Cells.

ACTION:

In Chapter 28, ignore existing Table of Contents and replace with revised Table of Contents, as shown on page 2 of this Temporary Revision.

— Continued overleaf —

RECORDING INSTRUCTIONS:

Record this Temporary Revision No. and the relevant information in the appropriate columns of the TEMPORARY REVISION INDEX provided at the front of the manual.

HIGHLIGHTS

Pages that have been revised are listed below together with the highlights of the revision. Please Remove and insert the affected pages listed and enter insertion date and initials next to the Revision 1 issue date on the Record of Revisions page. On each affected page, an upper case "R" appears adjacent to the line(s) changed. An upper case "R" in the lower left-hand corner of an affected page indicates that the information on that page was relocated but remains unchanged.

COMPONENT MAINTENANCE MANUAL

OVERHAUL MANUAL FOR PART NUMBER 38040-1
TANK FILLER CAP ASSEMBLY

INTRODUCTION

This manual provides component level maintenance instructions with an illustrated parts breakdown for the Tank Filler Assembly, Part Number 38040-1. The assembly is manufactured by Shaw Aero Devices, Inc., 3580 Shaw Blvd., Naples, FL 34117, Telephone (239) 304-1000, Fax (239) 304-1088.

The instructions in this manual provide the information necessary to perform maintenance functions ranging from simple test and replacement to complete shop type repair.

This manual begins with a general description of the function and principals of operation of the unit. This is followed by instructions for the proper disassembly, cleaning, checking, repair, assembly and storage of the unit.

Refer to the Table of Contents for the page location of applicable topics.

This manual will be revised as necessary to reflect current or updated information.

COMPONENT MAINTENANCE MANUAL

OVERHAUL MANUAL FOR PART NUMBER 38040-1
TANK FILLER CAP ASSEMBLY

1. Description

   A. The unit shown in Figure 1 is a tank filler closure. It is designed to mate and seal a 3 inch diameter adapter opening.

2. Operation

   A. Before the Cap is inserted into the Adapter the Handle must be in the vertical or raised position and rotated counter-clockwise to its stops. The Cap is then inserted into the Adapter and the Handle rotated clock-wise to its stops at which point the Cap will be closed but not locked. A downward rotation of the Handle at this point will lock the Cap and the unit is now in its operation configuration.

OVERHAUL MANUAL FOR PART NUMBER 38040-1
TANK FILLER CAP ASSEMBLY

1. Dismantling

A. Dismantle Cap from Adapter

1. Lift Handle

Caution Because Pressure May Exist In The Tank Lift Handle But Do Not Turn. Make Certain Seal Between Cap And Adapter Is Broken Before Turning Handle.

2. Turn Handle counter-clockwise to its stops and lift Cap away from Adapter.

3. Unhook Chain from Cap.

B. Dismantle Cap

1. Remove Nut using 7/16 wrench and remove Washer. -

2. Slide off Cone and Spring.

3. Full Handle, Handle Pin and Cone Pin sub-assembly out of engagement with Base.

4. Remove Handle Pin thereby separating Handle from Cone Pin.

5. Remove Bearing Plate.

6. Remove 0 rings from Base and Cone Pin.

1. Cleaning

A-. No special procedures need be observed during cleaning except normal care in handling to preclude denting, chipping and/or distorting the parts.

2. Inspection

A. Inspect 0 rings and 0 ring seal surfaces. 0 rings and sealing surfaces should be smooth and free of nicks and/or cracks.

B. Handle Pin must be straight within .010 F.I.R. measured at its midpoint in relation to its end diameter centers.

C. Seal seat on Adapter must be smooth.

3. Repair

A. Because of the unit size and nature repair is generally not recommended. Defective parts should be replaced.

1. Assembly

A. Install 0 ring on Cone Pin using Parker-0-Lube or equivalent lubrication.

B. Assemble Handle to Cone Pin with Handle Pin.

Note: Head on Handle Pin must be to the left when Handle is in the position to read "Shaw".

C. Slide Bearing Plate over threaded end of Cone Pin and over 0 ring.

D. Insert Cone Pin Assembly thru hole in Base. Align the notch in the Bearing Plate with the projecting boss in the Handle recess of the Base and fold Handle down in the recess.

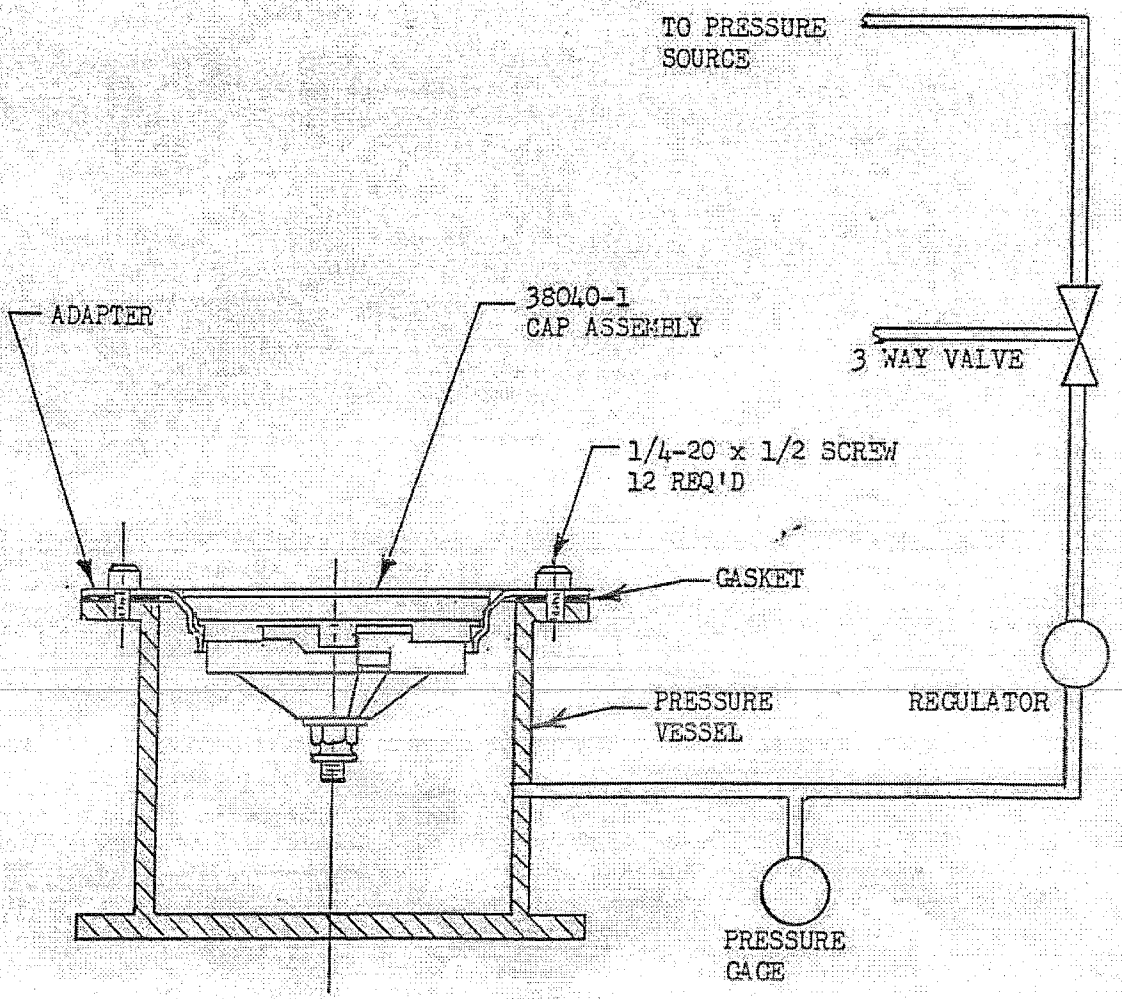
E. Turn Base Assembly over, slide Spring over projecting Cone Pin onto stepped boss on Base and place Cone in position over Cone Pin and against Spring.

F. Align rectangular hole in Cone with flats or. Cone Pin and the opening in the Cone flange with the narrow boss on the Base. Hold Cone down against Spring and in firm contact with Cone Pin. Slide washer over end of Cone Pin and install Nut with 35 pound inches of torque.

G. Install 0 ring in Base using Parker-0-Lube or equivalent lubrication.

1. Testing

A. Equipment



1. 25 psi pressure source
2. Pressure gage (0-60 psi preferred)
3. Three-way valve (Off-On-Exhaust)
4. Pressure Regulator
5. Pressure vessel or tank, approximately 1 quart capacity
6. Gasket
7. Test fluid - Stoddard solvent or TT-S-735, Type I
8. Filler Cap adapter

B. Set up

1. Test Set Up Page 6

C. Test Specifications

1. Pressurize to 25 psi holding pressure for 1 minute. There shall be no leakage as indicated by fluid seepage.

1. DESCRIPTION AND OPERATION.

A. Description.

Adel Fuel Booster Pumps, Part Number 71383-3 and 71383-3A, are power-driven, screw-type pumps, designed for small aircraft and helicopter installations. The pumps are used to transfer fuel from the fuel system reservoir into feed lines at a specified design flow and pressure while submerged in the reservoir. The two units are identical except the 71383-3A contains a secondary seal (45, figure 4) between the slinger (43) and bearing (46).

B. Operation.

Each unit has a self-contained source of power which is an electrically-driven, explosion-proof motor whose main components are a field coil and an armature. The field coil provides the flux which causes the armature to rotate when an electrical current is made to flow through the system. Rotation of the armature turns the screw-type impeller enclosed in the pump chamber, thus creating the pump action. The pump is also equipped with a radio noise filter. Leading particulars are listed in Table I.

TABLE I. LEADING PARTICULARS

Pump Mounting Position	Motor upward; major axis vertical
System Fluid	Fuel per MIL-J-5624 (JP-4)
Rated Flow	450 PPH at 22 psig (min)
Power Input	8.0 amps at 28 vdc
Motor Duty Cycles	Continuous
Zero Flow	33.6 psig (max)
Pump Discharge Port	per AND10053 for 1/2 ANPT
Drain Ports (2)	per AND10053 for 1/4 ANPT
Weight Dry	4.2 lb (max) est

2. DISASSEMBLY. (See figure 4.)

Disassemble in order of index numbers assigned to figure 4, noting the following:

A. Remove lockwire after noting method of lockwiring for duplication during reassembly.

CAUTION: MAKE CERTAIN ALL PARTS ARE PROTECTED DURING DISASSEMBLY. PLACE ALL REMOVED PARTS IN ADEQUATE, CLEAN CONTAINERS, KEEPING PUMP PARTS (1 THROUGH 26) AND MOTOR PARTS (27 THROUGH 59) IN SEPARATE CONTAINERS.

WARNING: PREVENT FUEL SPILLAGE. DO NOT ALLOW ANY AMOUNT OF FUEL TO REMAIN IN PUMP CHAMBERS AND PASSAGES.

B. Following removal of pump parts (1 through 26), proceed with disassembly of motor. Parts (42 through 51) are to be removed together, after removal of screws (41), and then separated.

CAUTION: BEFORE REMOVING SCREWS (31) WHICH CONNECT LEADS OF COIL ASSEMBLY, BRUSHES (49) AND FILTER (34) TO PLATE ASSEMBLY (50), IDENTIFY POSITIVE LEAD COIL ASSEMBLY WITH A DAB OF BLACK INDIA INK. THE POSITIVE LEAD OF COIL ASSEMBLY IS CONNECTED WITH BLACK LEAD WIRE OF FILTER (34).

C. Do not remove nameplate (2) unless necessary for replacement.

D. Inspect check valve assembly (10 through 13) as outlined in paragraph 4B. Disassemble only if inspection requirements are not met.

E. Drill out plug (58) if it is scorched or damaged.

3. CLEANING. (See figure 4.)

A. Wash all non-electrical parts, except bearings, with an approved mineral oil base cleaning solvent. Dry with moisture-free, filtered compressed air at 20 psig, or use a dry, lint-free cloth. Make certain that flame arrester plug (58) is not clogged.

WARNING: USE SOLVENT IN A WELL-VENTILATED AREA. AVOID PROLONGED BREATHING OF FUMES. KEEP SOLVENT AWAY FROM FLAME.

B. Remove all surface dirt and grease, and clean electrical parts with a lint-free cloth slightly moistened with cleaning solvent.

C. Blow out all bores, internal passages, orifices and ports with filtered, compressed air at 20 psig.

D. Place all cleaned parts in adequate, clean, dust-tight containers.

4. INSPECTION/CHECK. (See figure 4.)

A. Under strong light and preferably under magnification, visually inspect all metallic parts, as applicable, for breaks, cracks, nicks, scratches, scoring, stripped or crossed threads, corrosion, distortion, worn plating, pitting, gouging, or other obvious defects.

B. Inspect check valve assembly (10 through 13) to make sure it is not distorted, that flapper (12) is seated by spring (11) tension, and that valve opens and closes smoothly, without binding. Check security of installation of flapper (12) components.

C. Check throat (15) for a minimum outside diameter (not at mounting section) of 1.8085 inch. Inspect bore of throat for nicks or scratches which would indicate distortion of pump components and/or improperly installed impeller (21), or presence of foriegn matter in impeller vanes.

D. Inspect impeller (21) for broken, cracked or bent blades.

E. Inspect seals (23, 24) for condition of contact area by running finger nail across sealing surface and examining under magnification. There shall be no evidence of galling or roughness.

F. Check alignment of spring (22) by rolling spring across a clean, smooth, flat surface; spring shall not wobble. Test spring for stacking or fatigue by measuring free length and compressed length of spring. Free length shall be 0.96 inch. Under a load of 2 ±0.1 pounds, compressed length shall be 0.280 inch.

NOTE: Flapper spring (11) and brush spring (48), if removed from their respective assemblies, must be replaced.

G. Check coil assembly (35 through 38) for security of installation and condition of lead terminals. Inspect laminations for nicks or scratches which would indicate a distorted pump assembly or worn bearings (39, 46) causing armature assembly (51) to rub against coil assembly. Check condition of insulation on coil leads. Measure coil resistance at 70°F; it should be between 23.9 and 26.5 ohms.

H. Inspect armature assembly (51) for smooth and shiny commutator surfaces and insulators between commutator bars recessed approximately 0.025 inch. Inspect shaft for evidence of excessive heat around bearing areas. Check commutator with a growler for open windings.

I. Inspect body (59) for warped mounting flange. Check body bore for evidence of incorrectly installed impeller (21) as indicated by nicks and/or heavy scratches. Use Zyglo or die-check inspection methods to check structural condition of body.

5. REPAIR. (See figure 4.)

A. Replace any part which fails to meet inspection requirements and is obviously damaged beyond allowable repairs specified below.

B. At each overhaul replace all packings, tablock washers (33), motor brushes (49) and bearings (39, 46). Replace removed springs (11, 48).

C. Replace coil assembly (35 through 38) and/or armature assembly (51) if electrical requirements specified for these parts are not met.

CAUTION: DO NOT ATTEMPT TO REMOVE LIGHT SCRATCHES OR OTHER MINOR IMPERFECTIONS FROM COMMUTATOR BARS OR COIL LAMINATIONS BY POLISHING OR ANY OTHER METHOD TO PREVENT ALTERATION OF THE DESIGN GAP BETWEEN COIL AND ARMATURE. IF COIL ASSEMBLY OR ARMATURE ASSEMBLY (51) IS OBVIOUSLY DAMAGED AS INDICATED BY HEAVY SCRATCHES, DISTORTION OF COMMUTATOR BARS OR COIL ASSEMBLY LAMINATIONS, REPLACE THE PART.

D. Non-critical internal surfaces of body (59) and external surfaces may be polished with aluminum abrasive cloth provided that not more than 0.002 inch of material is removed from polished area.

E. Replace entire pump assembly if there is evidence of distortion.

6. ASSEMBLY. (See figure 4.)

Reassemble in reverse order of index numbers assigned to figure 4, noting the following:

A. Install washer (55) on filter (34) wire lead, then insert lead through grommet (56) and washer (57)(for -3 only). Slide grommet down on wire lead until washer is held between grommet and lead shielding. Carefully insert lead into passage in body (59) and pull lead out of upper face of body (59). Pull lead through until grommet and washer are seated in body passage, then install retaining ring (54).

B. Solder terminals (53) to each wire using SN50W or SN60W solder per Specification QQ-5-571.

C. Assemble parts (42 through 51) and carefully position armature assembly (51) on body (59). Insert lead through opening in plate assembly (50), then secure installation with screws (41) which attach brush holder plate assembly (50) to body.

D. Press spring washer (40) into recessed bottom of cover (29) internal boss.

E. Install field coil assembly (35 through 38) in cover (29) and secure with tablock washers (33) and bolts (32). Tighten bolts well and bend tablock washer tabs against flat of bolt heads. Install insulator (30).

F. Connect leads of coil assembly (35 through 38), each wire of filter (34) lead, and leads of brush assembly (49) to brush holder plate assembly (50) with screws (31).

CAUTION: CONNECT WHITE WIRE OF LEAD AND NON-MARKED LEAD OF COIL ASSEMBLY TO NEGATIVE (GROUNDED) SIDE OF BRUSH HOLDER PLATE ASSEMBLY (50). CONNECT BLACK WIRE OF LEAD AND BLACK-MARKED LEAD OF COIL ASSEMBLY TO POSITIVE (INSULATED) SIDE OF BRUSH HOLDER PLATE ASSEMBLY (50).

G. Perform motor tests as outlined in paragraph 8B before continuing reassembly procedure.

H. Turn pump motor upside down and install packing (25) on seal (24), and install seal on armature assembly shaft.

I. Install packing (26) on armature assembly shaft.

J. Carefully install shaft rotating seal (23) on armature assembly shaft.

K. Install spring (22) and shaft key (20) on armature assembly shaft. Install impeller (21) and secure on shaft with locknut (19).

NOTE: Rotate impeller and shaft by hand to check for binding. Impeller must rotate freely without binding.

L. Required clearance between the installed impeller (21) and throat (15) (refer to figure 1) is 0.006 to 0.010 inch. Peel off or add laminations to shim (16) as required. Install correct shim thickness on throat matching installation holes in shim and throat. Install packings (18) in throat grooves and secure throat and filter (34) to body with screws (14).

M. Reassemble check valve (10 through 13), if disassembled. Install screen (8) and secure with cotter pin (7). Refer to figure 2 for cotter pin installation details.

N. Ascertain that flapper (12) operates freely, without binding. Load required to unseat flapper shall not exceed 0.0072 pound. Install check valve assembly in pump body and secure with screw (9).

NOTE: Install check valve assembly with hinge-pin side upward.

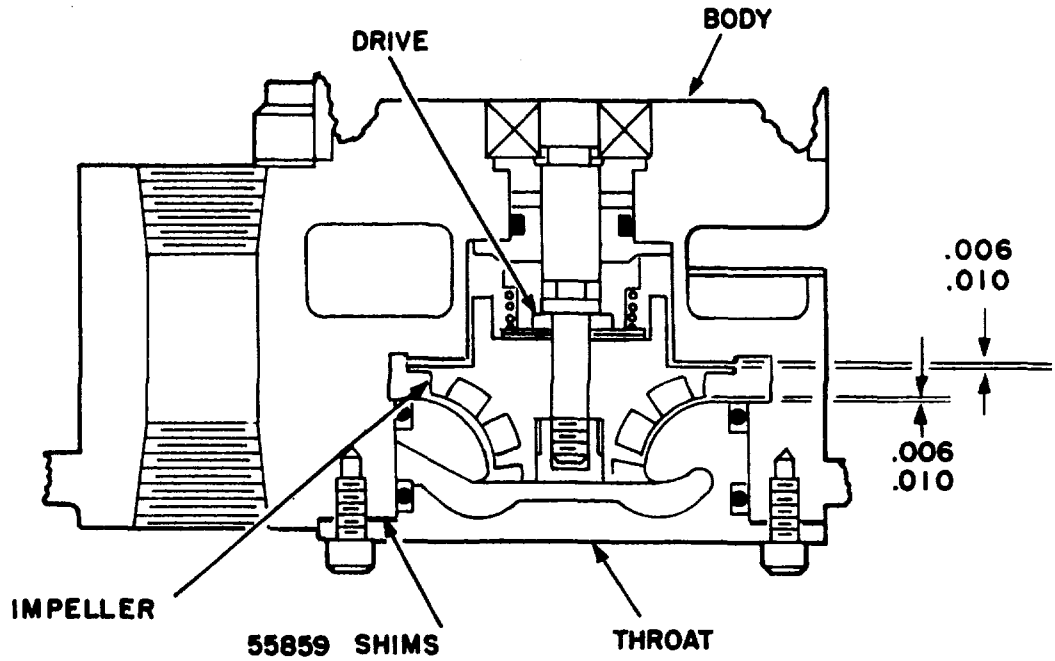

Figure 1. Shim Installation

O. Install screen (6) and secure with one screw (5), washers (4) and screws (3). Lockwire screws (3, 9)
P. as noted during disassembly.

Secure nameplate (2) to bottom of
Q. pump with screws (1).

Test reassembled unit as directed in paragraph 8C(1) and calibrate as instructed in paragraph 8C(2).

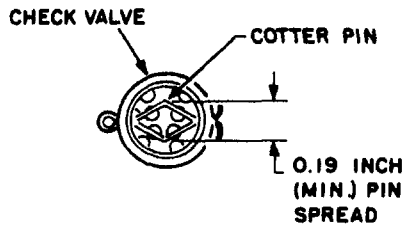

Figure 2.
Cotter Pin Installation

7. FITS AND CLEARANCES.

Not applicable. Refer to Section 6 for assembly clearances.

8. TESTING. (See figures 3 and 4.)

A. Setup and Equipment.

(1) A fluid reservoir capable of pressurization and equipped with an AN4130-7 fitting must be available for mounting and submersion of pump. (See figure 3.)

(2) As test fluid, use aviation gasoline, Specification MIL-G-5572, or solvent, Specification P-S-661, Type I.

B. Motor Assembly Tests.

(1) Dielectric Strength Test.

(a) Lift negative brush off commutator to unground motor.

(b) Apply 600 volts (rms), 60 cps, between positive (black) wire terminal and motor assembly cover or body for one second. There shall be no flashover or any evidence of damage.

(2) Brush Run-In Test.

(a) Replace negative brush in brush holder plate assembly making certain that it contacts the commutator.

(b) Connect motor to a direct-current power source.

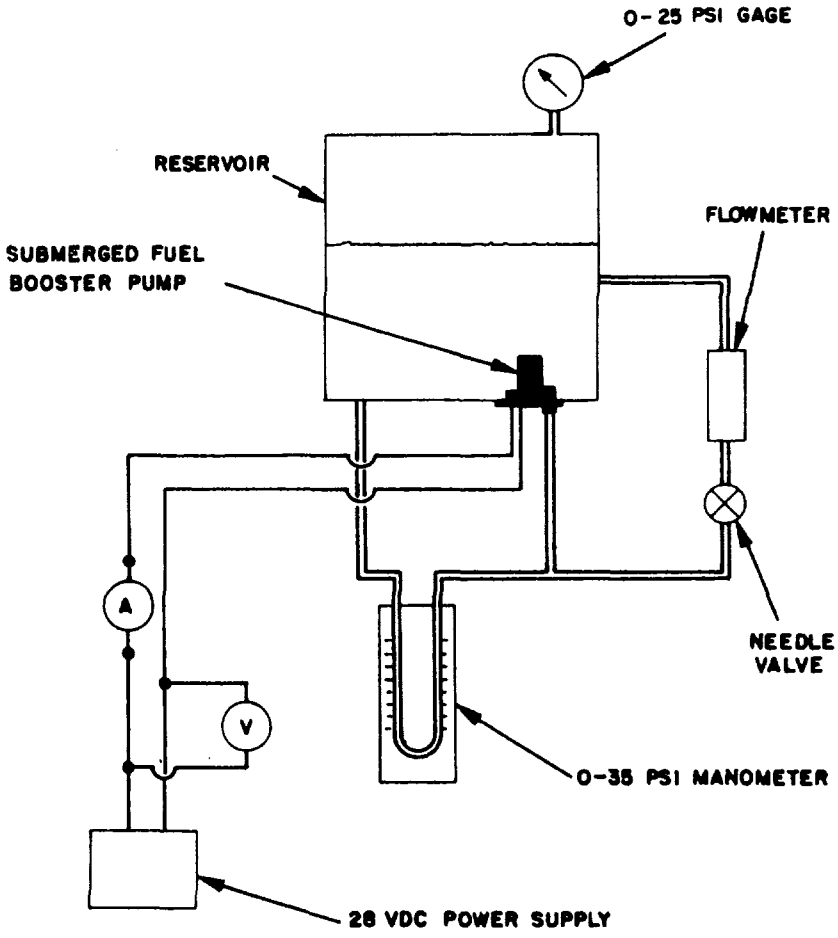

Figure 3. Test Setup

(c) Operate motor, unloaded, for 30 minutes at 27 vdc. Seat brushes on commutator with a cam stick, if necessary. Check for armature balance. Motor must operate smoothly, and direction of rotation (as viewed from shaft end) shall be clockwise. With a Frahm Tachometer, measure no-load speed; it shall not exceed 13, 200 rpm at 27 volts.

(d) Adjust power supply to deliver the voltage required to reduce the no-load speed to 10,300 rpm and allow motor to run until 100 percent brush contact in the direction of rotation is obtained. Total contact area between each brush and commutator shall be approximately 90 percent.

C. Fuel Booster Pump Tests.

NOTE: During the following tests, check for seal leakage at seal drain port. There shall be none. Should leakage occur, disassemble pump to the extent required to replace rotating seal (24, figure 4.) and stationary seal (25).

(1) External Leakage Test.

(a) Mount pump in suitable reservoir and connect the hydraulic test setup as illustrated in figure 3. Fill reservoir with enough test fluid for complete submergence of the pump.

(b) Apply 15 psig air pressure to reservoir for five minutes and check for leakage at flange casting, seal drain port, motor vent, or any other external (exposed) surfaces of pump. There shall be none.

CAUTION: IF SHAFT LEAKAGE OCCURS, THE DRAIN PORT MUST BE THOROUGHLY DRAINED BEFORE THE ATTITUDE OF THE PUMP IS CHANGED FROM THE DRAIN-PORT-DOWN POSITION TO PREVENT FUEL (OR SOLVENT) FROM COMING INTO DIRECT CONTACT WITH MOTOR BEARING.

(c) Relieve air pressure from reservoir.

(2) Calibration.

(a) With pump submerged in reservoir fluid, connect lead to a 28 vdc power supply, as shown in figure 3.

(b) Slowly apply voltage to pump motor to a maximun of 28 volts and observe current drain. Current drain shall not exceed 8.0 amperes. Allow pump to run for a maximum of 20 minutes. Adjust needle valve to allow zero and maximum (1.25 gpm) flow and calibrate pump as that the performance requirements listed in Table II are met without interference or switching pump on and off.

CAUTION: IF CURRENT DRAIN FLUCTUATES NOTICEABLY, SHUT OFF MOTOR SINCE IT MAY INDICATE MOTOR OVERHEATING. KEEP RESERVOIR FLUID COOL BY FANNING OR ANY OTHER CONVENIENT METHOD.

TABLE II. CALIBRATION PARAMETERS

TEST FLUID	GPM	PSI	AMPS
P-S-661 Type I	0	33.6 (max)	8.0 (max)
	1.15	22.0 (max)	8.0 (max)

9. TROUBLESHOOTING. (See figure 4.)

Refer to Table III for troubleshooting information.

TABLE III. TROUBLESHOOTING

TROUBLE	PROBABLE CAUSE	REMEDY
Motor overheats	Insufficient clearance between impeller (21) and throat (15)	Refer to paragraph 6L for proper shimming.
Excessive current drain	Damaged bearing(s) (39, 46)	Replace damaged bearing(s).
Insufficient motor rpm	Coil assembly (35 through 38) and armature (51) binding or damaged.	Remove any foreign matter between coil and armature. Replace if damaged.
Pump delivery above or below desired values	Improper shimming	Refer to paragraph 6L and correct clearance.
	Damaged impeller (21) and/or throat (15)	Replace damaged part(s).
Erractic operation	Damaged electrical ports	Replace all electrical ports.
Pump fails to deliver any flow	Incorrect brush wiring (incorrect pump rotation)	Refer to paragraph 6F and correct wiring.
Fluid leakage through seal drain	Damaged seal(s) (23, 24)	Replace seals.
Leakage at throat	Damaged packing (18)	Replace packing.
	Damaged throat	Replace throat.

10. STORAGE INSTRUCTIONS.

A. Following satisfactory testing, lockwire screws as noted before disassembly.

B. Flush pump with preservative oil and plug all ports.

C. Store unit in accordance with local directives.

D. Storage time is limited to 12 months.

11. SPECIAL TOOLS, FIXTURES AND EQUIPMENT.

No special tools are required for overhaul of this pump. Refer to Section 8 and figure 3 for test equipment required.

12. ILLUSTRATED PARTS LIST.

SERVICE BULLETIN

PART NO. 52-2145-002

PART NO. 52-2889-002

Purpose:

For overhaul of P/N 52-2889-002, Fuel Filter, use Overhaul Instructions 28-20-01 dated 2/24/69. Differences in detail is shown on Page 2 of this Bulletin.

General Information:

P/N 52-2145-002 and 52-2889-002 serve the same function, the only difference being that P/N 52-2889-002 uses a disposable element somewhat larger than the cleanable element used in P/N 52-2145-002. To house the larger element for P/N 52-2889-002 it is necessary to use a larger can assembly and use an adapter ring to expand the overall diameter of the head assembly. Several additional "O" Rings are required at the various sealing points.

All procedures and tests described in Overhaul Instructions 28-20-01 are applicable to both models.

Parts Kit P/N 52-01127-2 is used to modify P/N 52-2145-002 to P/N 52-2889-002.

OVERHAUL
FUEL FILTER
PART NO. 52-2145-002

1. DESCRIPTION AND OPERATION

A. This fuel filter has a housing and valve assembly to which a can containing a 70-micron filter element is attached. The element is held against the housing by a spring loaded seal plate. The housing contains a spring loaded poppet that acts as a relief valve. The can has a drain port to remove dirt and water periodically.

B. Fuel entering at the housing inlet normally flows down in the can, around and through the filter element to the outlet of the housing. The relief valve, in a parallel circuit to the element, is mounted in a wall of the housing and opens only when the pressure drop across the element reaches 2.5 psi.

C. The housing is an aluminum alloy casting while the can is machined from aluminum alloy bar; the relief valve parts and seal plate are stainless steel; the filter element is a pleated stainless screen cemented between plates; packings and seal are fuel resistant synthetic rubber.

D. The filter is installed in the fuel system between the tank and the engine and is not accessible in flight.

E. Leading particulars of the filter are as follows:

(1)	Dimensions, inches:	Length	4.13
		Width	3.11
		Height	5.25
(2)	Ports: Inlet and outlet		7/8-14 internal thread for 5/8 in. OD tube fitting
	Drain		7/16-20 internal thread for 1/4 in. OD tube fitting
(3)	Mounting holes, tapped (screw thread inserts)		1/4-28 x 0.250 min depth
(4)	Filter opening size, microns		70
(5)	Performance, fluid		MIL-J-5624
	(calibrating)		MIL-F-7024
	rated flow		2.0 gpm
	pressure drop at rated flow		0.50 psi
	relief valve opens at pressure drop		1.50 psi
	relief valve pressure drop at rated flow		2.50 psi
	sump volume		3.3 cu in.
	operating pressure		60 psig
	temperature		-65° to +135°F
(6)	Weight, lb (approx)		1.0

2. DISASSEMBLY. (See figure 2.)

A. Cut lockwire, loosen can retainer (knurled) and remove filter can (1). Lift packing (2) from groove in can.

B. Do not remove nameplate or separate retainer from can unless damaged and replacement is required.

C. Lift strainer (3) from can then depress fingers of seal plate (4) to remove. Do not disassemble strainer or seal plate.

D. Remove 2 screws (6), withdraw access cap (5) and work packing (7) from groove in cap.

E. Hold stem (11) with a screw driver inserted through access hole of housing (12) and remove nut (8) from stem with open-end-wrench through bottom of housing. Withdraw spring (10) through larger passage at bottom of housing as other parts (8, 9, 11) are removed through access hole.

F. Hold stem in a suitable hand chuck (3/16 inch) to remove nut (8) and poppet (9).

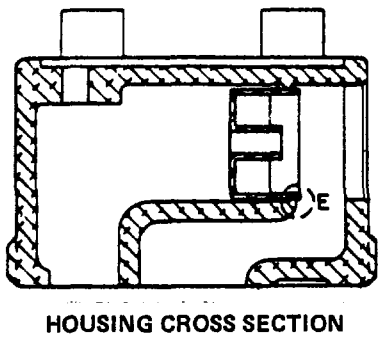
CAUTION: HANDLE POPPET (9) WITH CARE TO AVOID DAMAGING VALVE FACE. SUCH DAMAGE WILL RESULT IN EXCESSIVE LEAKAGE THROUGH RELIEF VALVE.

3. CLEANING.

A. Clean all metal parts with solvent, Federal Specification P-D-680, Type II (Stoddard Solvent).

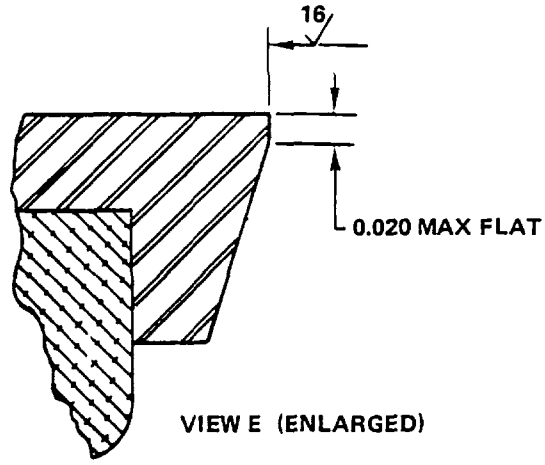
WARNING: USE SOLVENT IN A WELL-VENTILATED AREA AND AVOID PROLONGED BREATHING OF FUMES. KEEP SOLVENT AWAY FROM OPEN FLAME.

B. Use a stiff bristle brush dipped in solvent to remove stubborn residue.



C. After all chips, grease, and dirt have been removed, dry components with clean, filtered, compressed air.

D. Flow solvent through strainer from central bore to outside (reverse of normal flow direction). Solvent for strainer flushing must be filtered to 10 microns and must not be re-used on other strainers unless filtered again.



4. INSPECTION.

A. Inspect parts as follows:

Part Name and Index No. (See Figure 2)	Inspect For
All Parts	Cracks or distortion.
Threaded parts (1, 11, 12)	Stripped, crossed or otherwise damaged threads.
Can (1), access cap (5)	Inspect that O-ring groove is smooth and edges are free from burrs or nicks.
Strainer assembly (3)	Distortion or damage to screen; loose bonds; holes in fine-mesh, pleated screen; plugged area in excess of 3 square inches that cannot be removed by repeated cleaning.
Seal plate (4)	Inspect that seal has not deteriorated (not tacky) and that spring is securely attached.
Poppet (9)	Scratches or other damage to seating surface. Use 8X to 10X magnification.
Spring (10)	Cracks, deformation. Load at 0.800 in. from 11.0 to 13.5 oz.
Seating surface on housing (12) bushing	Scratches or other damage (must meet requirements given on figure 1). Use 8X to 10X magnification.

HOUSING CROSS SECTION

VIEW E (ENLARGED)

5. REPAIR AND REPLACEMENT.

A. Replace damaged parts unless simple minor repair will restore the part to serviceability without affecting sealing or operating action.

B. Remove and replace inserts in housing when necessary using standard tools and procedures.

C. Refinish bushing seat (installed in housing) by lapping to meet requirements shown on figure 1. Lap must pilot in bushing bore. To replace bushing, pull from casting, press in new bushing, and lap seat.

D. Replace strainer assemblies that do not meet inspection requirements. Do not attempt repair.

E. Replace packings and small hardware at each overhaul.

6. ASSEMBLY. (See figure 2.)

A. Hold stem (11) in chuck to attach poppet (9) with nut (8). Tighten nut securely.

B. As parts (8, 9, 11) are inserted through access hole of housing (12), insert spring (10) through larger passage in bottom of housing and slide over stem.

C. Restrain stem with screw driver through access hole to install second nut (8) approximately half way onto threaded end of stem.

D. Install new packing (7) in groove of access cap (5). Lubricate packing with petrolatum (Vaseline) then install cap in housing with 2 screws (6). Test housing and adjust relief valve if necessary, before completing assembly.

E. Depress fingers of seal plate (4) to install in can (1). Ends of fingers must hook below ring on inside of can with seal up.

F. Install packing (2) in groove of can and lubricate with petrolatum. Place strainer (3) on seal plate (either end down), engage housing assembly and securely tighten retainer.

G. After satisfactory completion of testing, attach lockwire between retainer and one adjacent port.

7. FITS AND CLEARANCES. Not applicable.

8. TESTING.

A. Use calibrating fluid, Military Specification MIL-F-7024A, Type II for all testing.

B. Clamp housing assembly (5 through 12, figure 2) to a metal plate using a suitable piece of sheet rubber for a gasket to seal across bottom of housing. Test (and adjust) as follows:

(1) Make a suitable connection and supply fluid to inlet port at a slowly increasing pressure. Check that valve cracks at a pressure between 1.3 and 1.7 psi (2.8 to 3.7 inches of mercury). Adjust valve if necessary by tightening or loosening nut (8) over spring (10).

(2) After adjustment supply fluid to inlet port at a flow rate of 2 gpm. Check that pressure drop through housing does not exceed 2.5 psi (5.1 inches of mercury). Allow for pressure drop of inlet and outlet fittings.

(3) Reduce fluid pressure to zero, then increase to 2.7 inches of mercury (1.32 psi) and check that leakage through the valve does not exceed 100 CC per minute after a three-minute waiting period.

(4) Increase pressure to 3.4 inches of mercury (1.67 psi) and check that flow exceeds 200 CC per minute.

(5) Recheck valve cracking pressure (paragraph (1) above).

C. Remove test plate and complete assembly (install parts 1 thru 4). Test complete filter as follows:

(1) Install gasket, MS29512-10, and plug, AN806-D10, in outlet port; gasket, MS29512-4, and plug, AN806-D4, in drain port.

(2) Completely fill filter with calibrating fluid. Apply pressure at inlet of 120 psig for not less than one minute. Observe that there is no leakage from any portion during the test period.

(3) Release all pressure and remove plug from outlet.

(4) Connect filter to a suitable flow system. Establish fluid flow through filter at 2 gpm and check that net pressure drop does not exceed 1 inch of mercury (0.49 psi).

D. After completion of all testing completely drain all fluid and install port closures.

9. TROUBLE SHOOTING.

A. If the filter fails to meet any test requirement, it must be disassembled, re-checked for defective parts or assembly procedures, reassembled and retested.

10. STORAGE INSTRUCTIONS.

A. Plug all ports to protect interior from dirt.

11. SPECIAL TOOLS, FIXTURES AND EQUIPMENT.

A. A steel plate, 3/8 inch thick by 3 inches square, with 1/16 inch rubber sheet cemented to one side, may be used for testing the housing assembly.

B. A test stand providing calibrating fluid at up to 2 gpm and 120 psig is required for testing the filter.

12. ILLUSTRATED PARTS LIST.

A. The parts list is arranged in the order of disassembly and each part is keyed to the illustration (figure 2) to provide accurate identification.

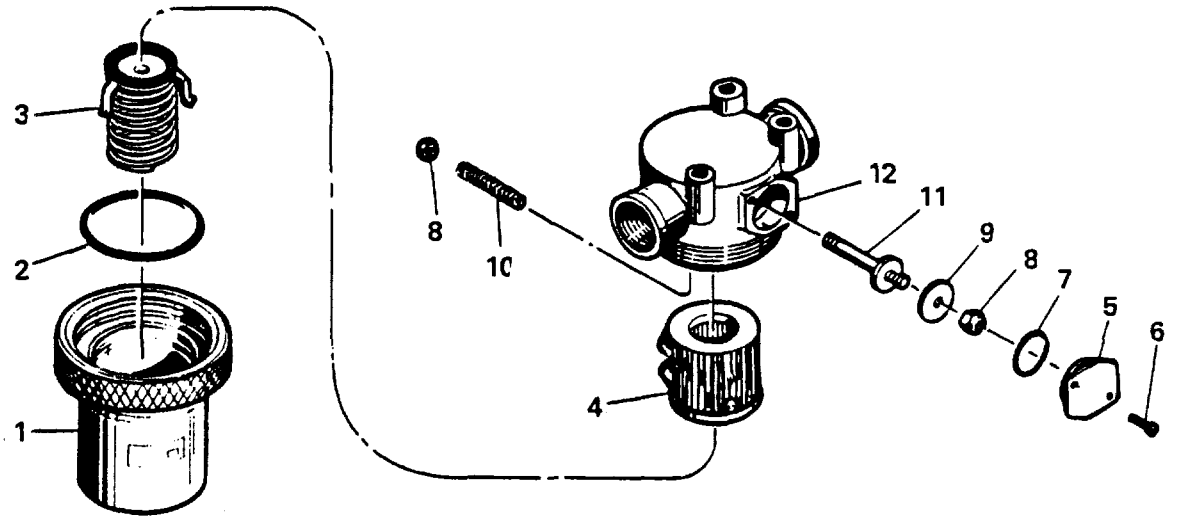
B. Symbols are employed in the Usage Code column to designate parts application to particular models. Where the application of a part applies to all models covered, the Usage Code column is blank.

C. Part numbers in this list are those of Aero-Flow Dynamics, Inc., Aero-Corry Division, unless a vendor's code number follows the part nomenclature. Standard numbers are prefixed as follows:

AN Army - Navy Standard
MS Military Standard

D. Part numbers of vendors are shown in the Part Number column whenever applicable. The vendor's code number is shown in parentheses following the description of the part. This code number is prefixed with a capital letter "V".

E. Vendor's codes used in this list are as follows:



VENDOR CODES

V-02615	Nylok Co., The Division of United Shoe Machinery Corp 611 Industries Ave. Paramus, N.J. 07652
V-22893	Shell Chemical Co Willow Pass Road P.O. Box 831 Pittsburgh, Calif. 94565
V-72962	Elastic Stop Nut Corp of America 2330 Vauxhall Road Union, N.J. 07083
V-91767	Heli-Coil Corp Shelter Rock Lane Danbury, Conn. 06813

F. Symbols used, with the exception of vendor's code, symbols, are as follows: ---*--- Designates the end of each group of attaching parts.

G. Numerical Parts List Index.

(1) Due to the brevity of the Group Assembly Parts List, a numerical parts list index is not used.

1. DESCRIPTION AND OPERATION

A. Introduction. This overhaul manual contains overhaul and testing instructions for Model 1D2-17 Submerged Duplex Fuel Pump.

B. Description. The Airborne submerged duplex pump is a new concept in high performance tank-mounted pumps. In this matched two-stage pump, the vapor separating ability of the centrifugal impeller and self-priming high pressure capabilities of the positive displacement vane section are combined to provide the advantages of both pumping element designs. The duplex pumps minimize fuel vaporization and help assure the delivery of "solid" high pressure fuel to the engines of the most demanding high performance aircraft.

(1) Wet DC motors are fuel-cooled and lubricated, eliminating the need for rotating seals and seal drain plumbing.

(2) Simple fuel-lubricated carbon sleeve bearings with virtually unlimited service life eliminate troublesome oil-lubricated ball and roller bearings.

(3) Commutators and brushes are fuel-cooled and lubricated, greatly improving brush life.

(4) Brushes are submerged in fuel, eliminating the excessive wear problems induced by high altitude operation of "dry" motor pumps.

(5) Permanent magnet motor keeps weight and current drain at a minimum.

C. Special tools are illustrated in Section 10, Figures 24 and 25. Detail dimensional drawings (Figures 26, 27 and 28) are provided to be used to fabricate tools not illustrated in Fugures 24 and 25.

2. DISASSEMBLY (see Figure 30)

A. Disassemble the unit only to the extent necessary for inspection, cleaning and repair. Detailed instructions are given in the following paragraphs.

B. Remove the one drive screw (2) holding strainer assembly (1) to pump housing (56).

NOTE: A small chisel sharpened on one side only will aid in this removal. (See Figure 2.)

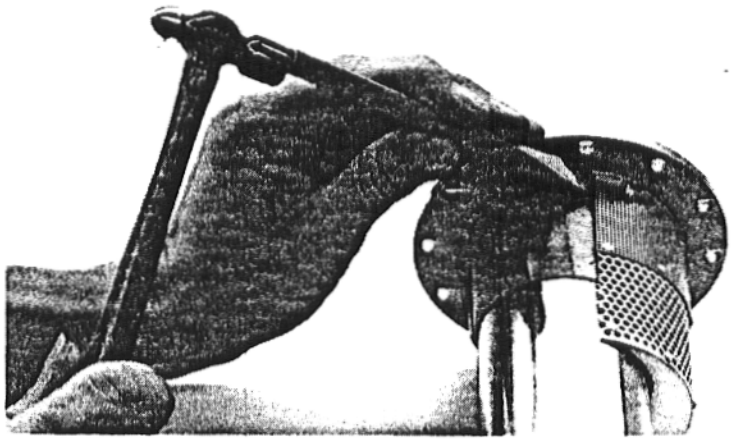

Figure 2

Very carefully break screen away from housing at flange surface. Remove screen and straighten any minor dents encountered during removal.

C. Remove two 3/8 hex nuts (3) and washers (4) and two round head screws (5) and washers (6) from motor cover, and lift cover (7) straight off so as to not damage cover bearing (not shown in Illustrated Parts Breakdown, Figure 29).

D. Remove two 5/16 hex nuts (10), two lockwashers (11), and phenolic cover (9) from upper brush holder assembly (8). Hold springs back and lift brushes (12) away from commutator on armature.

E. Remove upper brush holder (13), armature shims (14), and thrust washer (15). Lift field tube (16) from pump assembly. Locate the negative wire from the electrical terminal running up one of the studs (stud nearest the discharge port).

F. Unsolder the brush (12) and carefully cut black shrink tube holding the negative lead to the stud (43). Be careful not to cut the insulation on the wire. Locate the positive wire and remove the 5/16 hex nut (37) holding the wire to brush holder (33). See Figures 3 and 4.

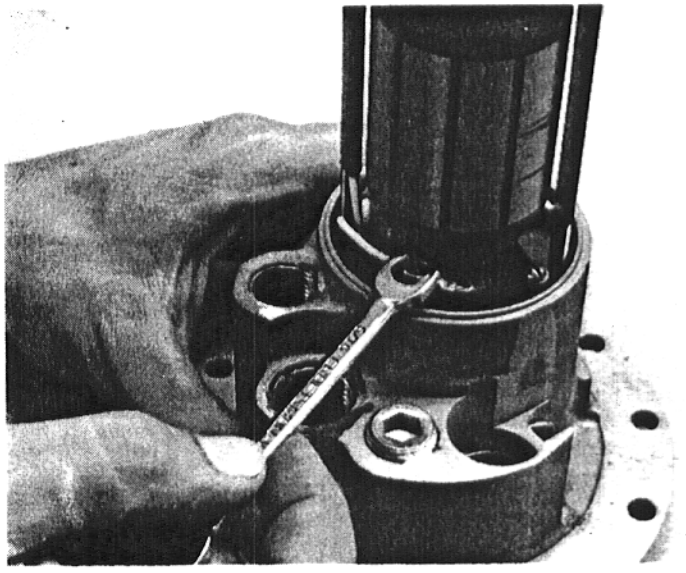

Figure 3

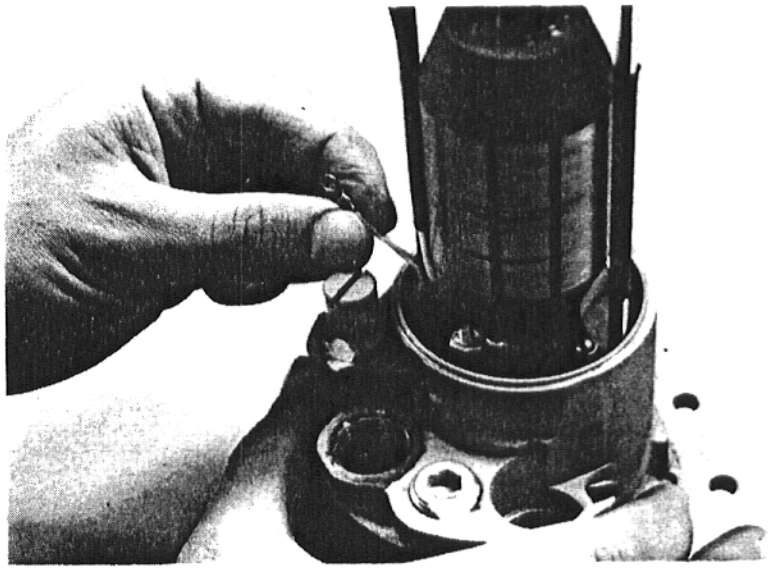

Figure 4

G. Unscrew nylon terminal assembly (17) using 9/16 box wrench. See Figure 19.
NOTE: Do not use an open end wrench, as damage to terminal will result. It may be helpful to turn wires while removing terminal to prevent wire from winding up and possible breaking.

H. Pry square wire retainer ring (19) from housing (54) with screwdriver or other suitable tool far enough to grasp with pliers (see Figures 5 and 6). Use pliers to complete removal of retainer.

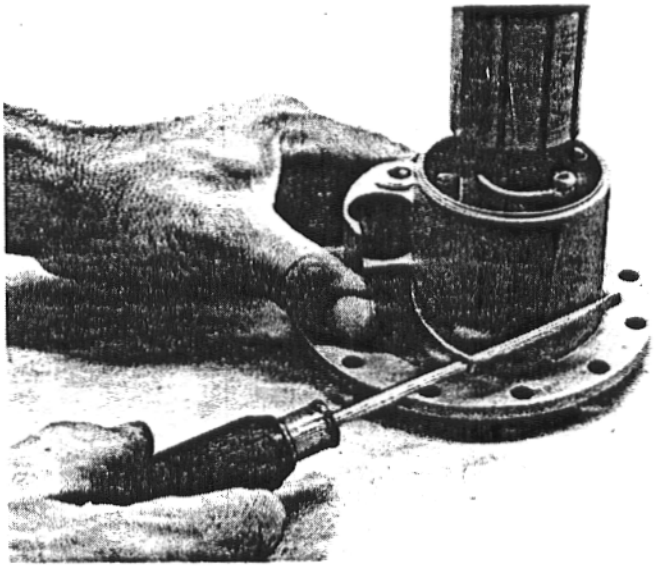

Figure 5

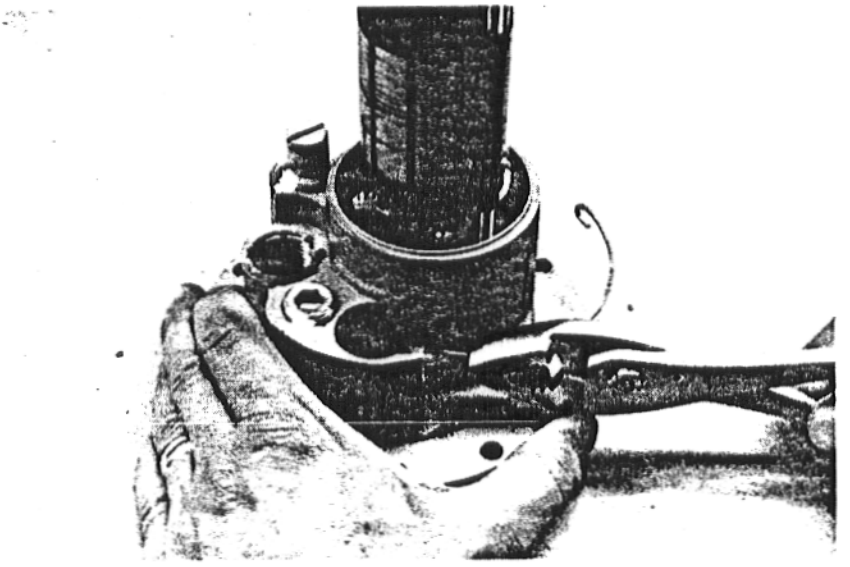

Figure 6

I. Grasp the armature and studs securely with one hand (see Figure 7) and without allowing armature to slip upward with respect to lower brush holder, tap downward on housing with rawhide or plastic mallet.

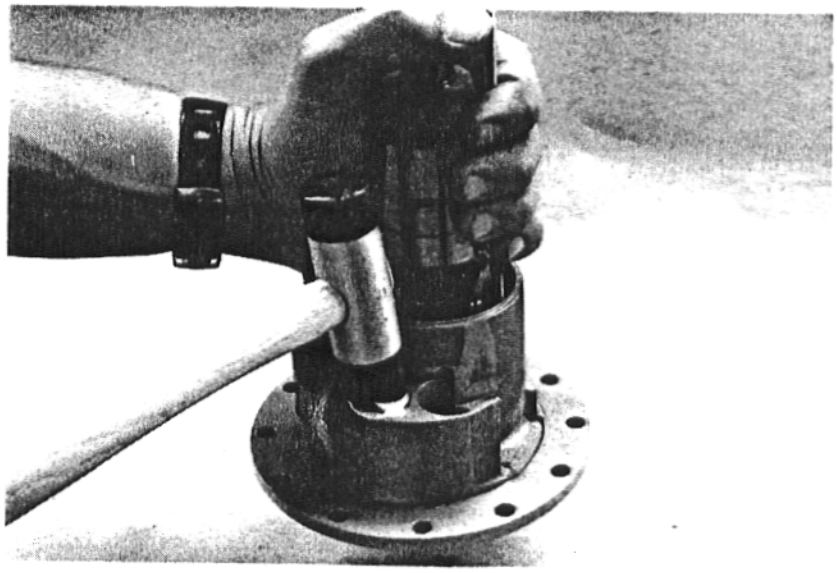

Figure 7

NOTE: Tap on heavy parts of housing, rather than on thin flange, where possible, to avoid any damage to gasket surface. This removal should be performed over a workbench area so as not to drop the housing or impeller.

Remove loose impeller and inlet seal (20) from housing. Discard carbon seal and O-ring (21) and (44).

J. Remove slotted head pipe plug (22) and carefully lift out poppet valve assembly (23). Check for damage and clean as necessary.

K. Keep armature down tight against brush holder while performing the following operations: Remove the woodruff key (25) and unscrew inlet retaining clamp (26). See Figure 16 and Figure 26. Lift off the bronze pressure plate (27). Remove the four vanes (28) and the rotor (29), then remove the square key (30) from the armature shaft.

L. Lift the brushes (36) and lock in outward position with brush springs. See Figure 8. Slide armature from pump. Do not lose thrust washer (31). Remove 5/16 nut holding remaining upper brush and remove the two round head screws (34) and washers (35) retaining the lower brush holder. Lift brush holder assembly (33) from liner housing (39).

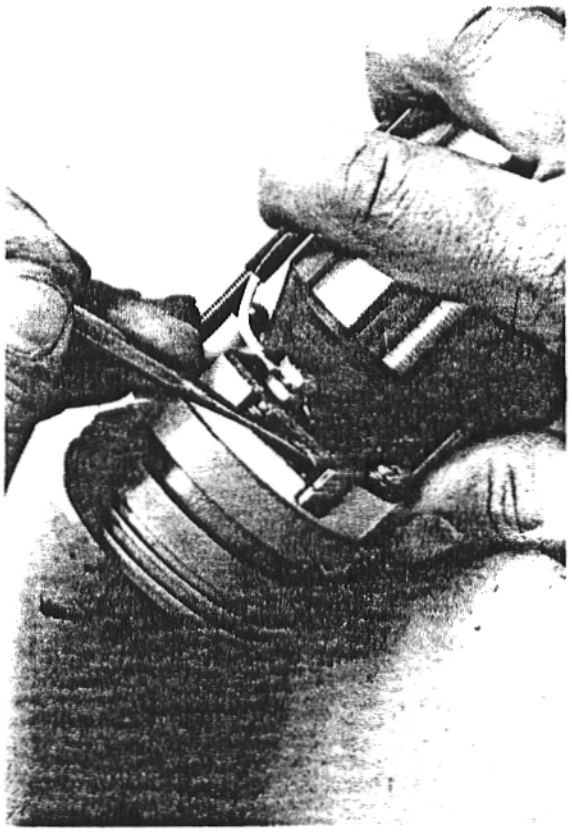

Figure 8

M. Press liner (38) from liner housing (39) and discard (see Figure 9).

3. CLEANING

A. General - Remove any loose accumulation of foreign matter from the disassembled parts with clean dry compressed air. Particular attention should be given to the passages in the pump housing and field tube assembly.

(1) Clean parts by immersing in clean solvent. Scrub with non-metallic brush if necessary. Dry with clean dry compressed air.

(2) Wipe parts with clean lintless cloth moistened in solvent. Give special attention to armature bearing journals, key slots, commutators, brush holders, rotor and threaded parts.

(3) Store cleaned parts in plastic bags or clean containers until reassembly.

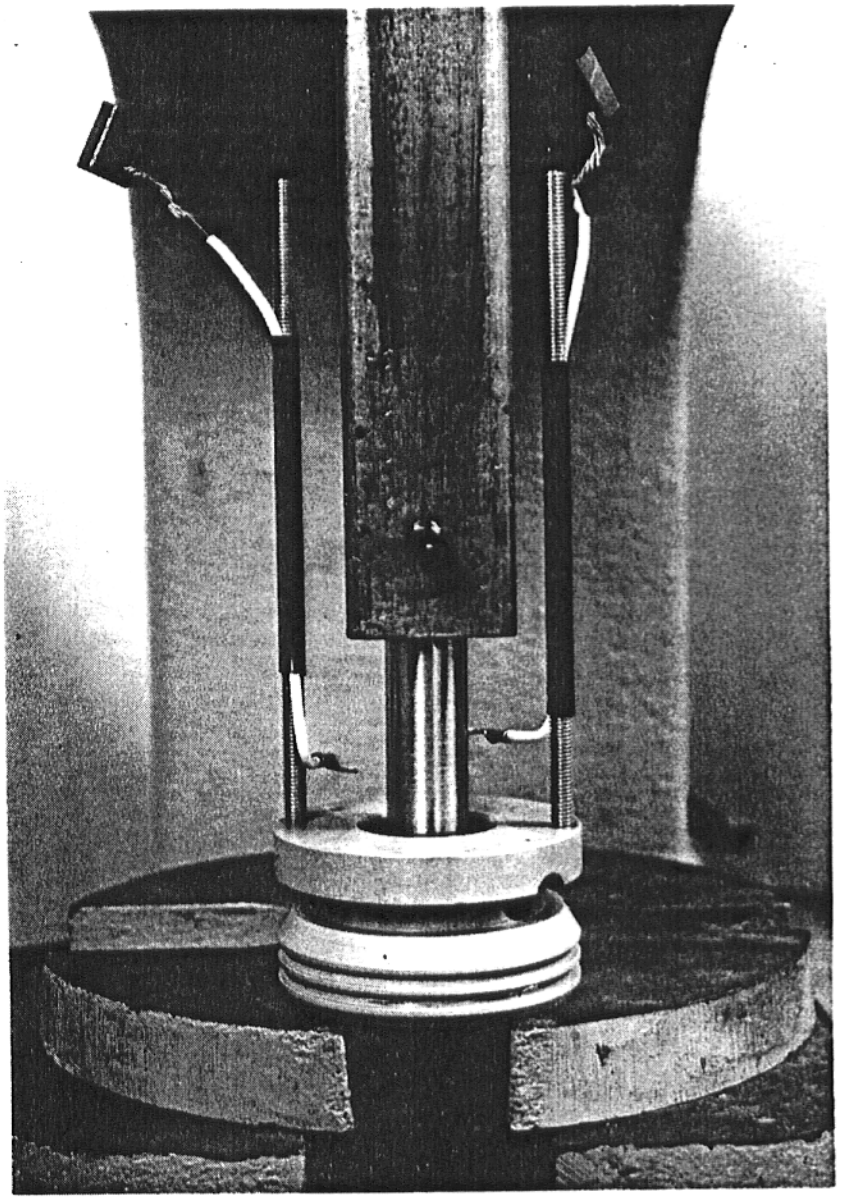

Figure 9

4. INSPECTION

A. General - Examine parts for obvious damage or wear; deep grooves, evidence of overheating such as swollen or expanded potting compound in armature. Damaged terminal loops are usually cause for rejection. The following table of inspection provides a guide for determining the serviceability of parts. See also individual paragraphs in Reassembly.

TABLE 2. INSPECTION

Part Name:	Type of Inspection:	Inspect For:	Disposition:
Liner	Visual	Scoring on face mating to thrust washer or bore (bare aluminum showing)	Replace.
Rotor	Visual	Nicks, scratches, scoring on both ends. (Scoring results from dry running.)	Wipe on true flat surface plate with 500 grit paper using Figure 8 movement.
Thrust Washers	Visual	Scoring	Replace.
Liner Housing Assembly	Visual	Nicks, burrs, distorted threads on housing on rods	Clean with fine tooth file or thread die on studs.
Housing	Visual	Thread distortion, nicks, burrs on gasket face. Inlet defuser for secure bonding. Vapor holes for foreign material.	Clean threads with thread tap, remove nicks and burrs with 500 grit paper. Clean vapor holes.
Brush Holder	Visual	Worn brushes. Dry running or overheating brush channels or warping.	Replace brushes. Replace holder.
O-rings	None		Replace all O-rings.
Lock Nuts	None		Replace all locknuts.
Internal Leads	Visual	Terminal damage	Replace.
Pressure Plate	Visual	Scoring (could lead to pump failure) (Results of dry running)	Resurface to tolerance in Table of Fits and Clearances.
Terminal Assembly	Visual		Replace as an assembly.
Impeller	Visual	Broken fin tips Scoring on bronze face.	Clean and lap to tolerance on Table of Fits and Clearances. Replace.
Cover Bearing	Visual	Wear on bearing face and bore	Press in new bearing. Ream to dimensions on Table of Fits and Clearances.

TABLE 2. INSPECTION (continued)

Part Name:	Type of Inspection:	Inspect For:	Disposition:
Cover Pilot Diameter	Visual	Check vapor holes for foreign material	Clean.
Inlet Seal	Visual	Seal face scoring	Replace.
Shims	Visual	Scoring	Replace.
Armature Assembly	Visual	Cracked potting (resulting from dry running).	Replace.
	Mechanical	Commutator diameters	Replace if below tolerance (Figure 3).
	Visual	Burned commutators	Grind to tolerance or replace.
	Mechanical	Shaft straightness	Straighten to tolerance or replace.
	Visual	Fretting in key slots	Replace (Figure 3).
Pipe Plug Relief Valve	Visual	Distorted threads	Replace.
Housing Volute	Visual	Residue of foreign material.	Clean.
	Visual	Pipe plug, terminal lead and discharge threads	Clean with tapping ream to remove burrs and loctite.

5. REPAIR AND REPLACEMENT

A. Check impeller for broken or nicked fins. Lap both ends of rotor to remove any burrs or high spots. Lubricate new liner (38) and liner housing (39) with Dow No. 107 or equivalent and press liner into proper position with discharge ports of both parts in alignment (see Figure 10, Figure 11 and Figure 28). Check for squareness and correct if necessary. Total tolerance is .001 inch out of parallel with liner housing.

B. Each part should be cleaned and inspected for excessive wear or damage (see Table 2. Inspection). Armature should be inspected for expanded or cracked

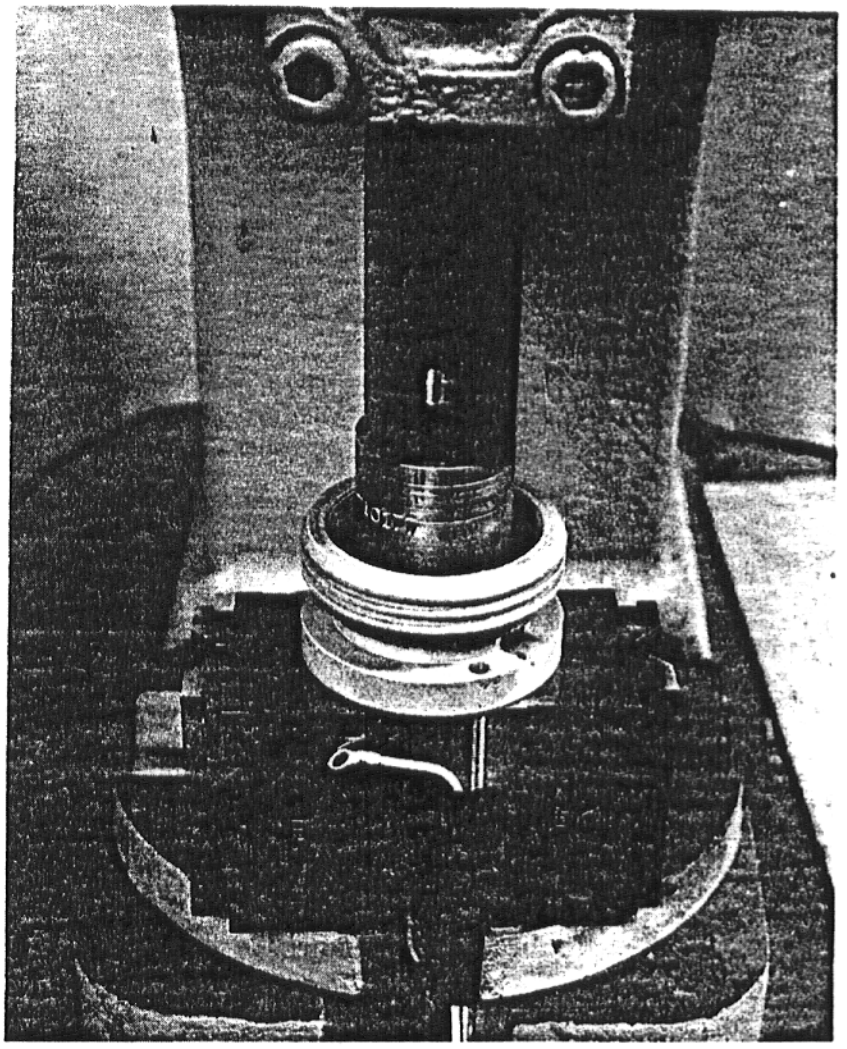

Figure 10

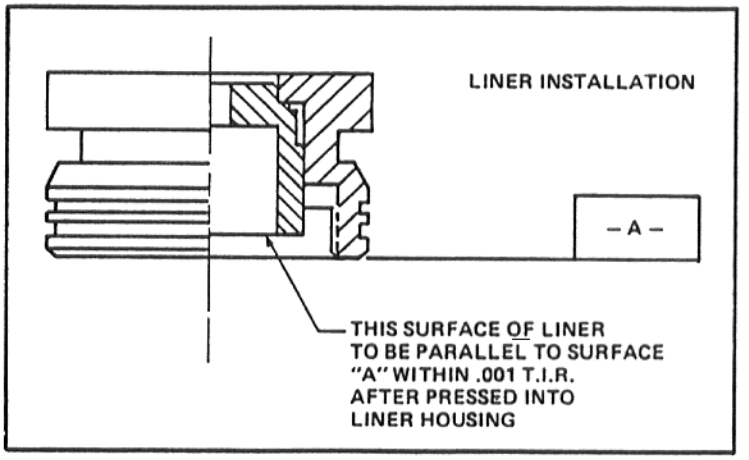

Figure 11

potting. Check armature to conditions shown on Figure 12. If within tolerances (see Table 3), grind on center, both commutators the minimum amount to just clean up completely. Minimum allowable diameter is .700 in. Deburr slots and polish afterward to prevent premature brush failure.

C. With a plug gage, check motor cover bearing (not illustrated in Parts Breakdown. Minimum diameter is .3135 and maximum diameter is .3145. If oversize, replace bearing and ream if necessary to specified tolerances (see Table 3). Lap impeller and pressure plate to restore flat surfaces if necessary. Any deep gouges, scratches or scoring is cause for replacement.

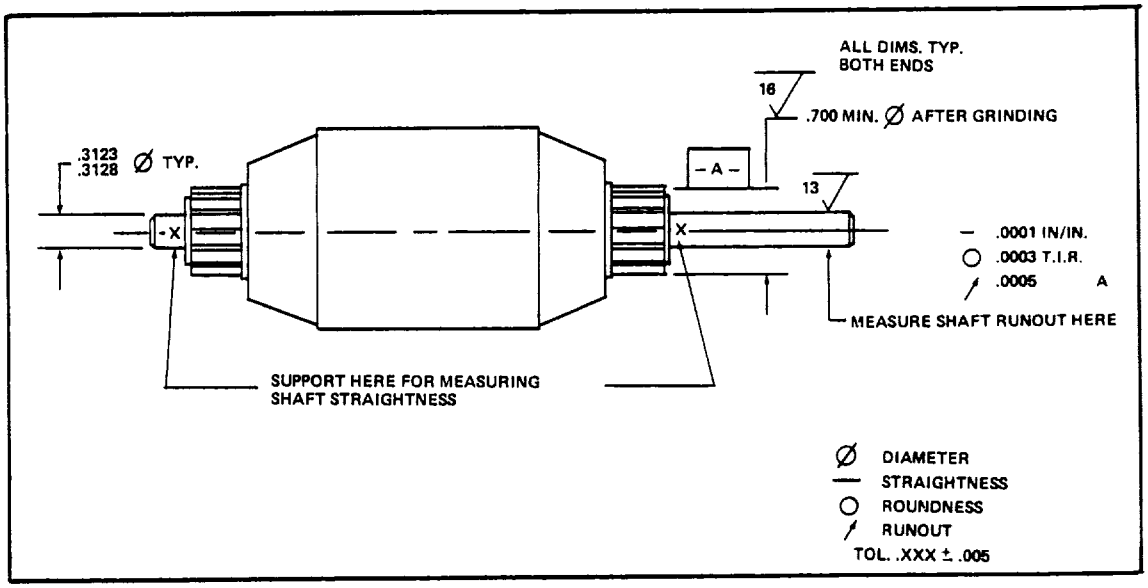

Figure 12

TABLE 3. PERMISSIBLE TOLERANCES

Part Area	Permissable Rework Dimension
Scored Impeller Bronze Face	Lap face flat and smooth.
Scored Pressure Plate Face	Lap face to flatness within 0.0005 T.I.R. Minimum thickness is 0.115 in.
Armature Assembly	Commutators diameter to .700 in. O.D. Deburr slots and edges. Clean out slots. Shaft straightness to .0008 in. T.I.R. runout as measured at long end when supported on parallel knife edges at journal areas.
Cover Bearing Bore	Bore diameter to .3135 .3145 in. I.D.

6. REASSEMBLY

A. Remove phenolic brush holder cover on brush holder assembly (33) and remove brushes (36). See Figure 13. Install new ring tongue terminals (42) on new brush leads and install brushes (36) in brush holder with springs holding them in the outward position.

NOTE: Watch for any frayed or loose strands of wire which may cause a short.

Replace cover and install brush holder assembly (33) onto liner housing (39) with two internal tooth lockwashers (35) and two round head screws (34) (see Figures 14 and 15). Use alignment tool (see Figure 27) to center brush holder assembly.

B. Place one thrust washer (31) over long shaft of armature (32) and install armature. Install square key (30), rotor (29) and vanes (28) with radius side toward bore of liner.

NOTE: End clearance of rotor and vanes must be .0008 minimum to .0022 inch maximum. Adjust as necessary. Vanes must have a clearance of .0015 / .0020 with respect to slots in rotor. Modify as necessary.

C. Position pressure plate (27) over roll pins and loosely install retaining clamp (26). Grasp liner housing (39) with one hand and with the armature up and as vertical as possible, tighten retaining clamp (26) against the pressure plate (27)

Figure 13

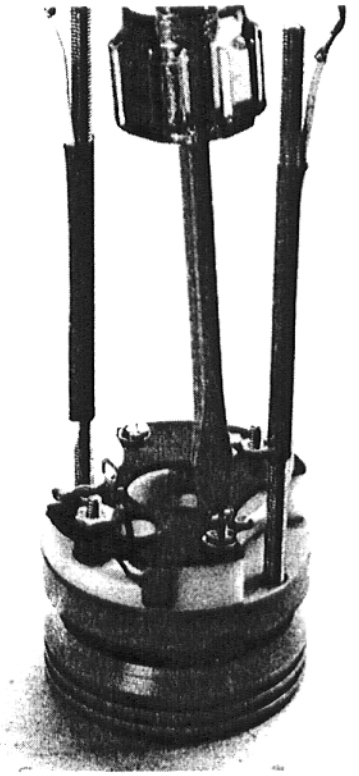

Figure 14

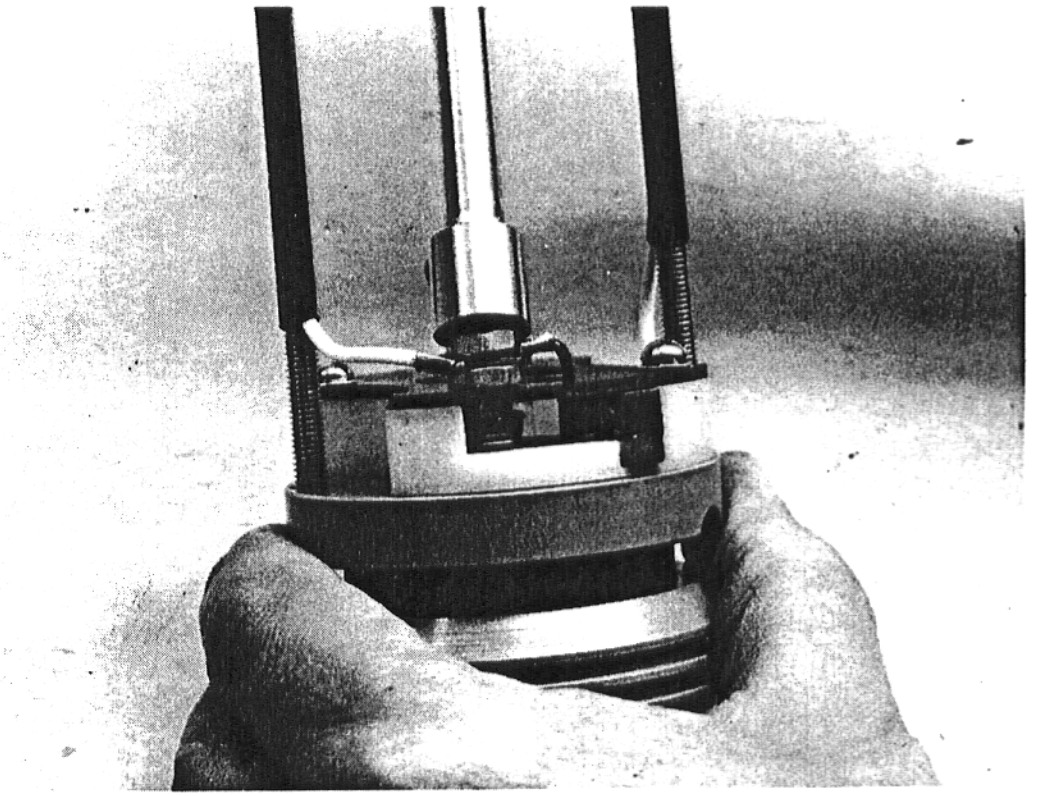

Figure 15

with tool (see Figure 16). This will prevent armature from influencing pressure plate in any one direction. Hold brush springs and carefully position brushes (36) against commutator.

D. Install woodruff key (25) and check impeller (24) for free sliding fit over shaft. Correct if necessary. Lubricate O-ring (21) and position on new seal (20). Carefully press seal and O-ring into housing. Lubricate O-ring (44) and install in top groove of liner housing (39) (see Figure 17). Also apply lubricant to bore of housing (54) to aid in assembly. Invert pumping section, impeller end up, and while holding armature UP against brush holder, lower main pump housing (54) over liner housing (39). Turn assembly right side up and slowly press down on top of brush holder assembly just far enough to allow insertion of wire retainer (19). See Figure 18. Also see Figure 6.

Figure 16

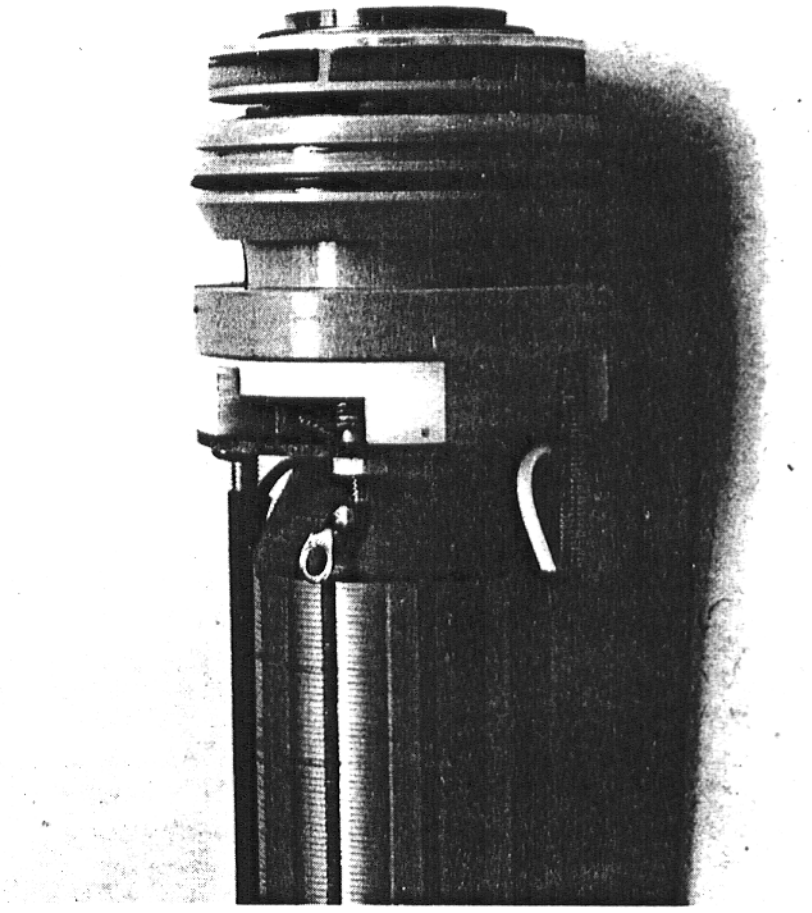

Figure 17

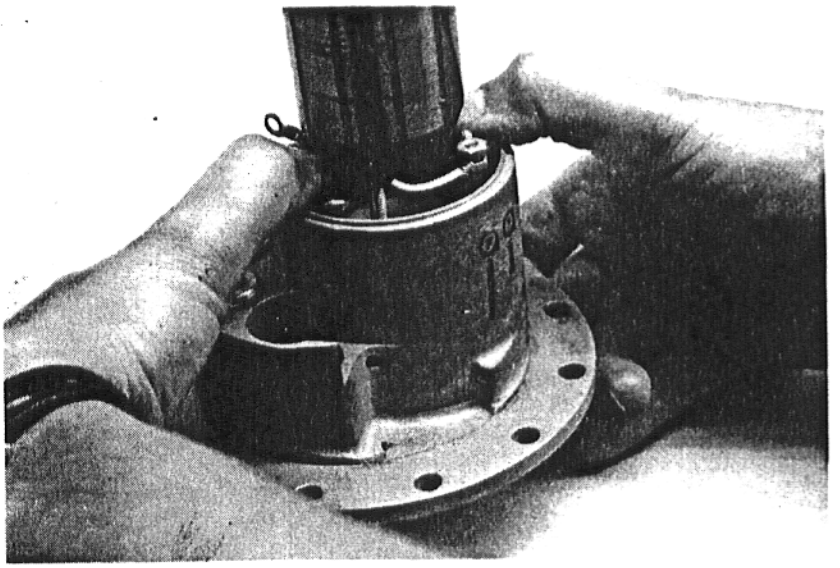

Figure 18

E. Position O-ring (18) over nylon terminal assembly (17) and start assembly into housing (see Figure 19). Apply loctite No. 601 to threads and O-ring prior to tightening terminal assembly.

NOTE: Make sure of alignment between housing and pumping cartridge before installation of terminal and wire assembly. It may be helpful to turn wires by hand near the armature to avoid winding up and possibly breaking. If new terminal assembly was used, install ring tongue terminal (42) on short positive wire from nylon terminal assembly.

F. Attach positive lead and one brush lead brush holder stud and retain with a No. 6 toploc nut (37) (see Figure 3). Route the long negative lead up the closest stud (42), slide a 2-1/2" piece of shrink tube (40) over stud and wire and shrink with heat gun to retain wire. Cut wire off flush with top of stud (42), strip insulation back 3/8" and tin. Trim brush (12) lead to 7/8" if required, tin, and solder to tinned lead (use a heat sink). Remove and replace remaining upper brush (12).

G. Attach lower negative brush lead and upper positive lead to stud on lower brush holder with a No. 6 toploc nut (32). Install the field tube with the North magnet (small white dot) over the positive brush on the lower brush holder assembly (see Figure 20). Install partially assembled upper brush holder (13). Hold springs back and install brushes (12) and wires in correct position to provide adequate movement. Relax spring pressure. Install phenolic cover (9), lockwashers (11), and two hex nuts (10). See Figure 21.

H. Place one thrust washer (15) and shims (14) as required to obtain .010 / .025 end clearance with cover installed. Rotate field tube (16) full CCW, viewing from motor end, and secure cover with two flat washers (4) and two locknuts (3) torqued to 30/35 in. lbs. Secure upper brush card with two flat washers (4) and two round head screws (5).

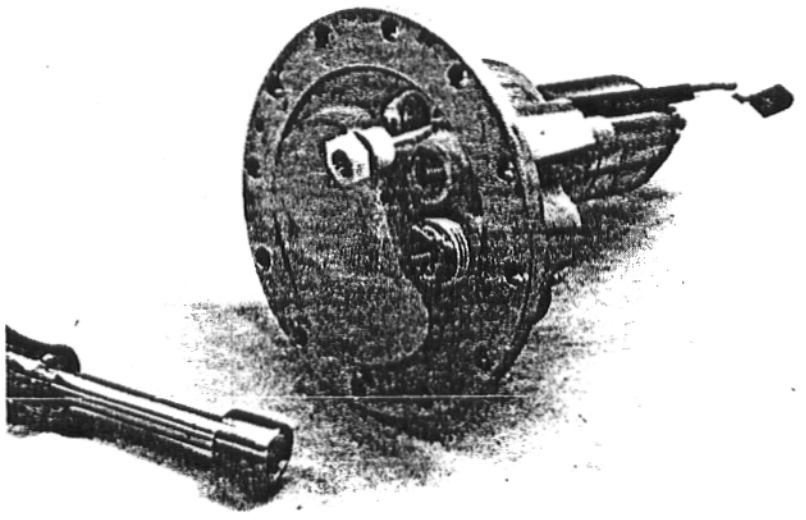

Figure 19

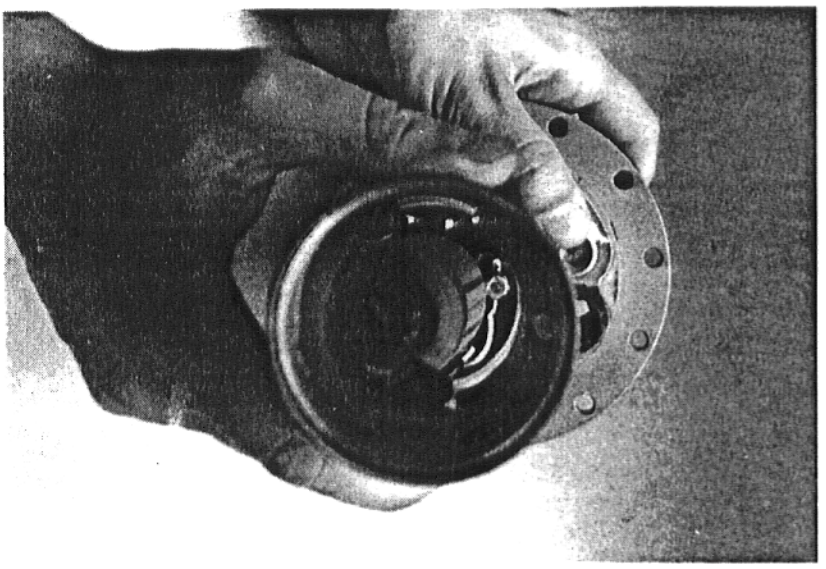

Figure 20

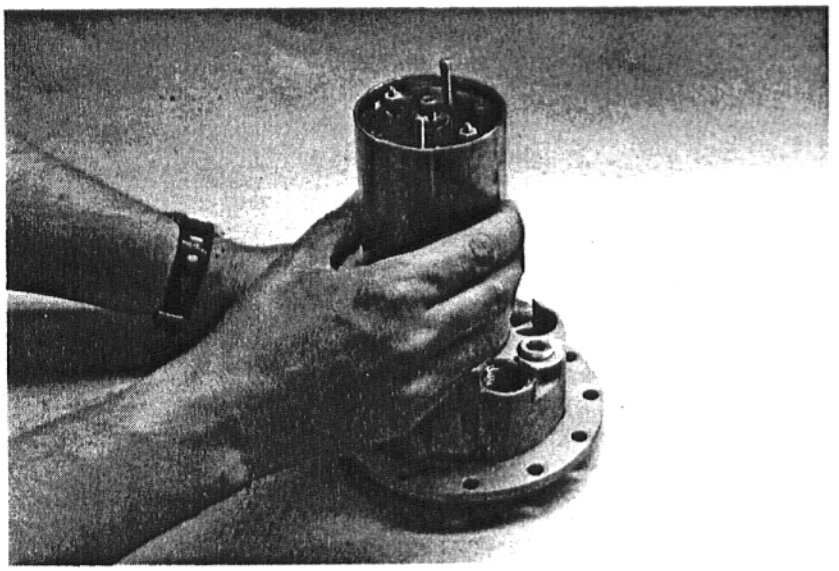

Figure 21

I. Install relief valve assembly in housing. See Figure 22. Apply an antiseize lubricant to threads of cover plug and install it into housing. Reinstall screen to housing with a drivescrew. Fill any void between screen and housing flange with 3M epoxy 2158.

7. TESTING

A. Hydrostatic Testing - The purpose of the hydrostatic test is to prove the integrity of the positive terminal seal, the lack of porosity in the housing, and the ability of the housing flange to seat and seal properly.

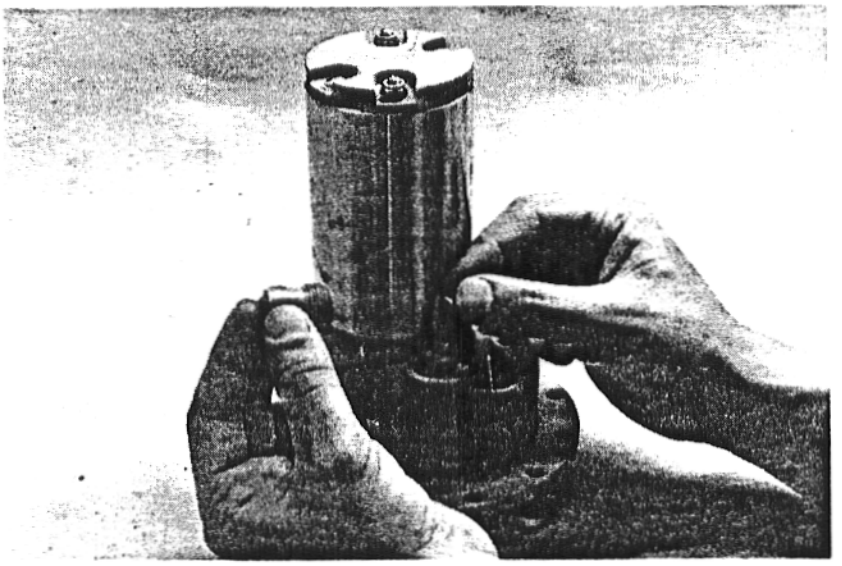

Figure 22

(1) The hydrostatic test setup consists of a tank suitable for mounting the unit and safely withstanding an internal air pressure of 60 PSIG. See Figure 23.

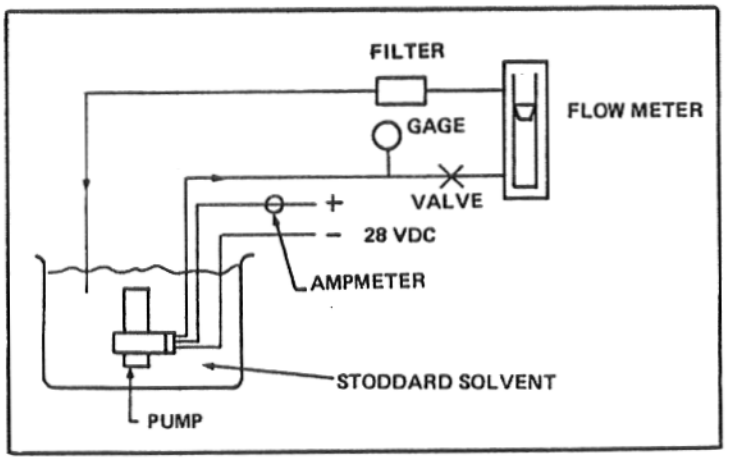

Figure 23

TEST PROCEDURE

1. Production test using Stoddard solvent or fuel specified on outline drawing. CAUTION: Do not run pump dry.
2. Performance: Measure pressure at flow and no flow conditions, and record along with highest current reading at specified voltage in the production test log. The test log must show test performance for each pump by serial number.

(2) Install seal drain plug. Mount unit in a suitable tank to which air pressure can be applied. Cover flange with water. Pressurize vessel. There shall be no leaks at 60 PSI. Leakage through the positive terminal, pores of the housing or around the edges of the flange shall be cause for rejection of the unit.

(a) Re-examine flange face for nicks or burrs and repair, should leak occur around edges.

(b) Re-install positive terminal, checking for cut or distorted O-ring and sufficient torquing of terminal plug, should leak occur here.

(c) Disassemble pump and rebuild with new housing should housing appear porous.

B. Functional Test - The purpose of the functional testing is to prove that the pump meets the performance characteristics for this model.

(1) The functional test setup consists of a vessel suitable for providing sufficient fluid to meet required flow. Instrumentation shall be capable of monitoring flow, discharge pressure, volts DC, current and fluid temperature. Figure 23 schematically illustrates the setup. All instruments must be accurate within plus or minus 2 percent of true reading.

(2) Open discharge valve. Apply voltage briefly to check for shorts or open circuit on ammeter. Apply 28 VDC. Set flow at 450 PPH. Recheck voltage and adjust to 28 VDC. Observe pressure and record. Shut off discharge valve and observe ammeter for increase or decrease in amperage. Record max amps. Read and record pressure at zero flow. Units successfully completing all tests shall be wiped clean of fluid and stored in a clean container with protective plugs in the drain and discharge ports.

Minimum pressure at 450 PPH is 22 PSI. Maximum pressure at 0 PPH is 32 PSI. Maximum current is 8.5 amps.

8. TROUBLESHOOTING

A. Units failing to meet any of the requirements shown in Table of Leading Particulars shall be rejected. Determine cause of failure, take necessary corrective action, and retest the pump. Table of Troubleshooting lists typical failures, their causes, and remedial action to be taken.

TABLE 4. TROUBLESHOOTING

Trouble	Probable Cause	Remedy
Loss of Flow and Pressure	Wedging vane in slot by foreign material	Disassemble, clean and reassemble.
	Worn pressure plate	Disassemble and lap. Replace.
	Relief valve hanging open by foreign material.	Remove valve, clean cavity.

TABLE 4. TROUBLESHOOTING (continued)

Trouble	Probable Cause	Remedy
Loss of Flow and Pressure	Relief valve seat damaged	Replace as assembly. Remove valve, inspect seat, replace if damaged.
	Relief valve improperly adjusted.	Remove and reset pressure.
	Broken impeller seal	Disassemble and replace.
	Broken O-Ring in liner housing	Disassemble and replace.
	Pump assembled without rotor key.	Disassemble and install.
	Vanes installed backwards.	Disassemble and reassemble with rounded edge outward.
	One or more vanes missing	Disassemble and reassemble correctly.
Failure to Operate	Brush hung-up	Disassemble and free up.
	Open circuit	Check for open circuit Check for poor solder connection.
	Short circuited to field tube or housing.	Examine leads. Check for foreign metallic fragments. Check for broken or chaffed insulation.
	Wedged vane	Disassemble. Examine for chips or foreign material. Clean if not chipped, or replace if damaged.
	Damaged armature. Wires cut during turning of armature commutators.	Replace armature
	Field tube on backwards, 180° out of polarity	Disassemble and correct polarity.
	Pump not connected electrically	Correct connections.
Noisy Pump	Broken vanes	Replace.
	Foreign material	Clean.
	Out-of-balance armature	Replace.
	Bent shaft	Straighten or replace.

9. STORAGE AND PRESERVATION

A. No special instructions are necessary for storage and preservation of these units except that after overhaul and test, the unit or units should be dry and protected against any dirt or foreign matter.

10. SPECIAL TOOLS

A. Special tools required to overhaul these units are shown in Figures 24 and 25. Detail dimensional drawings (Figures 26, 27, 28 and 29) are provided to be used to fabricate tools not illustrated in Figures 24 and 25.

(1) See Figure 24 for tools required.

(2) See Figures 25 and 26 for pliers ground to facilitate key installation and rotor removal.

11. ILLUSTRATED PARTS LIST

A. General - This section contains listings of assemblies, sub-assemblies and detail parts arranged in disassembly sequence except that attaching parts are listed immediately after the parts they attach, under the heading of "ATTACHING PARTS."

B. Item Number - The item number indicates the identification of a part in the illustrations.

C. Part Number - This column contains numbers for identification of parts.

D. Description - Description of each item is indented by columns to indicate relationship to the next higher assembly.

E. Quantity Required - The numbers listed in the "Quantity Required" column indicate the quantity of parts used per assembly at the location shown and are not necessarily the total quantity used per pump. The letters "AR" indicate the part is used as required.

OVERHAUL, MAINTENANCE AND TESTING

of CHECK VALVE 700 246

28 September 1967

DISMANTLING: See Exploded View of 700 246

Unscrew valve and cap assembly, item 4, and with a suitable pair of pliers remove retaining ring, item 3. Remove the element, item 2, from the housing, item 1.

Check all sealing faces and threads for nicks, scratches, deformation or any other imperfections.

If the rubber seal in the valve, item 4, is damaged the complete valve and cap assembly should be replaced.

CLEANING:

Clean all the components ultrasonically or by soaking in clean varsol and scrubbing with a bristle brush, taking care not to damage the rubber seal. Rinse components with a final prefiltered petroleum naptha or varsol.

Dry components thoroughly using a clean filtered air blast.

ASSEMBLING:

Assemble element with housing ensuring retaining ring is fully inserted in the groove. (Ring gap shall be .179 minimum).

Assemble cap and valve assembly with aluminum gasket, item 5, into housing and tighten to 600 in. lbs. torque.

PROOF PRESSURE TESTING:

1. Connect outlet port of valve to an adequate source of hydrostatic pressure (hand pump). Fill the system with MIL-F-7024 Type II and use a test quality pressure gauge, the range of which is not greater than 500 PSI. The fluid shall be filtered to 10 micron.

2. Expell all air from the system.

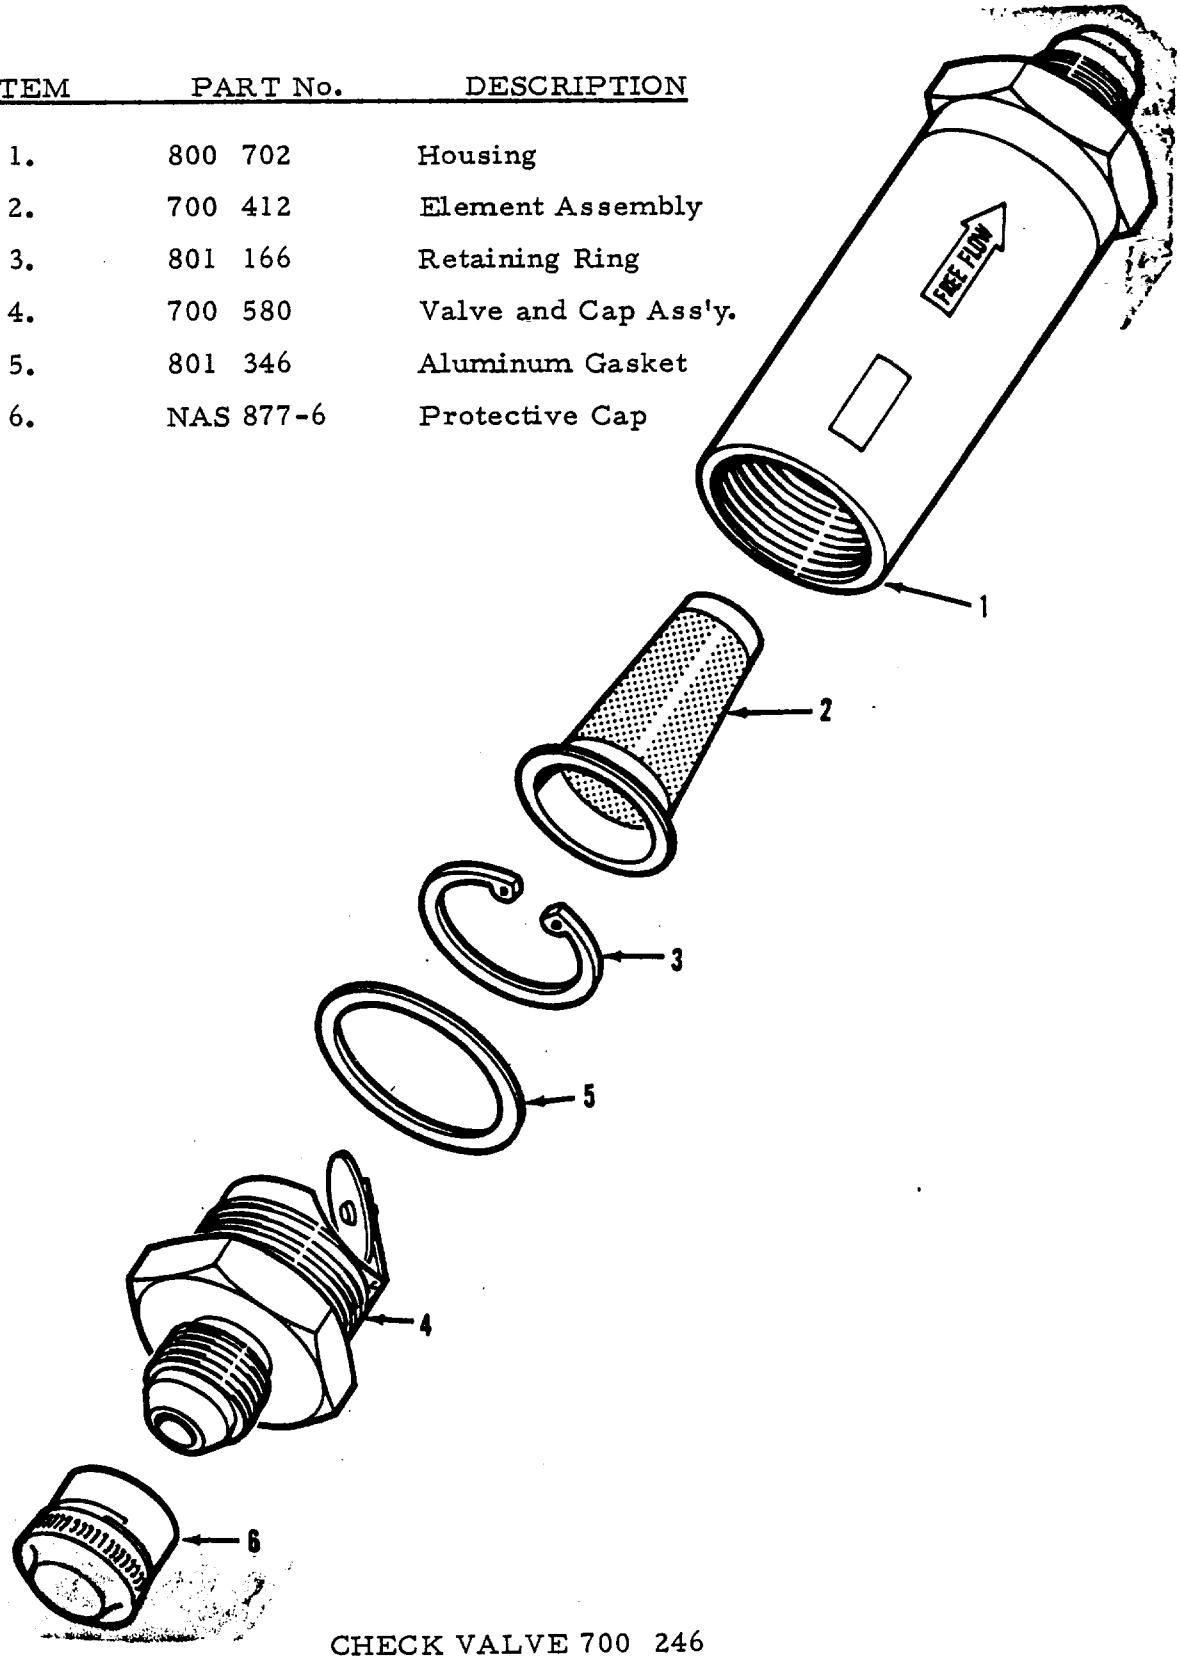
3. Apply $\frac{1}{2}$ PSI pressure. Wipe the outside of the unit dry. Hold pressure for one minute. There shall be no leakage.

OVERHAUL, MAINTENANCE AND TESTING

of CHECK VALVE 700 246

4. Increase pressure to not less than 90 PSI and not more than 95 PSI. Hold for not less than two minutes. There shall be no leakage.

5. Release pressure. Check threaded joints for slackening tighten if necessary in accordance with relevant assembly procedure.



6. Repeat steps 3, 4 & 5 above.

7. The test shall be carried out at room temperature (65 - 85°F). Dry valve unit thoroughly in a clean oven at 160°F max. or with clean filtered air blast.

8. Store in a clean sealed polyethelene bag until used.

Q. Description and Operation

A. Description

(1) The fuel booster pump, Part No. 60-611, is composed of a 28-volt DC motor, impeller and screen assemblies mounted on a flange assembly and is enclosed in an explosion-proof, cannister-type housing. The pump is a centrifugal fuel, continuous duty type, incorporating a thermal protector and radio interference filter.

B. Operation

(1) The pump is motor driven and is mounted on the fuel tank. The motor operates on 28 VDC with a maximum current drain of 4.0 amps. Pump rated flow is 1.155 gpm JP-4 aircraft fuel Motor rotation clockwise when viewed from shaft end.

Table 1. Leading Particulars

Use	Aircraft fuel system
Type	Centrifugal – motor-driven
Installation	Tank mounted
Operation	Continuous duty
Fluid	JP-4 fuel (MIL-T-5624)
Power Supply	28 VDC battery
Max. Current Drain	4.0 amperes
Thermal Protection	Non-resettable
Capacity	1.155 gpm
Weight	3.2 lbs.

1. Disassembly (see figure 6)

A. Disassemble in sequence of index numbers assigned to exploded view, observing the following:

NOTE: Prior to separation of flange assembly (15) and motor housing (6), disconnect wires from radio interference filter (4). Remove screws (5) and filter (4).

B. Remove motor housing (6) by removing screws (10) and washers (11).

C. Remove bearing (34), wick (35), and bearing retainer (36) from armature assembly (44) shaft. Remove O-Ring (8) from motor housing.

D. Pull slinger (40) from armature assembly (44) shaft.

E. Remove screws (50) washers (51), and disconnect brush wires from field assembly (54). Remove brush assembly (-45), and disassembly brush springs (47), and brushes (48), from plate (46). Discard brushes and springs. Unsolder and remove capacitors (49), from plate (46).

F. Remove spacer (52), and spacer assembly (56).

G. Remove thermal fuse (55), from field assembly (54).

H. Disassembly pump assembly (1) as follows:

(1) If necessary, remove nameplate (3) from flange assembly (15).

(2) Pry thrust bar (14), if necessary to remove, from flange assembly (15). Bar is cemented and pressed into flange assembly.

(3) Remove screen assembly (13), fron flange assembly (15). Separate inlet adaptor (16), from seal housing (32), by removing screws (1

NOTE: Adaptor (16) is cemented to housing (32).

(4) To remove impeller (20), pull pin (18). Remove O-Ring (19).

(5) Disassemble seal assembly by removing seal insert (23) and O-Ring (27) from seal holder (25). Remove spring (26).

(6) Remove seal shell (28) and plug (31) from seal housing (32). Remove and discard gasket (30).

(7) Remove bearing guide (39), bearing (43), wick (41), and bearing retainer (42) from armature (44) shaft.

NOTE: Bearing guide (39) is installed on Part No. 60-611A configuration only.

2. Cleaning (see figure 6)

WARNING: USE CLEANING SOLVENT IN A WELL-VENTILATED AREA. AVOID BREATHING FUMES. KEEP AWAY FROM FLAME.

A. Wash all non-electrical parts with dry-cleaning solvent (Federal Specification P-S-661) and thoroughly dry.

WARNING: USE METHYL-ETHYL-KETONE IN A WELL-VENTILATED AREA. AVOID BREATHING FUMES. KEEP AWAY FROM FLAME.

B. Remove cement and sealant from flange assembly (15), seal housing (32), inlet adaptor (16), thrust bar (14), nameplate (3), and screen assembly (13), with methyl-ethyl-ketone (Federal Specification TT-M-00261): then remove methyl-ethyl-ketone with dry-cleaning solvent (Federal Specification P-S-661).

C. Sonically clean seal assembly (-21) using an ultrasonic cleaner (Acoustica Associates, Inc., Los Angeles, California).

D. Wipe all electrical parts with a clean lint-free cloth. Use a soft bristle brush to clean hard-to-reach areas.

E. Carefully clean between commutator bars on armature assembly (44) with a copper wire brush.

3. Inspection/Check (see figure 6)

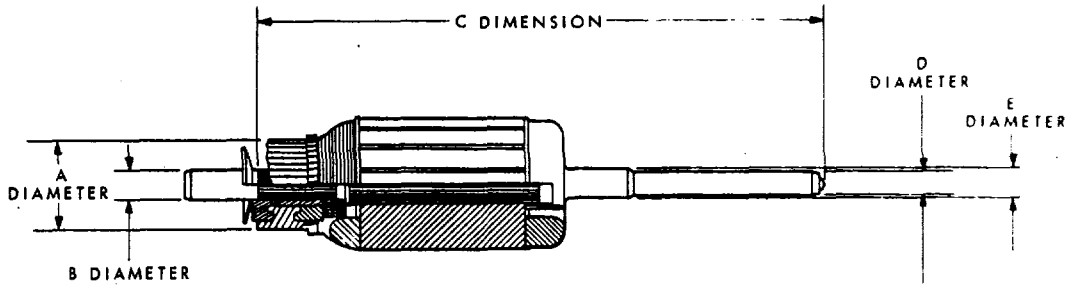
A. Visual Inspection

(1) Inspect all parts for damage. Check all threads for cross-threading and stripping.

(2) Examine machined surfaces for cracks, nicks, scratches, and corrosion.

(3) Thoroughly check bearing (34, 43). Bearings must not be rusted, discolored, fractured, or have obviously worn surfaces and must rotate smoothly without roughness or binding.

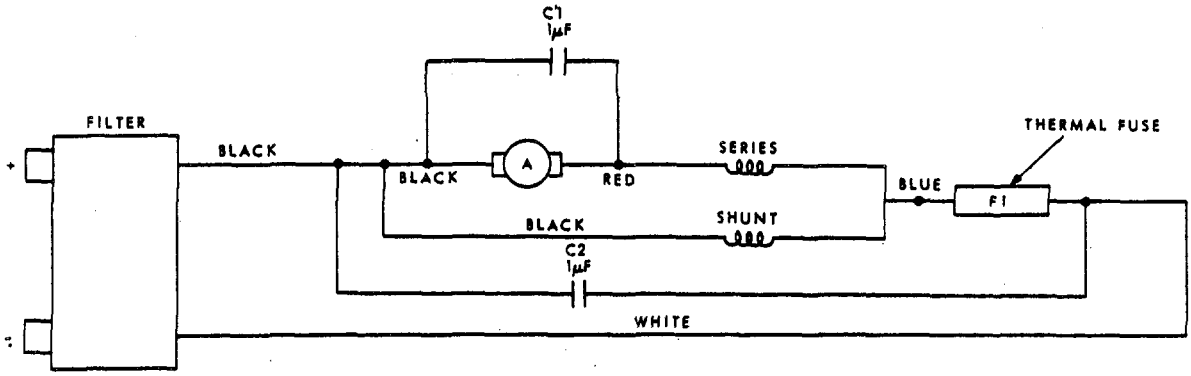
(4) Check armature assembly (44) shaft for chipping, scoring, and deep wear patterns. Dimensionally inspect in accordance with figure 1.



B. Mechanical Inspection

(1) Inspect spring (26) for cracks, breaks, and distortions. At compressed length of 0.245 inch, load must be 1.47 lb. maximum. When load is removed, spring must return to a free length of 1.111 inches (±0.010) with no permanent set or distortion.

(2) Check field assembly (54) for continuity.



(3) Check resistance of field assembly (54, figure 6); resistance of one coil must be the same as the other within 10 percent of the higher value. (See figure 2 for wiring diagram.)

Dielectric test the motor applying 500 volts ac, rms, at 60 cps for one minute. Maximum leakage shall not exceed 0.003 ampere. There shall be no indication of insulation breakdown.

A	B	C	D	E
0.746 IN. (MIN)	0.2485 IN. (MIN)	4.664 IN. 4.684	0.1865 IN. (MIN)	0.2485 IN. (MIN)

Armature Dimensional Requirements
Figure 1

Wiring Diagram
Figure 2

(4) Check wiring insulation and sleeving for evidence of deterioration (brittleness) abrasion or other damage.

(5) Inspect filter (4) and field assembly (54) terminals for corrosion, looseness, breaks, and other damage.

4. Repairs (See figure 6)

A. Replace all parts that do not pass inspection/check and are damaged beyond simple repair.

B. Special materials required for repair are listed in Table 2.

C. Remove minor scratches, burrs, and corrosion from metal parts by light polishing with fine aluminum oxide or silicon carbide abrasive cloth (Federal Specification P-C-451).

D. Replace all packings at each overhaul.

E. If armature windings are shorted, check for solder deposits between commutator bars. Remove deposits and recheck windings. If still shorted, armature must be replaced. If circuit is open in armature windings, inspect for thrown solder. Resolder circuit where necessary using solder, specification QQ-S-571 and recheck circuit. If circuit is still open, replace the armature assembly.

F. If commutator eccentricity exceeds limits specified in figure 1, machine minimum amount of metal from commutator to bring commutator within limits. Use a diamond-bit tool and hand-feed lathe slowly at maximum spindle speed to machine commutator. Polish machined surface to a finish of approximately 16 micro-inches rms. If minimum B diameter (figure 1) cannot be maintained, replace armature assembly; slot in commutator bar indicates allowable minimum diameter. Undercut mica between commutator bars to a depth of 0.040 inch, using care to avoid removing material from bars.

G. If finish on outside diameter of armature laminations is defective, remove defects with abrasive paper (Federal Specification P-P-101,

Table 2. Special Materials for Repair

Material	Part No.	Vendor or Specification	Application
Anodic Coating	None	MIL-A-8625, Type II Class I	Para. 4H
Solder	SA5 WRAP2	QQ-S-571	Para. 4E
Varnish	6001	*11147	Para. 4G
Carbide Abrasive Cloth	None	P-C-451, Grit 600 to 800	Para. 4C
Abrasive Paper	None	P-P-101 600 Grit	Para. 4G

*Epoxylite Corp., South El Monte, California

No. 600 grit). Clean thoroughly, then bake at 2 hours at 235°F, 1.5 hours at 325°F. Apply one coat of varnish (See Table 2). Outside diameter must comply with dimensions shown in figure 1 after painting.

H. Touch up worn or rework anodized surfaces on aluminum parts by applying anodic coating in accordance with MIL-A-8625, Type II, Class I.

I. Replace pin (18) and springs (26, 47) at each overhaul.

5. Assembly (See figure 6)

A. General

Refer to Table 3 for special materials required for assembly procedures.

Table 3. Special Material for Assembly

B. Pump and Motor Assembly (See figure 6)

NOTE: Apply light coating of grease to all packing and O-Rings prior to assembly.

(1) Coat mating surfaces of flange assembly (15) and screw (5) with primer (MIL-S-22473, Grade N) and allow to dry for two minutes; then coat screws (5) with stud lock and secure radio interference filter (4) on flange assembly. Tighten screws 5 to 10 inch-pounds torque.

(2) Solder black lead of motor to filter (4) positive terminal and white lead to negative terminal in accordance with MIL-S-6872. Coat terminals with red enamel.

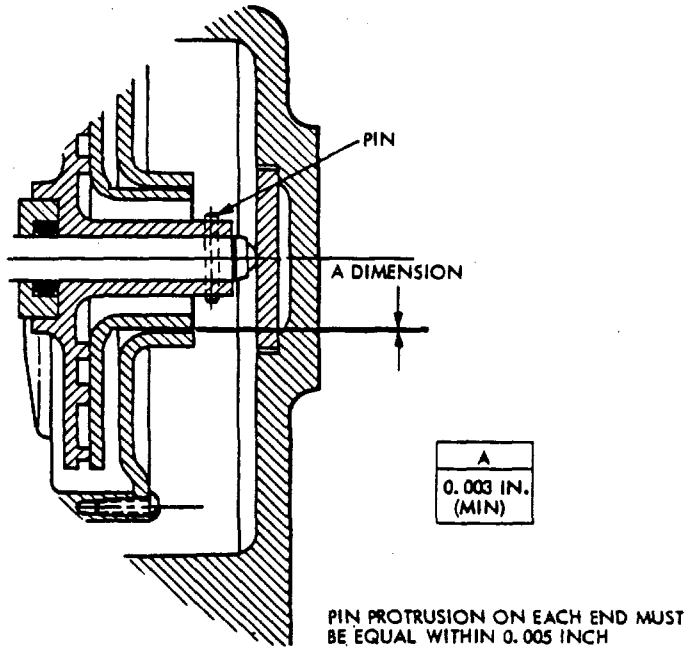
(3) If nameplate (3) was removed, activate adhesive backing on new nameplate with methyl-ethyl-ketone and install on flange assembly (15).

(4) Coat mating surfaces of thrust bar (14) and flange assembly (15) with cement and press thrust bar into flange assembly.

(5) Install screen assembly (13) on flange assembly (15) and fill joints between assemblies with sealant. Joints must be water tight after sealant cures.

(6) Cement seal shell (28) in seal housing (32). Assemble seal insert (23) into seal holder (25). Install O-Ring (27) into holder and insert assembly into seal shell (28) with spring (26) installed.

(7) Apply a coating of Stabond to surfaces of flange assembly (15), seal housing (32), and gasket (30). Assemble parts while Stabond is still tacky. Cure at room temperature for 24 hours.



(8) Install bearing retainer (36), bearing wick (35) and bearing (34) on armature (44) shaft. Soak wick (35) with oil specification MIL-L-23699. The wick shall contain 2 to 3 grams of oil when installed.

(9) Install armature shaft (44) through seal assembly (-21) and seal housing (32). Insert plug (31) into housing (32).

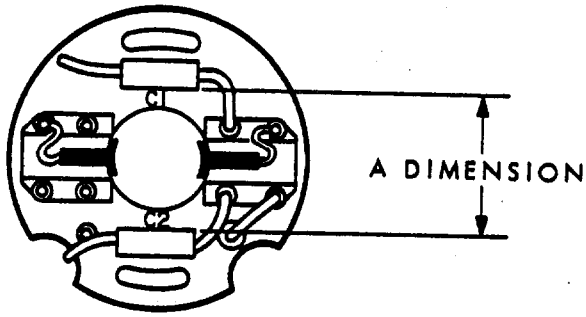
(10) Install O-Ring (19) in impeller (20). Install impeller on armature (44) shaft and insert pin (18) through impeller and shaft. Amount of pin protrusion on each end shall be equal within 0.005 in.

(11) Apply cement to mating surfaces of inlet adaptor (16) and seal housing (32) and in two holes in seal housing. Install adaptor (16) so that clearance dimension complies with that specified in figure 3 when the armature (44) shaft is positioned in true running position.

NOTE: Secure inlet adaptor (16) to seal housing (32) with screws (17).

Inlet Adapter to Impeller Clearance
Figure 3

(12) Assemble spacers (52, 56) on field assembly (54). Solder thermal fuse (55) to field assembly wires.



(13) Assemble brushes (48) and springs (47) on plate (46). Refer to figure 4 and solder the two capacitors (49) into the brush guide and brush assembly (-45). Coat slinger (40) and shaft (44) mating surfaces with adhesive and install slinger on armature shaft.

(14) Install the bearing retainer (42) bearing wick (41) and bearing (4 on armature shaft (44). Apply 2 to 3 grams oil specification MIL-L-23699 to the wick prior to installation.

NOTE: On Part No. 60-611A pump assemblies, a bearing guide (39) is installed prior to the retainer and wick.

(15) Secure bearing and brush assemblies through field assembly (54) an spacers to flange assembly (15) with screws (50) and washers (51).

(16) Insert O-Ring (8) in motor housing (6) and attach housing to flang assembly (15) with screws (10) and washers (11). Tighten screws

A
0.80 IN. 1.00

Capacitor Installation
Figure 4

4 to 6 inch-pounds torque. Safety wire screws with lockwire MS20995C32.

NOTE: On Part No. 60-611A pump assemblies, install flange (9) on housing (7) and secure to flange assembly (15) with screws (12). Tighten screws 4 to 6 inch-pounds torque. Safetywire screws with lockwire MS20995C32.

6. Fits and Clearance (See figure 6)

Table 4. Fits and Clearances

Impeller (20) to Inlet Adapter (16)	0.003 inch min.
Bearing (34, 43) to Armature Shaft (44)	0.0005 to 0.0020 in.

7. Testing

A. Test Conditions

(1) Test fuel shall be JP-4 in accordance with specification MIL-T-5624.

(2) Tests shall be conducted at ambient pressure and temperature.

(3) Motor brushes shall not be less than 90 percent seated prior to performance testing.

B. Test Fixtures and Equipment

Testing can be accomplished with the use of test fixtures and equipment listed in Table 5, as well as those normally available at overhaul facilities.

C. Partial Motor Assembly (see figure 6)

(1) Remove all grease, oil, or other corrosion resistant compounds from exterior of test unit.

(2) With motor installed in test fixture T-29363, perform dielectric test as follows:

(a) Disconnect one end of both capacitors (46).

(b) Apply 500 volts ac, rms, between motor winding and case for one minute. Increase and decrease voltage in steps of 100 volts per second. There shall be no evidence of flashover or breakdown. Maximum current leakage shall be 3 ma.

(3) With motor installed in test fixture T-29363, conduct the performance test as follows:

(a) Check that both capacitor leads are properly connected.

(b) Check that power switch of power supply is OFF.

(c) Connect the (black) motor lead to the positive terminal of th power supply.

(d) Connect the (white) motor lead to the negative terminal of th power supply.

(e) Set power switch on power supply to ON.

(f) Adjust voltage until voltmeter indicates 10.0 volts. Observe and record shaft rotation. Rotation shall be clockwise as viewed from shaft end.

Table 5. Test Fixtures and Equipment

Part No.	Description and Manufacturer	Application
Coml	Dynamometer, (0-10 oz-in.) ± 2% accuracy	Performance testing
Coml	Voltmeter (0 to 30 vdc (*16902)) ± 1/2% accuracy	Performance and continuity testing
Coml	Ammeter (0 to 5 amps) ± 1% accuracy	Performance testing
Coml	Power Supply (0 to 30 vdc) 5 amps minimum	Functional testing
Coml	Test Fixture - T-29363 or equivalent	Dielectric and performance test
Coml	RPM Counter (0 to 10,000 rpm) ± 2% accuracy	Performance testing
Coml	Test unit to Dynamotor adapter	Performance testing
Coml	Test fluid (JP-4 (MIL-T-5624))	Performance and leak testing
Coml	P Gauge (0 to 60 psig) ± 1% accuracy	Performance testing
Coml	Pressure Gauge (0 to 30 psig) ± 1% accuracy	Leakage testing
Coml	Vacuum Gauge (0 to 30 Hg) ± 1% accuracy	Leakage testing
Coml	Fuel Tank (30 gal. min. w/sight glass)	Performance and leak testing
Coml	Flowrater type Flowmeter (0 to 5 gpm) ± 1% accuracy	Performance testing
Coml	High Potential Tester (capable producing 500 VAC, rms, 60 cps	Insulation breakdown testing

*VENDOR CODE	NAME AND ADDRESS.
16902	Simpson Instruments, Inc., Escondido, California

(g) Increase power supply voltage until voltmeter indicates 28 ± 0.2 volts.

(h) Set dynamometer for 9.2 ± 2% inch torque. Reset voltage to 28.0 ± 0.2 volts.

Observe and record RPM and ammeter indication. RPM shall be greater than 8,800 RPM. Ammeter indication shall be 3.5 amps maximum.

D. Fuel Pump (See figure 6)

(1) Install the pump assembly in the test setup as shown in figure 5 and perform a break-in run as follows:

(a) With the double outlet port plugged, operate the pump for 15 minutes.

(b) Flow shall be from 1.18 to 1.50 gpm with 28 ± 0.2 VDC applied to the motor leads.

(2) With the pump operating as in paragraph D(1), perform external and shaft seal leakage test as follows:

(a) Apply 15 psig (+0.5, -0) air to the test tank for 5 minutes.

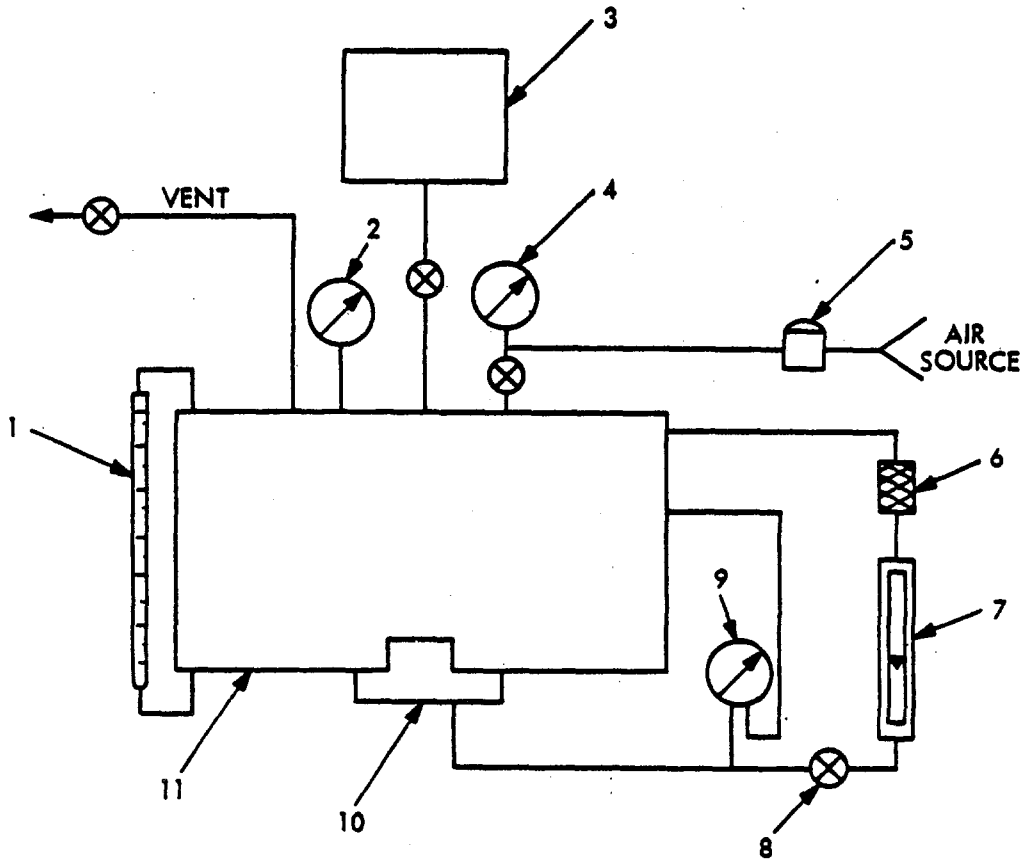
(b) There shall be no evidence of leakage or weeping from the flange (14).

(3) With the pump operating as in paragraph D(1), perform motor housing leakage test as follows:

(a) Apply 10 Hg (± 0.2) vacuum to test tank.

(b) Observe through the tank window for appearance of bubbles at flange (15).

(c) No air bubbles are permissible.



(4) No leakage of fuel from the seal drain port after break-in run and subsequent testing is permissible.

(5) Calibration Test

(a) Calibration is performed at ambient temperature and pressure.

(b) Pump performance shall be tested as follows.

(c) The pressures and flow rates are with 0.79 to 0.80 specific gravity JP-4 test fluid.

1. SIGHT GAGE
2. 30 IN. VAC. GAGE
3. VACUUM PUMP
4. 0 - 30 PSIG GAGE
5. PRESSURE REGULATOR
6. 10 MIC. NOM. 25 MIC. ABS. FILTER
7. 0 - 5 GPM FLOWRATER
8. FLOW CONTROL VALVE
9. 0 - 60 PSIG ΔP GAGE
10. 60-611 TEST UNIT
11. JP-4 TANK (WITH WINDOW)

Test Setup
Figure 5

(d) Fuel Flow GPM	Discharge Press. (PSID) Max.	Min.	Current Amps Max.
0	40	25	4.0
1.155	40	22	4.0

To account for varying fuel densities, the following procedure will be used in determining fuel flow rates and minimum discharge pressures at the rated flow of 450 PHR. To convert

from flow in pounds per hour (PHR) to flow in GPM, use the following values:

Fuel Sp. Gr.	GPM at 450 PHR	Discharge Press. (PSID) Min.	Max.
0.800	1.125	22.6	40
0.790	1.140	22.3	40
0.780	1.155	22.0	40
0.770	1.170	21.7	40
0.760	1.185	21.4	40
0.750	1.200	21.1	40

(6) Screen Sealant Bond Check (See figure 6)

(a) Wipe screen (13) and flange (15) dry.

(b) With pump positioned in installed attitude (motor vertical), fill the inside cavity with JP-4 fuel to the height of the screen bonding.

(c) No leakage of fuel through bonded joints after 5 minutes is permissible.

8. Trouble Shooting

Refer to Table 6 for trouble shooting information.

Table 6. Trouble Shooting Information

Trouble	Possible Cause	Isolation Procedure	Correction
Pump operates but does not pump fuel	Sheared impeller assembly pin	Check for shearing of impeller assembly pin	Replace impeller assembly pin
Pump operates at less than rated flow and pressure	Impeller assembly binding	Check impeller assembly for freedom of movement	Obtain correct assembly dimensions
	Pump clogged with foreign material	Check parts and impeller assembly for foreign material	Remove foreign material and clean parts
Pump operates but vibrates excessively	Armature assembly damaged	Remove armature assembly and dimensionally inspect	Repair or replace armature assembly
	Worn bearing assemblies	Check fit of rotor shaft in bearing assembly	If rotor shaft fits too loose in either bearing assembly, replace bearing assembly
	Bent or damaged impeller assembly	Check impeller assembly for damage or deformation	Replace defective impeller assembly
Motor fails to Operate	Power circuit open	Check power circuit	Repair power circuit.
	Brush connection defective	Check brush connection	Repair defective brush connection
	Thermal protector defective	Check thermal protector for continuity	Replace thermal protector
	Motor armature assembly open	Inspect motor armature assembly	Resolder commutator or replace armature assembly

Table 6. Trouble Shooting Information (cont)

Trouble	Possible Cause	Isolation Procedure	Correction
Motor runs at less than specified speed with no load	Brushes not fully seated	Check brushes and brush springs	Run in until approximately 80% contact is obtained
	Rough finish on commutator	Inspect armature assembly	Machine commutator
	Commutator bars or armature assembly winding shorted	Inspect armature assembly	Undercut commutator or replace motor armature assembly
	Bearing defective	Check bearings	Replace bearing
	Field assembly windings soiled	Check field assembly for continuity	Replace field assembly
	Defective capacitor	Check capacitor	Replace capacitor
Motor operates at excessive speed or runs too slow when rated load is applied	Field assembly coils loose	Check field assembly coils for looseness	Replace field assembly

9. Storage Instructions

Install a suitable protective cap on receptacle and plug inlet and outlet ports. Wrap fuel booster pump in grade A paper, Military Specification MIL-B-121, or equivalent. Place in padded carton. Seal carton and stamp pump assembly serial number, part number and overhaul date on carton.

10. Special Tools, Fixtures, and Equipment

Not applicable.

11. Illustrated Parts List

A. Introduction

(1) Purpose of parts list.

The illustrated parts list is intended for use in provisioning, storing and issuing the replaceable fuel booster pump assembly parts, and in identification of new and reclaimed parts.

(2) Use of parts list when part number is not known.

Look through the illustration and identify the part by appearance. Note the index number in the exploded view and check the corresponding index number in the accompanying parts list to find part number, the description, and quantity required for that application.

(3) Use of parts list when part number is known.

Turn to the numerical index, and locate the part number. Figure and index number on the illustration where the part appears are listed in the column to the right of the part number. Turn to the illustration and locate the index number. The corresponding index number in the accompanying parts list will give part number, description, assembly relationship, and quantity required for that particular application.

(4) Assemblies covered by parts list.

The illustrated parts list covers Fuel Booster Pump Part Number 60-611 and 60-611A.

(5) Assembly relationship.

Each assembly listed is followed immediately by a listing of its component parts, properly indented to show their relationship to the assembly. Parts are listed in general order of disassembly, with the exception of attaching parts. Attaching parts are captioned as such and follow immediately after the part they attach and are separated from other detail parts by a symbol "- - - * - - -", alternate parts are listed in parenthesis in the description column.

(6) Units per assembly.

Quantities specified in the "Units per Assy" column are the total number of each part required per assembly or subassembly and are not necessarily the total used per the complete equipment.

(7) Abbreviations.

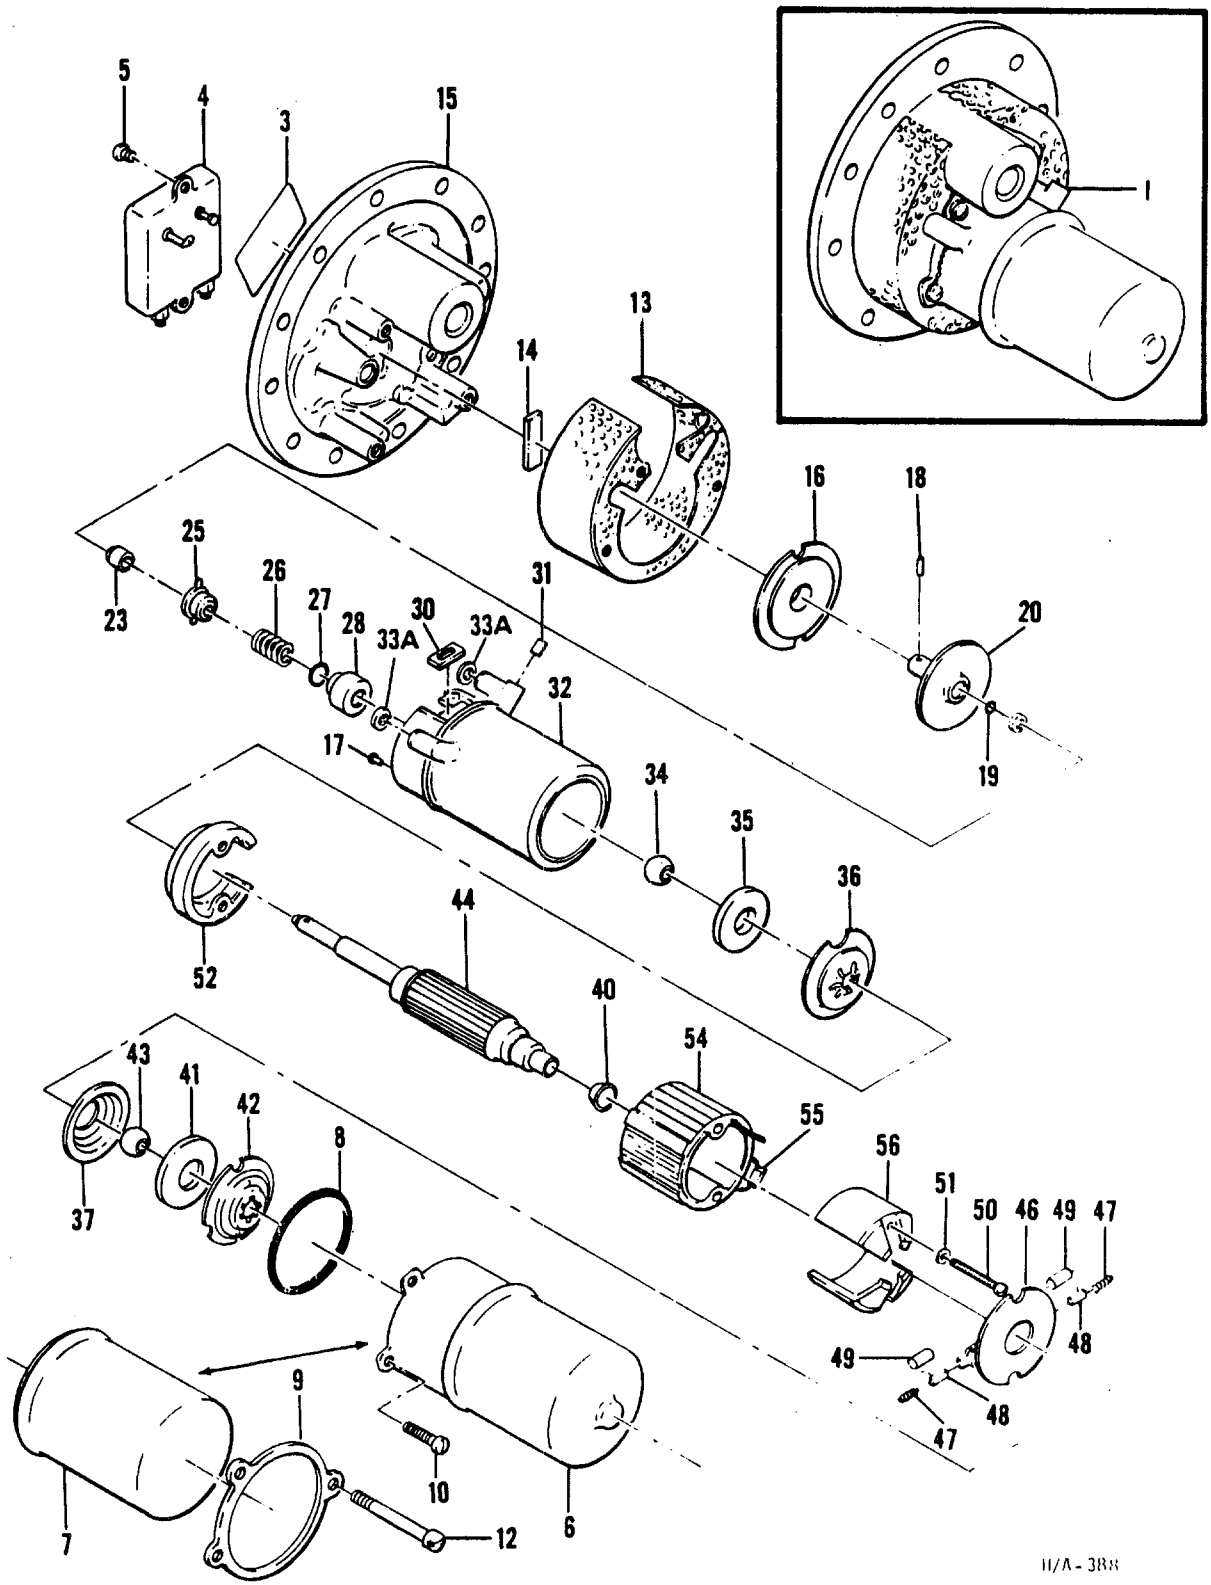
Abbreviations used in the Illustrated Parts List are as follows:

AN	Army-Navy Standard
MS	Military Standard
NAS	National Aircraft Standard
NO	Number
P/N	Part Number
RF	Reference. Indicates those parts which have their requirements listed elsewhere in the parts list.

(8) Vendors' part.

Vendors' parts used in the Fuel Booster Pump assembly, and which are not altered by Hydro-Aire, are listed by the vendor's part number, vendor's description of the part, and vendor's code listed in parentheses following the description. Vendor's code symbols used in this publication are taken from Federal Supply Code of Manufacturers Cataloging Handbook H4-1 and consist of the applicable code symbol preceded by the letter "V". Following is a numerically arranged list of vendor codes used in this publication.

VENDOR's CODE	NAME AND ADDRESS
00287	CEM Co., Inc., Danielson, Connecticut
05972	American Sealants Co., Hartford, Connecticut
06255	Acoustica Associates, Inc., Los Angeles, California
11147	Epoxylite Corp., South El Monte, California
12406	ELPAC, Inc., Fullerton, California
16902	Simpson Instrument, Inc., Escondido, California
24446	General Electric Co., Schenectady, New York
27012	Micro Devices Corp., Dayton, Ohio
71984	Dow-Corning Corporation, Midland, Michigan



83040	American Latex Products Corp., Hawthorne, California
92555	The Lee Co., Westbrook, Connecticut
97119	Carl H. Biggs Co., Los Angeles, California

B. Illustrated Parts List

The illustrated parts list does not list or illustrate parts which lost their identity by being permanently welded to other pieces, or rivets, cotter pins (split pins) and items made from raw (bulk) stocks, such as cut to lengths of conduit, electric leadwire, locking wire, etc.

(1) Symbols used in the illustrated parts list.

- - - * - - -	Designates the end of each group of attaching parts.
-	A dash before an item number indicates a nonillustrated item.
*	Indicates items not procured separately; order next higher assembly.
A	Indicates items used on 60-611 Fuel Booster Pump only.
B	Indicates items used on 60-611A Fuel Booster Pump only.

SERVICE BULLETIN LIST

SERVICE BULLETIN NO.	DATE INCORPORATED	SERVICE BULLETIN NO.	DATE INCORPORATED

INTRODUCTION

1. GENERAL

This publication is issued to provide instructions to overhaul the Fuel Booster Pump Assembly, Part Numbers 160-011 and 160-065 manufactured by Hydro-Aire Division, Crane Co., Burbank, California 91510 USA.

The information in this manual is divided into sections in accordance with Air Transport Association Specification 100, to enable maintenance personnel to disassemble, clean, inspect, check, assemble, troubleshoot and test the pump. An illustrated parts list is provided to locate, identify and requisition parts.

To ensure that coverage contained in this publication will reflect changes in the pump overhaul concepts and procedures, revised information is provided to the customer through a letter of transmittal. The letter includes highlight pages which identify changed pages.

Warnings, Cautions and Notes are used to emphasize information throughout this publication. Warnings must be followed to avoid injury or death to persons. Cautions must be followed to avoid equipment damage and Notes call attention to work simplification, or additional information.

The following special terms and/or abbreviations are used in this publication.

%	Percent	PPH	Pounds Per Hour
°F	Degrees Fahrenheit	psi	Pounds Per Square Inch
ASSY	Assembly	psig	Pounds Per Square Inch Gage
EFFECT	Effectivity	REV	Revision
FIG.	Figure	RPM	Revolutions Per Minute
gpm	Gallons Per Minute	TP	Test Procedure
Hz	Hertz	UNC	Unified National Coarse
IPL	Illustrated Parts List	UNF	Unified National Fine
mA	Milliamperes	UNJC	Controlled Radius Root Screw Thread Coarse
N/A	Not Applicable	vac	Volts Alternating Current
No.	Number	vdc	Volts Direct Current

2. FACILITIES/EQUIPMENT REQUIREMENT

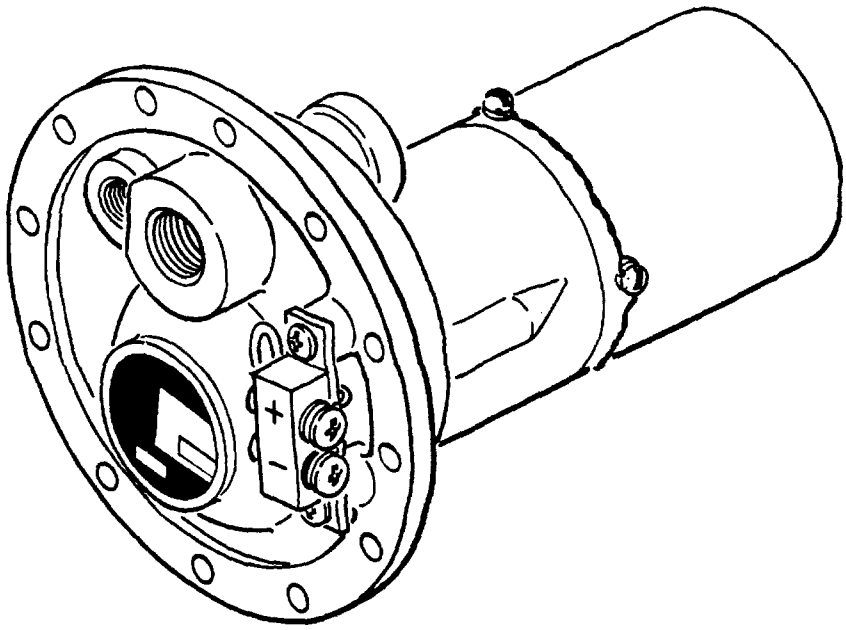
This component is critical to the certified performance of the aircraft. It is therefore equally critical that all maintenance, repair and/or overhaul activities relative to this unit be performed strictly in accordance with the provisions of this manual. Only those parts identified in the Illustrated Parts List of this manual are approved replacement parts.

All special tools and equipment must be calibrated within the intervals specified by the manufacturer, or at a maximum interval of six months. All calibration procedures and standards shall be traceable to the U.S. National Bureau of Standards, British Standards Institution or equivalent national standards.

Test fluids are to be maintained at contamination levels equivalent to those of new fluids.

All provisions of FAA Federal Air Regulations Part 43 "Maintenance, Preventive Maintenance, Rebuilding and Alterations"; Part 45 "Identification and Registration Markings"; Part 65 "Certification Airmen Other Than Flight Crew Members"; and Part 145 "Repair Stations" shall apply.

The overhaul shop work area designated for this component should be clean and environmentally controlled to prevent the accumulation of airborne dust particles or other contaminants that may interfere with the proper operation of the unit.



0. DESCRIPTION AND OPERATION

A. DESCRIPTION (See Figure 1)

The fuel booster pump is a bottom tank-mounted, gravity-fed, dc powered, ac motor-driven centrifugal pump suitable for operation with various grades of aviation fuel. The pump's major components consist of an ac motor, impeller and a dc-to-ac inverter assembly enclosed by aluminum housings. Leading particulars for the fuel booster pump are listed in Table 1.

B. OPERATION

The pump assembly contains a solid state inverter which converts 28 vdc input power into a three-phase 28 vac square wave output to supply the pump's ac induction motor with a maximum current usage of 7.5 amps. The pump's rated flow is 1.15 gpm at 22 psi using JP-4 aircraft fuel. It will boost fuel from remote fuel tanks to the aircraft engine-driven pump in a vapor-free condition. The pump employs wet-carbon bearings which serve as combination journal and thrust bearings. Pressurized fuel is routed internally for wet-carbon bearing lubrication and cooling of the ac motor and the inverter assembly.

Fuel Booster Pump - Assembled View
Figure 1

TABLE 1. LEADING PARTICULARS

Use	Aircraft Fuel System
Type	Solid state inverter supplying an ac induction motor
Operation	Continuous duty
Power Supply	7.5 amps max at 28 vdc 0.28 HP at 10,500 rpm
Nominal Rating	1.15 gpm at 22 psi
Weight	3.8 lb max with radio noise filter
Pressure at zero flow	35 psig max
Port Sizes:	
Inlet	Sump type with perforated screen
Discharge	1/2 inch per AND10053
Mounting	Bottom tank-mounted

1. DISASSEMBLY (See Figure 1101)

Do not disassemble pump more than necessary to effect repairs or replacement of defective parts.

A. Cut and discard all lockwire.

B. Disconnect leadwires at terminal block assembly (41).

C. Remove screws (4).

D. Remove flange (1) and screens (2, 3). Remove packing (5) from flange (1). Push lead wire assembly (35) from flange (1).

CAUTION: WHEN SEPARATING PUMP, TAKE CARE TO PREVENT ROTOR-SHAFT ASSEMBLY (20) FROM SCORING INSIDE OF STATOR ASSEMBLY (21).

E. Separate volute housing (6) from end bell assembly (17) and rotor-shaft assembly (20).

CAUTION: REMOVE IMPELLER (8) CAREFULLY TO AVOID DAMAGE.

F. Remove and discard nut (9) securing impeller (8) to rotor-shaft assembly (20). Remove impeller (8).

G. Remove spring pin (10) from rotor-shaft assembly (20).

H. Separate end bell assembly (17) from motor housing assembly (25).

I. Separate shims (11, 12, 13, 14), thrust washer (15), end bell assembly (17) and rotor-shaft assembly (20).

J. Remove thrust washer (24) and shims (14A, 14B, 14C) from rotor-shaft assembly (20). If necessary, remove spring pin (22).

K. Do not remove thrust bearing (18) from motor end bell (19), unless necessary for replacement.

NOTE: Thrust bearing (18), stator assembly (21) and bearing (26) are a shrink fit in motor end bell (19) and motor housing (27). Motor end bell and/or motor housing must be heated to 370 $\pm$15°F if stator assembly or bearings are to be replaced.

L. Remove screws (29) and cover (28).

M. Remove screws (32) and washers (33), or screws (32A) and spacers (33A), securing inverter assembly (30 or 30A) and radio noise filter (31) to motor housing assembly (25).

N. Disconnect radio noise filter (31) and stator assembly (21) leadwires from inverter assembly (30) leadwires by uncrimping end caps (-34).

O. Remove inverter assembly (30 or 30A).

NOTE: Inverter assembly is not field repairable. Replace as an assembly and return defective inverter to vendor.

P. Cut leadwires of radio noise filter (31) as close as possible to potting compound at leadwire assembly (35). Remove radio noise filter (31).

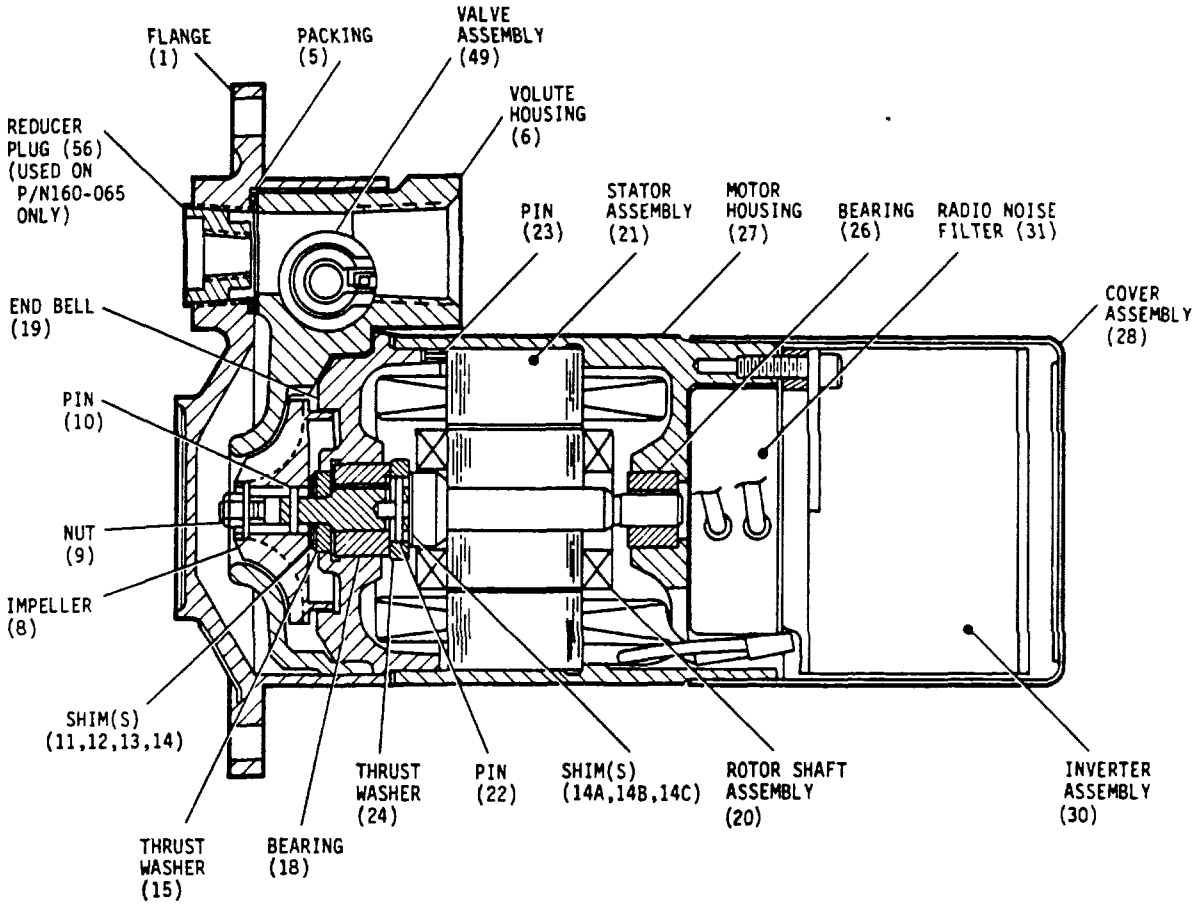
Q. Remove leadwire assembly (35) and conduit tube (36) from flange (1). Remove packing (37) from leadwire assembly (35).

R. Remove terminals (39, 40) from leadwire assembly (35).

S. Do not remove stator assembly (21) and bearing (26) from motor housing (27), unless necessary for replacement.

T. Remove spring pin (23) from stator assembly (21).

U. Remove screws (42), washers (43) and terminal block (41) from flange (1).



V. Remove pin (50) securing valve assembly (49) to volute housing (6).

W. Remove packing (55) from valve assembly (49).

X. Disassemble valve assembly (49) by removing pin (51), spring (52) and flapper assembly (53) from valve body (54).

Y. On 160-065 pumps, remove reducer plug (56).

-Index number not shown on Figure 1101.

NOTE: NUMBERS IN PARENTHESES ARE FIGURE 1101 INDEX NUMBERS.

Fuel Booster Pump - Cutaway View
Figure 101

2. CLEANING

The materials required for cleaning are listed in Table 201.

A. VAPOR DEGREASING PROCEDURES

This cleaning method is to be used prior to ultrasonic procedures when grease marks, metal chips, fingerprints, corrosion products, lubricants and other contaminants are evident at time of disassembly.

CAUTION: DO NOT CLEAN ELECTRICAL PARTS USING THIS PROCEDURE OR DAMAGE TO PARTS MAY OCCUR.

(1) Place parts to be cleaned in wire baskets or equivalent. Lower parts into solvent, within solvent container.

NOTE: Immerse parts in solvent and agitate for 30 seconds, or long enough to ensure cleanliness.

(2) Raise parts above solvent into the condensing zone and flush for 1 minute or more in vapors.

WARNING: WHEN USING COMPRESSED AIR, DIRECT AIRSTREAM AWAY FROM BODY AND OTHER PERSONNEL.

(3) Raise parts above cleaning container and allow to dry. Using clean filtered air (20 psi), apply pressurized air to parts to quicken drying.

NOTE: If use of compressed air is impractical, dry by wiping with a clean, lint-free cloth.

(4) Remove parts from basket with padded tongs, lint-free gloves, or equivalent.

(5) Check parts for cleanliness.

B. ULTRASONIC CLEANING PROCEDURES

(1) Place parts in wire racks or equivalent and submerge in cleaning solution within ultrasonic cleaning unit.

(2) Keep parts submerged between 5 to 10 minutes.

WARNING: WHEN USING COMPRESSED AIR, DIRECT AIRSTREAM AWAY FROM BODY AND OTHER PERSONNEL.

(3) Remove parts from ultrasonic cleaning unit and thoroughly dry, using clean, dry, compressed air at 20 psi.

NOTE: If the use of compressed air is impractical, dry by wiping with a clean, lint-free cloth.

(4) Check parts for cleanliness.

NOTE: If inspection/check is not to be performed immediately after cleaning, protect parts from damage or contamination. Place parts in a clean polyethylene container. Seal container and store in clean, dry area until inspection/check is to be performed.

C. Wipe electrical parts with a clean, lint-free cloth. Use a soft, bristle brush to clean hard-to-reach areas. Remove tarnish from pins of electrical connectors with a soft, rubber eraser.

TABLE 201. CLEANING MATERIALS

Material	Part Number	Specification
Solvents:		
Trichloroethylene	None	O-T-634B (Technical Grade)
Perchloroethylene (Tetrachloroethylene)	None	O-T-236B
Isopropyl Alcohol	None	Commercial

3. INSPECTION/CHECK

General inspection procedures are outlined in Paragraph A. Inspection procedures for the rotor-shaft assembly and inverter assembly are outlined in Paragraphs B and C.

A. GENERAL INSPECTION/CHECK

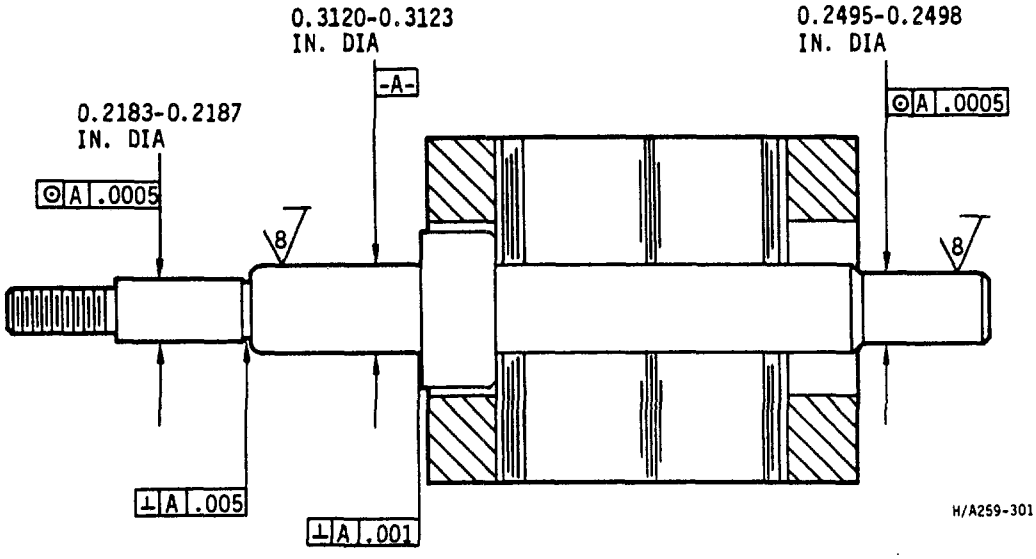
(1) Check all parts under strong light for cracks, nicks, distortion and other damage. Make sure all passages are clean and unobstructed, threads undamaged and sealing areas free from scratches, pits, nicks, excessive wear, corrosion and other damage.

NOTE: Excessive wear is defined as any obvious deformation or deterioration of parts which may render the pump inoperative. If doubt exists concerning condition of a part, replace part.

(2) Check plated areas for evidence of leakage, blisters, pits and other damage.

(3) Check threaded areas for stripped, crossed or otherwise damaged threads. Refer to Table 401.

B. ROTOR-SHAFT ASSEMBLY



(1) Check bearing journals for deep wear pattern. Dimensionally check shaft as shown in Figure 501.

(2) Check shaft for damage and condition of rotor varnish coating.

NOTE: If shaft has rub marks of more than 0.010 inch in depth, replace rotor-shaft assembly.

(3) Check condition of varnish on lamination assembly. Check lamination assembly for deep scoring, nicks, pits or other damage.

NOTE: Varnish on lamination assembly may be repaired as outlined in Section 4, Repair.

Rotor-Shaft Assembly Dimensional Requirements
Figure 301

C. INVERTER ASSEMBLY P/N 52-485-183 (Ref TP 52-485-183, REV B)

Test inverter assembly for proper function, as follows:

CAUTION: INVERTER ASSEMBLY IS NOT FIELD REPAIRABLE AND NO ATTEMPT AT REPAIRS SHOULD BE MADE. RETURN DEFECTIVE UNIT TO VENDOR.

1.0 TEST EQUIPMENT AND REQUIREMENTS

1.1 Dual Trace Oscilloscope, Tektronix Model 561A (V80009).

1.2 Frequency Counter, HP Model 5223L (V28480).

1.3 DC Power Supply, Harrison Model 6289A, 28 VDC, 1.5A (V83572).

1.4 99-599 Inverter Tester (V81982).

1.5 All tests shall be performed in an ambient temperature of 72 ±12 degrees Fahrenheit.

1.6 DC Ammeter, Weston Model 901 (V65092).

1.7 DC Power Supply, NJE Model CR36-30 (V98380).

1.8 Motor Load, Hydro-Aire SE 1370 (V81982).

NOTE: Refer to Table 1101 for vendor name and address.

1.9 The preceding test equipment shall be used to perform the tests required by this procedure. Equivalent equipment may be substituted. Test equipment shall be tested and calibrated periodically and shall be current in regard to calibration.

2.0 PROCEDURE

2.1 Initial Test

2.1.1 Connect the DC supply to the DC supply terminals on the 99-599 tester. Set the tester power and load switches to OFF. Connect the inverter ground (white) lead wire to the white terminal and the inverter 28V pwr (orange) lead wire to the orange terminal. Connect the inverter phase wires to the 99-599 tester phase terminals (black to black, red to red and green to green). Set the power supply to ON and adjust to 28 ±0.1 volt. Set the 99-599 power switch to ON.

NOTE: All measurements shall be made with test equipment ground connected to the 99-599 ground (black) terminals.

2.1.2 Select the power supply meter to current. The meter shall indicate less than 0.5 amps.

2.2 Frequency Test

2.2.1 Connect the frequency counter to the black wire (black phase). Allow a minute for the converter to stabilize. The frequency counter shall indicate 183 ±3 Hz.

2.2.2 Set the power supply voltage to 16 ±0.1 volts. The frequency counter shall indicate 140 ±5 Hz.

2.3 Phasing and Magnitude

2.3.1 Set power supply voltage to 28 ±0.1V. Set the tester load switch to ON. Set the oscilloscope to chop mode. Connect channel 1 of the oscilloscope to the black phase and channel 2 to the red phase. Adjust the triggering to stabilize the waveform. The waveform shall resemble Figure 302, Pattern A, with a voltage minimum between +.5 and +1.5 volts and a maximum of 26 ±2 volts.

2.3.2 Connect channel 2 of the oscillscope to the green phase. Adjust the triggering to stabilize the waveform. The waveform shall resemble Figure 302, Pattern B, with a voltage minimum of between +.5 and +1.5 volts and a maximum of 26 ±2 volts.

2.4 Load Motor Test

2.4.1 Connect the NJE Model CR36-30 DC power supply to a 115 VAC source.

2.4.2 Set the AC and DC power switches to ON.

2.4.3 Connect a DVM set to DC volts to the power supply output terminals and set the output to 28.0 ±0.1 VDC.

2.4.4 Set the DC power switch to OFF. Connect the INVERTER to the motor load. See Figure 303 for the test setup.

CAUTION: DO NOT SET DC POWER SUPPLY SWITCH TO ON POSITION FOR MORE THAN 5.0 SECONDS. DAMAGE MIGHT OCCUR IN THE INVERTER DUE TO HEAT DISSIPATION ON THE INVERTER UNDER TEST.

2.4.5 Set the DC power supply DC power switch to ON for a maximum of 5.0 seconds only, then return the switch to OFF. The current meter shall indicate 7.5 amperes maximum after the unit has stabilized.

D. INVERTER ASSEMBLY P/N 52-527-183 (Ref TP 52-527-183, N/C)

Test inverter assembly for proper function, as follows:

CAUTION: INVERTER ASSEMBLY IS NOT FIELD REPAIRABLE AND NO ATTEMPT AT REPAIRS SHOULD BE MADE. RETURN DEFECTIVE UNIT TO VENDOR.

TEST EQUIPMENT

The following test equipment shall be used to perform the tests required by this procedure. Equivalent equipment may be substituted. Test equipment shall be tested and calibrated periodically and shall be current in regard to calibration.

Item	Manufacturer & Model No.
1. Dual Trace Oscilloscope	Tektronix Model 561A (V80009).
2. Frequency Counter	HP Model 5223L (V28480).
3. DC Power Supply, 28 VDC, 1.5A	Harrison Model 6289 (V83572).
4. Inverter Tester	Hydro-Aire 99-599 (V81982).
5. DC Ammeter	Weston Model 901 (V65092).
6. DC Power Supply	NJE Model CR36-30 (V98380).
7. Motor Load	Hydro-Aire T-62950 (V81982) (2 pole motor).

NOTE: Refer to Table 1101 for vendor name and address.

1.0 PROCEDURE

1.1 Initial Test

1.1.1 Connect the DC supply to the DC supply terminals on the 99-599 tester. Set the tester POWER and LOAD switches to OFF. Connect the inverter ground (white) lead wire to the white terminal and the inverter 28V Pwr (orange) lead wire to the orange terminal. Connect the inverter phase connections to the 99-599 tester phase terminals (black to black, red to red and green to green). Set the power supply to ON and adjust to 28.75 $\pm$0.1 volts. Set the 99-599 POWER switch to on.

NOTE: All measurements shall be made with test equipment ground connected to the 99-599 ground (black) terminals.

1.1.2 Select the POWER SUPPLY meter to CURRENT. The meter shall indicate less than 0.5 amps.

1.2 Frequency Test

1.2.1 Connect the frequency counter to the black phase. Allow a minute for the converter to stabilize. The frequency counter shall indicate 183 ±4 (179 - 187) Hz.

1.2.2 Set the power supply voltage to 14.0 +0.1 volts. The frequency counter shall indicate 140 ±8 (132 - 148) Hz.

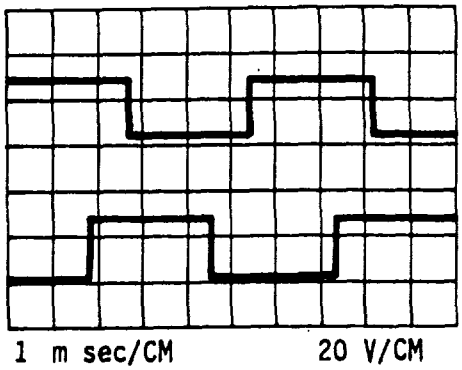
1.3 Phasing and Magnitude

1.3.1 Set power supply voltage to 25.5 ±0.1 (25.4 - 25.6) volts. Set the tester LOAD switch to ON. Set the oscilloscope to chop mode. Connect channel 1 of the oscilloscope to the black phase and channel 2 to the red phase. Adjust the triggering to stabilize the waveform. The waveform shall resemble Figure 302, Pattern A, with a minimum of 0.5 ±1.0 (-0.5 - 1.5) volts and a maximum of 24 ±2 (22 - 26) volts.

1.3.2 Connect channel 2 of the oscilloscope to the green phase. Adjust the triggering to stabilize the waveform. The waveform shall resemble Figure 302, Pattern B, with a minimum of 0.5 ±1.0 (-0.5 - 1.5) volts and a maximum of 24 ±2 (22 - 26) volts.

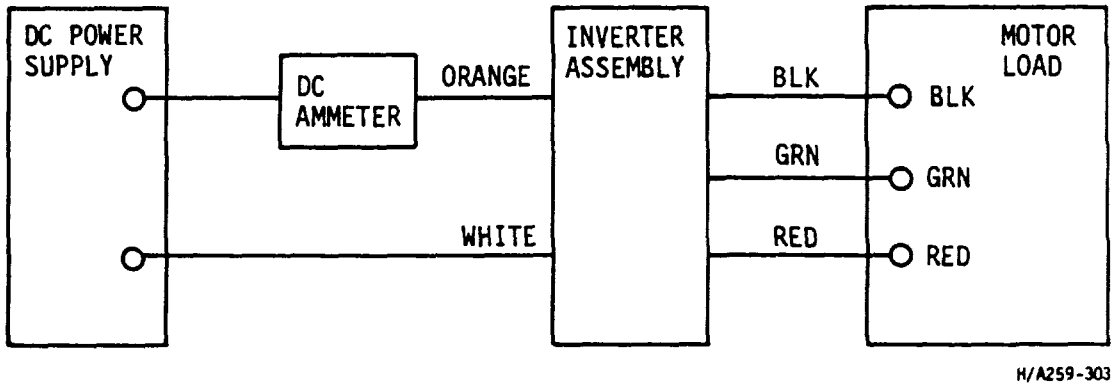
1.4 Load Motor Test

1.4.1 Connect the NJE Model CR36-30 DC power supply to a 115 VAC source.



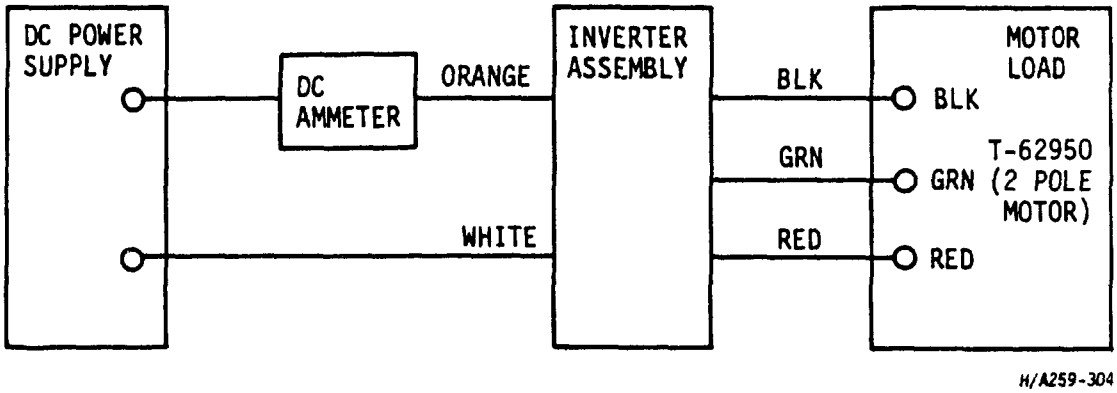
1.4.2 Set the AC and DC power switches to ON.

1.4.3 Connect a DVM set to DC volts to the power supply output terminals and set the output to 25.5 ±0.1 (25.4 - 25.6) volts.



1.4.4 Set the DC POWER switch to OFF. Connect the inverter to the motor load. See Figure 304 for the test setup.

CAUTION: DO NOT SET DC POWER SUPPLY DC POWER SWITCH TO ON POSITION FOR MORE THAN 5.0 SECONDS. DAMAGE MIGHT OCCUR IN THE INVERTER DUE TO HEAT DISSIPATION ON THE INVERTER UNDER TEST.



1.4.5 Set the DC power supply DC POWER switch to ON for a maximum of 5.0 seconds only, then return the switch to OFF. The current meter shall indicate 13.0 amperes maximum after the unit has stabilized.

4. REPAIR

General repair procedures are outlined in Paragraph A. Repair procedures for the rotor-shaft assembly are outlined in Paragraph B. The materials required for repair are listed in Table 403. The vendor codes shown in this table, along with their names and addresses, are listed numerically in Table 1101.

A. GENERAL REPAIR

(1) Replace following parts at each overhaul.

All packings

Screws (4, 32 or 32A, 42)

Washers (33, 43)

Spacers (33A) (if applicable)

Nut (9)

(2) Polish out minor nicks and scratches on noncritical steel surfaces with abrasive cloth. Polish out minor nicks and scratches on aluminum parts with abrasive aluminum oxide cloth, provided that critical mating surfaces are not damaged.

NOTE: Do not make repairs on impeller. If surface is damaged, replace part.

NOTE: Ultrasonic clean repaired parts as described in Section 2, Cleaning.

(3) Use thread chaser or tap to repair stripped threads (2 threads maximum). Refer to Table 401.

TABLE 401. THREAD CHART

IPL Fig. and Item Number	Attachment Point Location	Tap and Die Size
1101 1	Screw (4, IPL 1101)	.190-32 UNF-2B (MIL-S-7742)
	Screw (42, IPL 1100)	.164-32 UNC-2B (MIL-S-7742)
	Reducer Plug (56, IPL 1101)	1/2 ANPT (MIL-P-7105)
1101 20	Nut (9, IPL 1101)	.1640-32 UNJC-3A (MIL-S-8879)
1101 56	Flange (1, IPL 1101)	1/8 ANPT (MIL-P-7105)

(4) Touch up worn or reworked anodized surfaces on aluminum parts by applying an alodine coating as follows:

(a) Remove soiled and oxide film by swabbing surface with acid solvent cleaner (1 volume Deoxidine 624 to 3 volumes water mixed at room temperature) allowing a 1 to 3 minute solution contact time. Keep entire rework surface wet.

(b) Rinse by swabbing with clean wipers or sponges soaked in water. Repeat at least twice, wringing out wipers or sponges after each rinse.

(c) Mix a solution of one and one-half parts alodine to one part water. Apply to area to be alodined liberally and evenly with a cotton swab, soft nylon brush or clean lint-free cloth.

WARNING: DO NOT ALLOW SPONGE, CLOTH, OR SWAB APPLICATORS USED TO APPLY ALODINE SOLUTION TO DRY OUT. WHEN DRY, EACH CONSTITUTES AN EXTREME FIRE HAZARD. RINSE THOROUGHLY IN WATER WHEN ALODINE APPLICATION IS COMPLETE.

NOTE: Do not alodine below 60°F.

(d) Swab off and rinse with cellulose sponge or clean, soft cloth saturated with clean water. Use blotting motion or very gentle swabbing to prevent damage to fresh alodine film. Wring out sponge or cloth and repeat rinsing at least twice, blotting any pools of water.

WARNING: WHEN USING COMPRESSED AIR, DIRECT AIRSTREAM AWAY FROM BODY AND OTHER PERSONNEL.

(e) Air dry thoroughly with plant air filtered to remove oil, water and solid particles, and not exceeding a temperature of 160°F.

NOTE: Do not touch new alodine surface until dry, as fresh alodine films are easily damaged. Refer to Table 402 for alodine drying times.

TABLE 402. ALODINE DRYING TIME

Ambient Temperature (°F)	105	100	95	90	85	80	75	70	65	60
Alodine Coating (minutes)	2	2.25	2.5	2.8	3.4	4.0	4.6	5.5	7	10

B. ROTOR-SHAFT ASSEMBLY (See Figure 301)

(1) Repair varnish on lamination assembly as follows:

(a) Remove old varnish by cleaning surface to be varnished with MEK (Methyl-ethyl-ketone) or acetone.

(b) Preheat rotor-shaft assembly at 350°F for 2 hours.

(c) Allow rotor-shaft assembly to cool to 200°F.

(d) Thin varnish 6001 with thinner 6001T to a suitable viscosity for spraying, then apply a light spray coat of varnish 6001.

(e) Place rotor-shaft assembly in a vertical position and bake at 250°F for 2 hours, then at 300°F for 3 hours.

TABLE 403. REPAIR MATERIALS

Material	Part Number	Vendor/ Specification
Acid-Solvent Cleaner	Deoxidine 624	V84063
Alodine Coating	Alodine 1000L (Liquid Concentrate)	V84063
Abrasive Aluminum Oxide Cloth	600 to 800 Grit	P-C-451
Abrasive Cloth	None	P-C-458
MEK (Methyl-Ethyl-Ketone)		TT-M-261
Thinner	6001T	V11147
Varnish	6001	V11147

Refer to Table 1101 for vendor name and address.

5. ASSEMBLY

Materials required for assembly are listed in Table 501. The vendor codes shown in this table, along with their names and addresses, are numerically listed in Table 1101.

A. Heat motor end bell (19) and motor housing (27) to 370 ±15°F.

CAUTION: MAKE SURE BEARINGS BOTTOM FIRMLY AGAINST SHOULDERS OF THEIR RESPECTIVE HOUSINGS. THRUST BEARING (18) MUST BE INSTALLED SO THAT THREE INTERRUPTED FACE GROOVES ARE FACING AWAY FROM SHOULDER OF MOTOR END BELL (19).

B. Apply a thin coat of R393 cement to OD of bearing (18, 26). Shrink fit thrust bearing (18) in motor end bell (19) and bearing (26) in motor housing (27).

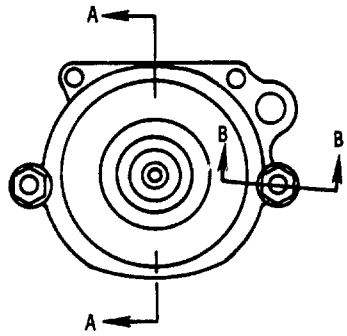
CAUTION: MAKE SURE STATOR ASSEMBLY (21) SEATS FIRMLY AGAINST SHOULDER IN MOTOR HOUSING (27).

C. Shrink fit stator assembly (21) in motor housing (27) with leadwires toward ribbed end of housing and positioned approximately as shown in Figure 501.

D. Install spring pin (23) in stator assembly (21).

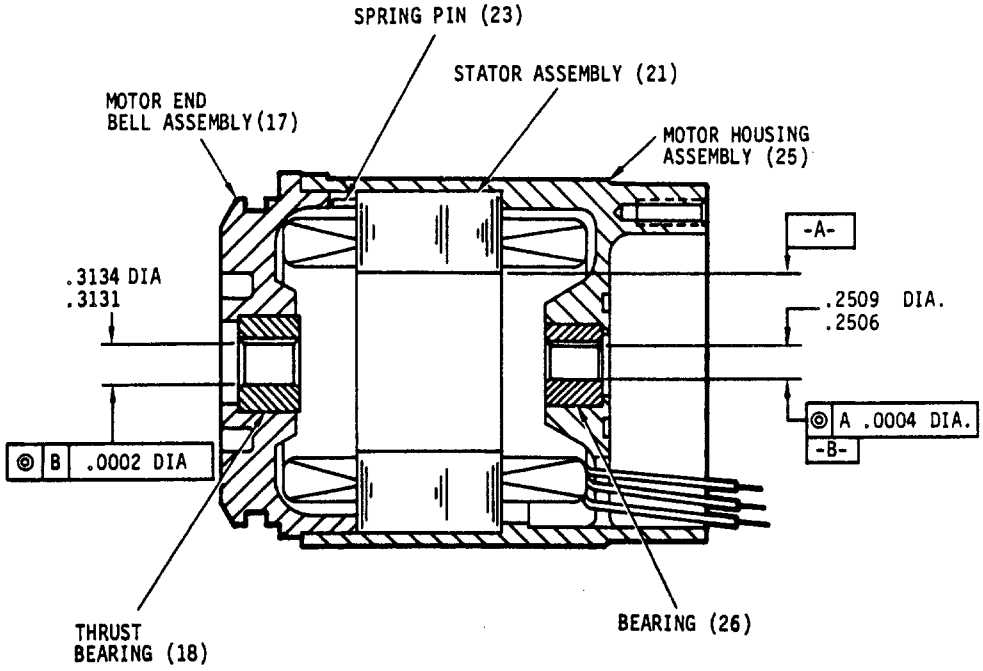
E. Lock motor housing assembly (25) and end bell assembly (17) together using two MS35207-264 screws, MS15795-742 washers and 0.190-32 nuts as shown in Figure 501.

WARNING: WHEN USING COMPRESSED AIR, DIRECT AIRSTREAM AWAY FROM BODY AND OTHER PERSONNEL.



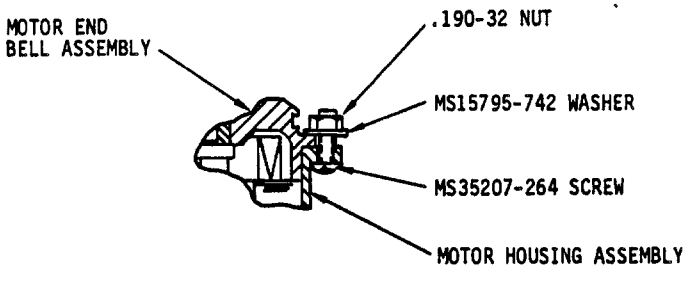
F. Line-ream bearings (18, 26) in line to dimensions shown in Figure 501. Blow out carbon dust with compressed air at 20 psi.

NOTE: Finish of bores shall be 32 microinches rms or better.



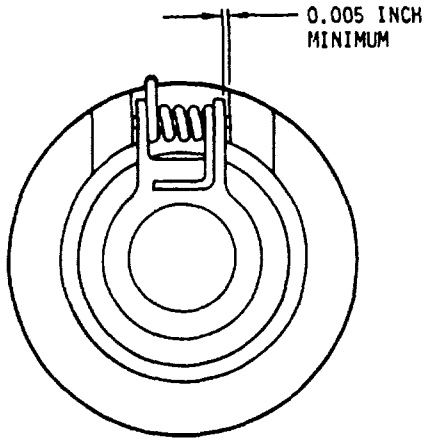
G. Remove screws, washers and nuts and separate motor housing assembly (25) and end bell assembly (17).

H. Assemble valve assembly (49) by connecting flapper assembly (53), spring (52) and pin (51) to valve body (54). Stake pin both sides of pin (51) to prevent pin from sliding.



NOTE: Check for 0.005 inch minimum end play at hinge ears of flapper assembly (53), see Figure 502.

MOTOR HOUSING ASSEMBLY AND END BELL ASSEMBLY



VIEW A-A

VIEW B-B

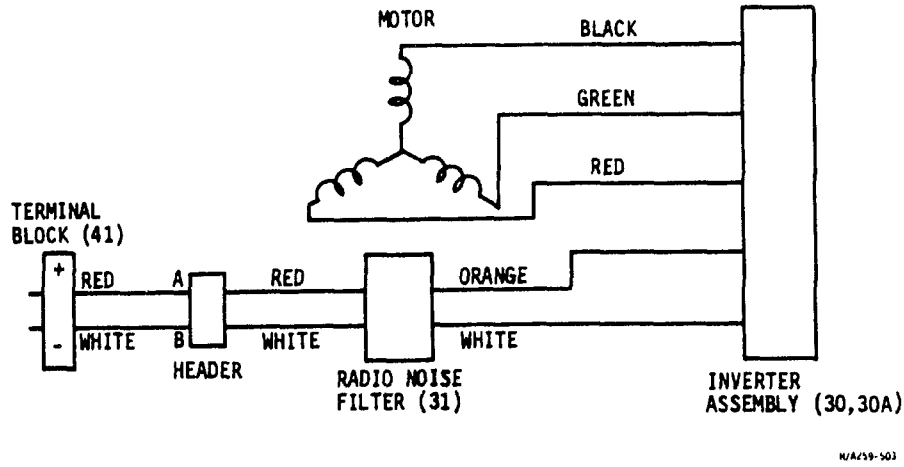
Bearing Machining Dimensions
Figure 501

H/A259-501

Valve Assembly Clearance Requirement
Figure 502

I. Install packing (55) on valve assembly (49). Install valve assembly (49) in volute housing (6) and secure with spring pin (50).

J. Thread shielded leadwires of radio noise filter (31) through motor housing assembly (25). Temporarily attach radio noise filter (31) to motor housing assembly (25) with screws (32 or 32A).



K. Trim leadwires of radio noise filter (31) to length required. Strip metal braid one inch from trimmed ends of leadwires. Etch tips.

L. Slide conduit tube (36) and T-61113 potting boot over radio noise filter (31) leadwires. Strip insulation 3/8 inch, tin wires and solder to header assembly of leadwire assembly (35) (red wire to pin A; white wire to pin B) per MIL-STD-454, requirement 5. (See Figure 503 for wiring diagram.)

M. Slide potting boot T-61113 on plug of leadwire assembly (35) and snap bead into packing groove. Encapsulate leadwire assembly (35) connection with 220 potting compound and 951 hardener per manufacturer's instructions. Cure for a minimum of 4 hours, then remove potting boot and discard.

N. Install required number of shims (14A thru 14C) on rotor-shaft assembly (20) to provide 0.0010 to 0.0020 inch end play.

O. Install spring pins (10, 22) and thrust washer (24) on shaft of rotor-shaft assembly (20).

Wiring Diagram
Figure 503

P. Obtain a 0.003 to 0.008 inch impeller clearance as follows.

(1) Install end bell assembly (17) over rotor-shaft assembly (20). Place thrust washer (15) and impeller (8) on rotor-shaft assembly (20). Secure with nut (9) and torque 7 to 10 inch-pounds.

(2) Install rotor-shaft/end bell assembly into a suitable holding fixture to hold thrust bearing (18) firmly against thrust washer (24).

(3) Set volute housing (6) over impeller (8) and end bell assembly (17).

(4) Using a depth micrometer, measure distance between top of volute housing (6) to top of impeller (8) as shown in Figure 504. Record as dimension A.

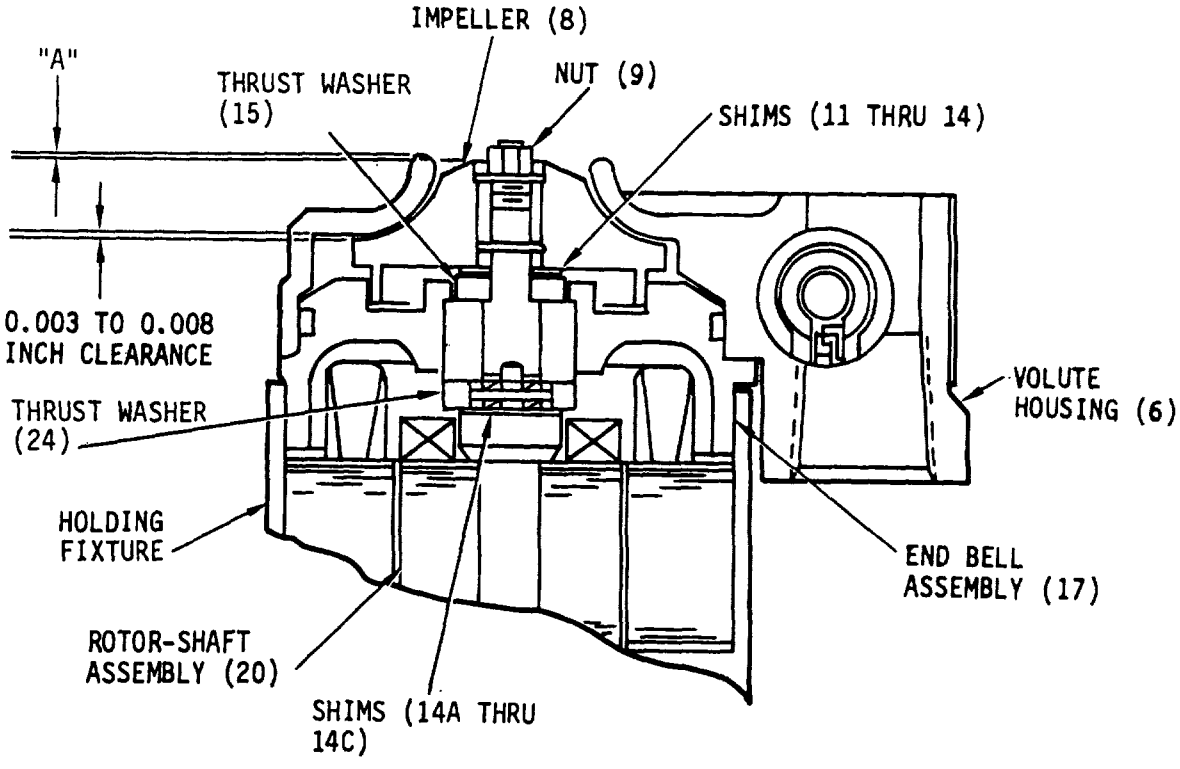
(5) Remove assembly from fixture and remove volute housing (6), nut (9) and impeller (8).

(6) Install 0.050 inch thickness of shims (11 thru 14) on rotor-shaft assembly (20).

(7) Reinstall impeller (8) and secure with nut (9). Torque nut 7 to 10 inch-pounds.

(8) Reinstall volute housing (6).

NOTE: There should be solid contact between impeller (8) and volute housing (6).



(9) Remeasure distance between top of volute housing (6) and top of impeller (8). Record as dimension B.

(10) Calculate required shim thickness. For example:

Dimension A (no shims installed)	0.206 inch
Dimension B (0.050 thickness shims installed)	-0.168 inch
	0.038 inch
Desired impeller clearance (0.003 to 0.008 inch)	-0.005 inch
Required shim thickness =	0.033 inch

(11) Remove volute housing (6), nut (9) and impeller (8).

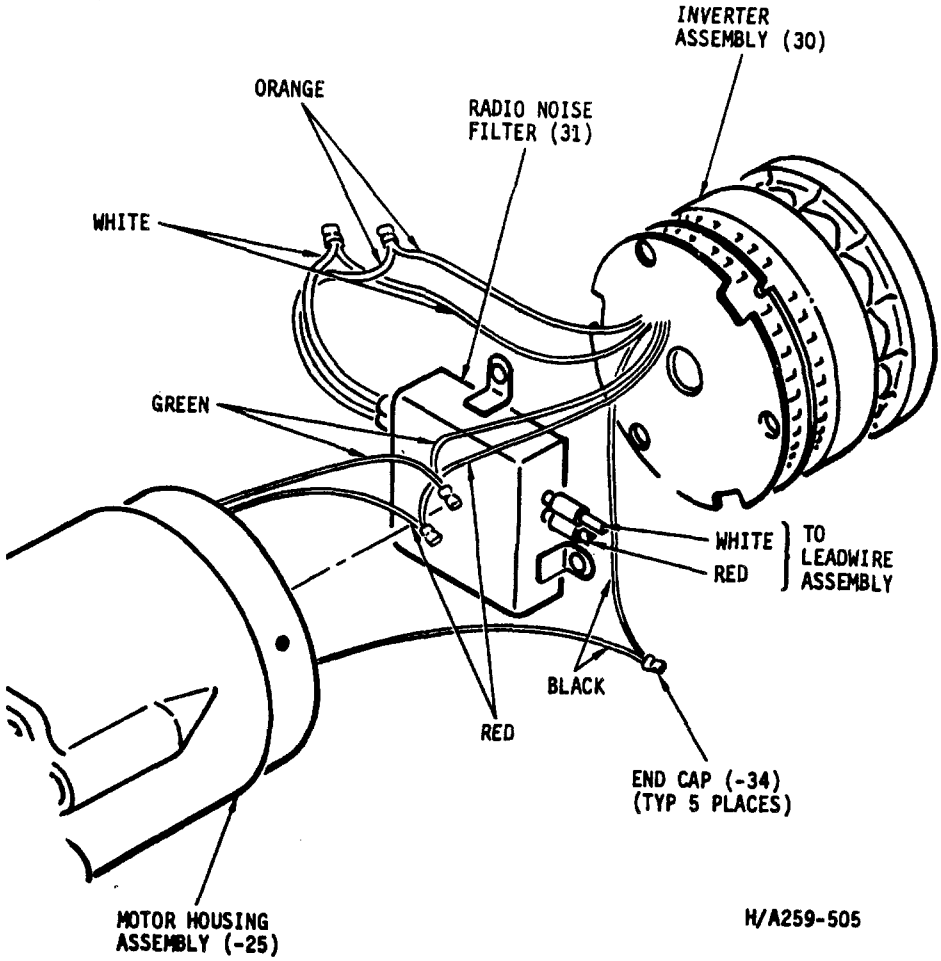
(12) Install required number of shims (11 thru 14) on rotor-shaft assembly (20).

N/A259-504

Impeller Clearance Requirement
Figure 504

(13) Reinstall impeller (8) and secure with nut (9). Torque nut 7 to 10 inch-pounds.

(14) Reinstall volute housing (6) over end bell assembly (17). Turn assembly upside down and spin rotor-shaft assembly (20) to verify that impeller (8) rotates freely.



Q. Temporarily place assembly on flange (1).

R. Remove screws (32 or 32A) temporarily used to attach radio noise filter (31) to motor housing assembly (25). (Refer to Step J.)

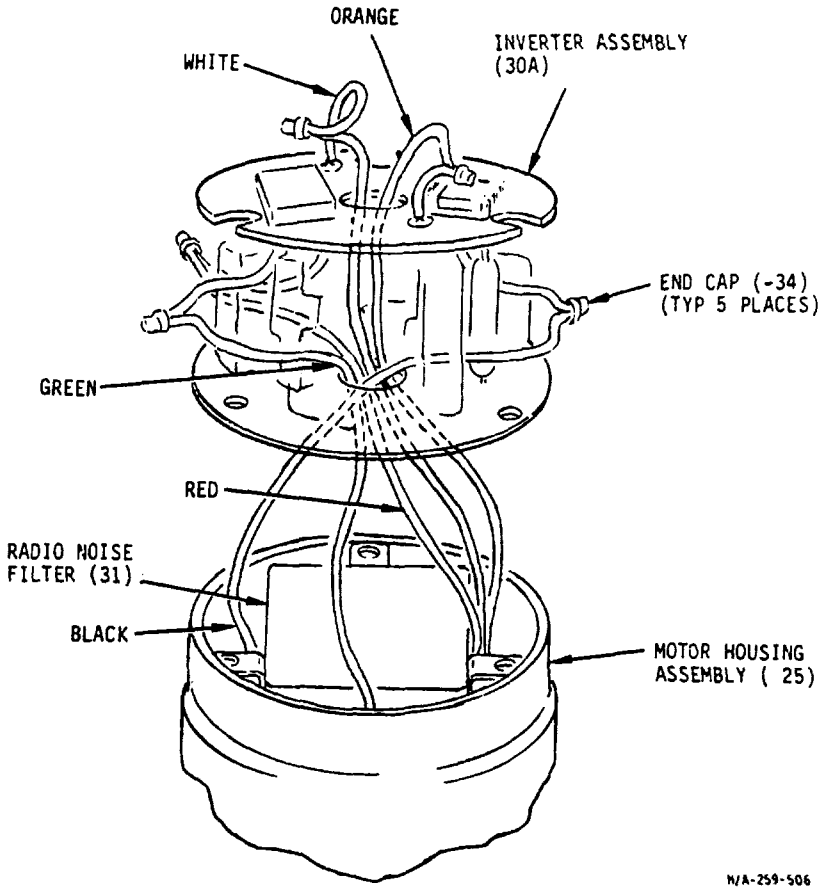
S. Replace radio noise filter (31) on motor housing assembly (25).

T. Wire and secure inverter assembly (30) (52-485-183), radio noise filter (31) and stator assembly (23) as follows:

(1) Distribute and match leadwires according to colors as shown in Figure 505.

Inverter-Radio Noise Filter-Stator Wiring Connection for Inverter Assembly 52-485-183
Figure 505

(2) Trim leads to approximately 2 inches measured straight out from motor housing assembly (25).



(3) Strip ends, twist together and crimp-fit end caps (-34) over each connection.

(4) Carefully twist, fold and tuck wires into cavities on underside of inverter assembly (30), taking care wires are not pinched when inverter is installed in position.

(5) Secure radio noise filter (31) and inverter (30) with screws (32) and washers (33). Torque screws (32) 7 to 10 inch-pounds.

U. Wire and secure inverter assembly (30A) (52-527-183), radio noise filter (31) and stator assembly (23) as follows:

(1) Distribute and match leadwires according to colors as shown in Figure 506.

Inverter-Radio Noise Filter-Stator Wiring Connection for
Inverter Assembly 52-527-183
Figure 506

(2) Trim leads to approximately 4 inches measured straight out from motor housing assembly (25).

(3) Strip ends, twist together and crimp-fit end caps (-34) over each connection.

(4) Carefully twist, fold and tuck wires into cavities of inverter assembly, taking care wires are not pinched when inverter is installed in position.

(5) Secure radio noise filter and inverter with screws (32A) and spacers (33A). Torque screws 7 to 10 inch-pounds.

V. Install cover (28) and secure with screws (29). Torque screws (29) 7 to 10 inch-pounds.

W. Lubricate and install packing (37) on leadwire assembly (35). Pull leadwires through passage toward filter end until potted end seats in conduit tube (36). Position conduit tube (36) in motor housing assembly (25).

X. Lubricate and install packing (5) on flange (1). Install screens (2, 3) on flange (1) and secure with screws (4). Torque screws (4) 18 to 22 inch-pounds.

Y. Trim leadwires of leadwire assembly (35) to 2 1/2 inch lengths. Crimp terminal (39) on white leadwire and terminal (40) on red leadwire.

Z. Install terminal block (41) on flange (1) and secure with screws (42) and washers (43). Torque screws (42) 7 to 10 inch-pounds.

AA. Connect terminal block (41) leadwires per wiring diagram, Figure 503. Bend terminals away from terminal block.

AB. If removed, bond identification plate (58) and thread tape decal (57) to flange (1) using 847 adhesive.

AC. After completion of testing, complete final assembly as follows:

(1) Safetywire and seal screws (4, 29, 42) with MS20995C20 lockwire per MS33540.

(2) Install sleeving S28A105-C over lockwire at terminal block (41) to prevent possibility of electrical short.

(3) Push leadwire assembly (35) inward and fill gap around flange (1) with PR1535 potting compound.

(4) On 160-065 fuel booster pump, apply R/C75 loctite on threads of reducer plug (56). Install reducer plug (56) in flange (1) and torque 90 to 100 inch-pounds.

(5) If alternate part number packings are installed, bond rubber curing date tag (59) to flange (1) using 847 adhesive.

TABLE 501. ASSEMBLY MATERIALS

Material	Part No.	Vendor/ Specification
Adhesive	847	V04963
Cement	R393	V05866
Hardener	951	V99384
Loctite	R/C75	V05972
Lockwire	MS20995C20	---
Potting Compound	PR1535	V83574
Potting Compound	220	V99384
Sleeving	S28A105-C	---
Solder	Sn63WRAP2	QQ-S-571
Tetra Etch	Etch	V07080

6. FITS AND CLEARANCES

Fits and clearances required for assembly of the fuel booster pump are a 0.003 to 0.008 inch clearance between the end bell assembly and impeller as shown in Figure 504, and a 0.0010 to 0.0020 inch rotor-shaft end play.

7. TESTING

A. TEST PROCEDURE (TP 160-011, Rev H)

1.0 TEST EQUIPMENT

The following test equipment shall be used to perform the tests required by this procedure. Equivalent test equipment may be substituted. Test equipment shall be tested and calibrated periodically and shall be current in regard to calibration.

Item	Manufacturer and Model No.
Voltmeter 0-30 VDC	Weston 931 (V65092)
Ammeter 0-10 amps DC	Weston 931 (V65092)
Pressure Gage 0-50 psig	Dresser 1801-T (V38056)
Flowmeter 0.7 - 5.7 gpm	Fisher & Porter 10A0735YP (V22375)
Reservoir 4 gal	Adel 622707 (V81833)
Pressure Regulator 0-100 psig	Union Carbide Purox GGA-540 (V21134)
Regulator Vent/Relief Open at 31 psig	---
Power Supply 0-30 volts at 8.5A and 30A peak in-rush	Sweinhart (V98965)
Tachometer 6,000 to 24,000 ±100 RPM	3215 Frahm (V87405)
Temperature Indicator 0-200°F	Dillon (V17879)

2.0 TEST CONDITIONS

Test fluid shall be P-D-680 (Type I) at a temperature of 80 ±10°F.

CAUTION: ENSURE THAT NO DUST, DIRT, OR FOREIGN MATERIALS ENTER PORTS OR CONNECTORS DURING TESTING.

3.0 EXTERNAL LEAKAGE TEST

3.1 Mount the pump per the schematic on Figure 701.

3.2 Apply fifteen (15) psi air pressure to the reservoir for 5 minutes and observe for any leakage.

3.3 There shall be no leakage from the pump tank drain, pump flange gasket, seal ring or any other external part.

4.0 CALIBRATION AT RATED VOLTAGE

4.1 Mount the pump per Figure 401, with a minimum fuel head of 10.0 inches.

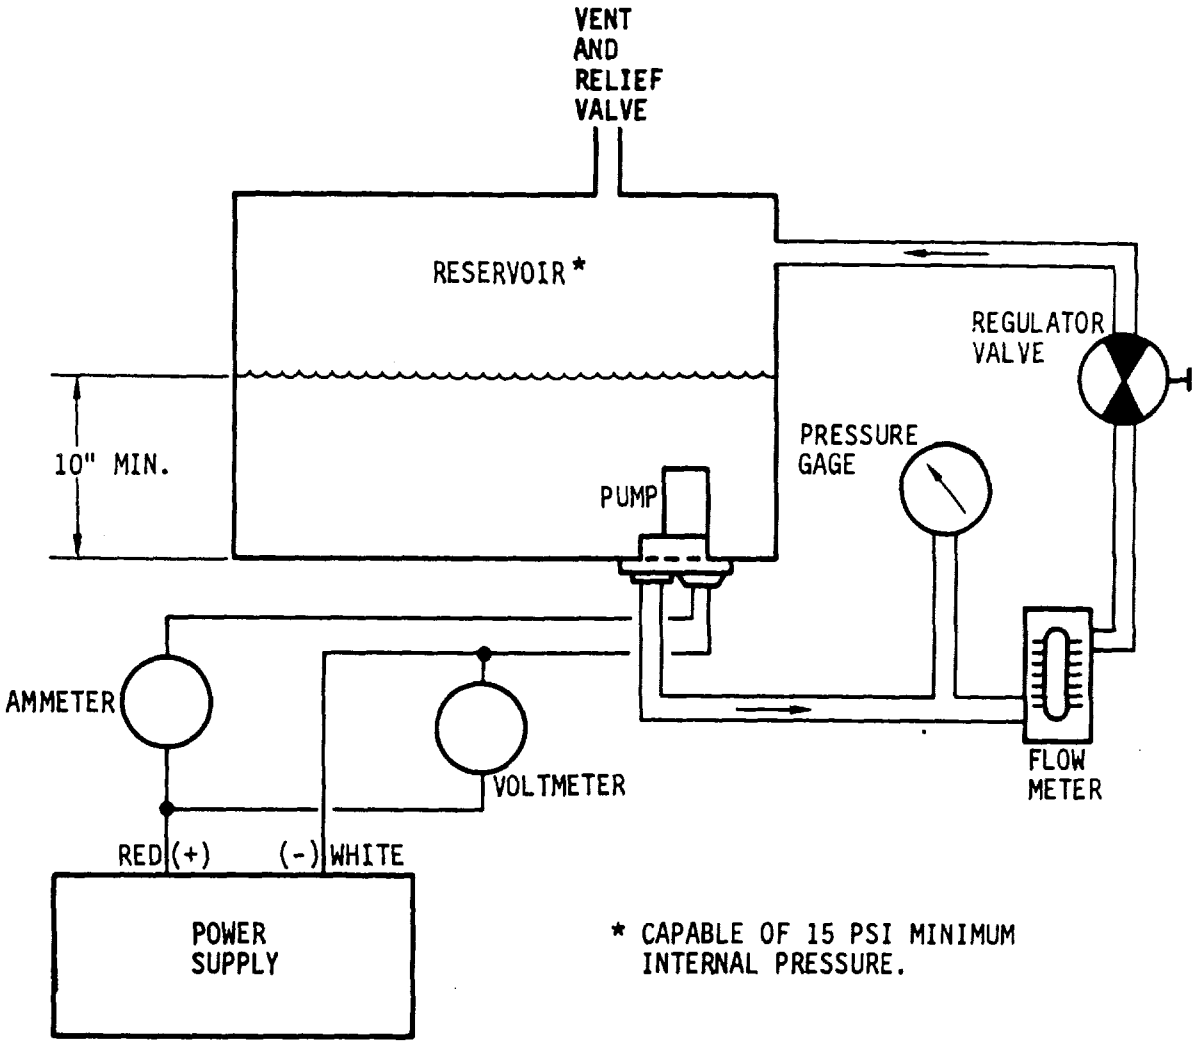
4.2 Connect leads to DC power supply observing proper polarity (Figure 702).

4.3 Preset voltage source to 28.75 ±0.5 volts and throw power switch to pump ON. Observe that current remains at 7.5 amps or below in steady-state operation. Perform a warmup run for a minimum of 10 minutes at the rated flow of 450 PPH. After warmup, measure and record the pump differential pressure, and current for flow rates of zero flow and 450 PPH.

4.3.1 Requirement

The pump discharge pressure at 450 PPH shall be 22 psig minimum. The pump discharge pressure shall be 35 psig maximum at a flow rate of zero PPH. Current shall not exceed 7.5 amps during steady-state operation at any flow.

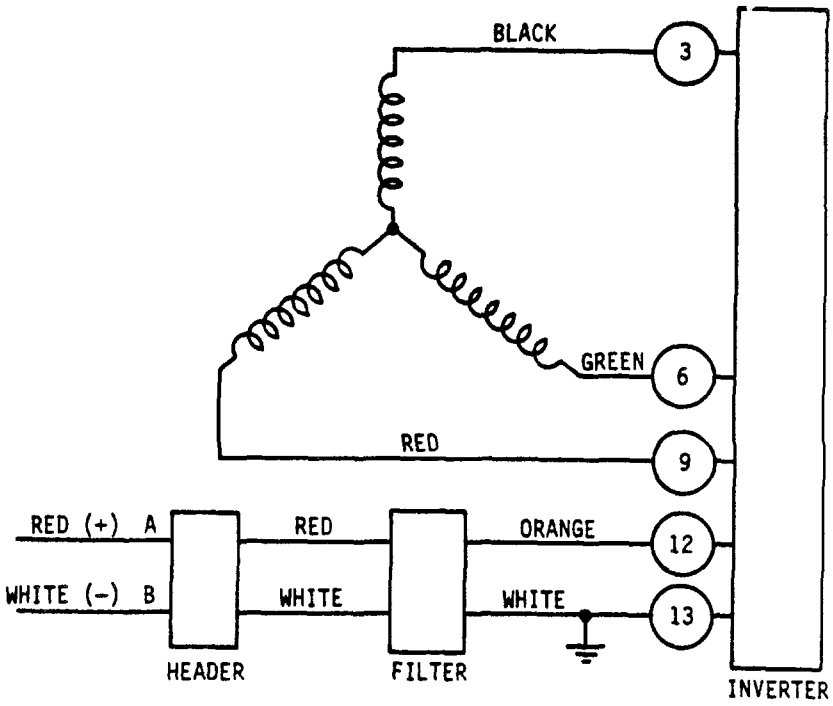
5.0 CALIBRATION AT REDUCED VOLTAGE AND VARIABLE FREQUENCY INVERTER CALIBRATION



With the power supply set at 28.75 volts and with the power switch in the ON position, slowly decrease power supply voltage until either the current draw exceeds 8.0 amps (do not allow current draw to exceed 9.0 amps) or until the power supply reaches 16.0 volts.

5.1 If the current draw is greater than 8.0 amps, the pump does not contain a variable frequency inverter. Testing on this pump is complete.

5.2 If current draw is less than 8.0 amps, the pump contains a variable frequency inverter. Adjust pump flow rate to 390 PPH, at 16.0 ±0.5 volts.



5.2.1 Requirement

The pump differential pressure at 390 PPH shall be 8 PSI minimum and the current shall not exceed 8.0 amps.

H/A159-701

Functional Test Setup
Figure 701

Wiring Diagram
Figure 702

8. TROUBLESHOOTING

The troubleshooting information for the fuel booster pump is contained in Table 801. Table 801 contains procedural steps, based on an obvious condition, and provides remedial steps necessary to effect a solution for the problem encountered.

TABLE 801. TROUBLESHOOTING INFORMATION

Trouble	Probable Cause	Corrective Action
Pump does not operate but consumes power	Nut securing impeller loose	Replace nut and torque to 7 to 10 inch-pounds.
	Frozen bearing in end bell assembly and/or motor housing assembly	Replace bearings. NOTE: Check rotor shaft for damage. Repair or replace as necessary.
	Impeller jammed or binding	Check for foreign matter at screens and/or between impeller and end bell assembly. Remove foreign material and clean parts.
Pump does not operate and consumes no power	Broken wires or excessive corrosion on soldered joints	Repair wiring and/or clean solder joints.
	Inverter assembly inoperative	Replace inverter.
Pump operates but vibrates excessively	Bent or damaged impeller	Replace impeller.
	Worn bearings in motor housing assembly and end bell assembly	Replace bearings. Check rotor shaft and stator. Repair or replace as necessary.
	Rotor shaft bent	Replace rotor shaft.

TABLE 801. TROUBLESHOOTING INFORMATION (Cont'd)

Trouble	Probable Cause	Corrective Action
Pump operates but does not pump fuel	Discharge plugged	Disassemble pump and clean.
	Missing impeller spring pin	Replace spring pin and retorque nut to 7 to 10 inch-pounds.
Pump operates at less than rated speed flow and pressure	Impeller rubbing, binding or bent	Check impeller for freedom of movement. Replace if necessary.
	Bearings binding	Replace bearings.
	Impeller to end bell assembly clearance is too great	Correct clearance.
	Pump clogged with foreign material	Remove foreign material and clean parts.
	Inverter defective	Replace inverter.
	Valve assembly installed incorrectly	Correct installation of valve.
Motor runs at less than 10,100 rpm	Rubbing internal parts	Disassemble unit and correct malfunction.
	Defective inverter	Replace inverter.
	High resistance at soldered or crimped leadwire connections	Correct defective connections.
Excessive current (higher than 7.5 amps at any condition)	Excessive thrust bearing drag	Run in unit at zero flow rate for 48 hours maximum.
	Inverter defective	Replace inverter.

9. STORAGE

For storage or shipment, the pump should be enclosed and sealed in a polyethylene bag and placed in a padded carton. A desiccant should be included in the polyethylene bag if storage area is not moisture free. The carton should be sealed and tag affixed stating Part No., Serial No., Date of Overhaul and Cure Date.

TABLE 901. STORAGE MATERIALS

Item	Manufacturer/ Specification
Polyethylene Bag	Noland Paper Co. Los Angeles, CA
Container	Noland Paper Co. Los Angeles, CA
Desiccant	MIL-D-3464
Cap Plug	Tubing Seal Cap Co. Azusa, CA

Equivalent substitutes may be used.

10. SPECIAL TOOLS, FIXTURES AND EQUIPMENT

Overhaul of the fuel booster pump assembly may be accomplished with the special tools, fixtures and equipment normally available at overhaul facilities as well as those listed in Table 1001. Equipment of equal or greater accuracy may be used.

TABLE 1001. SPECIAL TOOLS, FIXTURES AND EQUIPMENT

Part Number/ Manufacturer	Description	Application
Model D250 (V17274)	Ultrasonic Cleaner V81982	Clean parts ultrasonically.
10A0735YP (V22375)	Flowmeter 0.7 - 5.7 gpm 3% Full Scale	Measure fuel flow.
1801-T701 (V38056)	Pressure Gauges 0 to 50 psig; 1/2% Full Scale 0 to 5 psig; 1/2% Full Scale	Measure fuel discharge pressure.
901 (V65092)	Ammeter	Measure current for inverter assembly test.
931 (V65092)	Voltmeter 0 to 30 vdc, ±0.5%	Measure input dc voltage.
931 (V65092)	Ammeter 0 to 10 amps dc, ±0.5%	Measure current.
NJE Model CR36-30 (V98380)	Power Supply	Provide input power for inverter assem-
6289A (V83572)	DC Power Supply 28 vdc, 1.5 amps	Provide input power for inverter assembly test.

TABLE 1001. SPECIAL TOOLS, FIXTURES AND EQUIPMENT (Cont'd)

Part Number/ Manufacturer	Description	Application
(V98965)	Power Supply 0 to 30 volts at 3.5 amps and 30 amps peak in rush	Provide input power.
99-599 (V81982)	Inverter Tester	Test inverter assembly.
SE 1370 (V81982)	Motor Load	Test inverter assembly.
HP Model 5223L (V28480)	Frequency Counter	Test inverter assembly.
561A (V80009)	Dual Trace Oscilloscope	Test inverter assembly.
GGA-540 (V21134)	Pressure Regulator 0 to 100 psig	Regulate fuel flow.
62707 (V81833)	Reservoir 4 gal.	Fuel supply.
3215 (V87405)	Tachometer 6000 to 24000 ±100 rpm	Measure rotor speed (rpm).
(V17879)	Temperature Indicator 0 to 200°F	Indicate fuel temperature.
---	Vent and Relief Valve Open at 31 psig	Control reservoir pressure.
T62950 (V81982)	Motor Load	Test inverter assembly.
T61113 (V81982)	Potting Boot	To pot RNF leadwires.

Refer to Table 1101 for vendor name and address.

11. ILLUSTRATED PARTS LIST

A. PURPOSE

The Illustrated Parts List is intended to assist customer personnel in requisitioning, storing and issuing the replaceable components and in identifying new and reclaimed parts. It is not approved for any other purpose.

The Illustrated Parts List does not list or illustrate parts which lose their identity by being permanently welded or riveted to other pieces, items made from raw (bulk) stocks, such as cut to lengths of conduit, electric leadwire, lockwire, etc.

B. HOW TO USE THE PARTS LIST

The figure number on the parts list refers to the corresponding illustration.

The number in the FIG. ITEM column corresponds to the item number pointing to the part on the corresponding illustration.

A vendor's part is identified by the vendor's part number in the PART NUMBER column and the vendor's Federal Supply Code number following the part description in the NOMENCLATURE column.

Quantities specified in the UNITS PER ASSY column are the total number of each part required per assembly or subassembly and are not necessarily the total used per complete end item assembly.

RF in the UNITS PER ASSY column indicates the item is listed for reference purposes.

AR in the UNITS PER ASSY column indicates parts are used as required.

The EFFECT CODE column contains one or more code letters indicating the configuration to which an assembly or part applies. When no code letter appears in the column, the part is common to all units.

C. GENERAL SYSTEM OF ASSEMBLY ORDER

The indention system used in this illustrated parts list shows the relationship of one part to another. Each unit listed is followed immediately by a listing of its component parts. For a given item, the

indention code shows a system, installation or general heading starting in the extreme left position continuing on down into succeeding columns until the end detail is reached, as follows:

1234567

Installation Assembly (RF) Number
.Detail Parts for Installation
.Assembly
.Attaching Parts for Assembly
***
..Detail Parts for Assembly
..Subassembly
..Attaching Parts for Subassembly
***
...Detail Parts for Subassembly
...Sub-subassembly
...Attaching Parts for Sub-subassembly
***
....Detail Parts for Sub-subassembly

Parts are listed in general order of disassembly, with the exception of attaching parts. ATTACHING PARTS are captioned as such and follow immediately after the part they attach and are separated from other detail parts by the symbol ***.

D. NUMERICAL INDEX

The Numerical Index (refer to Table 1102) is a complete listing of all parts included in the illustrated parts list. These part numbers are cross-referenced to the applicable figure and item number in the parts list.

E. VENDORS' CODE

Vendor parts used, unaltered by Hydro-Aire, are listed by vendor part number, vendor description and vendor code. Vendors' code symbols used in this publication are taken from Federal Supply Code of Manufacturers Cataloging Handbook H4-1 and H4-2. Following is a numerically arranged list of vendor codes used in this publication.

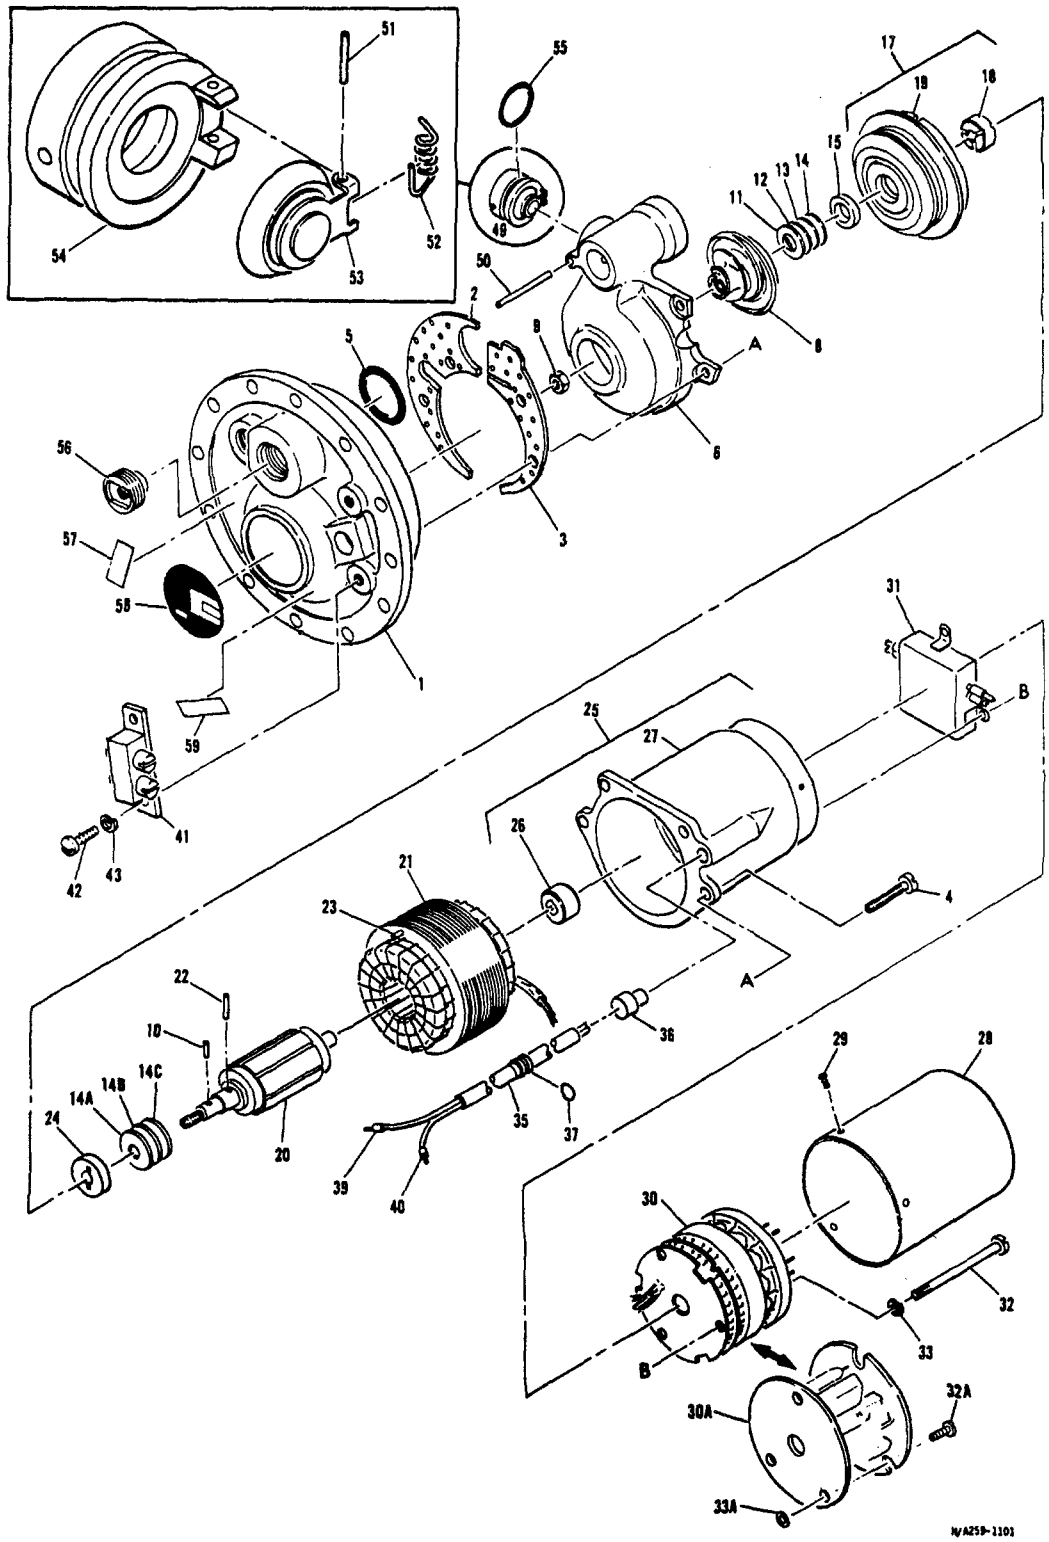


TABLE 1101. VENDOR CODE LIST

INTRODUCTION

This publication is issued to provide instructions to overhaul the Fuel Booster Canister Pumps, Part No's. 72266-3, 72390-2, manufactured by Hydro-Aire Division, Crane Co., Burbank, California 91510 USA.

The information in this manual is divided into sections in accordance with Air Transport Association Specification 100, to enable maintenance personnel to disassemble, clean, inspect/check, repair, assemble, troubleshoot and test the pumps. An illustrated parts list is provided to locate, identify and requisition parts.

To ensure that coverage contained in this handbook will reflect changes in the pump overhaul concepts and procedures, revised information is provided to the customer through a letter of transmittal. The letter includes highlight pages which identify changed pages.

Warnings, Cautions and Notes are used to emphasize information throughout this publication. Warnings must be followed to avoid injury or death to persons. Cautions must be followed to avoid equipment damage, and Notes call attention to work simplification, or additional information.

The following special terms and/or abbreviations are used in this publication.

°F	Degrees Fahrenheit	lb	pound
AMPS	Amperes	MAX	Maximum
ASSY	Assembly	MIN	Minimum

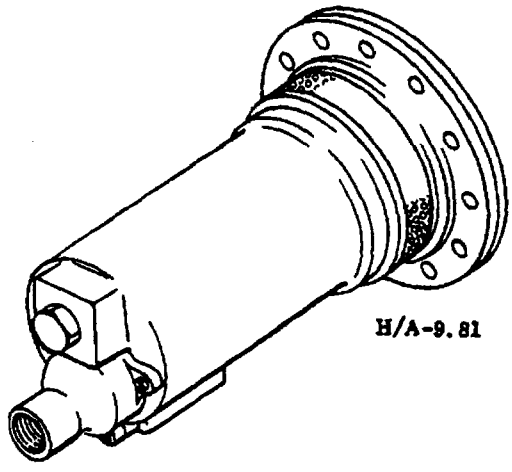
In	Inch	vdc	Volts Direct Current



0. DESCRIPTION AND OPERATION

A. DESCRIPTION

Fuel Booster Canister Pumps, Part No's. 72266-3 and 72390-2 are rotary, power-driven pumps. The pumps are used to transfer fuel from fuel system reserviors into feed lines at specified design flow and pressure while submerged in the reservior.

The basic concept of the canister pump design is that of the cartridge or plug-in component which when applied to a submerged unit eliminates undesirable consequences of having to drain the aircraft fuel tank. The motor-pump cartridge is installed in a separate cylindrical shell, or housing, which is an integral part of the tank. This housing, or canister, is filled with an internal, rotary sleeve valve which, when rotated into closed position, seals the inside of the canister from the fuel tank. The motor-pump cartridge can then readily be withdrawn from canister without losing more than a few spoonfuls of fuel. The necessary sequence of operations is mechanically programmed by detailed design of the unit. Rotation of the sleeve valve to seal off canister from fuel tank, and removal of motor-pump assembly with simultaneous disconnecting of fluid and electrical fittings are controlled positively in this order for pump removal, and in the reverse order for reinstallation.

Positive cooling for the motor is furnished by primary fuel flow passing in the space between the outside of the motor housing and the inside of the canister. This port is equipped with a self-sealing disconnect valve which retains fuel in the discharge piping when motor-pump is removed.

Fuel Booster Canister Pump - Assembled View
Figure 1

B. OPERATION

Each pump has self-contained source of power which is an electrically driven, explosion-proof motor whose main components are a field coil and an armature. The field coil provides the flux which causes the armature to rotate when an electric current is made to flow through the system. Rotation of the armature turns the centrifugal type impeller enclosed in the pump chamber, thus creating the pump action. Physically, the two units differ in that Part No. 72266-3 incorporates a radio noise filter and a capacitor. Leading particulars are listed in Table 1.

TABLE 1. LEADING PARTICULARS

Pump Mounting Position	Motor upward; major axis vertical
System Fluid:	
72266-3	JP-4 Fuel per MIL-T-5624
72390-2	Jet "A" per ASTM Spec D1655-65T
Test Fluid	Stoddard Solvent per P-D-680, Type I
Rated Flow:	
72266-3	450 pph at 22 psig (min)
*72390-2	3 gpm at 19 psig (min)
Power Input:	
72266-3	8.0 amps at 28 volts dc
*72390-2	7.5 amps at 28.75 ±0.25 volts dc
Motor Duty Cycle	Continuous
Zero Flow:	
72266-3	33.6 psig (max)
72390-2	50 psig (max)
Dimensions:	
72266-3	5.25 in. dia x 11.49 in. high
72390-2	5.25 in. dia x 9.41 in. high
Weight	5.7 lb (max)

*Using test fluid.

1. DISASSEMBLY (See Figure 1101)

Prior to disassembly, perform the procedures in Section 7, Testing, to determine extent of disassembly required to repair or replace components.

Disassembly may be accomplished using tools and equipment normally available at maintenance facilities. Special tools, fixtures and equipment, if specified, are listed in Table 1001.

WARNING: AVOID SPILLING FUEL. DO NOT ALLOW ANY FUEL TO REMAIN IN PUMP CHAMBERS OR PASSAGES. KEEP PUMP AWAY FROM OPEN FLAME.

CAUTION: PLACE ALL PARTS IN CLEAN, COVERED CONTAINERS. KEEP PARTS (3 THROUGH 47) AND PARTS (50 THROUGH 90) SEPARATED.

NOTE: Note method of lockwiring for duplication during reassembly.

A. Remove screws (97) and locking plate assembly (-96 or -103). Do not remove nameplate.

B. On 72266-3 pump, remove two nuts (99) two screws (100) and block (98) from plate (102). Do not remove grommet (101) unless necessary for replacement.

C. Turn lever (5) counterclockwise with an 3/8 inch Allen wrench until it can be removed from canister pump. Remove and discard packing (6) from lever.

D. Pull pump assembly (-1 or -2) carefully out of canister (117) housing assembly. Remove and discard packings (3, 4) from pump assembly.

E. Remove two screws (7) and handle (8).

F. On 72266-3 pump, remove screw (9) and washer (11) and detach braid (13) with sleeving (15, 17, 18, 19, 20) and terminals (21, 22).

G. On 72390-2 pump, remove screw (-10) and washer (11) and detach braid (14) with flexible tubes (16, 23).

H. On 72266-3 pump, remove nut (24), union (25), packing (26), sleeve (27) and tubing (28).

I. Remove three screws (29) and pump body (30).

J. When removing shims (31, 32), record total thickness for use during reassembly.

K. To remove locknut (33), hold impeller (34) with wrench T47492 to prevent armature assembly (87) from turning. Then use screwdriver T56644, and unscrew locknut. After removal of locknut, pull impeller from armature shaft, then remove key (35). Upon removal of impeller (34) use care to prevent loss of key (35).

L. Remove screws (37) and bushing retainer (36).

WARNING: BUSHING RETAINER (36) IS LOADED BY SPRING (41) AND WILL BE FREE TO MOVE OUT OF END BELL WITHOUT EXTERNAL FORCE.

M. Remove bushing (38), adapter (39), drive (40), spring (41), rotating seal (42) and stationary seal (43).

N. Remove three slip tubes (46). Remove and discard packings (44, 45, 47).

CAUTION: LIFT MOTOR COVER (50) FROM END BELL (90) CAREFULLY BY TWISTING SLIGHTLY AND PULLING SIMULTANEOUSLY TO AVOID DAMAGE EITHER TO ELECTRICAL LEADS OR TO FIELD COIL ASSEMBLY (-56).

O. Remove four screws (51), then lift motor cover (50) away from end bell (90) far enough to gain access to two screws (64) which connect electrical leads to brush holder plate assembly (79, 80). Remove terminals (65 or 66).

P. Remove insulator (52) and packing (53). Discard packing.

NOTE: Remove field coil assembly (-56) only if replacement is necessary.

Q. Remove two screws (54) and two key washers (55) securing field coil assembly from motor cover assembly carefully to avoid damage to coil assembly. Do not disassemble coil assembly. If any part requires replacement, replace entire assembly.

R. Remove four screws (69, 71, 73) on 72266-3 pump or (67) on 72390-2 pump securing brush holder plate assembly (79 or 80) to end bell (90); then lift armature assembly (87) with slinger (78) and brush holder plate assembly attached from end bell.

S. On 72390-2 pump after removing screws (69, 71 and 73), remove noise filter (68), capacitor (70) and clamp (72).

CAUTION: DO NOT USE EXCESSIVE VICE CLAMPING PRESSURE ON ARMATURE AS DAMAGE TO ARMATURE LAMINATIONS OR WINDINGS MAY RESULT.

T. Hold armature assembly (87) in a vise with soft jaws as shown in Figure 101. Use two screwdrivers placed opposite each other and pry slinger (78) off of armature shaft. Then remove brush holder plate assembly (79 or 80).

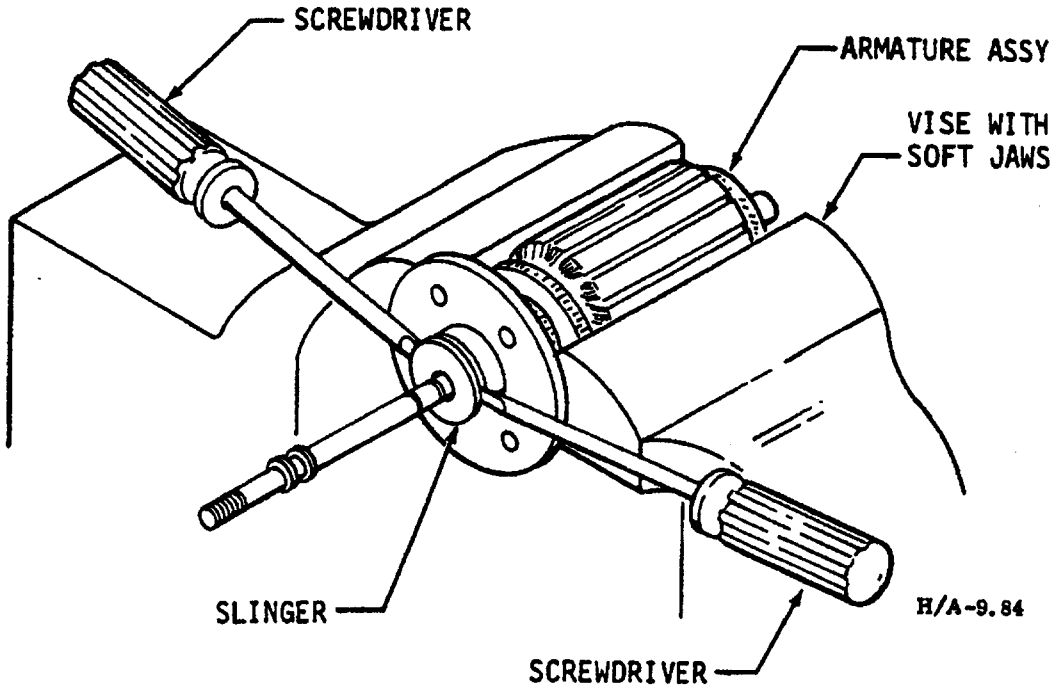
U. Remove washers (85, 86) if used noting number to aid in reassembly. Remove and discard packing (84). Do not remove felt holder (81), spring (82) and felt rings, (83) unless replacement is required.

V. Do not remove springs (88) from brush plate holder assembly (79 or 80) when replacing brush assemblies (89). Remove brush by lifting spring and sliding brush out of holder.

W. Do not remove lead wires (74 or 75) unless necessary for replacement.

X. Do not remove nameplate (93 or -94) from canister (117) unless necessary for replacement.

Y. Remove screen (104), noting manner of lockwiring for duplication during reassembly. Remove screen only if damaged or if necessary for cleaning.



Z. Remove plug (105) and packing (106). Discard packing.

AA. Remove three screws (108) and washers (109) securing fitting (107).

AB. Remove two screws (111) and valve (110).

AC. Remove screw (112) and packing (113). Discard packing.

AD. Remove four screws (115), two segments (114) and sleeve (116). Use wrench T58525 to remove sleeve (116).

Slinger Removal
Figure 101

2. CLEANING

The materials required for cleaning are listed in Table 201.

A. ULTRASONIC CLEANING PROCEDURE

WARNING: USE SOLVENT IN A WELL-VENTILATED AREA. AVOID BREATHING FUMES. KEEP AWAY FROM OPEN FIRE OR FLAMES.

CAUTION: DO NOT CLEAN ELECTRICAL PARTS USING THIS PROCEDURE OR DAMAGE TO PARTS MAY OCCUR.

(1) Place parts in wire baskets, or equivalent, keeping parts separated from each other. Immerse parts in cleaning solution within ultrasonic cleaning unit and keep parts submerged between 5 to 10 minutes.

B. VAPOR DEGREASING PROCEDURE

(1) Raise parts above solvent into condensing zone of degreaser and flush for 1 minute or more in vapors.

WARNING: WHEN USING COMPRESSED AIR, DIRECT AIRSTREAM AWAY FROM BODY AND OTHER PERSONNEL.

(2) Raise parts above cleaning container and allow to dry. Use clean, dry, compressed air to quicken drying.

NOTE: If use of compressed air is impractical, dry by wiping with a clean, lint-free cloth.

(3) Remove parts from basket with padded tongs.

(4) Check parts for cleanliness.

TABLE 401. CLEANING MATERIALS

Item	Number	Manufacturer or Specification
Isopropyl Alcohol	None	TT-I-735A
Lint-free Cloth	None	Commercial
Padded Tongs	None	Commercial
Soft-bristled Brush	None	Commercial
Solvents: Trichloroethylene		O-T-634B (Technical Grade)
Perchloroethylene (Tetrachloroethylene)	None	O-T-236B

Equivalent substitutes may be used.

3. INSPECTION/CHECK

A. GENERAL

Check all parts under strong light for cracks, nicks, and other damage. Make sure all passages are clean and unobstructed, threads undamaged and sealing areas free from scratches, pits, nicks, excessive wear, corrosion and other damage.

NOTE: Excessive wear is defined as any obvious deformation or deterioration of parts which may render the pump inoperative. If doubt exists concerning the condition of a part, replace the part.

B. INDIVIDUAL PARTS CHECK

(1) Check pump body (30) bore for nicks and scratches that would indicate distortion of pump components, improperly installed impeller (34) or presence of foreign matter in impeller vanes.

(2) Check impeller (34) for broken, cracked or bent vanes.

(3) Check seals (42, 43) for condition of contact area by running fingernail across sealing surface. There should be no evidence of galling or roughness. If one seal is replaced, replace other seal also.

(4) Check alignment of spring (41) by rolling spring across a clean, smooth, flat surface. Spring shall not wobble. Test spring for stacking or fatigue by measuring free length and compressed length. Free length of spring shall be approximately 1.000-inch. Under a load of 1.806 to 2.006 pounds, compressed length shall be 0.282-inch.

NOTE: Brush springs (88), if removed, must be replaced.

(5) Check coil assembly (-56) for security of installation and condition of lead terminals. Inspect laminations for nicks and scratches which indicate a distorted pump assembly or worn bearing (62) causing armature assembly (87) to rub against coil assembly. Check condition of insulation on coil leads. Measure resistance of shunt coil between leads white and black. Resistance shall be 80 $\pm$4 ohms at 70°F. Measure resistance of series coil between leads green and black. Resistance shall be 0.209 $\pm$0.025 ohms at 70°F.

(6) Check armature assembly (87) for smooth and shiny commutator surfaces and insulators between commutator bars recessed approximately 0.025-inch. Check shaft for evidence of excessive heat around bearing area. Check armature with a growler for open windings.

(7) Check canister (117) for warped mounting flange.

(8) Check pump body (30) bore for evidence of incorrectly installed impeller (34) as indicated by nicks and/or heavy scratches. Use Zyglo or Diecheck inspection methods to check structural condition of body.

4. REPAIR

The repair procedure for the pumps are only those necessary to make simple repairs. The necessary repair materials are listed in Table 401.

A. Replace all parts that do not pass inspection/check and are damaged beyond simple repair.

B. Replace all packings and packing retainers, seals, insulators, sleeving and grommets.

C. Replace washers (55), brushes (89), bearing (62) and springs (88).

CAUTION: DO NOT ATTEMPT TO REMOVE LIGHT SCRATCHES OR OTHER MINOR IMPERFECTIONS FROM COMMUTATOR BARS OR COIL LAMINATIONS BY POLISHING OR ANY OTHER METHOD TO PREVENT ALTERATION OF THE DESIGN GAP BETWEEN COIL AND ARMATURE. IF COIL ASSEMBLY (-56) OR ARMATURE (87) IS OBVIOUSLY DAMAGED AS INDICATED BY HEAVY SCRATCHES, DISTORTION OR COMMUTATOR BARS OR COIL ASSEMBLY LAMINATIONS, REPLACE PART.

D. Replace coil assembly (-56) and/or armature (87) if electrical requirements specified for these parts are not met.

E. Noncritical internal surfaces of canister (117) and external surfaces may be polished with aluminum abrasive cloth provided that not more than 0.002 inch of material is removed from polished area.

CAUTION: DO NOT USE CROCUS ABRASIVE CLOTH P-C-458 ON ALUMINUM OR MAGNESIUM PARTS AS IT CONTAINS AN IRON OXIDE WHICH CAUSES RAPID CORROSION OF THESE METALS.

F. Polish out minor nicks and scratches on noncritical steel surfaces with crocus abrasive cloth P-C-458. Polish out minor nicks and scratches on aluminum parts with carbide abrasive cloth P-C-451, provided that critical mating surfaces are not damaged.

NOTE: After abrasive cloth has been used, ultrasonic clean as outlined in Section 2, Cleaning.

G. Use thread chaser or tap to repair stripped threads (2 threads maximum) at port and attachment points.

H. Touch up worn or reworked anodized surfaces on aluminum parts as follows:

(1) Remove soiled and oxide film by swabbing surface with acide solvent cleaner (1 volume Deoxidine 624 to 3 volumes water mixed at room temperature), allowing a 1 to 3 minute solution contact time. Keep entire rework surface wet.

(2) Rinse by swabbing with clean, soft, lint-free cloth soaked in water. Repeat at least twice, wringing out cloth after each rinse.

WARNING: ALL CLOTH APPLICATORS USED TO APPLY ALODINE SOLUTION SHALL NOT BE ALLOWED TO DRY OUT. WHEN DRY, EACH CONSTITUTES AN EXTREME FIRE HAZARD. RINSE THOROUGHLY IN WATER WHEN ALODINE APPLICATION IS COMPLETE.

(3) Apply alodine coating (3 volumes of alodine 1000L concentrate to 2 volumes of water) evenly and liberally with a clean, soft, lint-free cloth. Do not apply solution like paint, but thoroughly wet reworked surface to be alodines.

(4) Allow alodine coating to air dry as follows:

Ambient Temperature (°F)	100	90	80	70	60
Alodine Coating Contact (minutes)	2.25	2.8	4.0	5.5	10

NOTE: Do not touch new alodine surface until dry, as fresh alodine films are easily damaged.

(5) Swab off and rinse with cellulose sponge or clean, soft, lint-free cloth saturated with clean water. Use blotting motion or very gentle swabbing to prevent damage to fresh alodine film. Wring out sponge or cloth and repeat rinsing at least twice, blotting any pools of water.

TABLE 401. REPAIR MATERIALS

Item	Number	Manufacturer or Specification
Acid-Solvent Cleaner	Deoxidine 624	V84063
Alodine Coating	Alodine 1000L (Liquid Concentrate)	V84063
Abrasive Cloth, Aluminum Oxide	600 to 800 Grit	P-C-451
Abrasive Cloth	None	P-C-458

Equivalent substitutes may be used.
Refer to Table 1001 for vendor name and address.

5. ASSEMBLY (See Figure 1101)

Assembly may be accomplished using tools and equipment normally available at maintenance facilities. Special tools, fixtures and equipment, if specified, are listed in Table 1001.

CAUTION: ASSEMBLY SHOULD BE ACCOMPLISHED IN A WELL-LIGHTED, DUST-FREE AREA. ALL PARTS SHOULD BE THOROUGHLY CLEANED PRIOR TO ASSEMBLY.

NOTE : Coat bore of canister (117) (in teflon coated area) with fluorosilicone grease FS3451, before installing sleeve (116).

A. Install sleeve (116) in canister (117). Install segments (114) and secure with four screws (115). Segment gap to be located 45° counter clockwise from discharge port as viewed from flanged end of canister (117).

B. Install packing (113) and screw (112) in canister (117).

C. Install swing check valve (110) and secure with two screws (111).

D. Install fuel outlet fitting (107) and secure with three screws (108) and three washers (109). Apply permatex "Aviation Forms-A-Gasket No. 3" between fitting (107) and canister (117). Cure for 8 hours at room temperature.

E. Install packing (106) and plug (105) in canister (117).

F. If removed, install screen (104) and safetywire as noted during disassembly.

G. If nameplate (93 or -94) was removed from locking plate assembly (-96 or -103), install with screws (95).

H. Do not install locking plate assembly until pump assembly (3 through 90) has been assembled and inserted into canister assembly (-91 or -92).

I. Install bearing (62) on armature (87) shaft.

J. Lubricate packing (84) with fluorosilicone grease FS3451. Place packing (84) in groove of brush holder plate assembly (79 or 80). Install brush holder plate and slinger (78) on armature (87) shaft.

K. Install end bell (90) over brush holder plate assembly. On 72390-2 pump, use same number of washers (85, 86) noted during disassembly to maintain required dimension "L" of Figure 501. Fasten washers to underside of plate assembly with Eastman 910 adhesive, or equivalent.

L. Secure end bell (90) to brush holder plate as follows:

(1) On 72266-3 pump, secure end bell (90) to brush holder plate assembly (79) with screws (69, 71, 73) while installing flexible tubing (76, 77), noise filter (68), clamp (72), terminal (65) and capacitor (70). See Figures 502 and 503.

NOTE: Encapsulate capacitor (70) and leadwires (74, 75) using silastic sealant RTV732, after attaching them to brush holder plate assemblies.

(2) On 72390-2 pump, secure end bell (90) to brush holder plate assembly (80) with screws (67). Install leadwire (74, 75). See Figures 502 and 503.

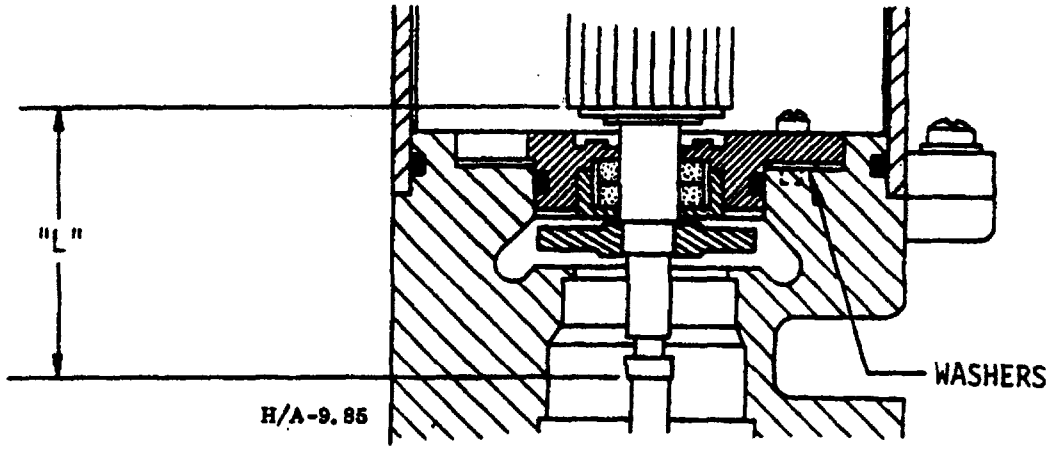
NOTE: Solder leadwires and terminals per MIL-S-6872 using SN60 or SN40 per QQ-S-571.

M. Install two new brush assemblies (89) in brush holder plate assembly (79 or 80) with brush pigtail away from plate (79, 80). Perform dielectric test as outlined in Testing, Section 7.

N. Install spring washer (63) into internal boss of cover assembly (50). Use a small amount of heavy grease to retain spring washer during motor assembly.

O. Install packing (53) in groove of end bell (90). Lubricate packing with fluorosilicone grease FS3451 prior to installation.

CAUTION: INSTALL FIELD COIL ASSEMBLY (-56) AS SHOWN IN FIGURE 506 TO PREVENT MOTOR FROM TURNING IN WRONG DIRECTION.



P. If field coil assembly (-56) was removed during disassembly, install coil assembly in cover assembly (50) as shown in Figure 506 and secure with key washers (55) and screws (54). Tighten screws and bend key washer tabs against flat of screw heads. Install insulator (52).

Q. Install leads of field coil assembly (-56) to brush holder plate assembly (79 or 80) with screws (67). See Figures 502 through 505.

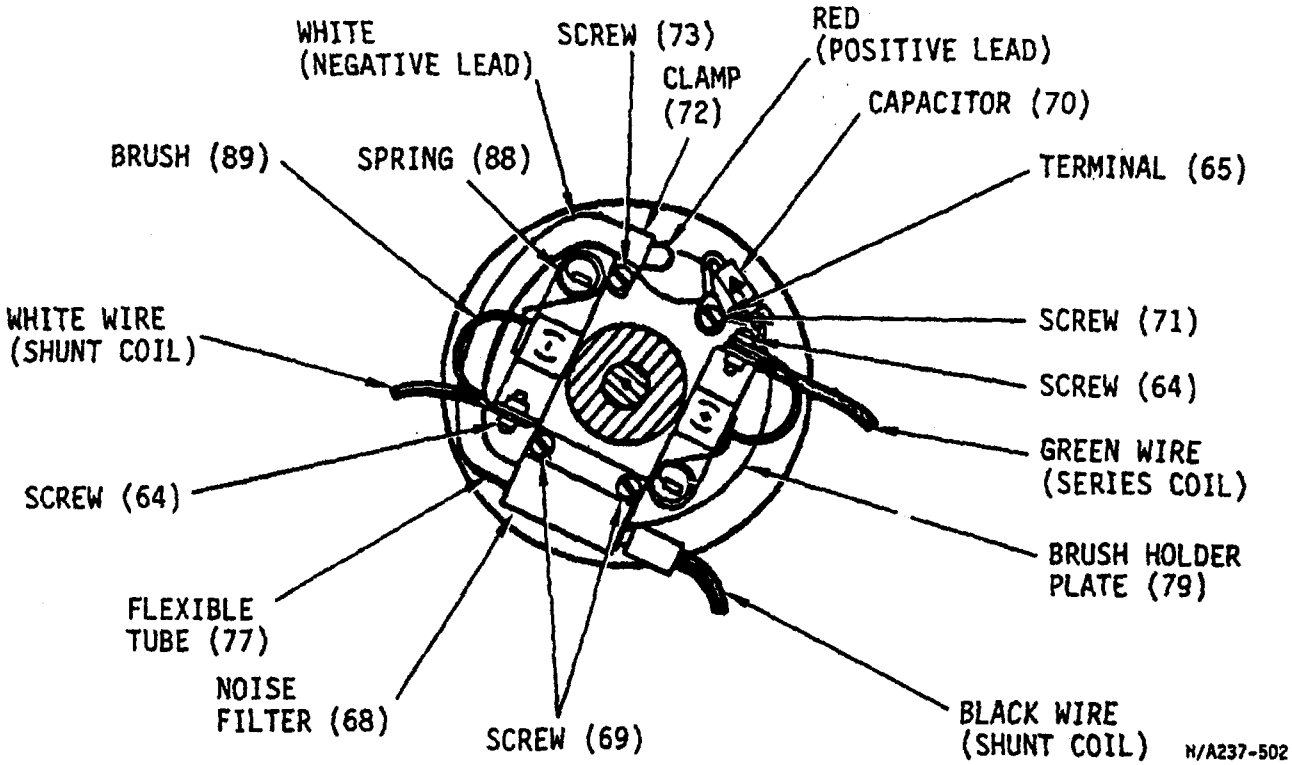
R. Secure motor cover (50) to end bell (90) with screws (51). Alignment mark in end bell to be in line with index slot of cover.

S. Perform motor tests as outlined in Testing, Section 7 before continuing assembly procedure.

T. Turn pump motor (-48 or -49) upside down and install slip tubes (46) with packings (47).

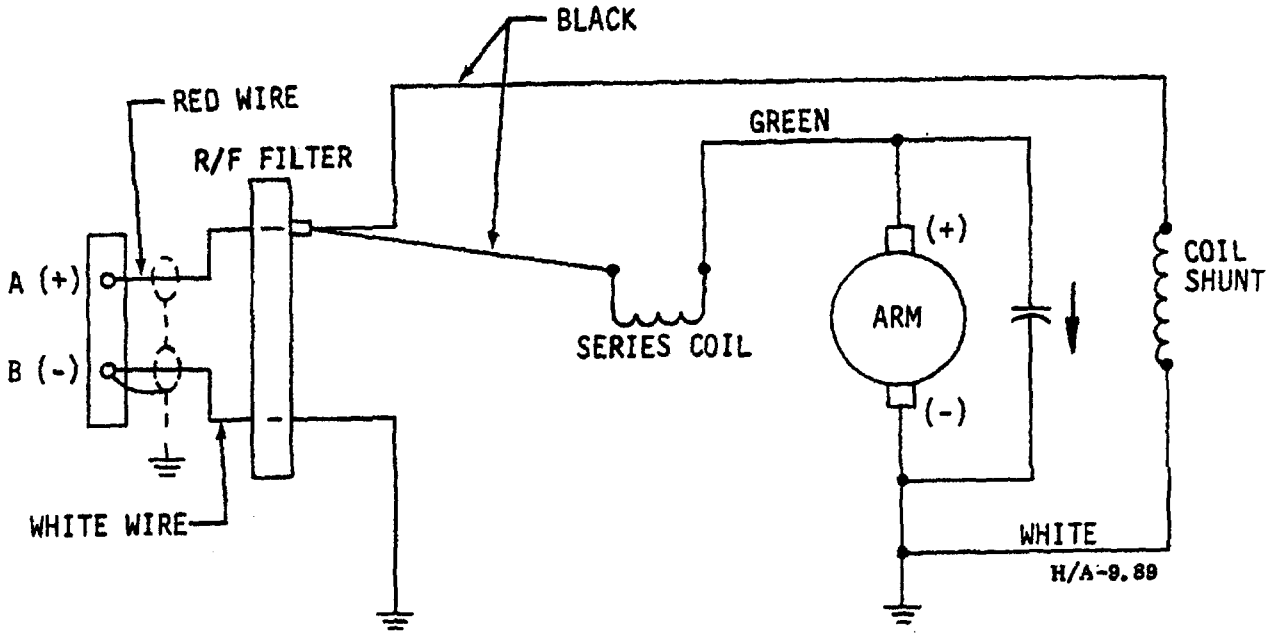
Dimension "L" (inches)	No. of Washers Required (See Figure 1101) (85)	(86)	Stack Height (inch)
1.460 to 1.446	1	1	0.048
1.445 to 1.431	1	0	0.032
1.430 or less	0	1	0.016

NOTE: Fasten washers to underside of brush holder plate assembly using Eastman 910 adhesive.



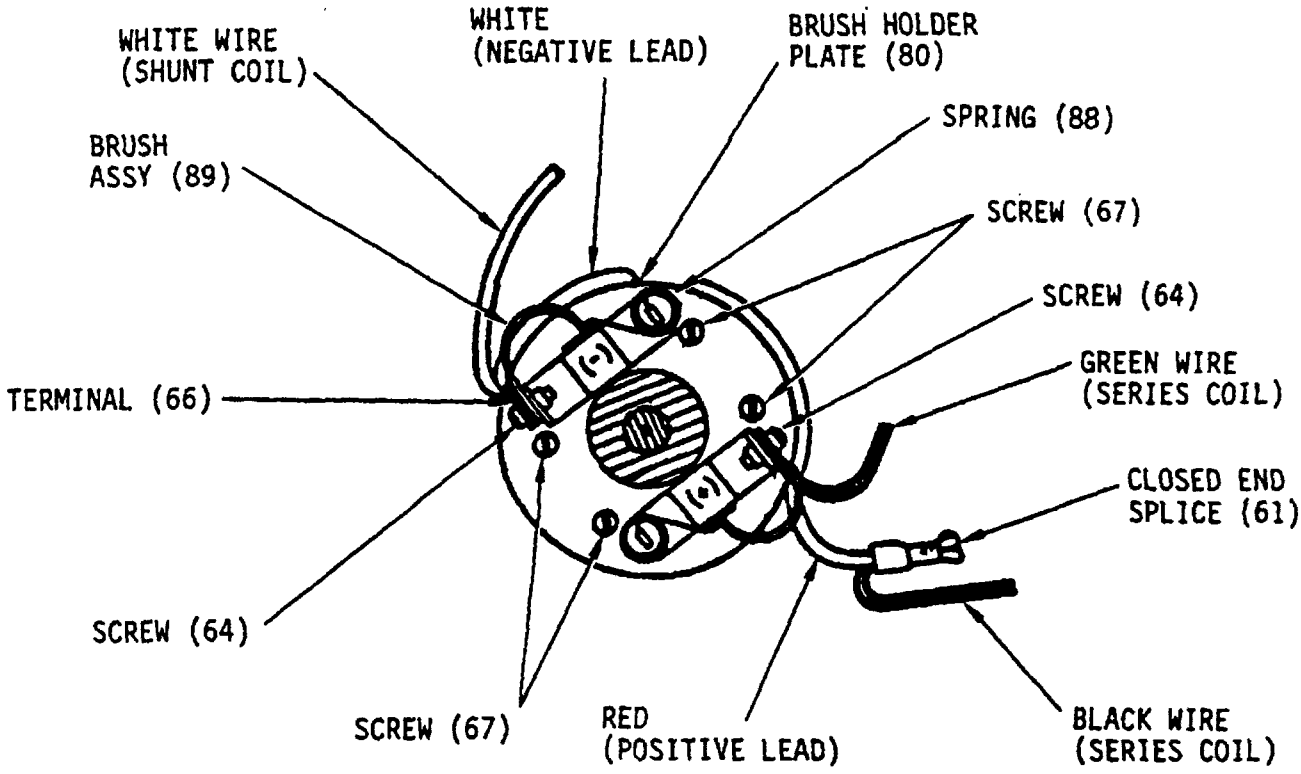
Impeller Dimension
Figure 501

U. Lubricate packing (44) with FS3451 silicone grease (Dow Corning), install on seal (43) and install seal on armature assembly (87) shaft being careful not to damage polished surface of seal.

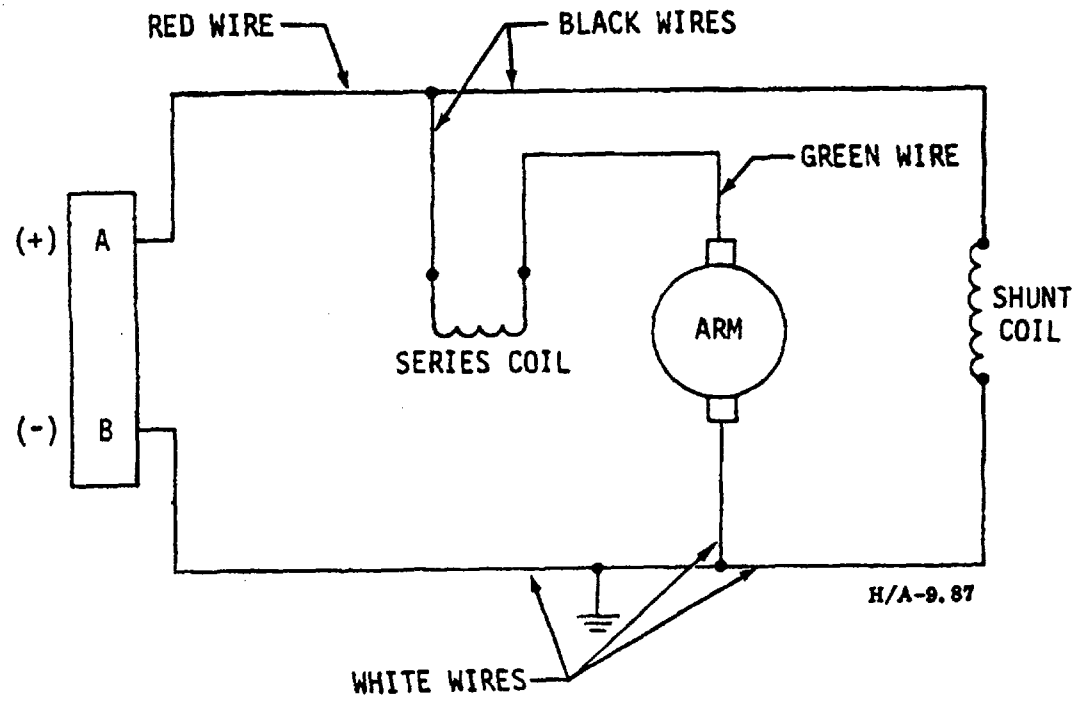


V. Install packing (45) on armature (87) shaft.

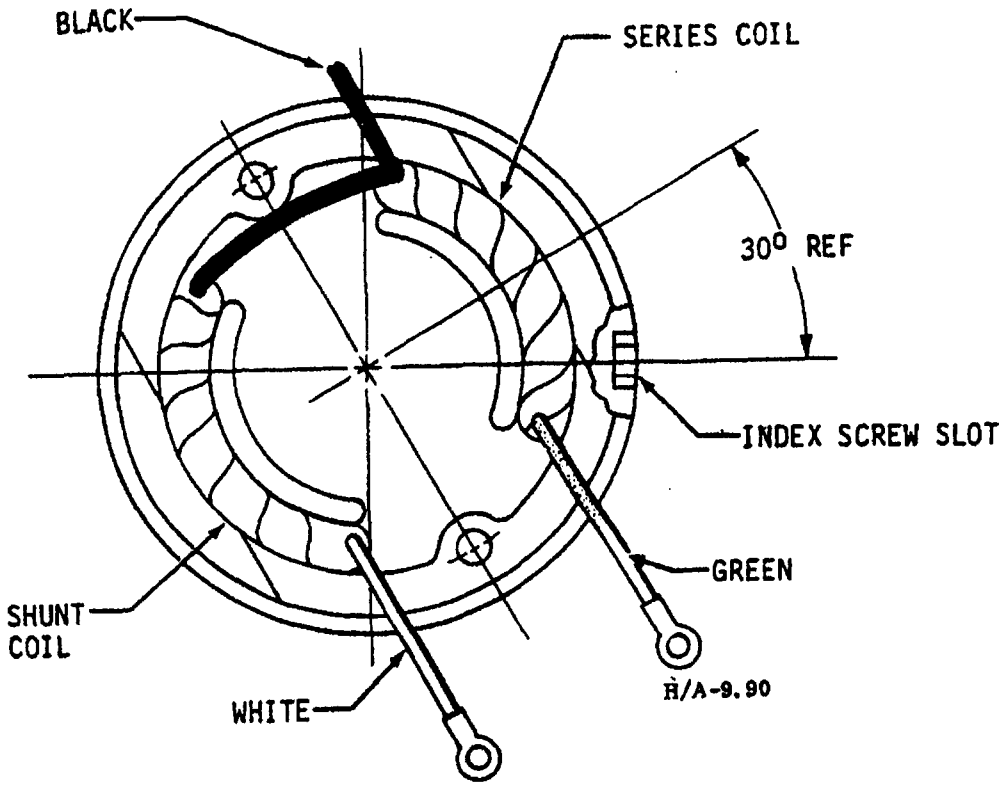
CAUTION: ENSURE THAT DRIVE (40) IS INSTALLED IN ACCORDANCE WITH FIGURE 507.



W. Carefully install rotating seal (42) and drive (40) on armature shaft.



Electrical Assembly for 72266-3 Pump
Figure 502



Wiring Diagram 72266-3 Pump
Figure 503

Electrical Assembly for 72390-2 Pump
Figure 504

Wiring Diagram for 72390-2 Pump
Figure 505

Field Coil Assembly Installation
Figure 506

X. Install spring (41), adapter (39), bushing (38) and bushing retainer (36). Secure with screws (37).

CAUTION: ENSURE THAT KEY (35) IS INSTALLED IN ACCORDANCE WITH FIGURE 507.

Y. Install key (35). Install impeller (34) using impeller wrench T47492. Secure with nut (33) using screwdriver T56644. Torque nut (33) to 5.50 ±0.50 inch-pounds.

NOTE: Rotate impeller and shaft by hand to check for binding. Impeller must rotate freely without binding.

Z. Shim to obtain required clearance 0.004 to 0.008-inch between impeller (34) and pump body (30). Proper clearance is obtained as follows (see Figure 508):

(1) Measure from face of body (30) to flat of throat in body and record as dimension "A".

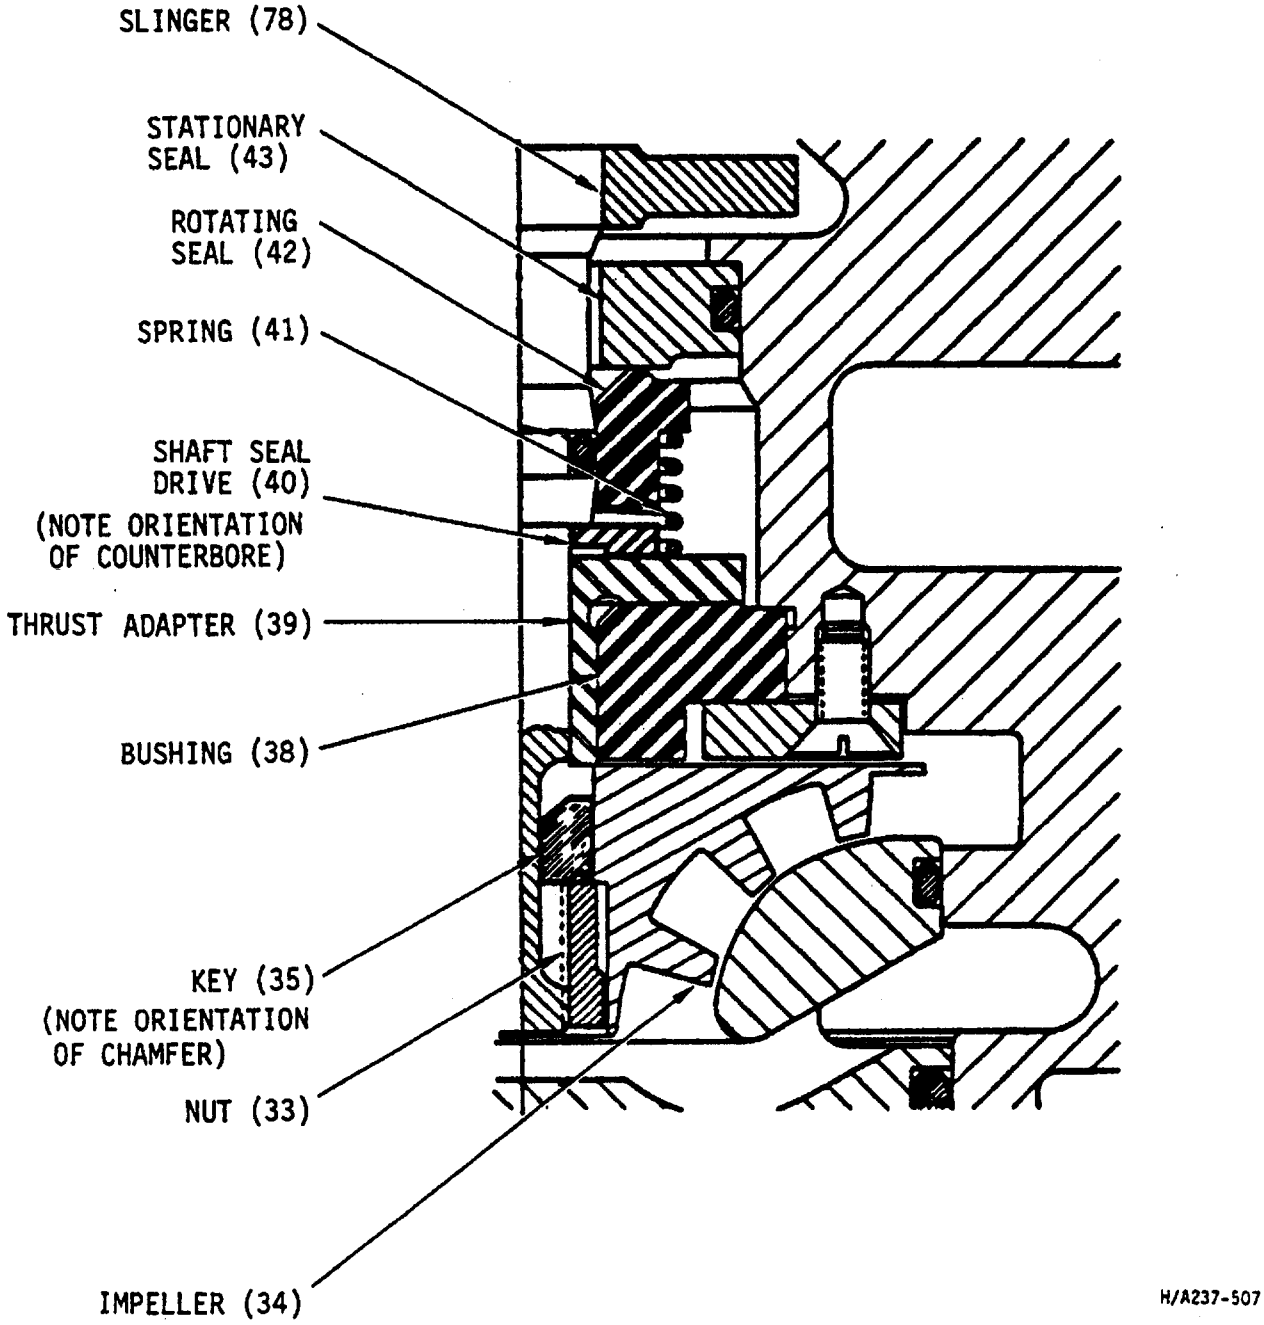
(2) Measure from face of end bell (90) to point of top impeller vane and record as Dimension "B".

(3) Subtract dimension "A" from dimension "B". Result is total amount of shimming required to obtain metal to metal contact or zero clearance. Record this figure.

(4) To figure recorded in step (3), add clearance of 0.006 ±0.002-inch. Total will be amount of shimming required to establish proper clearance between impeller and throat.

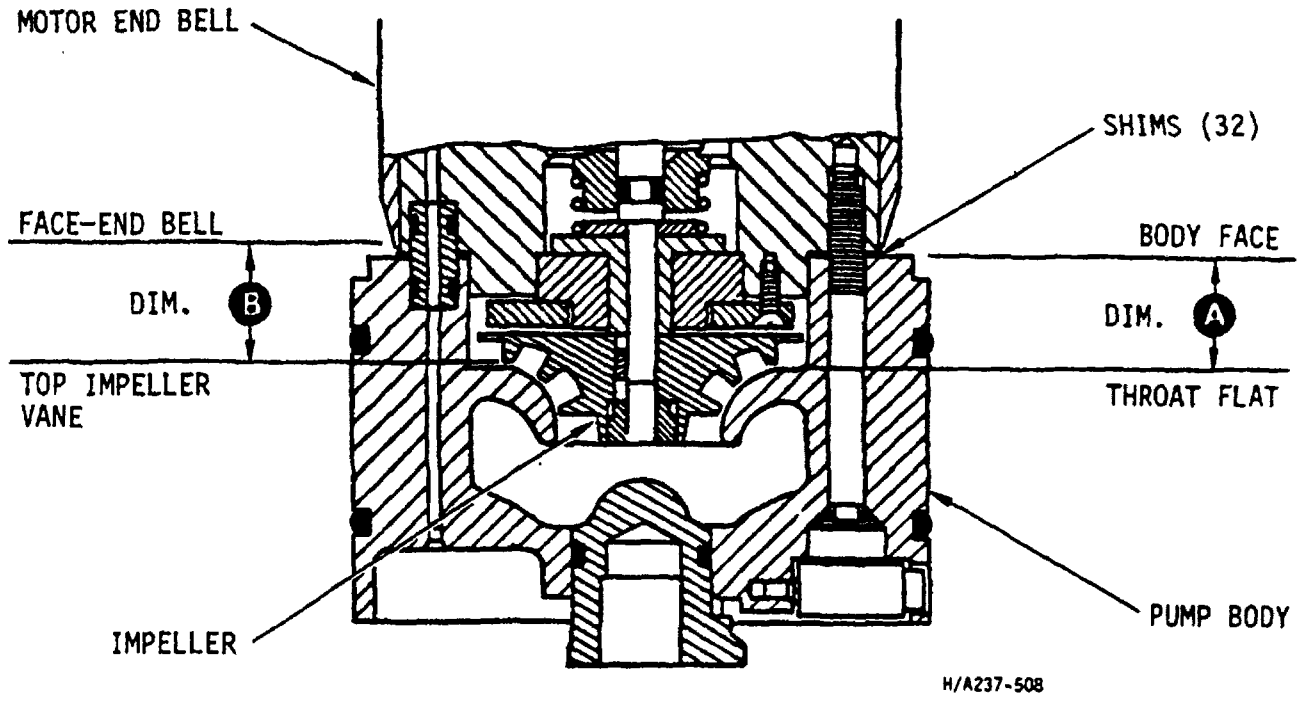
(5) Install combination of shims (31, 32) as required to obtain clearance established in step (4).

AA. Secure body (30) with three screws (29).



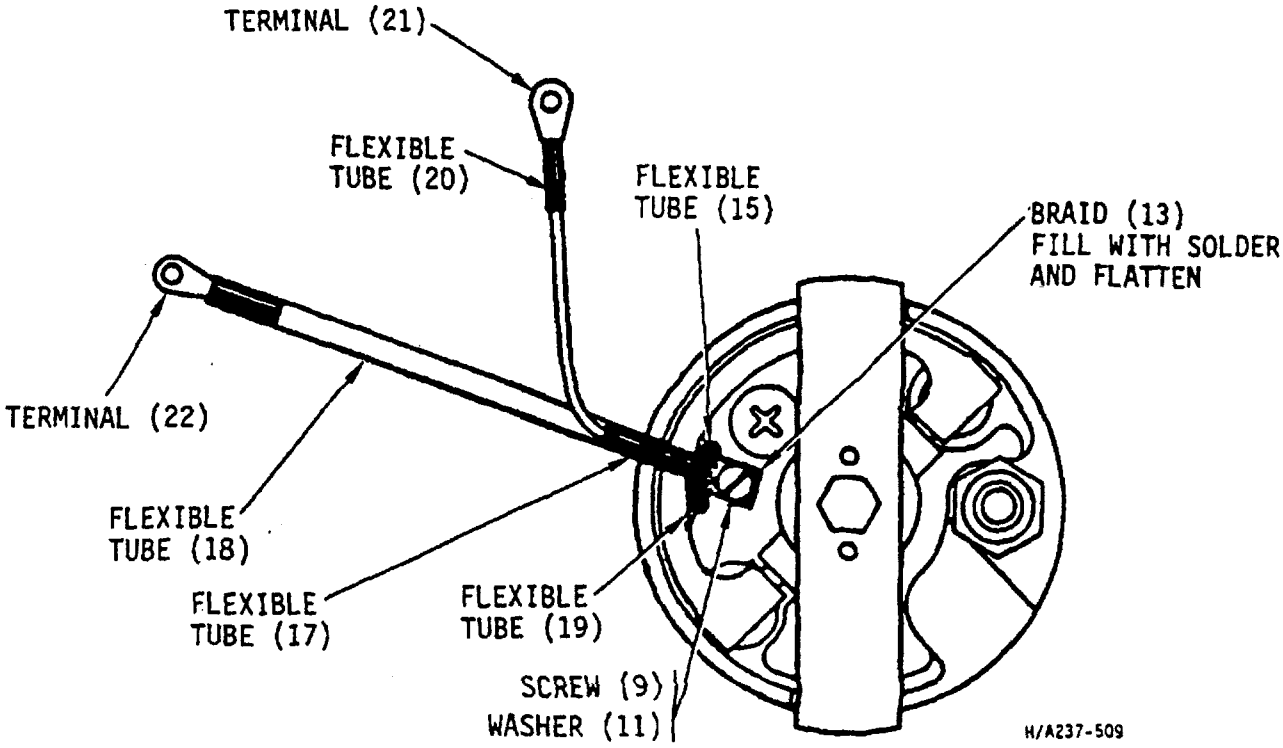
AB. On 72266-3 pump, install tubing (28), sleeve (27), packing (26), union (25) and nut (24).

AC. On 72266-3 pump, install terminals (21, 22), flexible tubes (17, 18, 19, 20) and braid (13) with washer (11) and screw (9). See Figure 509.



AD. On 72390-2 pump, install flexible tubes (16, 23) and braid (14) with washer (11) and screw (-10). See Figure 510.

AE. Install handle (8) with screws (7).

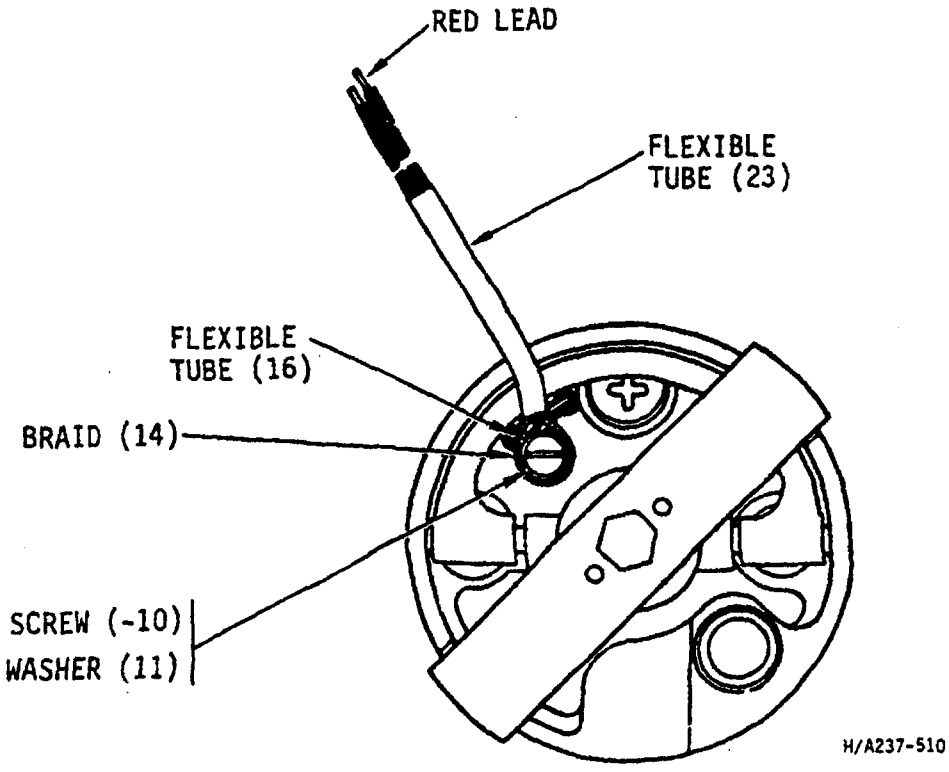


AF. Lubricate packings (3, 4) with fluorosilicone grease FS3451 and install on pump body (30).

Proper Installation of Drive and Key
Figure 507

Shim Installation
Figure 508

Wiring Assembly for 72266-3 Pump
Figure 509



AG. Carefully insert pump and motor assembly (-1 or -2) into canister assembly (-91 or -92).

AH. Place packing (6) on lever (5). Insert lever into pump body (30). Turn lever clockwise with an 3/8 allen wrench until lever locks in place securing pump in canister.

AI. On 72266-3 pump, assemble block (98), two screws (100) and two nuts (90) on plate (102).

AJ. Install locking plate assembly (-96 or -103) with screws (97).

AK. Test completed assembly in accordance with Testing, Section 7.

Wiring Assembly for 72390-2 Pump
Figure 510

TABLE 501. ASSEMBLY MATERIALS

Item	Number	Manufacturer or Specification
Fluorosilicone Grease	FS3451	V71984
Permatex	Aviation Forms-A-Gasket No. 3	MIL-S-4580, Type III
Silastic Sealant	RTV732	V71984

Equivalent substitutes may be used.
Refer to Table 1101 for vendor name and address.

6. FITS AND CLEARANCES

Not applicable. See Assembly, Section 5, for clearances used during reassembly.

7. TESTING (TP 72266-3, REV C and FTP 72390-2, REV B)

1.0 TEST EQUIPMENT

The following test equipment shall be used to perform the required tests. Equivalent equipment may be substituted.

Description	Range and Accuracy
DC Power Supply	0-30 vdc
Ammeter	0-10 amps 1%
DC Voltmeter	0-30 vdc, 1/2%
Flowrater	0-4 gpm, 2%
Pressure Gauge	0-50 psig, 1%
Pressure Gauge	0-60 psig, 1%

2.0 TEST CONDITIONS

A fluid reservoir capable of pressurization to 15 psig minimum must be available for mounting and submersion of pump.

See Figure 701 for test setup. Test fluid shall be solvent, P-D-680, Type I, at a fluid temperature of 80° ±10°F.

All tests shall be conducted at an ambient temperature between 60°F and 90°F and ambient atmospheric pressure.

Voltage at motor terminals shall be as follows:

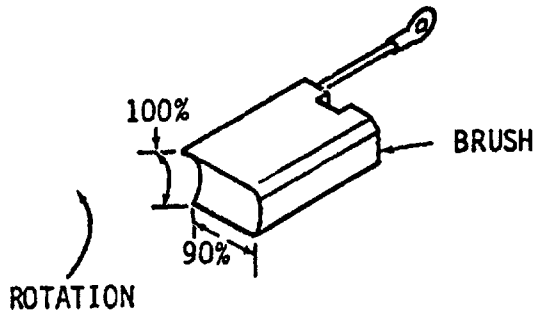
72266-3 Pump	28.0 ±0.25 volts dc.
72390-2 Pump	28.75 ±0.25 volts dc.

3.0 MOTOR TESTS

3.1 Assemble motor with run-in bearing support T57881 prior to break-in run test.

3.1.1 DIELECTRIC TEST

NOTE: Grounded motors must be ungrounded during this test. Disconnect leads from brush holder terminal and remove negative brush.



3.1.2 Apply 500 volts, 60 cycles ac between positive brush holder and end bell (90) for 15 seconds. No damage shall occur.

3.1.2 BREAK-IN RUN

CAUTION ELECTRIC CIRCUIT AND MOTOR FOR PUMP 72266-3 INCLUDE AN ELECTROLYTIC CAPACITOR. IF POLARITY OF POWER IS REVERSED EVEN FOR A FRACTION OF A SECOND, CAPACITOR WILL BURN OUT, AND UNIT WILL LOSE ITS RADIO NOISE FILTERING ABILITY. THERE IS NO EASY WAY TO DETERMINE WHETHER CAPACITOR IS FUNCTIONING OR BURNED OUT. HENCE, EXTREME CARE IS REQUIRED TO OBSERVE CORRECT POLARITY. RED LEAD IS (+); WHITE LEAD IS (-).

3.1.4 Run motor at no-load with voltage adjusted to give approximately 11,000 rpm until 100 percent brush contact in direction of rotation and approximately 90 percent of total area is obtained. See Figure 701.

3.1.5 Visually inspect brushes. Run-in time shall be 18 hours minimum.

Brush Run-in
Figure 701

4.0 CANISTER ASSEMBLY LEAKAGE TEST

4.1 Plug pressure pickup port with pressure outlet port open. Rotate sleeve valve to closed position.

CAUTION: A TEST TANK CAPABLE OF WITHSTANDING A MINIMUM OF 15 PSI INTERNAL PRESSURE IS REQUIRED.

4.2 Install canister in suitable tank with test fluid. Apply air pressure to tank and observe leakage through outlet check valve and sleeve valve. Pressure to be applied as follows:

Pressure	Time	Leakage Requirement
0.1 to 0.2 psig	5 min	0.01 cc/min (1 drop in 5 min)
2 psig	5 min	0.01 cc/min (1 drop in 5 min)
15 psig	5 min	0.01 cc/min (1 drop in 5 min)

5.0 PUMP CARTRIDGE TEST

5.1 Install pump cartridge inside canister assembly.

5.2 Install unit in test setup. See Figure 702.

5.3 OUTLET PORT LEAKAGE TEST

5.3.1 Test outlet port fitting for leakage at 60 psig. No leakage allowed.

5.4 WET RUNNING-IN.

CAUTION: OBSERVE POLARITY. POSTIVE, BLACK WIRE; NEGATIVE, WHITE WIRE.

5.4.1 Start fully submerged pump at 28 volts dc, then immediately reduce voltage until current drops to 7.5 amperes maximum.

5.4.2 Pump shall be run-in wet at rated flow for 18 hours minimum. During entire test, adjust voltage periodically to 28 volts dc, but at same time not exceeding 7.5 ampere limit.

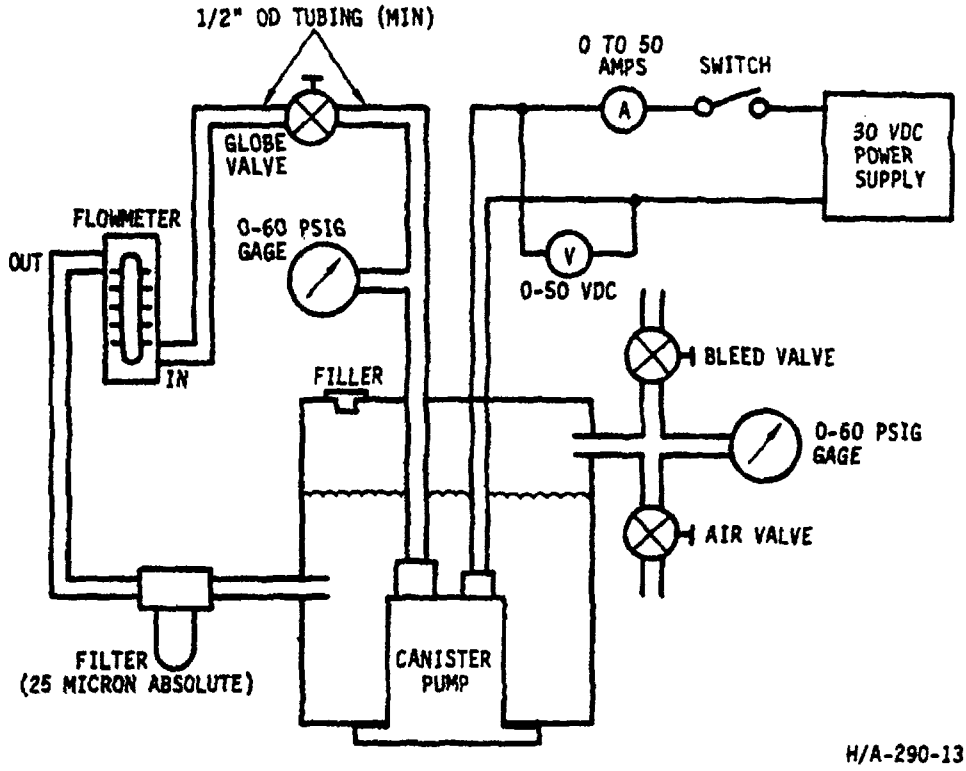
5.5 SHAFT SEAL LEAKAGE TEST

5.5.1 This test shall be conducted simultaneously with running-in procedure for a minimum period of 18 hours.

5.5.2 Total leakage at seal drain port shall not exceed 2.25 cc for 18 hour period, or 3 cc for a 24 hour period.

5.6 CALIBRATION

5.6.1 Run pump a minimum of 15 minutes at rated voltage. Set flow rates indicated in Table 701 and record discharge pressure, amperes and fluid temperature.



5.6.2 Pump performance shall be within limits shown in Table 701.

CAUTION: IF CURRENT DRAIN FLUCTUATES NOTICEABLY, SHUT OFF MOTOR SINCE CURRENT FLUCTUATIONS MAY INDICATE MOTOR OVERHEATING OR INCORRECT ASSEMBLY.

5.6.3 During calibration, observe for external leakage from pump body. None is permissible.

TABLE 701. PERFORMANCE PARAMETERS

Pump	Rated Voltage (vdc)	Flow (gpm)	Flow (pph)	Discharge Pressure (psig)	Current (amps)	Fluid Temp (°F)
72266-3	28.0	1.15	450	22 (min)	8 (max)	80 ±10
	28.0	0	0	33.6 (max)	8 (max)	80 ±10
72390-2	28.75	3.0	1170	19 (min)	7.5 (max)	80 ±10
	28.75	0	0	50 (max)	7.5 (max)	80 ±10

Test Setup
Figure 702

8. TROUBLESHOOTING

Troubleshooting information is contained in Table 801. This table is not all inclusive, however, it does contain the causes of malfunctions most likely to occur.

TABLE 801. TROUBLESHOOTING INFORMATION

Trouble	Probable Cause	Remedy
Motor overheats	Insufficient cooling	Convection cool externally.
	Damaged wiring	Continuity and visual check. Repair as required.
	Misalignment	Locate parts properly.
Excessive current drain	Damaged bearing (62)	Replace damaged bearing.
	Impeller (34) rubbing	Correct clearance.
Insufficient motor rpm	Coil assembly (-56) and armature (87) binding	Remove any foreign matter caught between coil and armature. Check parts for damage. Replace if damaged.
Pump delivery above or below desired values	Improper shimming	Correct impeller clearance.
	Damaged impeller (34) and/or body (30)	Replace damaged part or parts.
Erractic operation of pump	Damaged electrical parts	Replace all electrical parts.
Pump fails to deliver any flow	Incorrect brush wiring (incorrect pump rotation)	See Figures 502 through 505 for correct brush wiring.

TABLE 801. TROUBLESHOOTING (Cont'd)

Trouble	Probable Cause	Remedy
Fluid leaks through seal drain	Damaged seals (42, 43)	Replace seals.
Leakage at throat	Damaged packings (3, 4)	Replace packings.
	Damaged body (30)	Replace damaged body.

9. STORAGE INSTRUCTIONS

A. Flush pump with preservative oil and install plastic plugs in accordance with MIL-C-5501.

B. Encase pump in polyethylene bag, wrap in barrier material MIL-B-121 and place in a padded carton PPP-B-636 or equivalent.

C. Use desiccant MIL-D-4364 as required. Seal carton and stamp Part Number, Serial Number and Date of Overhaul on outside of carton.

10. SPECIAL TOOLS, FIXTURES AND EQUIPMENT

The test equipment required to test the pumps are listed under "Test Equipment" in Section 7, Testing. Maintenance can be accomplished with the use of special tools listed in Table 1001, as well as those normally available at maintenance faciliites. The tools may be obtained from the manufacturers indicated.

TABLE 1001. SPECIAL TOOLS

Part Number	Description and Manufacturer	Application
T56644	Screwdriver (V81982)	To remove and install locknut.
T47492	Impeller Wrench (V81982)	To hold impeller.
T57881	Bearing Support (V81982)	To assemble motor for run-in test.
T58525	Wrench (V81982)	To remove sleeve from canister.

11. ILLUSTRATED PARTS LIST

A. PURPOSE

The Illustrated Parts List is intended to assist customer personnel in requisitioning, storing and issuing the replaceable components and in identifying new and reclaimed parts. It is not approved for any other purpose.

The Illustrated Parts List does not list or illustrate parts which lose their identity by being permanently welded or riveted to other pieces, items made from raw (bulk) stocks, such as cut to lengths of conduit, electric leadwire, lockwire, etc.

B. HOW TO USE THE PARTS LIST

The figure number on the parts list refers to the corresponding illustration.

The number in the FIG. ITEM column corresponds to the item number pointing to the part on the corresponding illustration.

A vendor's part is identified by the vendor's part number in the PART NUMBER column and the vendor's Federal Supply Code number following the part description in the NOMENCLATURE column.

Quantities specified in the UNITS PER ASSY column are the total number of each part required per assembly or subassembly and are not necessarily the total used per complete end item assembly.

RF in the UNITS PER ASSY column indicates the item is listed for reference purposes.

AR in the UNITS PER ASSY column indicates parts are used as required.

The EFFECT CODE column contains one or more code letters indicating the configuration to which an assembly or part applies. When no code letter appears in the column, the part is common to all units.

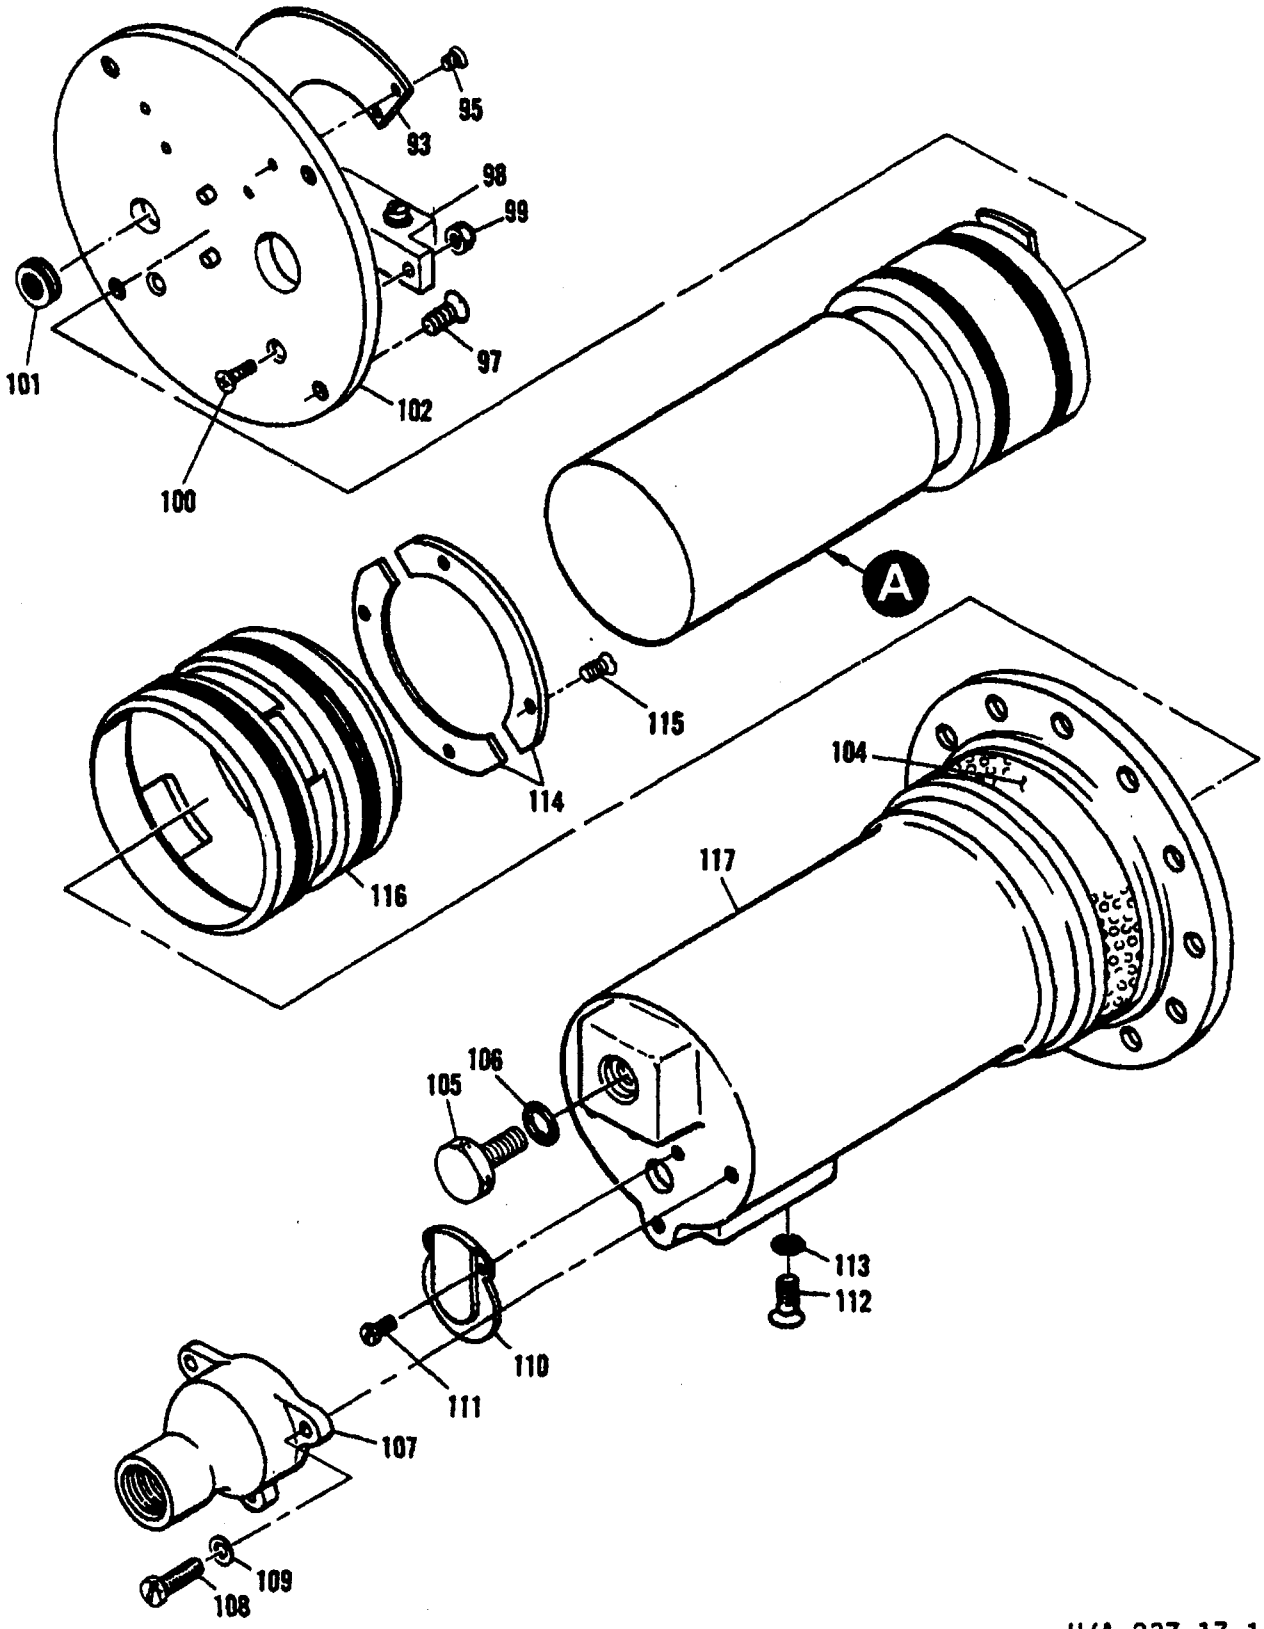
C. GENERAL SYSTEM OF ASSEMBLY ORDER

The indention system used in this illustrated parts list shows the relationship of one part to another. Each unit listed is followed immediately by a listing of its component parts. For a given item, the

indention code shows a system, installation or general heading starting in the extreme left position continuing on down into succeeding columns until the end detail is reached, as follows:

1234567

Installation Assembly (RF) Number
.Detail Parts for Installation
.Assembly
.Attaching Parts for Assembly
***
..Detail Parts for Assembly
..Subassembly
..Attaching Parts for Subassembly
***
...Detail Parts for Subassembly
...Sub-subassembly
...Attaching Parts for Sub-subassembly
***
....Detail Parts for Sub-subassembly



Parts are listed in general order of disassembly, with the exception of attaching parts. ATTACHING PARTS are captioned as such and follow immediately after the part they attach and are separated from other detail parts by the symbol ***.

D. VENDORS' CODE

Vendor parts used, unaltered by Hydro-Aire, are listed by vendor part number, vendor description and vendor code. Vendors' code symbols used in this publication are taken from Federal Supply Code of Manufacturers Cataloging Handbook H4-1 and H4-2. Following is a numerically arranged list of vendor codes used in this publication.

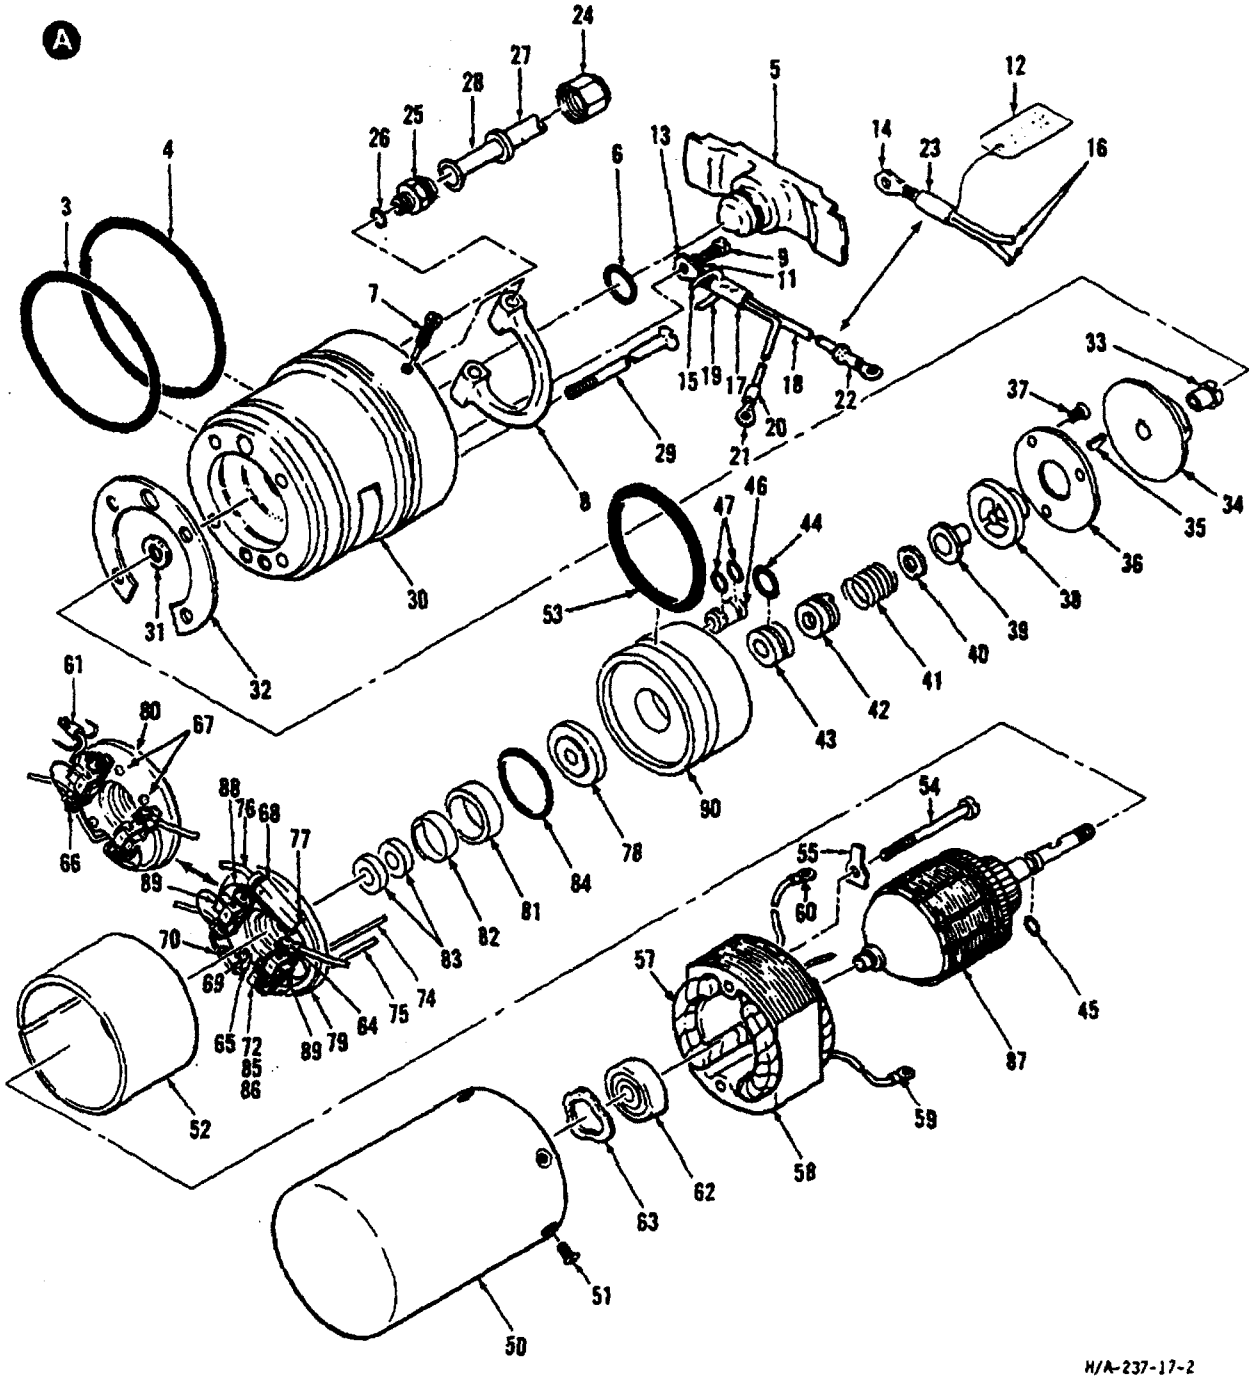


TABLE 1101. VENDOR CODE LIST

Vendor Code	Vendor Name and Address
V00779	Amp Incorporated Harrisburg, PA
V02310	Abscoa Industries, Inc. Inglewood, CA
V03038	Long Lok Corporation Santa Monica, CA

OVERHAUL MANUAL
72368-1

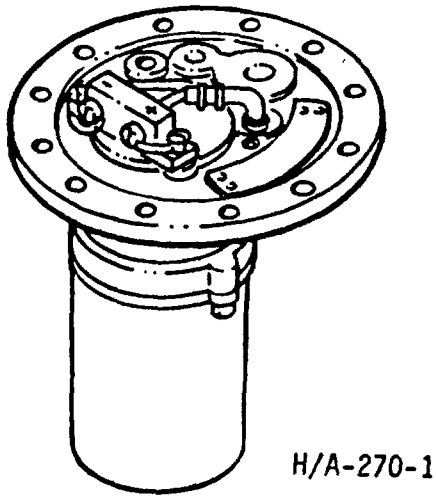
INTRODUCTION

This publication is issued to provide instructions to overhaul the Fuel Booster Pump Assembly, Part No. 72368-1 manufactured by Hydro-Aire Division, Crane Co., Burbank, California.

The information in this manual is divided into sections in accordance with Air Transport Association Specification 100, to enable maintenance personnel to disassemble, clean, check, repair, assemble, troubleshoot and test the fuel booster pump. An illustrated parts list is provided to locate, identify and requisition parts.

To ensure that coverage contained in this handbook will reflect changes in the booster pump overhaul concepts and procedures, revised information is provided to the customer through a letter of transmittal. The letter includes highlight pages which identify changed pages.

Warnings, Cautions and Notes are used to emphasize information throughout this handbook. Warnings must be followed to avoid injury or death to persons. Cautions must be followed to avoid equipment damage, and Notes call attention to work simplification, or additional information.



0.0 DESCRIPTION AND OPERATION.

A. DESCRIPTION. (See Figure 1.)

Hydro-Aire Fuel Booster Pump, Part No. 72368-1 is a rotary, power-driven screw type pump for use in small aircraft and helicopter installations. The self-contained source of power is an electrically-driven, explosion-proof motor whose main components are a field coil and an armature. The unit contains an internal radio noise filter per MIL-I-6181 and is of a wet carbon bearing design. Leading particulars are listed in Table 1.

B. PURPOSE AND LEADING PARTICULARS. (Refer to Table 1.)

The purpose of the fuel booster pump is to transfer fuel from the fuel system reservoir into feed lines at a specified design flow and pressure while submerged in the reservoir.

Fuel Booster Pump, Part No. 72368-1
Figure 1

C. OPERATION.

The field coil provides the flux which causes the armature to rotate when an electric current is made to flow through the system. Rotation of the armature turns the screw-type impeller enclosed in the pump chamber, thus creating the pump action.

TABLE 1. LEADING PARTICULARS

Pump Mounting Position	motor upward; major axis vertical
System Fluid	fuel Military Specification MIL-J-5624 (JP-4)
Rated Flow	450 pph at 22 psig (min)
Power Input	8.0 amps (max) at 28 vdc
Motor Duty Cycle	continuous
Zero Flow	33.6 psig (max)
Pump Discharge Port	per AND 10053 (MIL-P-7105) for 1/2 ANPT
Drain Ports (two)	per AND 10053 (MIL-P-7105) for 1/4 ANPT
Mounting Holes	12 holes 0.281 to 0.287 inch diameter equally spaced on 4.750 diameter bolt circle
Dimensions	2.64 in. dia to 5.25 in. dia x 6.62 in. high
Weight (dry)	4.0 pounds (max)

1.0 DISASSEMBLY.

A. See Figure 1101 and disassemble fuel pump noting the following:

WARNING: AVOID SPILLING FUEL. DO NOT ALLOW ANY FUEL TO REMAIN IN PUMP CHAMBERS OR PASSAGES. KEEP PUMP AWAY FROM OPEN FLAME.

CAUTION: PLACE ALL PARTS IN CLEAN COVERED CONTAINERS. KEEP PARTS (2 THROUGH 38) AND PARTS (40 THROUGH 81) SEPARATED.

(1) Remove lockwire. Note method of lockwiring for duplication during reassembly. (Item 2, Table 201)

(2) Do not remove nameplate (1) and screws (2) unless necessary for replacement.

(3) After removing valve assembly (10 through 13), inspect it as instructed in the CHECKING section, paragraph A, step (2). Disassemble only if replacement of a component is necessary.

(4) When removing shim (22), record thickness of laminations for use during reassembly after overhaul and modification.

(5) To remove slotted nut (25), carefully insert a hardwood stick between outer end of impeller (27) and pump body (81) to prevent armature assembly (71) from turning, then unscrew slotted nut. After removal of slotted nut, pull impeller from armature shaft, then remove shaft key (26).

(6) Remove three screws (29), retainer (28), bushing (31) and adapter (32).

CAUTION: REMOVE SEAL FROM ARMATURE ASSEMBLY SHAFT CAREFULLY TO AVOID DAMAGE TO LAP SEAL FACE.

(7) Remove seal (36) from armature assembly (71) as follows:

Prepare a soft wire lifter, horseshoe shaped, with flattened ends bent inward approximately 90 degrees. Insert wire lifter ends between seal (36) and pump body (81), then pull seal out of body bore.

CAUTION: LIFT MOTOR COVER ASSEMBLY FROM PUMP BODY CAREFULLY BY TWISTING SLIGHTLY AND PULLING SIMULTANEOUSLY TO AVOID DAMAGE TO ELECTRICAL LEADS AND TO FIELD COIL ASSEMBLY.

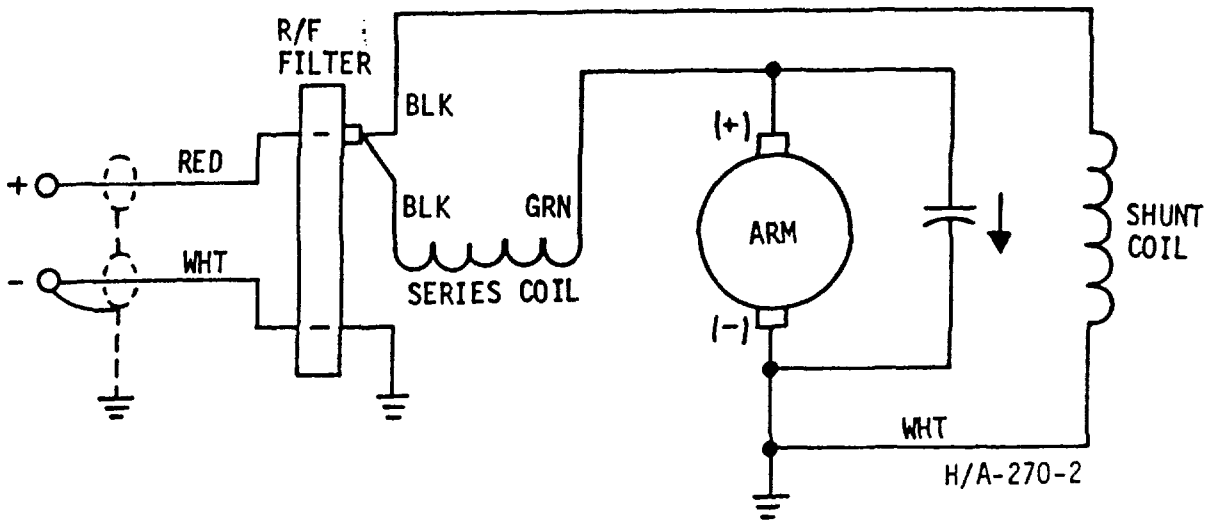
(8) Remove screws (41) and washers (42), then lift motor cover assembly (40) away from body (81) far enough to gain access to screws (44) which connect electrical leads to brush holder plate assembly (66). Identify electrical leads, positive and negative, and remove two screws (44). (See Figure 101 for wiring identification.)

(9) Remove screws (45) and key washers (46) securing field coil assembly (48 through 51) to motor cover assembly (40); then remove field coil assembly from motor carefully to avoid damage to coil assembly.

NOTE: Do not disassemble coil assembly. If any part requires replacement, replace entire assembly.

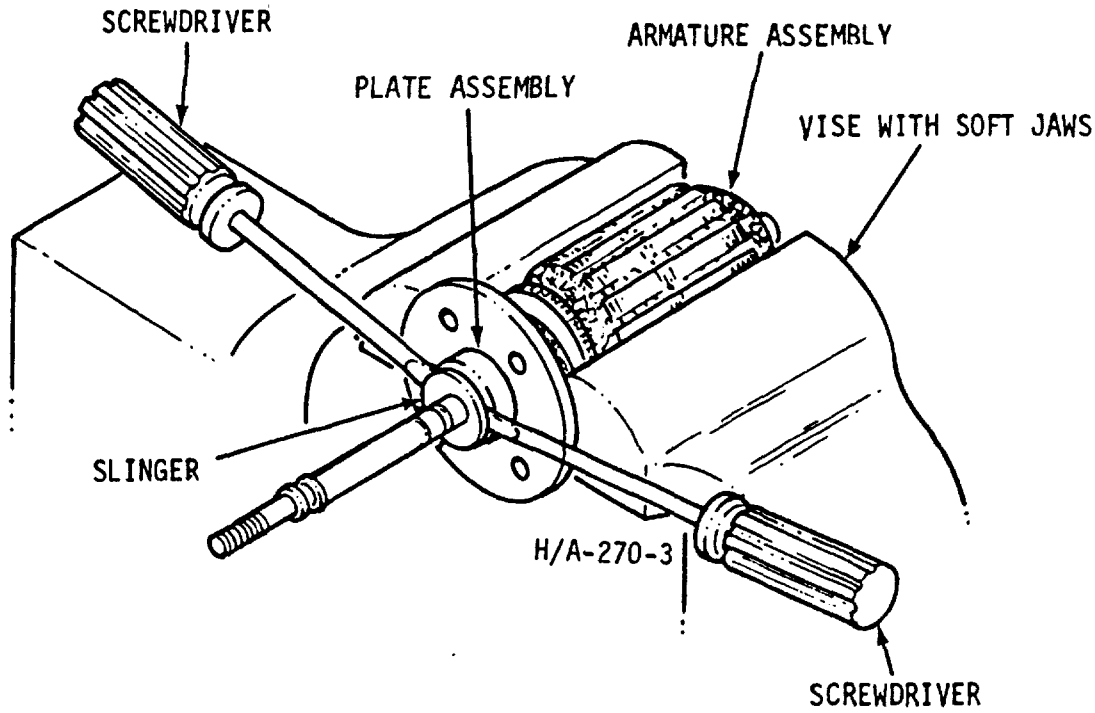
(10) Remove screws (56) securing brush holder plate assembly (66) to body (81) then lift armature assembly (71) with parts (34 through 38, 52, 54, 55, 59 through 70) attached from body (81). Discard packings (37, 38, 70).

NOTE: Some early Fuel Booster Pumps may contain washers under the brush holder plate assembly. If the pump does contain washers, the thickness must be noted during disassembly and either the same washers or washers of the same thickness must be used on reassembly to prevent armature from rubbing against the body.



(11) Remove slinger (54) from armature assembly (71) shaft by holding armature in a vise with soft jaws as illustrated in Figure 102. Use two screwdrivers placed opposite each other between slinger (54) and plate assembly (66) and pry off from armature.

(12) Remove brush assemblies (65) by lifting springs (64), and sliding brushes out of holders.



NOTE: Do not remove capacitor unless necessary for replacement. Do not remove springs from plate assembly when replacing brush assemblies. Do not remove flame arrester plug from body unless replacement is required. If plug is burned, clogged, or damaged, it may be removed by drilling out of body.

(13) Remove bearing (52) carefully to avoid damaging shaft threads.

NOTE: Use corrosion preventative oil (item 2, Table 201) and spray lubricate armature shaft of slinger and bearing several hours before disassembly.

Wiring Diagram
Figure 101

Slinger Removal
Figure 102

2.0 CLEANING.

A. Clean all nonelectrical parts, except bearings, with an approved mineral oil base cleaning solvent, (item 1, Table 201). Dry with moisture free, filtered, compressed air at 20 psig or use a clean, lint-free cloth. Make certain that flame arrester plug (80) is not clogged.

WARNING: SOLVENT, FEDERAL SPECIFICATION P-D-680 IS FLAMMABLE AND TOXIC. USE IN A WELL-VENTILATED AREA AWAY FROM FLAME AND HOT SURFACES. DO NOT DIRECT AIR PRESSURE AGAINST SOLVENT IN CONTACT WITH SKIN. BREATHING FUMES MAY CAUSE INJURY TO PERSONNEL.

B. Remove all surface dirt and grease, and clean electrical parts with a lint-free cloth slightly moistened with solvent.

WARNING: WHEN USING COMPRESSED AIR, DIRECT AIRSTREAM AWAY FROM BODY AND OTHER PERSONNEL.

C. Blow out bores, passages, orifices and ports with filtered compressed air at 20 psig.

D. Remove all paint from exterior surfaces using paint and varnish remover (item 3, Table 201).

E. Place all cleaned parts in clean, dust-tight containers.

TABLE 201. CLEANING MATERIALS

Item No.	Material	Type or Grade	Government Specification
1	Dry Cleaning Solvent		P-D-680
2	Corrosion Preventative Oil	WD 40	Not Known
3	Paint and Varnish Remover	999	Not Known

3.0 INSPECTION/CHECK.

A. The following visual check should be made under a strong light and preferably under magnification. (See Figure 1101.)

(1) Visually check all metallic parts, as applicable, for breaks, cracks, nicks, scratches, scoring, stripped or crossed threads, corrosion, distortion, worn plating, pitting, or other obvious damage.

(2) Verify condition of check valve assembly (10 through 13) to make sure that it is not distorted, that flapper (12) is seated by spring (11) tension, and that valve opens and closes smoothly without binding. Check security of installation of flapper (12) components.

(3) Check throat (21) for a minimum outside diameter (not a mounting section) of 1.810 ±0.001 inches. Check bore of throat for nicks or scratches which would indicate distortion of pump components and/or improperly installed impeller (27), or presence of foreign matter in impeller vanes.

(4) Check impeller (27) for broken, cracked or bent vanes.

(5) Check seals (35, 36) for condition of contact area by running fingernail across sealing surface and examining under magnification. There shall be no evidence of galling or roughness.

(6) Check alignment of spring (34) by rolling spring across a clean, smooth, flat surface; spring shall not wobble. Test spring for stacking, or fatigue by measuring free length and compressed length. Free length of spring shall be approximately 1.000 inch; under a load of 1.806 to 2.006 pounds, assembled length shall be 0.280 inch.

NOTE: Flapper spring (11) and brush spring (64) if removed, must be replaced.

(7) Check coil assembly (48 through 51) for security of installation and condition of lead terminals. Check laminations for nicks or scratches which would indicate a distorted pump assembly or worn bearing (52) causing armature assembly (71) to rub against coil assembly. Check condition of insulation on coil (leads). Measure coil resistance at 70°F. Resistance of shunt coil white lead to black lead shall be 80 ±4 ohms. Resistance of series coil black lead to green lead shall be 0.209 ±0.002 ohms.

(8) Check armature assembly (71) for smooth and shiny commutator surfaces and insulators between commutator bars recessed approximately 0.025 inch. Check shaft for evidence of excessive heat around bearing area. Check commutator with a growler for open windings.

(9) Check body (81) for warped mounting flange caused by unbalanced or excessive torque applied to installation bolts. Check body bore for evidence of incorrectly installed impeller (27) as indicated by nicks and/or heavy scratches.

4.0 REPAIR/REPLACEMENT.

A. Repair or replace disassembled parts of Fuel Booster Pump as follows:

(1) Noncritical internal surfaces of body (81) and external surfaces may be polished with aluminum abrasive cloth, (item 1, Table 401) provided that not more than 0.002 inch of material is removed from polished area.

WARNING: NON-METALLIC ITEMS THAT COME IN CONTACT WITH ALODINE BECOME HIGHLY FLAMMABLE. PLACE ALL RAGS, SWABS, PAPERS AND/OR BRUSHES USED IN APPLYING ALODINE IN CONTAINER MARKED OR DESIGNATED FIREPROOF FOR DISPOSAL.

(2) Alodine protected surfaces may be touched up using alodine (item 2, Table 401).

CAUTION: DO NOT ATTEMPT TO REMOVE LIGHT SCRATCHES OR OTHER MINOR IMPERFECTIONS FROM COMMUTATOR BARS OR COIL LAMINATIONS BY POLISHING OR ANY OTHER METHOD TO PREVENT ALTERATIONS OF THE DESIGN GAP BETWEEN COIL AND ARMATURE. IF COIL ASSEMBLY OR ARMATURE ASSEMBLY IS OBVIOUSLY DAMAGED AS INDICATED BY HEAVY SCRATCHES, DISTORTION OF COMMUTATOR BARS OR COIL ASSEMBLY LAMINATIONS, REPLACE THE PART.

(3) Replace coil assembly (48 through 51) and/or armature assembly (71) if electrical requirements specified for these parts are not met.

(4) Replace entire pump assembly if there is evidence of distorted assembly.

(5) Replace any part which fails to meet checking requirements and is obviously damaged beyond allowable repairs. Replace any part heavily scratched, pitted, corroded, obviously distorted, or cracked.

(6) At every overhaul replace all packings, key washers (46), motor brushes (65) and bearing (52). Replace removed springs (11, 64).

(7) Replace placarding or decals if damaged or illegible. Brush or spray trichloroethylene (item 6, Table 401) to activate adhesive backing.

TABLE 401. CONSUMABLE MATERIALS

Item No.	Material	Type or Grade	Government Specification
1	Abrasive Aluminum Oxide Cloth		P-C-451
2	Alodine		MIL-A-8625
3	Lockwire		MS20995C20
4	Solder SN50, SN60		QQ-S-571
5	Fluro Silicone Grease	FS1292	
6	Trichloroethylene		MIL-T-27602
7	Garnet Paper	240A	

(8) Remove corrosive carbon buildup or burrs from armature with finishing paper (item 7, Table 401).

(9) Install armature assembly (71) in standard lathe and using diamond tool resurface commutator removing not more than 0.003 inches of material. Diameter of commutator must not be less than 0.860 inches minimum after resurfacing. (If resurfacing does not clean the commutator, replace with new armature). After resurfacing, undercut commutator to remove all mica slivers, using 0.020 inch wide cutter, 0.025 inches deep.

(10) After repair, check armature on growler for continuity and shorts.

5.0 ASSEMBLY.

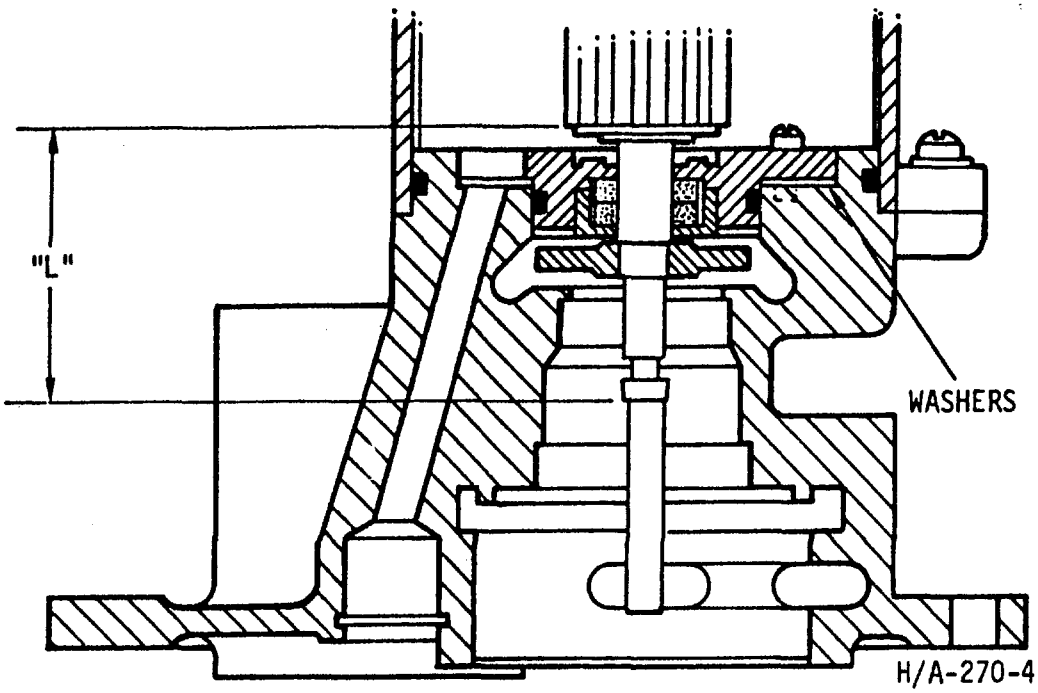
A. See Figures 501, 502, 503, 504 and 1101; assemble fuel pump noting the following:

NOTE: All parts must be kept thoroughly clean before and during assembly.

(1) Install one washer (78) over tubes (74, 71, 72). Slit grommet (79) and place over tubes. Slide grommet down on wire leads until washer is between grommet and lead shielding. Insert leads through second washer (78) into passage in body (81) and pull leads out of upper surface of body. Pull leads through until grommet and both washers are seated in body passage, then install retaining ring (77).

(2) Stake one terminal (73) to white wire lead (-) join shielding of white lead and red lead together and crimp terminal to both shieldings. Stake the other terminal (73) to red wire lead (+).

(3) Assemble parts (34 through 38, 54, 55, 59 through 70) and carefully position armature assembly (71) on body (81). Insert lead wires through opening in plate assembly (66) then secure installation with screws (56) which attach brush holder plate assembly (66) to body (81).



NOTE: If washers were noted under brush holder plate assembly during disassembly, install same washers or washers of the same thickness to maintain dimension "L" of Figure 501.

(4) Fasten washers to underside of plate assembly (66) using Eastman 910 adhesive or equivalent.

(5) Install spring washer (53) and bearing (52) in recessed bottom of cover assembly (40) internal boss.

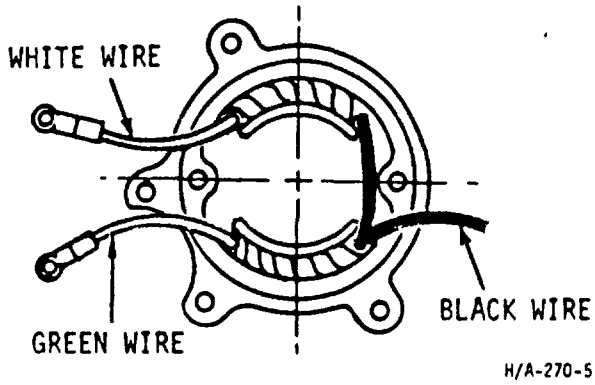
(6) See Figure 502, install field coil assembly (48 through 51) in cover assembly (40) and secure with key washers (46) and screws (45). Tighten screws and bend key washer tabs against flat of bolt heads. Install insulator (43).

(7) Connect leads of coil assembly (48 through 51); each lead wire and leads of brush assembly (65) to brush holder plate assembly (66) with screws (44).

Dimension "L" (in.)	No. of Washers Required AN960D4	AN960D4L	Stack Height (in.)
1.645 to 1.631	1	1	0.048
1.630 to 1.616	1	0	0.392
1.615 or less	0	1	0.016

NOTE: Fasten washers to underside of brush holder plate assembly using Eastman 910 adhesive.

Assembly Dimensional Data
Figure 501



CAUTION: CONNECT WHITE WIRE OF LEAD AND WHITE LEAD OF COIL ASSEMBLY TO NEGATIVE (GROUNDED) SIDE OF BRUSH HOLDER PLATE ASSEMBLY. CONNECT WHITE/BLACK STRIPE TRACER WIRE OF LEAD AND GREEN LEAD OF COIL ASSEMBLY TO POSITIVE (INSULATED) SIDE OF BRUSH HOLDER PLATE ASSEMBLY.

(7) Perform the following motor tests before continuing reassembly procedures.

(a) Dielectric Strength.

(1) Lift negative brush off commutator to unground motor.

(2) Apply 600 volts (rms), 60 cps, between positive (black) wire terminal and motor assembly cover or body for one second. There shall be no flashover or any evidence of damage.

Field Coil Installation
Figure 502

(b) Brush Run-in Test.

CAUTION: THE ELECTRIC CIRCUIT AND THE MOTOR INCLUDE AN ELECTROLYTIC CAPACITOR. IF POLARITY OF POWER IS REVERSED EVEN FOR A FRACTION OF A SECOND, THE CAPACITOR WILL BURN OUT, AND THE UNIT WILL LOSE ITS RADIO NOISE FILTERING ABILITY. THERE IS NO EASY WAY TO DETERMINE WHETHER THE CAPACITOR IS FUNCTIONING OR BURNT OUT. EXTREME CARE IS REQUIRED TO OBSERVE CORRECT POLARITY.

RED WIRE: POSITIVE (+)

BLACK WIRE: NEGATIVE (-)

(1) Replace negative brush in brush holder plate assembly making certain it contacts the commutator.

(2) Connect motor to a direct-current power source.

(3) Operate motor, unloaded, for 30 minutes. Check for armature balance. Motor must operate smoothly and direction of rotation (as viewed from shaft end) shall be clockwise. No load speed shall not exceed 14,000 rpm at 28.75 volts d.c.

(4) Adjust power supply to deliver voltage required to reduce the no-load speed to 11,000 rpm and allow motor to run until 90 percent brush contact in the direction of rotation is obtained.

NOTE: Run-in time to be 24 hours minimum. Brush contact to be determined by sampling inspection.

(c) Load Test.

(1) Couple motor shaft to a dynamometer. With 28.75 d.c. applied, load motor to 12.0 ounce-inch torque.

(2) At 12.0 ounce-inch load, minimum shaft speed shall be 11,000 rpm and maximum current drain shall be 7.3 amperes.

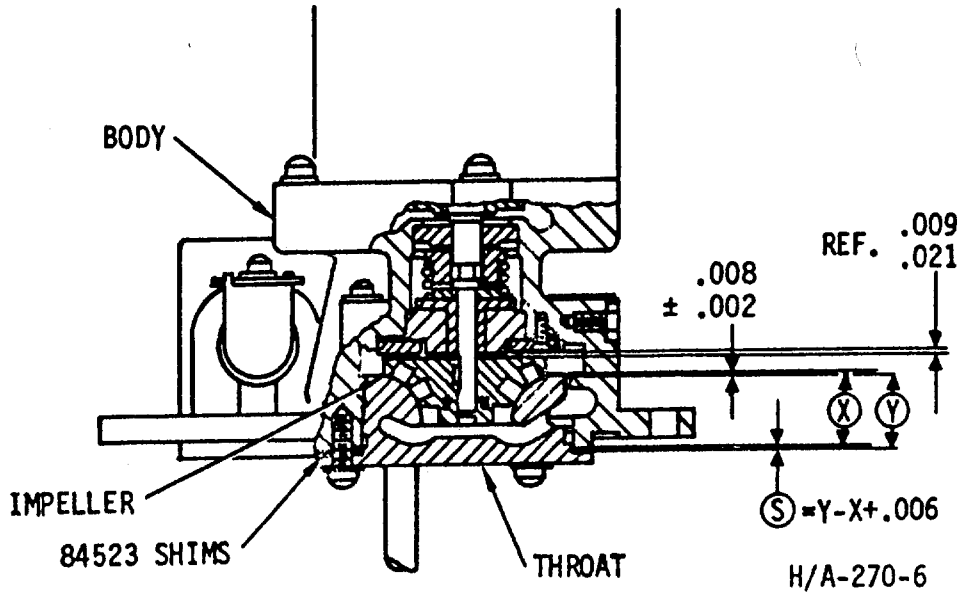
NOTE: If insufficient motor speed is observed, refer to Trouble-shooting Chart, Table 801 for cause of trouble and remedy. Correct condition before proceeding with reassembly of pump (see Assembly paragraph A. 7).

(8) Turn pump motor upside down and install packing (37) on stationary seal (36), and install seal on armature assembly shaft.

(9) Install packing (38) on armature assembly shaft.

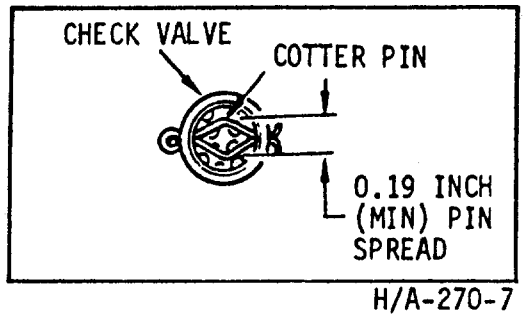
(10) Carefully install shaft rotating seal (35) and shaft seal drive (33) on armature assembly shaft. Place spring (34) over shaft on rotating seal; then install adaptor (32), bushing (31) and retainer (28). Secure retainer to body with screws (29).

(11) Install shaft key (26) on armature assembly shaft. Install impeller (27) and secure on shaft with locknut (25). Torque locknut to 5. 50 ±0. 50 inch-pounds.



NOTE: Rotate impeller and shaft by hand to check for binding. Impeller must rotate freely.

(12) Determine end play of shaft of armature assembly (71) by pushing shaft down by hand until it bottoms and measuring depth of shaft end with depth gage. Pull shaft up by hand to extreme height and again measure depth of shaft end; the difference between the two measurements is the shaft end play. Record this figure.



(13) To obtain required clearance between installed impeller (27) and throat (21), see Figure 503 and determine dimension "X" (distance from narrow spiral face of impeller blade at its extreme end to bottom face of pump body). Measure depth of throat (21), dimension "Y". See Figure 503 for applicable expression of shim (22) thickness "S" and add dimension obtained in step (12) to shim thickness.

(14) Peel off or add laminations to shim (28) as required and install correct shim thickness on throat, matching installation holes in shim and throat. Install packings (23, 24) in throat grooves.

(15) Reassemble check valve (8), if disassembled, install screen (7) and secure with cotter pin (6). See Figure 504 for cotter pin installation details.

Installation Details and Shimming
Figure 503

Cotter Pin Installation
Figure 504

(16) Check that flapper (12) operates freely, without binding. Load required to unseat flapper shall not exceed 0.0072 pound. Install check valve assembly (8) in pump body and secure with screw (9).

NOTE: Install check valve assembly (8) with hinge-pin side upward.

(17) Install screen (3) and secure with washers (5) and screws (4). Lockwire screws (4) as noted during disassembly.

(18) Secure nameplate (1) to bottom of pump with screws (2), if removed during disassembly.

(19) Test reassembled unit as directed in paragraph 7.0 and calibrate as instructed in paragraph 7.A.(6)(b).

6.0 FITS AND CLEARANCES.

A. This section is not applicable to this manual. See ASSEMBLY, Section 5.0, for assembly clearances.

7.0 TESTING.

A. Proceed with testing and calibration as follows:

(1) Test Equipment.

(a) A fluid reservoir capable of pressurization and equipped with an AN4130-7 fitting must be available for mounting and submersion of pump.

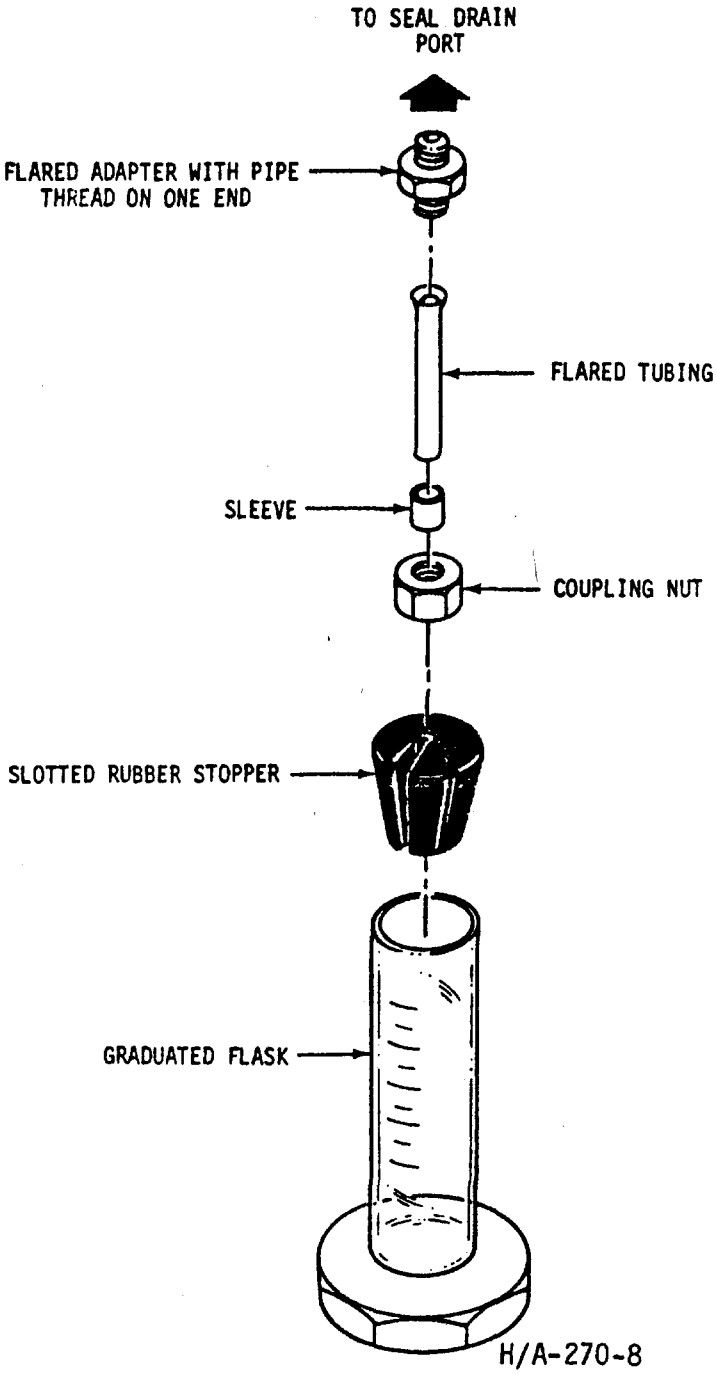
(b) See Figures 701 and 702 for test setup and related equipment.

(c) As test fluid, use solvent, Federal Specification P-D-680, Type I Stoddard solvent (formerly P-S-661). Fluid temperature +70° to +90°F (+21.1° to +32.2°C).

(d) Unless otherwise specified, all tests shall be conducted at ambient temperature between +60°F and +90°F (+15.6 to +32.2°C) and ambient atmospheric pressure.

(2) Pump Tests.

NOTE: During the following tests, check for seal leakage at seal drain port. There shall be none. Should leakage occur, disassemble pump to extent required to replace rotating seal (35, Figure 1101) and stationary seal (36).



(3) Wet Running-In.

NOTE: Fluid temperature shall not exceed 100°F during this test.

(a) Start fully submerged pump at rated voltage then immediately reduce voltage until current drops to 8.0 amperes maximum.

(b) Pumps to be run-in wet for 18 hours minimum. During run-in adjust voltage periodically to rated voltage. Do not exceed the 8.0 maximum ampere limit.

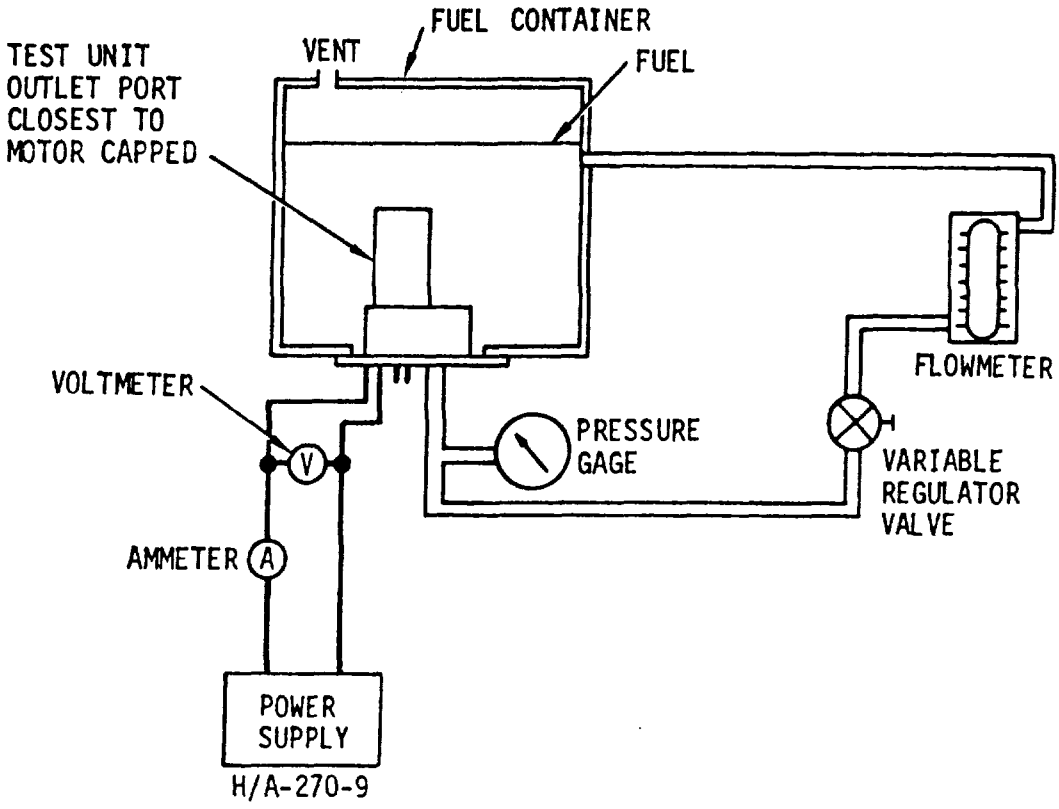
NOTE: The wet running-in test is completed when with rated voltage applied, the current does not exceed 8.0 amperes.

Shaft Seal Leakage Setup
Figure 701

(4) Shaft Seal Leakage. (See Figure 701.)

(a) This test to be conducted simultaneously with the running-in procedure for a minimum of 18 hours.

(b) At end of this time check that the total leakage at seal drain port shall not exceed 2.25 cc or 3 cc per 24 hours.



(5) External Leakage Test.

(a) Mount pump in suitable reservoir and connect the hydraulic test setup as illustrated in Figure 702. Fill reservoir with enough test fluid for complete submergence of fuel pump.

NOTE: Use dry cleaning (Stoddard) solvent, Federal Specification P-D-680, Type I, at +80°F ±10°F.

(b) Apply 15 psig air pressure to reservoir for five minutes and check for leakage at flange casting, seal drain port, motor vent, or any other external (exposed) surfaces of pump. There shall be no leakage allowable.

(c) Relieve air pressure from reservoir.

Test Setup
Figure 702

(6) Calibration.

CAUTION: IF CURRENT DRAIN FLUCTUATES NOTICEABLY, SHUT OFF MOTOR SINCE CURRENT FLUCTUATIONS MAY INDICATE MOTOR OVERHEATING. KEEP RESERVOIR FLUID COOL BY FANNING OR ANY OTHER CONVENIENT METHOD.

(a) With pump submerged in reservoir fluid, connect leads to a 28 vdc power supply as shown in Figure 702.

(b) Run pump for a minimum of 15 minutes at rated voltage. Record fluid, flow, pressure and amperes at two performance points. Adjust needle valve to allow zero and maximum (1.15 gpm) flow and calibrate pump so that the performance requirements listed in Table 701 are met without interruption or switching pump off and on.

TABLE 701. CALIBRATION PARAMETERS

Test Fluid	GPM	PSI	AMPS
P-D-680, Type I	0	33.6 Max	8.0 Max
P-D-680, Type I	1.15	22.0 Min	8.0 Max

NOTE: Pumps which exceed the maximum permissible amperes may be retested starting with paragraph A. (3) - Wet Running-In of Testing section.

8.0 TROUBLESHOOTING.

A. Trouble or test failure is normally traced by the nature of the malfunction.

(1) If fuel booster pump fails any any of the preceding tests, refer to Table 801, Troubleshooting Chart for probable cause and remedy.

(2) Replace parts as required and repeat all tests.

TABLE 801. TROUBLESHOOTING CHART

Trouble	Probable Cause	Remedy
Motor overheats Excessive current drain	Insufficient clearance between impeller (27) and body (81), and/or between impeller and throat (21)	Refer to Assembly paragraphs A. (13) and (14) for proper shimming; disassemble unit to extent required to check impeller clearances.
Insufficient motor rpm	Damaged bearing (52)	Replace damaged bearing.
	Coil assembly (47) and armature (71) binding, or damaged parts	Remove any foreign matter caught between coil and armature. Check these parts for damage; replace if damaged.
Pump delivery above or below desired values	Improper shimming	Refer to Assembly paragraphs (12 through 14) and correct impeller clearances.
	Damaged impeller (27) and/or throat (21)	Replace damaged part or parts.
Erratic operation of pump	Damaged electrical parts	Replace all electrical parts.
Pump fails to deliver any flow	Incorrect brush wiring (incorrect pump rotation)	See Figure 101 for correct brush wiring.
Fluid leakage through seal drain	Damaged seals (35, 36)	Replace seals.
Leakage at throat	Damaged packings (23, 24) Damaged throat (21)	Replace packings. Replace damaged throat.

9.0 STORAGE INSTRUCTIONS.

A. Prepare pump for storage or shipment as follows:

(1) Visually check pump for damage.

(2) Flush pump with preservative lubricating oil and install plastic plugs in accordance with MIL-C-5501.

(3) Encase pump in polyethylene bag, wrap in barrier material MIL-B-121 and place in a padded carton PPP-B-636 or equivalent.

(4) Use desiccant MIL-D-4364 as required, seal carton and stamp part number, serial number and date of overhaul on outside of carton.

10.0 SPECIAL TOOLS, FIXTURES AND EQUIPMENT.

A. No special tools, or fixtures are required. Refer to TESTING, section 7.0, and Figures 701 and 702 for test equipment required.

11.0 ILLUSTRATED PARTS LIST.

A. This section lists and illustrates parts for Fuel Booster Pump Assembly, Part No. 72368-1.

(1) Using the Parts Breakdown.

(a) This section is a breakdown of assemblies and detail parts of the unit. Index numbers on the exploded view illustration accompaying the parts breakdown indicate the order of disassembly of the unit for maintenance purposes. Component parts are indented to show relationship to the complete assembly.

(b) The Units Per Assy column of the parts breakdown indicates the quantity of each part required for the next higher assembly. The letters AR in this column indicate that the part is used as required. Letters
purposes.

(c) The Usable on Code column contains an alphabetical code which indicates applicability and interchangeability of parts. Where no code appears the part is applicable to all articles.

(d) Part numbers and description in the parts breakdown identify each part. The index numbers in the parts breakdown refer to the accompanying exploded view, and are used for locating a part after the part has been found in the illustration.

(e) Attaching parts are listed immediately beneath the item to be attached and preceding any detail part of the item. The caption "ATTACHING PARTS" is placed on the line immediately above the listing of attaching parts. The separation symbol "***" follows the listing of attaching parts in order to distinguish between attaching parts and subsequent listings of parts with the same indention or detail parts of the next indention to the right.

(2) Manufacturer's Codes.

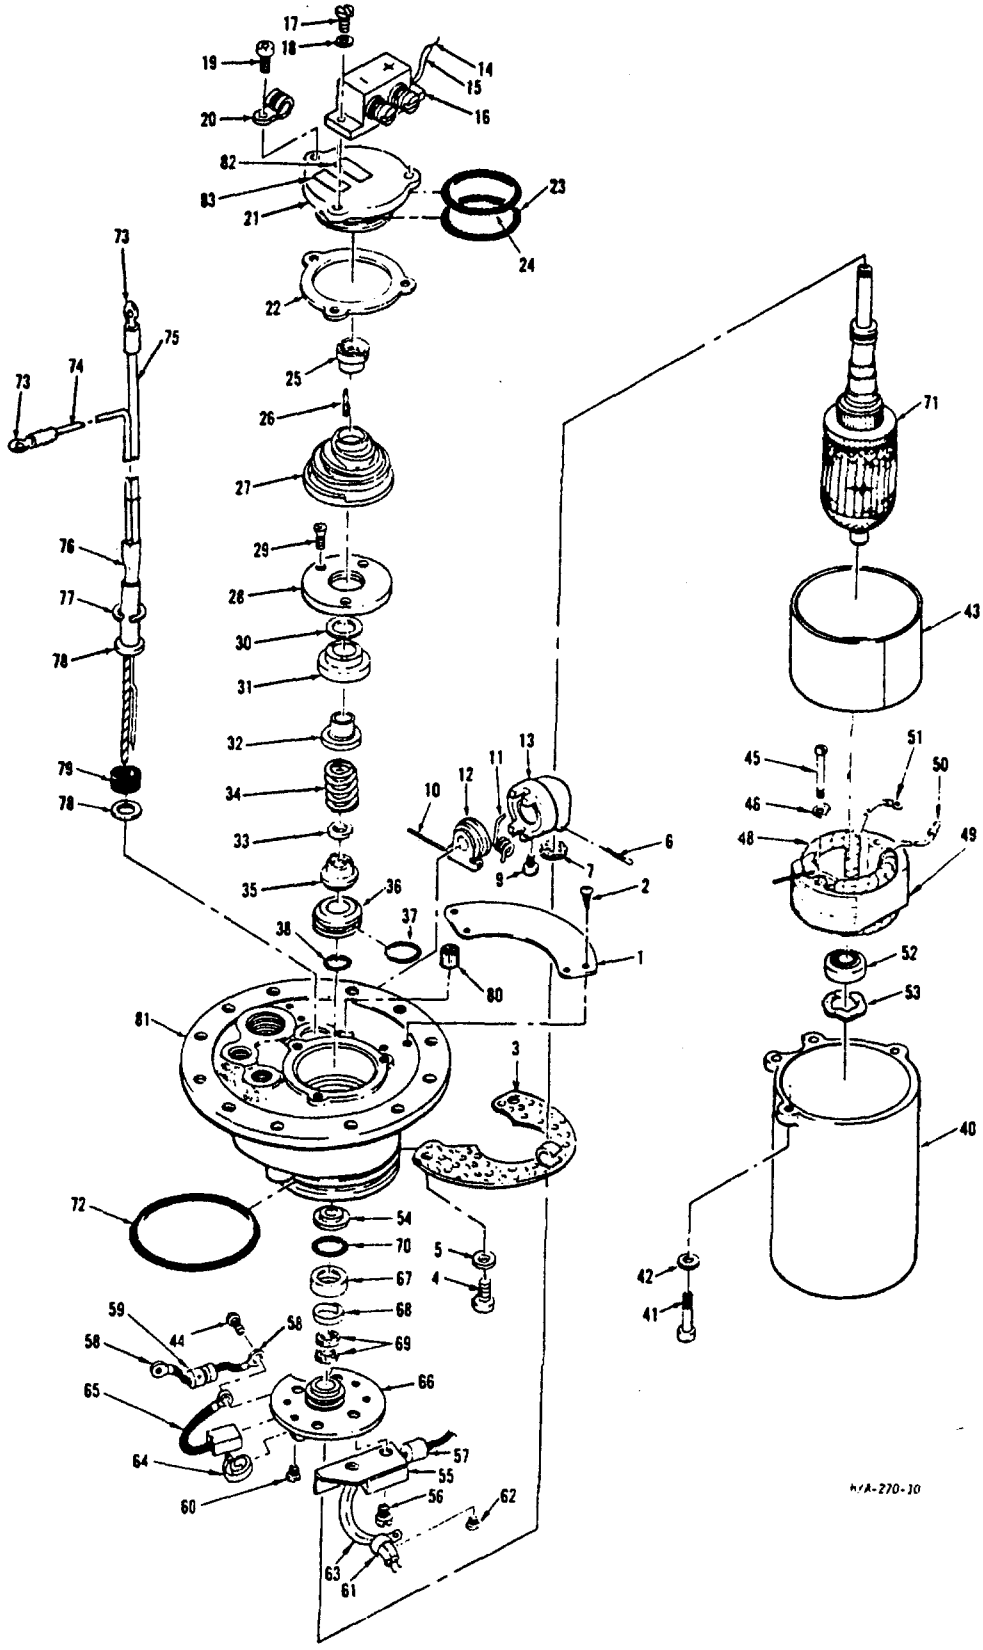
(a) Manufacturer's code numbers are used in the parts breakdown to indicate original equipment procurement sources. These code numbers are placed in parenthesis following the part name in the Description column of the parts breakdown. No manufacturer's code following the part number indicates the part source is Hydro-Aire Division, Crane Co.

(b) Manufacturer's code numbers are in accordance with the Federal Supply Code for Manufacturers Cataloging Handbook H4-1 and H4-2. The codes, names and addresses of the manufacturers are listed numerically as follows:

Code	Manufacturer and Address
03038	Long-Lok Corporation Los Angeles, CA 90066
43334	New Departure, Hyatt Division General Motors Sandusky, OH 44870
81982	Hydro-Aire Division Crane Co. Burbank, CA 91504
83930	DeLaval Adel Fasteners Division Huntington, West Virginia 25704
88044	Aeronautical Standards Group Department of Navy and Air Force
96906	Military Standard Promulgated by Standardization Division Directorate of Logistic Services DSA

(3) Model.

(a) This parts list covers Hydro-Aire Fuel Booster Pump, Part No. 72368-1.



(4) General System of Assembly Order.

1 2 3 4 5 6 7

Installation
- Detail Parts for Installation
- Assembly
- Attaching Parts for Assembly
  - Detail Parts for Assembly
  - Subassembly
  - Attaching Parts for Subassembly
    - Detail Parts for Subassembly
    - Sub-Subassembly
    - Attaching Parts for Sub-Subassembly
      - Detail Parts for Sub-Subassembly

Parts are listed in general order of disassembly, with the exception of attaching parts. Attaching parts are captioned as such and follow immediately after the part they attach and are separated from the other detail parts by the symbol "***".

SERVICE BULLETIN LIST

SERVICE BULLETIN NO.	DATE INCORPORATED	SERVICE BULLETIN NO.	DATE INCORPORATED

INTRODUCTION

This publication is issued to provide instructions to overhaul the Fuel Booster Pump Assembly Part No. 71383-2, manufactured by Hydro-Aire Division, Crane Co., Burbank, California 91510 U.S.A.

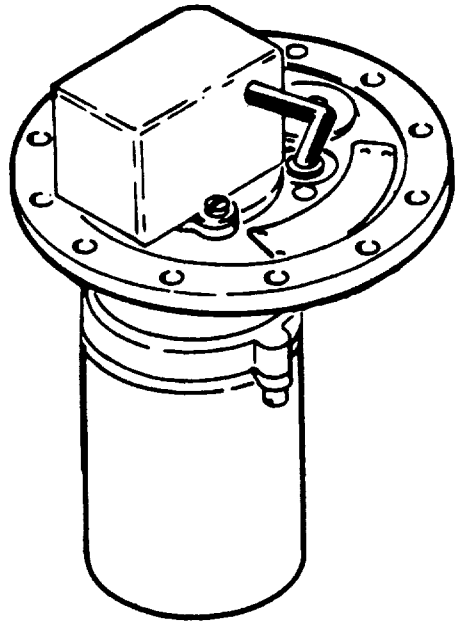
The information in this manual is divided into sections in accordance with Air Transport Association Specification 100, to enable maintenance personnel to disassemble, clean, inspect/check, repair, assemble, troubleshoot and test the pump. An illustrated parts list is provided to locate, identify and requisition parts.

To ensure that coverage contained in this handbook will reflect changes in the pump overhaul concepts and procedures, revised information is provided to the customer through a letter of transmittal. The letter includes highlight pages which identify changed pages.

Warnings, Cautions and Notes are used to emphasize information throughout this publication. Warnings must be followed to avoid injury or death to persons. Cautions must be followed to avoid equipment damage, and Notes call attention to work simplification, or additional information.

The following special terms and/or abbreviations are used in this publication.

°F	Degrees Fahrenheit	MAX	Maximum
ASSY	Assembly	pph	Pounds Per Hour
cc	Cubic Centimeter	psi	Pounds Per Square Inch
EFFECT	Effectivity	psig	Pounds Per Square Inch Gage
FIG	Figure	REV	Revision
FTP	Functional Test Procedure	rpm	Revolutions Per Minute
gpm	Gallons Per Minute	vdc	Volts Direct Current
MIN	Minimum		



0. DESCRIPTION AND OPERATION

A. DESCRIPTION (See Figure 1)

Fuel Booster Pump, Part No. 71383-2 is a rotary, power-driven screw type pump. The self-contained source of power is an electrically driven, explosion-proof motor whose main components are a field coil and armature. The pump is also equipped with a radio noise filter.

B. PURPOSE AND LEADING PARTICULARS

The purpose of the fuel booster pump is to transfer fuel from the fuel system reservoir into feed lines at a specified design flow and pressure while submerged in the reservoir. Leading particulars are listed in Table 1.

Fuel Booster Pump - Assembled View
Figure 1

C. OPERATION

The field coil provides the flux which causes the armature to rotate when an electric current is made to flow through the system. Rotation of the armature turns the screw-type impeller enclosed in the pump chamber, thus creating the pump action.

TABLE 1. LEADING PARTICULARS

Pump Mounting Position	Motor upward; major axis vertical
System Fluid	Fuel per Spec MIL-J-5624 (JP-4)
Rated Flow	450 pph at 24 psig (min)
Power Input	8.0 amps (max) at 28 vdc
Motor Duty Cycle	Continuous
Zero Flow	33.6 psig (max)
Dimensions	2.64 inch diameter to 5.25 inch diameter x 7.0 inch high
Weight (dry)	4.2 pounds

1. DISASSEMBLY (See Figure 1101)

Prior to disassembly, perform the procedures in Section 7, Testing, to determine extent of disassembly required to repair or replace components.

Disassembly may be accomplished using tools and equipment normally available at maintenance facilities. Special tools, fixtures and equipment, if specified, are listed in Table 1001.

WARNING: AVOID SPILLING FUEL. DO NOT ALLOW ANY FUEL TO REMAIN IN PUMP CHAMBERS OR PASSAGES. KEEP PUMP AWAY FROM OPEN FLAME.

CAUTION: PLACE ALL PARTS IN CLEAN COVERED CONTAINERS. KEEP PARTS (1 THROUGH 29) AND PARTS (31 THROUGH 64) SEPARATED.

A. Do not remove nameplate (1) unless replacement is necessary.

B. After removing check valve assembly (11 through 14), disassemble only if replacement of a component is necessary.

C. When removing shim (17), record thickness of shim laminations for use during reassembly.

D. To remove locknut (20), hold impeller with wrench T47492 to prevent armature assembly (60) from turning. Then use screwdriver T5644, and unscrew locknut. After removal of locknut, pull impeller (22) from armature shaft, then remove key (18). Prevent loss of key by carefully removing impeller.

E. If shims (23) are removed from armature (60) shaft between impeller (22) and drive (25), record number and thickness of shims removed to facilitate reassembly.

CAUTION: REMOVE SEAL (28) FROM ARMATURE ASSEMBLY (60) SHAFT CAREFULLY TO AVOID DAMAGE TO LAP SEAL FACE.

F. Remove seal (28) from armature assembly (60) as follows:

(1) Prepare a soft wire lifter, horseshoe shaped, with flattened ends bent inward approximately 90 degrees.

(2) Insert wire lifter ends between seal (28) and pump body (64), then pull seal out of body bore.

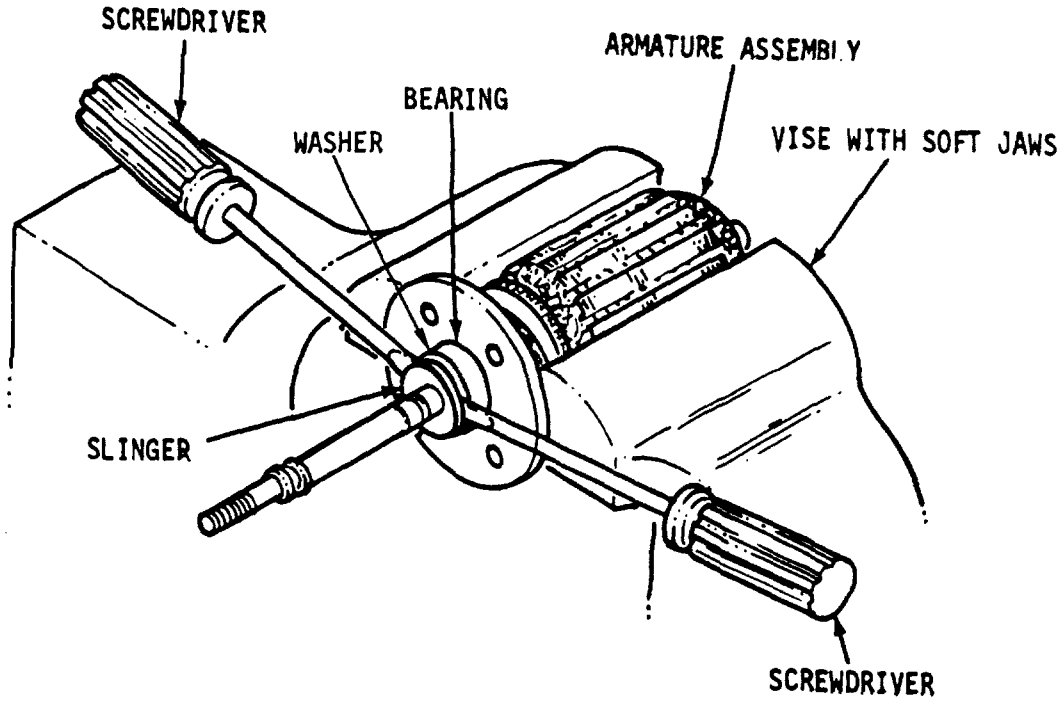
CAUTION: LIFT MOTOR COVER ASSEMBLY (31) FROM PUMP BODY (64) CAREFULLY BY TWISTING SLIGHTLY AND PULLING SIMULTANEOUSLY TO AVOID DAMAGE TO ELECTRICAL LEADS AND TO FIELD COIL ASSEMBLY (45 THROUGH 48).

G. Remove four screws (32) and washers (33), then lift motor cover assembly (31) away from body (64) far enough to gain access to two screws (35) which connect electrical leads to brush holder plate assembly (59). Identify positive lead of field coil assembly (45 through 48) with a dab of paint or other means before disconnecting leads. The positive lead of the coil assembly is connected with the black lead wire of filter (38).

H. Remove two screws (36) and two key washers (37) securing field coil assembly (45 through 48) to motor cover assembly (31); then remove field coil assembly from motor carefully to avoid damage to coil assembly. Do not disassemble field coil assembly. If any part requires replacement, replace entire assembly.

NOTE: Remove field coil assembly (-44) only if replacement is necessary.

I. Remove four screws (51) securing brush holder plate assembly (59) to body (64) then lift armature assembly (60) with parts (52, 53, 55, 56, 57, 58, 59) attached from body (64) of pump. Discard screws (51).



J. Remove slinger (53) from armature assembly (60) shaft by holding armature in a vise with soft jaws as shown in Figure 101. Use two screwdrivers placed opposite each other between slinger (53) and washer (54) and pry off from armature. Break swaged retaining ring (52) from armature shaft.

NOTE: Using corrosion preventative oil WD40, lubricate armature shaft at slingers and bearings several hours before disassembly.

K. Remove bearings (49, 55) carefully to avoid bending shaft or damaging shaft threads.

L. Do not remove springs (57) from brush holder plate assembly when replacing brushes (58). Remove brushes by lifting spring and sliding brush out of holder.

M. Do not remove flame arrester plug (63) from body (64) unless replacement is required. If plug is burned, clogged, or damaged in any way, it can be removed by drilling out of body.

Slinger Removal
Figure 101

2. CLEANING

The materials required for cleaning are listed in Table 201.

A. ULTRASONIC CLEANING PROCEDURE

WARNING: USE SOLVENT IN A WELL-VENTILATED AREA. AVOID BREATHING FUMES. KEEP AWAY FROM OPEN FIRE OR FLAMES.

CAUTION: DO NOT CLEAN ELECTRICAL PARTS USING THIS PROCEDURE OR DAMAGE TO PARTS MAY OCCUR.

(1) Place parts in wire baskets, or equivalent, keeping parts separated from each other. Immerse parts in cleaning solution within ultrasonic cleaning unit and keep parts submerged between 5 to 10 minutes.

B. VAPOR DEGREASING PROCEDURE

(1) Raise parts above solvent into condensing zone of degreaser and flush for 1 minute or more in vapors.

WARNING: WHEN USING COMPRESSED AIR, DIRECT AIRSTREAM AWAY FROM BODY AND OTHER PERSONNEL.

(2) Raise parts above cleaning container and allow to dry. Use clean, dry, compressed air to quicken drying.

NOTE: If use of compressed air is impractical, dry by wiping with a clean, lint-free cloth.

(3) Remove parts from basket with padded tongs.

(4) Check parts for cleanliness.

TABLE 201. CLEANING MATERIALS

Item	Number	Manufacturer or Specification
Isopropyl Alcohol	None	TT-I-735A
Lint-free Cloth	None	Commercial
Padded Tongs	None	Commercial
Soft-bristled Brush	None	Commercial
Solvent: Trichloroethylene		O-T-634B (Technical Grade)
Perchloroethylene (Tetrachloroethylene)	None	O-T-236B

Equivalent substitutes may be used.

3. INSPECTION/CHECK (See Figure 1101)

A. GENERAL.

Check all parts under strong light for cracks, nicks, and other damage. Make sure all passages are clean and unobstructed, threads undamaged and sealing areas free from scratches, pits, nicks, excessive wear, corrosion and other damage.

NOTE: Excessive wear is defined as any obvious deformation or deterioration of parts which may render the pump inoperative. If doubt exists concerning the condition of a part, replace the part.

B. INDIVIDUAL PARTS CHECK

(1) Verify condition of check valve assembly (11 through 14) to make sure that is not distorted, that flapper (13) is seated by spring (12) tension and that valve opens and closes smoothly without binding. Check security of installation of flapper (13) components.

(2) Check throat (15) for a minimum outside diameter (not a mounting section) of 1.809 inch. Check bore of throat for nicks or scratches which would indicate distortion of pump components and/or improperly installed impeller (22) or presence of foreign matter in impeller vanes.

(3) Check impeller (22) for broken, cracked or bent vanes.

(4) Check seals (26, 28) for condition of contact area by running fingernail across sealing surface and examining under magnification. There shall be no evidence of galling or roughness.

(5) Check alignment of spring (24) by rolling spring across a clean, smooth, flat surface. Spring shall not wobble. Test spring for stacking or fatigue by measuring free length and compressed length. Free length of spring shall be approximately 1,000 inch. Under a load of 1.806 to 2.006 pounds, compressed length shall be 0.280 inch.

NOTE: Flapper spring (12) and brush spring (57) if removed, must be replaced.

(6) Check field coil assembly (-44) for security of installation and condition of lead terminals. Check laminations for nicks or scratches which would indicate a distorted pump assembly or worn bearings (49, 55) causing armature assembly (60) to rub against coil assembly. Check condition of insulation on coil (leads). Measure coil resistance at 70°F; it shall be between 23.9 and 26.5 ohms.

(7) Check armature assembly (60) for smooth and shiny commutator surfaces and insulators between commutator bars recessed approximately 0.025 inch. Check shaft for evidence of excessive heat around bearing area. Check commutator with a growler for open windings.

(8) Check body (64) for warped mounting flange caused by unbalanced or excessive torque applied to installation bolts. Check body bore for evidence of incorrectly installed impeller (22) as indicated by nicks and/or heavy scratches.

4. REPAIR

The repair procedure for the pumps are only those necessary to make simple repairs. The necessary repair materials are listed in Table 401.

A. Replace all parts that do not pass inspection/check and are damaged beyond simple repair.

B. Replace all packings, key washers (37), motor brushes (58) and bearings (49, 55). Replace removed springs (12, 57).

CAUTION: DO NOT ATTEMPT TO REMOVE LIGHT SCRATCHES OR OTHER MINOR IMPERFECTIONS FROM COMMUTATOR BARS OR COIL LAMINATIONS BY POLISHING OR ANY OTHER METHOD TO PREVENT ALTERATIONS OF THE DESIGN GAP BETWEEN COIL AND ARMATURE. IF COIL ASSEMBLY (45 THROUGH 48) OR ARMATURE ASSEMBLY (60) IS OBVIOUSLY DAMAGED AS INDICATED BY HEAVY SCRATCHES, DISTORTION OF COMMUTATOR BARS OR COIL ASSEMBLY LAMINATIONS, REPLACE THE PART.

C. Replace coil assembly (-44) and/or armature assembly (60) if electrical requirements specified for these parts are not met.

D. Install armature assembly (60) in standard lathe and using diamond tool, resurface commutator removing not more than 0.003 inches of material. Diameter of commutator must not be less than 0.860 inches minimum after resurfacing. (If resurfacing does not clean up commutator, replace the new armature). After resurfacing, undercut commutator to remove all mica slivers, using 0.020 inch wide cutter, 0.025 inch deep.

E. After repair, check armature on growler for continuity and shorts.

CAUTION: DO NOT USE ABRASIVE CLOTH P-C-458 ON ALUMINUM OR MAGNESIUM PARTS AS IT CONTAINS AN IRON OXIDE WHICH CAUSES RAPID OXIDATION OF THESE METALS.

F. Polish out minor nicks and scratches on noncritical steel surfaces with abrasive cloth. Polish out minor nicks and scratches on aluminum parts with carbide abrasive cloth, provided that critical mating surfaces are not damaged.

NOTE: After abrasive cloth has been used, ultrasonic clean parts as outlined in Section 2, Cleaning.

G. Use thread chaser or tap to repair stripped threads (2 threads maximum) at port and attachment points.

H. Touch up worn or reworked anodized surfaces on aluminum parts as follows:

(1) Remove soiled and oxide film by swabbing surface with acid solvent cleaner (1 volume Deoxidine 624 to 3 volumes water mixed at room temperature), allowing a 1 to 3 minute solution contact time. Keep entire rework surface wet.

(2) Rinse by swabbing with clean wipers or sponges soaked in water. Repeat at least twice, wringing out wipers or sponges after each rinse.

WARNING: ALL CLOTH APPLICATORS USED OF ALODINE 1000L SOLUTION SHALL NOT BE ALLOWED TO DRY OUT. WHEN DRY, EACH CONSTITUTES AN EXTREME FIRE HAZARD. RINSE THOROUGHLY IN WATER WHEN ALODINE APPLICATION IS COMPLETE.

(3) Apply alodine coating (3 volumes of alodine 1000L concentrate to 2 volumes of water) evenly and liberally with a clean, soft, lint-free cloth. Do not apply solution like paint, but thoroughly wet reworked surface to be alodined.

(4) Allow alodine coating to air dry as follows:

Ambient Temperature (°F)	100	90	80	70	60
Alodine Coating Contact (minutes)	2.25	2.8	4.0	5.5	10

NOTE: Do not touch new alodine surface until dry, as fresh alodine films are easily damaged.

(5) Swab off and rinse with cellulose sponge or clean, soft cloth saturated with clean water. Use blotting motion or very gentle swabbing to prevent damage to fresh alodine film. Wring out sponge or cloth and repeat rinsing at least twice, blotting any pools of water.

TABLE 401. REPAIR MATERIALS

Item	Number	Manufacturer or Specification
Acid-Solvent Cleaner	Deoxidine 624	V84063
Alodine Coating	Alodine 1000L (Liquid Concentrate)	V84063
Abrasive Cloth, Aluminum Oxide	600 to 800 Grit	P-C-451
Abrasive Cloth	None	P-C-458

Equivalent substitutes may be used.
Refer to Table 1101 for vendor name and address.

5. ASSEMBLY (See Figure 1101)

Assembly may be accomplished using tools and equipment normally available at maintenance facilities. Special tools, fixtures and equipment, if specified, are listed in Table 1001.

CAUTION: ASSEMBLY SHOULD BE ACCOMPLISHED IN A WELL-LIGHTED, DUST-FREE AREA. ALL PARTS SHOULD BE THOROUGHLY CLEANED PRIOR TO ASSEMBLY.

A. Install washer (40) over lead shielding (43) on filter (38) wire lead. Insert lead through grommet (41) and washer (42). Slide grommet and washers down on wire lead until washer (42) is held between grommet and lead shielding. Carefully insert lead into passage in body (64) and pull lead out of upper face of body. Pull lead through until grommet and washers are seated in body passages, then install retaining ring (39).

B. Solder terminals (62) to each wire.

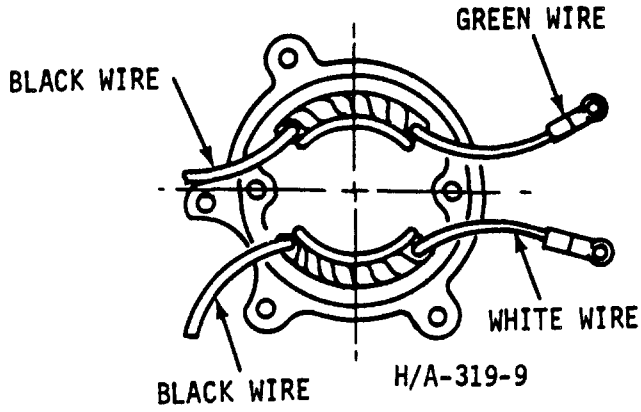
C. Assemble parts (52 through 60) and carefully position armature assembly (60) on body (64). Insert lead through opening in plate assembly (59), then secure with screws (51) which attach brush holder plate assembly (59) to body.

D. Install spring washer (50) and bearing (49) in recessed bottom of cover (31) internal boss.

CAUTION: CONNECT WHITE WIRE OF LEAD AND UNMARKED LEAD OF COIL ASSEMBLY TO NEGATIVE (GROUNDED) SIDE OF BRUSH HOLDER PLATE ASSEMBLY (59). CONNECT BLACK WIRE OF LEAD AND BLACK-MARKED LEAD OF COIL ASSEMBLY TO POSITIVE (INSULATED) SIDE OF BRUSH HOLDER PLATE ASSEMBLY (59).

E. Install field coil assembly (-44) in cover (31) and secure with key washers (37) and screws (36). Tighten screws and bend washer tab against flat of screw heads. Install insulator (34). See Figure 501.

F. Connect leads of field coil assembly (45 through 48), each wire of filter (38) lead, and leads of brush assemblies (58) to brush holder plate assembly (59) with screws (35).



G. Perform following motor tests before continuing reassembly procedures.

(1) Dielectric Strength Test

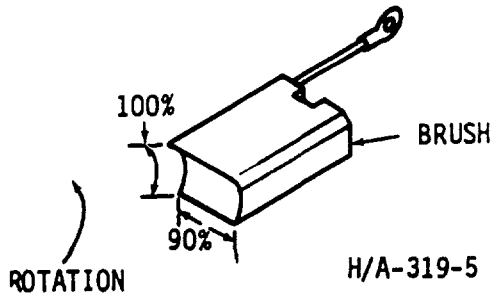
NOTE: Grounded motors must be ungrounded during this test. Disconnect leads from brush holder terminal and remove negative brush.

(a) Apply 500 volts (rms), 60 Hz ac between positive brush holder and cover (31) or body (64) for 15 seconds.

(b) There shall be no flashover or any evidence of damage.

Field Coil Installation
Figure 501

(2) Brush Run-In



(a) Replace negative brush in brush holder plate assembly making certain it contacts commutator.

(b) Connect motor to a direct-current power source.

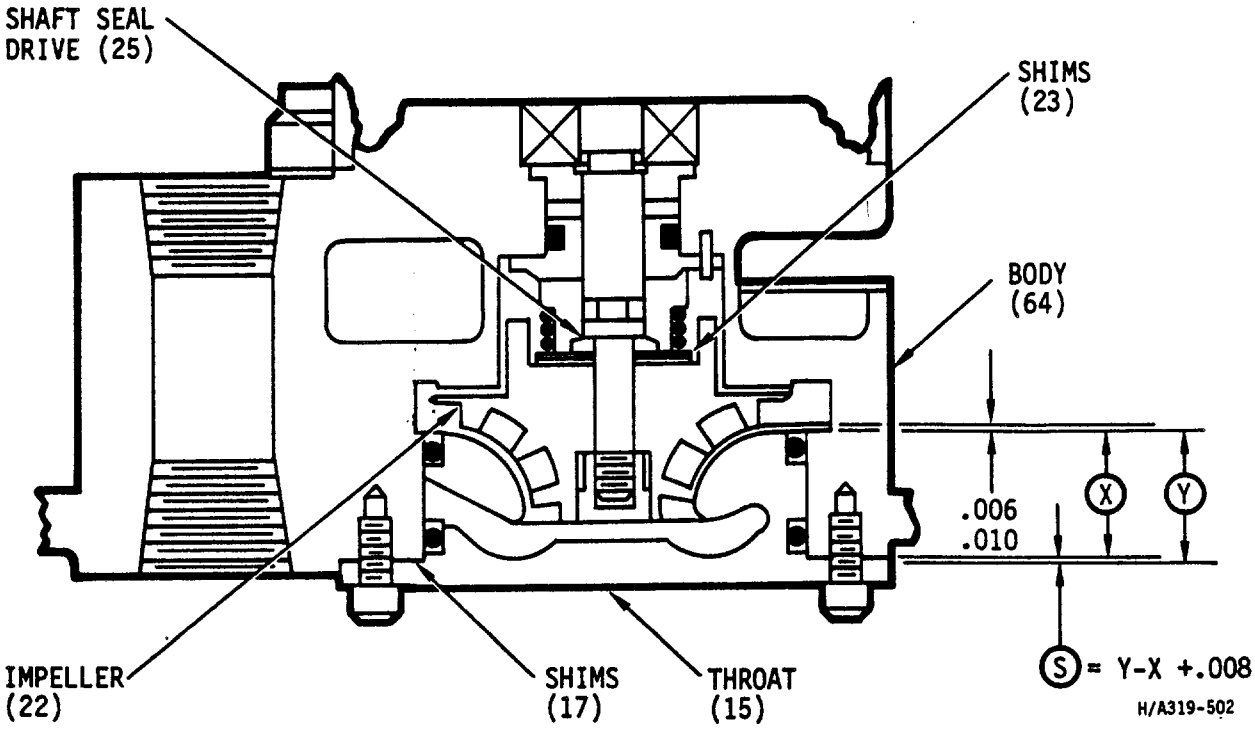
(c) Operate motor, unloaded, for 30 minutes. Check for armature balance. Motor must operate smoothly and direction of rotation (as viewed from shaft end) shall be clockwise. No-load speed shall not exceed 13,200 rpm at 27 volts dc.

(d) Adjust power supply to deliver voltage required to reduce no-load speed to 10,400 rpm and allow motor to run until 100 percent brush contact in direction of rotation is obtained with approximately 90 percent of total area in contact. See Figure 502.

NOTE: Run-in time to be 18 hours minimum. Brush contact to be determined by sampling inspection.

Brush Run-In
Figure 502

H. Turn pump motor upside down and install packing (29) on seal (28) and install seal on armature assembly shaft.



I. Install packing (27) on armature assembly shaft.

j. Carefully install shaft rotating seal (26) and shaft seal drive (25) on armature assembly shaft.

K. Install spring (24) and shaft key (21) on armature assembly shaft. Install impeller (22) and secure on shaft with locknut (20).

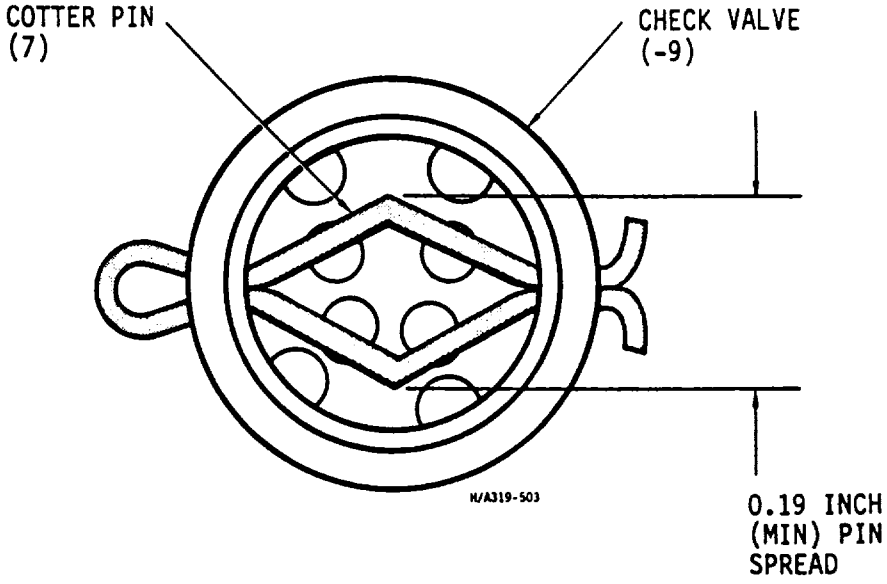
NOTE: Rotate impeller and shaft by hand to check for binding. Impeller must rotate freely.

L. To obtain required clearance between impeller (22) and throat (15), see Figure 503 and determine dimension X. With motor resting on bearing, measure distance from front vane surface of impeller to bottom face of pump body. Measure depth of throat (15) from inner flange to end of throat, dimension Y. See Figure 503 for applicable expression of shim (17) thickness S.

Shim Installation
Figure 503

M. Peel off or add laminations to shim (17) as required. Install correct shim thickness on throat matching installation holes in shim and throat. Install packings (19) in throat grooves and secure throat and filter (38) to body with screws (16).

N. If disassembled, reassemble check valve assembly (-9). Install screen (8) and secure with cotter pin (7). See Figure 504 for cotter pin installation details.



O. Check that flapper (13) operates freely without binding. Load required to unseat flapper shall not exceed 0.0072 pound. Install check valve assembly in pump body and secure with screw (10).

NOTE: Install check valve assembly with hinge-pin side upward.

P. Install screen (3) and secure with one screw (6), washers (5) and screws (4). Safetywire screws (4, 10) as noted during disassembly.

Q. Secure nameplate (1) to bottom of pump with screws (2).

R. Test completed assembly in accordance with Testing, Section 7.

Cotter Pin Installation
Figure 504

6. FITS AND CLEARANCES

A. This section is not applicable to this manual. See Assembly section for assembly clearances.

7. TESTING (FTP 71383-2, REV E)

1.0 TEST EQUIPMENT

The following test equipment shall be used to perform the required tests.

1.1 A fluid reservoir capable of 15 psi pressurization and equipped with an AN4130-7 fitting must be available for mounting and submersion of pump.

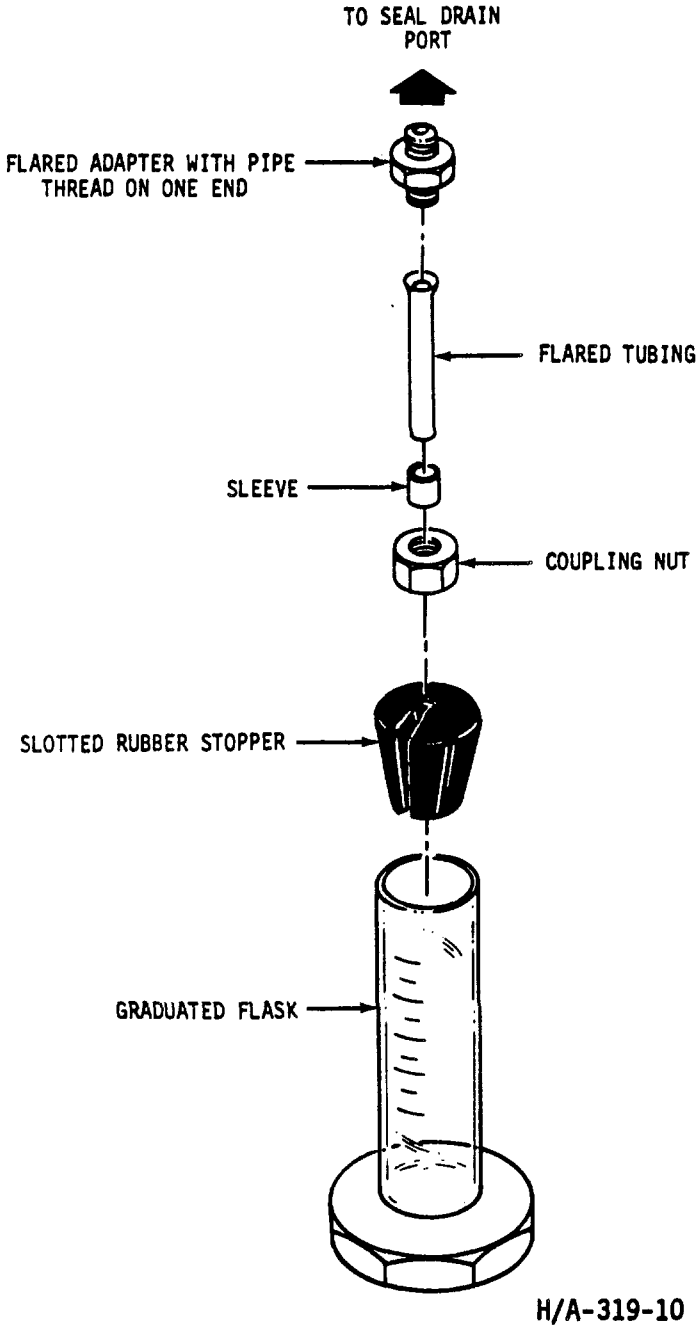
1.2 See Figures 701 and 702 for test setup and related equipment.

1.3 Test fluid shall be solvent, P-D-680, Type I, Stoddard solvent. Fluid temperature not to exceed 100°F.

NOTE: During following tests, check for seal leakage at seal drain port. There shall be none. Should leakage occur, disassemble pump to extent required to replace rotating seal (26) and stationary seal (28).

2.0 SHAFT SEAL LEAKAGE TEST (See Figure 701)

2.1 Start fully submerged pump at rated voltage then immediately reduce voltage until current drops to 7.5 amperes maximum.



2.2 Pumps shall be run for 18 hours minimum. During this entire test, adjust voltage periodically to rated, but at same time not exceeding 7.5 maximum ampere limit.

2.3 At end of this time, total leakage at seal drain port shall not exceed 0.75 cc or 1 cc in 24 hours.

3.0 EXTERNAL LEAKAGE TEST

3.1 Mount pump in suitable reservoir and connect to test setup as shown in Figure 702. Fill reservoir with enough test fluid to completely submerge fuel pump.

NOTE: Use aviation gasoline, MIL-G-5572 or solvent, P-D-680, Type I at 100°F maximum.

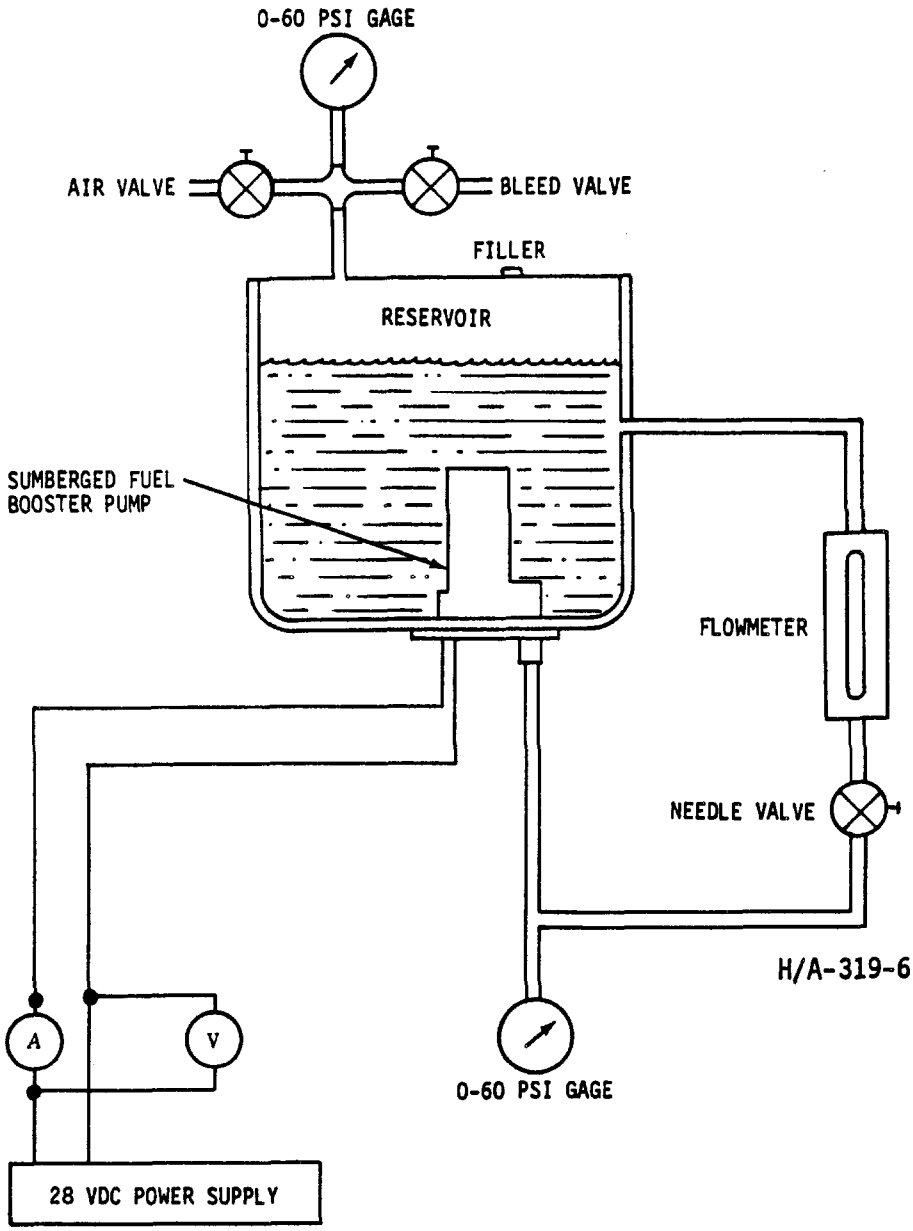
Shaft Seal Leakage Setup
Figure 701

3.2 Apply 15 psi air pressure to rerservoir for 5 minutes and check for leakage at flange casting, seal drain port, motor vent or any other external (exposed) surfaces of pump. No leakage allowable.

CAUTION: IF SHAFT LEAKAGE OCCURS, DRAIN PORT MUST BE THOROUGHLY DRAINED BEFORE ATTITUDE OF PUMP IS CHANGED FROM DRAIN-PORT-DOWN POSITION TO PREVENT FUEL (OR SOLVENT) FROM COMING INTO DIRECT CONTACT WITH MOTOR BEARING.

3.3 Relieve air pressure from reservoir.

4.0 CALIBRATION



CAUTION: IF CURRENT DRAIN FLUCTUATES NOTICEABLY, SHUT OFF MOTOR SINCE CURRENT FLUCTUATIONS MAY INDICATE MOTOR OVERHEATING. KEEP RESERVOIR FLUID COOL BY FANNING OR ANY OTHER CONVENIENT METHOD.

4.1 With pump submerged in fluid, connect lead to a 28 vdc power supply as shown in Figure 702.

4.2 Slowly apply voltage to pump motor to a maximum of 28 volts and observe current drain. Current drain shall not exceed 8.0 amperes. Allow pump to run for a maximum of 20 minutes. Adjust needle valve to allow zero and maximum (1.15 gpm) flow and calibrate pump so that performance requirements listed in Table 701 are met without interruption or switching pump off and on.

TABLE 701. CALIBRATION PARAMETERS

Gpm	Psi	Amps
0	33.6 max	8.0 max
1.15	22.0 min	8.0 max

Test Setup
Figure 702

8. TROUBLESHOOTING

Troubleshooting information is contained in Table 801. This table is not all inclusive, however, it does contain the causes of malfunctions most likely to occur.

TABLE 801. TROUBLESHOOTING INFORMATION

Trouble	Probable Cause	Remedy
Motor overheats	Insufficient clearance between impeller (22) and throat (15)	Disassemble unit to extent required to check impeller clearance.
	Damaged bearings (49, 55)	Replace damaged bearings.
Insufficient motor rpm	Coil assembly (45) through (48) and armature (60) binding or damaged parts	Remove any foreign matter caught between coil and armature. Check parts for damage. Replace if damaged.
	Improper shimming	Correct impeller clearance.
Pump delivery above or below	Damaged impeller (22) and/or throat (15)	Replace damaged part or parts.
Erratic operation of pump	Damaged electrical parts	Replace all electrical parts.
Pump fails to deliver any flow	Incorrect brush wiring (incorrect pump rotation)	Correct brush wiring.
Fluid leakage through seal drain	Damaged seals (26, 28)	Replace seals.
Leakage at throat	Damaged packings (18, 19)	Replace packings.
	Damaged throat (15)	Replace damaged throat.

9. STORAGE INSTRUCTIONS

A. Flush pump with preservative oil and install plastic plugs in accordance with MIL-C-5501.

B. Encase pump in polyethylene bag, wrap in barrier material MIL-B-121 and place in a padded carton PPP-B-636 or equivalent.

C. Use desiccant MIL-D-4364 as required. Seal carton and stamp part number, serial number and date of overhaul on outside of carton.

10. SPECIAL TOOLS, FIXTURES AND EQUIPMENT

The test equipment required to test the pump is listed under "Test Equipment" in Section 7, Testing. Maintenance can be accomplished with the use of special tools listed in Table 1001, as well as those normally available at maintenance facilities. The tools may be obtained from the manufacturers indicated.

TABLE 1001. SPECIAL TOOLS, FIXTURES AND EQUIPMENT

Part Number	Description and Manufacturer	Application
T56644	Screwdriver (V81982)	Remove and install locknut.
T47492	Impeller Wrench (V81982)	Hold impeller.

11. ILLUSTRATED PARTS LIST

A. PURPOSE

The Illustrated Parts List is intended to assist customer personnel in requisitioning, storing and issuing the replaceable components and in identifying new and reclaimed parts. It is not approved for any other purpose.

The Illustrated Parts List does not list or illustrate parts which lose their identity by being permanently welded or riveted to other pieces, items made from raw (bulk) stocks, such as cut to lengths of conduit, electric leadwire, lockwire, etc.

B. HOW TO USE THE PARTS LIST

The figure number on the parts list refers to the corresponding illustration.

The number in the FIG. ITEM column corresponds to the item number pointing to the part on the corresponding illustration.

A vendor's part is identified by the vendor's part number in the PART NUMBER column and the vendor's Federal Supply Code number following the part description in the NOMENCLATURE column.

Quantities specified in the UNITS PER ASSY column are the total number of each part required per assembly or subassembly and are not necessarily the total used per complete end item assembly.

RF in the UNITS PER ASSY column indicates the item is listed for reference purposes.

AR in the UNITS PER ASSY column indicates parts are used as required.

The EFFECT CODE column contains one or more code letters indicating the configuration to which an assembly or part applies. When no code letter appears in the column, the part is common to all units.

C. GENERAL SYSTEM OF ASSEMBLY ORDER

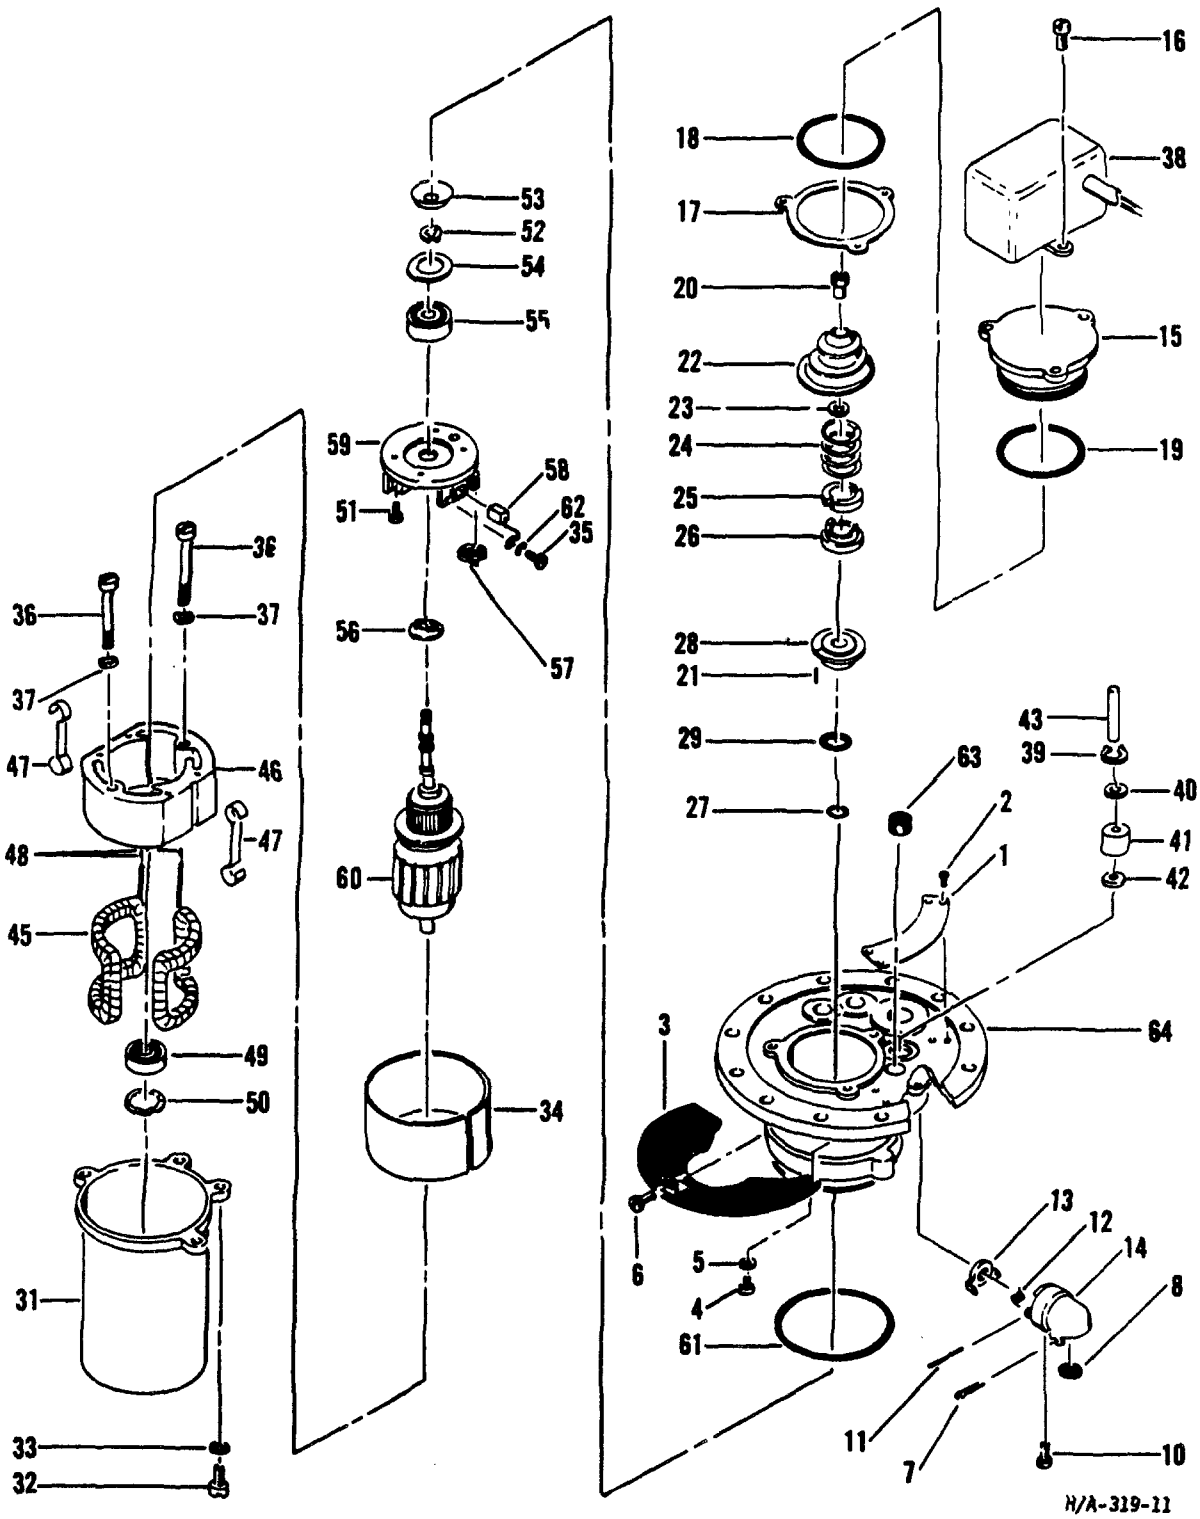
The indention system used in this illustrated parts list shows the relationship of one part to another. Each unit listed is followed immediately by a listing of its component parts. For a given item, the

indention code shows a system, installation or general heading starting in the extreme left position continuing on down into succeeding columns until the end detail is reached, as follows:

1234567

Installation Assembly (RF) Number
.Detail Parts for Installation
.Assembly
.Attaching Parts for Assembly
***
..Detail Parts for Assembly
..Subassembly
..Attaching Parts for Subassembly
***
...Detail Parts for Subassembly
...Sub-subassembly
...Attaching Parts for Sub-subassembly
***
....Detail Parts for Sub-subassembly

Parts are listed in general order of disassembly, with the exception of attaching parts. ATTACHING PARTS are captioned as such and follow immediately after the part they attach and are separated from other detail parts by the symbol ***.



D. VENDORS' CODE

Vendor parts used, unaltered by Hydro-Aire, are listed by vendor part number, vendor description and vendor code. Vendors' code symbols used in this publication are taken from Federal Supply Code of Manufacturers Cataloging Handbook H4-1 and H4-2. Following is a numerically arranged list of vendor codes used in this publication.

TABLE 1101. VENDOR CODE LIST

Vendor Code	Vendor Name and Address
V03038	Long Lock Corporation Santa Monica, CA
V81982	Hydro-Aire Division Crane Co. Burbank, CA

GAGE PRESSURE SWITCH 8G361-1 OVERHAUL MANUAL

1. DESCRIPTION AND OPERATION

Model 8G361-1 is a pressure actuated switch designed to sense gage pressure. Pressure is applied to a diaphragm. The resultant force created by the gage pressure is conveyed to a negative rate disc spring by a pressure plate. When the increasing gage pressure reaches a preset actuation point, the disc spring snaps over center allowing the pressure plate to actuate the electrical assembly. Upon decreasing gage pressure, at a preset value below the actuation point, the disc spring snaps back to its original position returning the pressure plate and electrical assembly to their original positions.

This model is used on commercial aircraft in the fuel boost pressure system for low fuel pressure warning.

TABLE I LEADING PARTICULARS

Service Media	JP4 and JP5 fuel
Actuation Points:	
Increasing Pressure	By 10 PSIG
Decreasing Pressure	At 2.5 ±0.5 PSIG
Proof Pressure	120 PSIG
Ambient Temperature	-65°F to +250°F -54°C to +121°C
Pressure Connection	Per MS33656E4 (mod.) 7/16-20 UNF-3A (thd.)
Electrical Data:	
Switching Element	SPDT
Current	5 amps resistive at 28 VDC
Receptacle	per MS33678-10SL-3P mates with MS3106-10SL-3S
Overall Dimensions:	
Height	2.50 inches max.
Width	0.68 inches hex.
Weight	1.5 ounces est.

2. DISASSEMBLY (See Figures 3 and 4)

A. Remove drive screws [13] from pressure capsule [4].

CAUTION: DO NOT MAR SURFACE OF PRESSURE CAPSULE [4].

B. Using a 66-4 tool, remove electrical assembly [12].

CAUTION: DO NOT ATTEMPT DISASSEMBLY OF ELECTRICAL ASSEMBLY [12]. ASSEMBLY IS SEALED WITH POTTING COMPOUND AND SHALL BE REPLACED AS A UNIT IF DEFECTIVE.

C. Remove O-ring [11] from electrical assembly [12].

NOTE: It is recommended that O-ring [11] be replaced at each overhaul.

D. Using blade end of 66-163 tool, remove helical spring [2] and adjustment shoe [3] from pressure capsule [4].

NOTE: Early models may have separate adjustment screw and helical spring. It is recommended that these parts be replaced by the current helical spring.

E. Apply a small amount of acetone to dissolve sealant which locks threads of stop [10] to disc spring register [9] and threads of disc spring register [9] to pressure capsule [4].

WARNING: AVOID SOLVENT CONTACT WITH SKIN AND AVOID BREATHING SOLVENT VAPORS. OBSERVE FIRE PRECAUTIONS.

F. Using a 66-48 tool, remove disc spring register [9] with stop [10] from pressure capsule [4].
G. Using 66-48 tool, remove stop [10] from disc spring register [9].
H. Remove register ring [8], disc spring [7], register ring [6] and pressure plate [5] from pressure capsule [4].

CAUTION: DO NOT ATTEMPT FURTHER DISASSEMBLY OF PRESSURE CAPSULE [4]. REPLACE AS A UNIT IF DEFECTIVE.

3. CLEANING

A. Clean all metal parts with dry cleaning solvent per Federal Specification P-D-680, Type 1, or equivalent; use a stiff bristle brush and/or a clean, lint-free cloth.

WARNING: AVOID SOLVENT CONTACT WITH SKIN AND AVOID BREATHING SOLVENT VAPORS. OBSERVE FIRE PRECAUTIONS.

B. Dry parts thoroughly with moisture free, compressed air or allow to air dry.

GAGF PRESSURE SWITCH 8G361-1 OVERHAUL MANUAL

4. INSPECTION/CHECK (See Figures 1 and 4)

A. Inspect all machined surfaces for cracks, nicks, burrs, corrosion, or any other condition which could cause a malfunction in service.
B. Inspect all threaded parts for crossed or stripped threads.
C. Check all plated parts for deterioration.
D. Check helical spring [2] for distortion, length, and rate.
(1) Free length should be .535/.565 inches.
(2) With spring deflected to solid height, reaction force should be approximately 1.2 pounds.
E. Refer to Figure 1 and using an ohmmeter or other suitable device, check circuitry of electrical assembly [12].
(1) With electrical assembly [12] in the deactuated position, there must be a closed circuit between receptacle pins A and B, and an open circuit between receptacle pins B and C.
(2) Apply slight pressure to actuating plunger at base of electrical assembly [12] until assembly actuates.

CAUTION: INTERNAL DAMAGE TO ELECTRICAL ASSEMBLY [12] CAN RESULT IF ACTUATING PLUNGER IS DEPRESSED TOO FAR.

(3) With electrical assembly [12] actuated, there must be a closed circuit between receptacle pins B and C, and an open circuit between receptacle pins A and B.
F. Test dielectric strength of electrical assembly [12].
(1) With the output limited to 18 milliamperes, apply 800 volts RMS 60 cycles between each receptacle pin and receptacle shell for a period of one minute.

CAUTION: THE OUTPUT CURRENT MUST BE LIMITED DURING THIS TEST AS A PRECAUTIONARY MEASURE TO PREVENT PERMANENT DAMAGE TO THE PART.

(2) There must be no arcing.
(3) Maximum permissible leakage is 2 milliamperes.

5. REPAIR (See Figure 4)

A. Stop [10] and disc spring register [9] contain nylon locking inserts. If required, these inserts should be removed and replaced with new nylon pellets of appropriate size.
B. Remove any minor nicks, corrosion, or burrs from aluminum parts with an aluminum oxide abrasive cloth per Federal Specification P-C-451.
C. Carefully deburr drive screw holes in pressure capsule [4].

D. Remove defects from stainless steel parts using crocus cloth per Federal Specification P-C-458, grade 600 or finer.
E. Repair minor thread damage by carefully chasing threads with an appropriate tap or die.
F. Replace any parts on which the plating has deteriorated.
G. Replace all parts that cannot be made serviceable by steps 5.A. thru 5.E.

6. ASSEMBLY (See Figures 1 thru 4)

A. Using a 66-48 tool, thread stop [10] into disc spring register [9] until bottom surfaces of each are approximately flush. Thread stop [10] 1/4 turn past flush.

NOTE: Stop [10] will protrude approximately .009 inch from disc spring side of disc spring register [9].

B. Install register ring [6] onto pressure plate [5]. Assemble register ring [8], disc spring [7], and pressure plate [5] with register ring [6] onto disc spring register [9] and stop [10].
C. With pressure capsule [4] inverted (pressure port up) and using outer portion of 66-48 tool, slowly thread disc spring register [9] with parts [5 thru 8] into pressure capsule [4] until disc spring register [9] bottoms out. Back out disc spring register [9] 1/4 turn (approximately .009 inch).
D. Mount the partially assembled unit in a test setup such as shown in Figure 2 and adjust disc spring [7] actuation.
(1) Slowly increase and decrease test pressure to obtain individual readings at which disc spring [7] actuates and deactuates.
(2) Using a 66-48 tool, adjust unit (see Table II) for decreasing pressure actuation of 6 to 8 PSIG with a 4 to 6 PSI dead band.

NOTE: The pressure difference between actuation and deactuation is the dead band.

TABLE II ADJUSTMENT PROCEDURES

PART	DIRECTION OF ROTATION	
	CLOCKWISE	COUNTERCLOCKWISE
Disc Spring Register [9]	Decreases actuation settings	Increases actuation settings
Stop [10]	Decr. dead band	Incr. dead band

(3) Fasten a .001 inch dial indicator to the pressure capsule [4] in such a manner that the movement of the pressure plate [5] will be indicated.

(4) Slowly increase and decrease test pressure to actuate and deactuate disc spring [7]. Check pressure plate [5] travel. If travel is not between .005 to .007 inch, adjust stop [10] to these values and recheck pressure settings per 6.D.(2). Use a 66-48 tool.

E. Using 66-163 tool, install helical spring [2] with adjustment shoe [3] into pressure port of pressure capsule [4].

NOTE: Use drill end of 66-163 tool to thread helical spring [2] into pressure capsule [4] and other end of tool to back out helical spring [2].

F. Adjust helical spring [2].

(1) With unit mounted in test setup, slowly increase and decrease test pressure to obtain individual readings at which disc spring [7] actuates and deactuates.

(2) If required, adjust helical spring [2] for decreasing pressure actuation of 1.0 to 2.0 PSIG with a 4 to 6 PSI dead band. To increase settings turn helical spring [2] counterclockwise; to decrease, turn clockwise.

G. Using a suitable torque locking material, (see Table III, Item 1), lock stop [10] to disc spring register [9] and disc spring register [9] to pressure capsule [4].

H. Install and synchronize electrical assembly [12].

(1) With partially assembled unit mounted in a test setup similar to Figure 2, slowly increase test pressure until disc spring [7] actuates and hold pressure.

(2) If electrical assembly [12] is not being replaced, it will be necessary to fill drive screw holes in the assembly with epoxy (see Table III, Item 3).

(3) Apply lubricant (see Table III, Item 2) to O-ring [11]. Install O-ring [11] around electrical assembly [12].

(4) Using a 66-4 tool, thread electrical assembly [12] into pressure capsule [4] until assembly actuates as noted by test lamp circuit A-B opening. Make a reference pencil mark on electrical assembly [12] and pressure capsule [4].

CAUTION: INTERNAL DAMAGE TO ELECTRICAL ASSEMBLY [12] MAY RESULT IF ASSEMBLY IS THREADED IN TOO FAR.

(5) Reduce test pressure to zero.

(6) Thread electrical assembly [12] into pressure capsule [4] until assembly actuates (circuit A-B opens). Back out electrical assembly [12] until assembly deactuates (circuit A-B closes). Make a pencil mark on pressure capsule [4] opposite mark on electrical assembly [12].
(7) Back out electrical assembly [12] until mark on assembly is halfway between marks on pressure capsule [4].

NOTE: Electrical assembly [12] has been synchronized and shall not be rotated again.

I. After unit has passed the testing of paragraph 8.A. thru 8.D., install drive screws [13].
(1) Drill new holes in electrical assembly [12] and/or pressure capsule [4]. Use a #51 drill (.067 inch) limited to 1/8 inch depth.

CAUTION: DO NOT ELONGATE EXISTING HOLES IN ELECTRICAL ASSEMBLY [12] AND/OR PRESSURE CAPSULE [4].

(2) Apply sealant (see Table III, Item 4) to drive screw holes in electrical assembly [12].
(3) Press drive screws [13] into electrical assembly [12].
(4) Cure sealant per manufacturer's instructions.
J. Test unit per paragraph 8.E.

TABLE III RECOMMENDED MATERIALS

ITEM	DESCRIPTION	MANUFACTURER
1	GLYPTAL 1201 Enamel	General Electric Company Schenectady, N.Y. (V08800)
2	INSULGREASE G624 Lubricant	General Electric Company Waterford, N.Y. (V01139)
3	STYCAST 2651 and CATALYST 9 Epoxy	Emerson and Cuming, Inc. Canton, Mass. (V04552)
4	PLASTIC GASKET Sealant	Loctite Corporation Newington, Conn. (V05972)

7. FITS AND CLEARANCES (Not Applicable)

GAGE PRESSURE SWITCH 8G361-1 OVERHAUL MANUAL

8. TESTING (See Figures 1, 2, and 4)

A. Mount the assembled unit in a test setup such as shown in Figure 2. The inlet manifold should be connected to a source of clean, dry, compressed air capable of delivering 120 PSIG.

B. Test unit for leakage by slowly applying 120 PSIG to pressure port. Shut off inlet valve and maintain a static pressure head for one minute. Reduce pressure to zero.

CAUTION: DO NOT EXCEED MAXIMUM INLET PRESSURE OF 120 PSIG.

C. Test unit operation.
(1) Slowly increase test pressure until circuit connected between receptacle pins B and C closes (A-B opens). Note the exact gage reading the instant this occurs.
(2) Slowly decrease test pressure until circuit connected between receptacle pins A and B closes (B-C opens).
(3) If required, adjust unit operation to conform with data given in Table IV by rotating helical spring [2] in small increments and repeating steps 8.C.(1) and 8.C.(2). To increase pressure settings, turn helical spring [2] counterclockwise; to decrease settings, turn clockwise.

TABLE IV UNIT OPERATING CHARACTERISTICS

TEST PRESSURE	PRESSURE PSIG	CIRCUIT	
		A-B	B-C
Increasing	By 10	Opens	Closes
Decreasing	At 2.5 ±.5	Closes	Opens

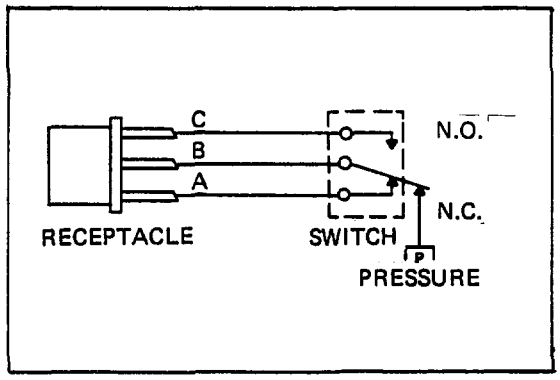

FIGURE 1 ELECTRICAL SCHEMATIC

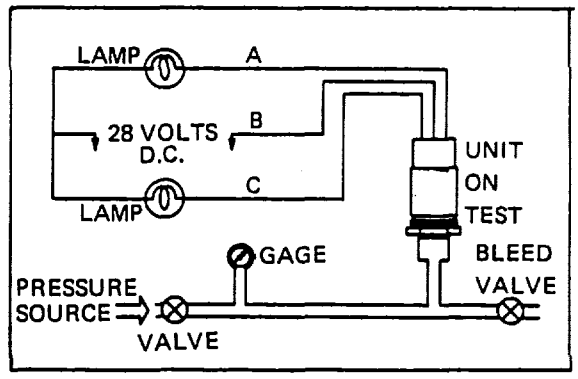

FIGURE 2 SUGGESTED TEST SETUP

D. Test dielectric strength.
(1) With the output limited to 18 milliamperes, apply 800 volts RMS 60 cycles between each receptacle pin and receptacle shell for a period of one minute.

CAUTION: THE OUTPUT CURRENT MUST BE LIMITED DURING THIS TEST AS A PRECAUTIONARY MEASURE TO PREVENT PERMANENT DAMAGE TO THE PART.

(2) There must be no arcing.
(3) Maximum permissible leakage is 2 milliamperes.

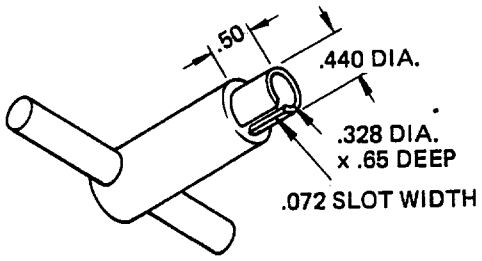
E. Test unit for leakage by slowly applying 2.5 PSIG to vent tube. Shut off inlet valve and maintain a static pressure head for one minute. Reduce pressure to zero.

CAUTION: DO NOT EXCEED MAXIMUM PRESSURE OF 2.5 PSIG.

9. TROUBLE SHOOTING (See Figure 4)

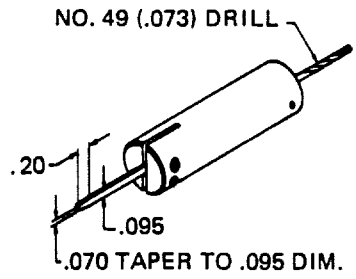
TABLE V

TROUBLE	PROBABLE CAUSE	REMEDY
Leakage	Defective pressure capsule [4]	Replace pressure capsule [4].
	Defective seal between elec. assy [12] and pressure capsule [4]	Reseal unit per paragraph 6.I.
Unit fails to operate or operate within pressure limits	Defective electrical assembly [12]	Check per paragraphs 4.E. and 4.F. Replace electrical assembly [12] if defective.
	Defective disc spring [7]	Replace disc spring [7].
	Incorrect synchronization of electrical assembly [12]	Resynchronize electrical assembly [12] per paragraph 6.H.
	Improper helical spring [2] setting	Readjust helical spring [2] per paragraph 8.C.
	Improper disc spring [7] setting	Adjust disc spring [7] per paragraph 6.D.



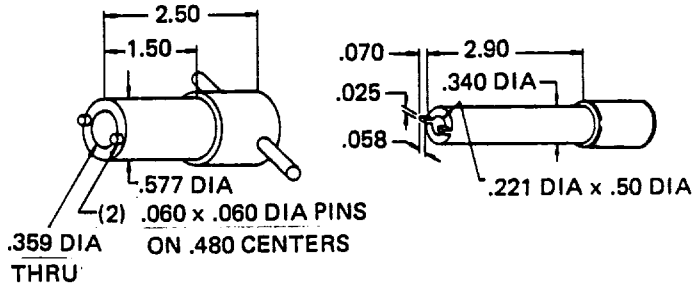
GAGE PRESSURE SWITCH 8G361-1 OVERHAUL MANUAL

10. STORAGE INSTRUCTIONS



Cap pressure port and electrical receptacle with closures per MIL-C-5501. Place unit in a suitable plastic bag and/or corrugated cardboard container.

11. SPECIAL TOOLS (See Figure 3)



Tools similar to those shown in Figure 3 will aid in the assembly, disassembly, and adjustment of the unit. These tools may be made in the average machine shop, or they may be procured from Custom Aviation Supply under part numbers 66-4, 66-48, and 66-163.

66-4 ELECTRICAL ASSEMBLY TOOL

66-163 HELICAL SPRING INSTALLATION TOOL

66-48 STOP AND DISC SPRING REGISTER ADJUSTMENT TOOL

OVERHAUL INSTRUCTIONS
WITH
PARTS BREAKDOWN

MOTOR OPERATED GATE VALVE

MODEL AV16B1864B

(These instructions also apply to Model AV16B1762B, when used with the difference data sheet at the back of the Manual.)

OVERHAUL MANUAL FOR MOTOR OPERATED GATE VALVE

1. Description and Operation

This overhaul manual covers Motor Operated Gate Valve AV16B1864B. The valve consists of three sub-assemblies: motor, actuator, and body assembly. The motor provides power through the gear train in the actuator to the slide in the body assembly. Movement of the slide allows or stops flow through the valve port.

A. Specification

Service MIL-H-5572, MIL-S-3136	Fuel Per MIL-I-5624 (JP-4)
Duty Rating	Intermittent
Operating Pressure	0 - 60 psig
Proof Pressure	188 psig
Ambient Temperature Range	-54°C (-65°F) to +71°C (+160°F)
Fluid Temperature Range	-54°C (-65°F) to +57°C (+135°F)
Rated Voltage	28 V dc (18 - 30 V dc)
Power Consumption	56 Watts
Weight	1.56 lb (approx)
Acceleration Factor	12 "G"
Operating Time at 28V dc and +21.1°C (+70°F)	0.5 sec (min) to 1.0 sec (m
Fluid Connection Size	MS33786-12
Electrical Connector	MS3102R14S5P

2. Disassembly (see Figure 3)

A. Disassemble in the same order as the key index number assigned to the exploded view illustration except as follows:

(1) Pull clip (4) from arm of needle bearing assembly (8).

(2) Do not disassemble needle bearing assembly (8). If defective, replace this unit as an assembly.

(3) Remove retainers (11) with an expanding drum mandrel of proper size

(4) Thermal reliefs 19 & 22 are staked; do not disassemble further.

(5) Refer to actuator section for disassembly of actuator.

3. Cleaning

A. Wash all metal parts except actuator in cleaning solvent, and dry with compressed air at 20 psig maximum, or a clean dry, lint-free cloth. Inaccessible places may be cleaned by using a soft nylon brush.

WARNING: IF MINERAL OIL SOLVENT IS UNAVAILABLE, AVOID BREATHING SOLVENT VAPORS AND SOLVENT CONTACT WITH SKIN. OBSERVE FIRE PRECAUTIONS. DO NOT DIRECT COMPRESSED AIR AGAINST SKIN.

4. Inspection

A. Inspect all parts for cracks, breaks, and signs of obvious damage or wear.

B. Check body (26) for cracks and slide groove for excessive wear and roughness. Slide groove must measure 0.103 ± .002 inch in width.

C. Check threaded surfaces for burrs, nicks, and evidence of cross-threading.

D. Check that rivet in needle bearing assembly (8) is tight and that driven head of rivet does not extend above surface of bearing valve arm.

E. Needle bearing assembly (8) shall turn freely without binding or sticking.

F. Check slide (9) for scoring and scratches that might allow leakage. Both sides shall be flat within 0.001 total indicator reading.

G. Spring (15) edges shall be flat and parallel within 0.020 total indicator reading. Concentricity and out-of-roundness of diameters must be within 0.020 total indicator reading.

H. Flange faces of body (26) shall be free of scratches or indentations.

5. Repair

A. Polish out minor scratches or marks in metal parts with crocus cloth and wash thoroughly to remove all traces of abrasive. Be certain that correct type crocus cloth is used for ferrous and non-ferrous parts.

B. Replace all packings each time valve is overhauled.

C. Thermal reliefs (19 & 22) have rubber type seat. If cure date limit is exceeded, replace entire assembly (19 & 22).

D. Replace all parts damaged, defective, or that fail inspection.

6. Lubrication

A. Lubricate slide contact surfaces of seal ring (13) and seal ring shell (13) and all "O" Ring packings with silicone grease MIL-L-15719 (DOW Corning 44) during assembly.

7. Assembly (see Figure 3)

A. Assemble parts 4 through 9 and move slide to closed position.

B. Push straight side of clip (4) through hole in arm assembly (8) that holds actuator (5) shaft.

C. Assemble parts 12 through 16 to each retainer (11) and push retainer into body (26). Retainer shall fit flush with body flange.

D. If heli-Coil inserts (17) are replaced, new inserts must be below body surface 3/4 to 1-1/2 turn.

E. Finish assembly of remaining parts and safetywire screws (6) and pins (1).

8. Testing

A. A test set-up as illustrated by Figure 1, or equivalent, is necessary for proper testing of this valve.

(1) Construct test plates per Specification MS33786-12. Drill mounting holes in test plates as necessary to fit valve body. Mount test plates uniformly over ports with even pressure around the flanges as shown in Figure 1. Connect air lines to fittings on plates.

(2) A light coat of silicone grease (DOW Corning 44) shall be applied to mating port flange seals before testing.

(3) Use mating connector for MS3102R14S5P electrical connector to apply 28 volts direct current.

(4) Use dry cleaning solvent, Commercial Standard 174-51-140-F, from regulated source to 188 psig for test medium. Ambient and fluid temperatures shall be between -15.6°C (+60°F) to -32.2°C (+90°F).

B. Continuity Test: Valve shall open when pin "A" is energized, and close when pin "B" is energized. When valve is open Pins "A" and "C" are connected. When valve is closed, Pins "B" and "D" are connected. Pin "E" is common.

C. Operate valve at zero pressure and check for binding or sticking.

CAUTION: KEEP HANDS CLEAR OF PORT OPENINGS WHEN OPERATING VALV

D. Submerge valve body in water, but do not immerse electrical connector.

(1) Apply internal fluid pressure (air may be used as an alternative for this test) to 188 psig to one port with other port blocked. Operate valve through 5 complete cycles. No external leakage allowed.

(2) Close slide (9) and apply pressures of 4 inches of fluid, 30 and 60 psig to one port with the other port open. Leakage from open port shall not exceed 0.5 cc after a two-minute waiting period. Repeat in opposite direction.

(3) The valve shall function properly at 60 psig pressure and shall not exceed the following time and electrical requirements at 27 $\pm$ 1 volts direct current

Amperes -- Starting: 5.0 maximum; -- running; 2.0 maximum; Operating time -- Opening or closing: 0.5 sec min; -- 1.0 sec max.

(4) Apply 60 psig pressure and operate valve at eighteen (18) volts direct current. Valve must operate in two (2) seconds or less.

(5) Cycle test valve 25 operations at 20 psig with 27 ± Volt dc.

(6) Interrupt current to valve at any partially closed position. When current is restored, valve must continue to the closed position.

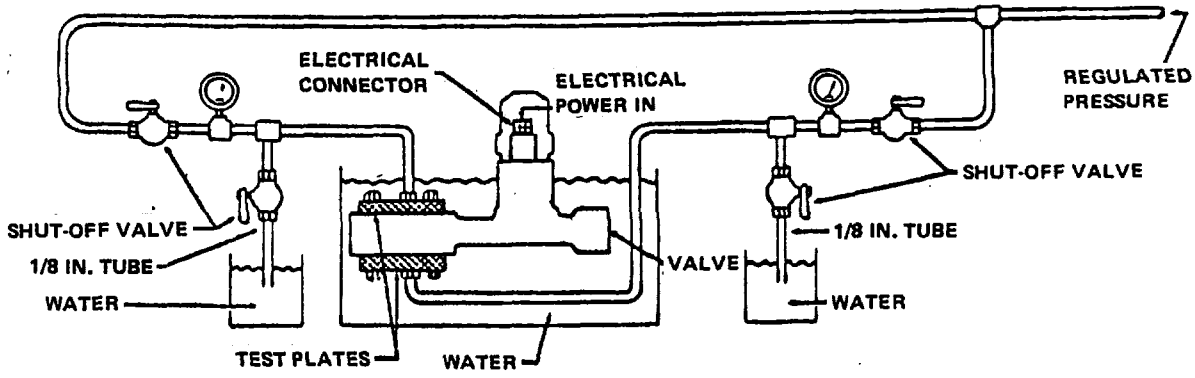
E. Thermal Relief Test:

The procedure presented in this step should be followed to determine actual thermal relief valve operation. Operation of line thermal relief valve (22) and body thermal relief valve (19), when pressure is applied from the side opposite actuator of the valve, is difficult to detect since the line thermal relief valve relieves first.

NOTE: Body and line thermal relief valves may be tested either assembled in valve body or separately in an appropriate test fixture (Figure 2). If tested assembled in valve body, pressure seepage into body cavity is slow and body thermal relief valve operation in both directions (opening and closing) may require considerable time. Do not assume malfunction from operating time requirements only. For immediate operation, use test fixture as indicated in Figure 2 and reduce allowable leakage at test pressure to 5 bubbles air pressure per minute or 0.5cc fluid pressure per minute.

(1) Adjust old line thermal relief valve (22) to approximately 200 psig or solid and apply bright paint to external end to enable identification of these sub-assemblies as "test units" when assembled in valve.

CAUTION: TEST UNITS SHALL BE POSITIVELY IDENTIFIED. ATTACH TAG TO VALVE TO INDICATE THAT TEST UNIT THERMAL RELIEF VALVE ASSEMBLIES ARE INSTALLED.

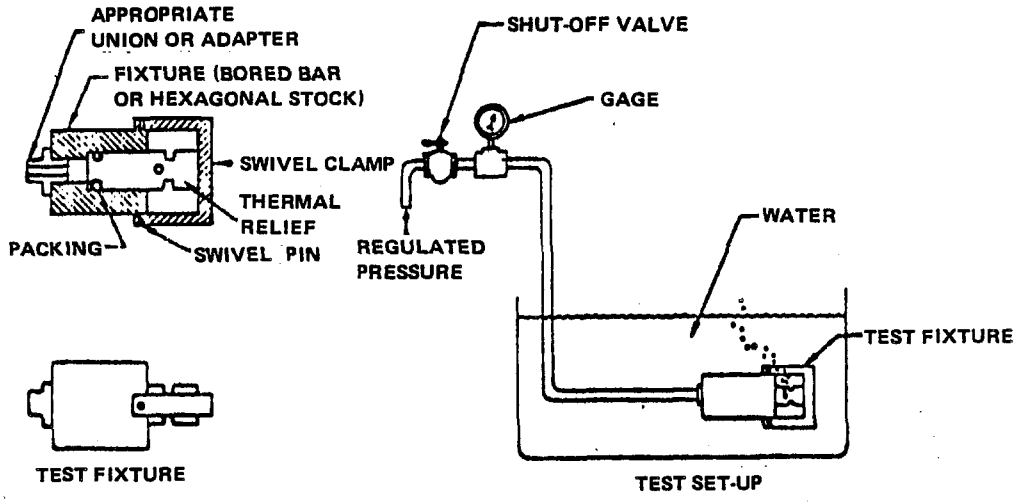


(2) Assemble test unit line thermal relief valve (22) to port on side of actuator and assemble new body thermal relief valve (19) to valve. Close slide (9) and apply test pressure of 60 psig to side opposite actuator of valve. Allowable leakage is 0.5cc per minute. Slowly increase pressure to 135 psig where flow is 1.0cc per minute minimum indicating opening. Slowly decrease pressure to 105 psig minimum for thermal relief valve to reseat; this will be indicated by a flow of 1.0cc per minute maximum. Further reduce pressure to 60 psig where leakage of 0.5cc per minute maximum is allowed. There shall be no external leakage.

(3) Replace "test unit" line thermal relief valve from port on side of actuator and assemble new line thermal relief valve (22) to valve. Close slide (9) and apply test pressure of 60 psig to side opposite actuator of valve. Allow

leakage is 0.5cc per minute. Slowly increase pressure to 100 psig where flow is 1.0cc per minute minimum. Slowly decrease pressure to 65 psig minimum for thermal relief valve to reseat; this will be indicated by a flow of 1.0cc per minute maximum. Reduce pressure to 60 psig, leakage shall not exceed 0.5cc per minute. There shall be no external leakage.

CAUTION: MAKE SURE THAT TEST UNIT IS REMOVED AND REPLACED WITH NEW THERMAL RELIEF VALVE ASSEMBLY (22) THAT HAS BEEN TESTED; OR SERIOUS DAMAGE COULD RESULT.

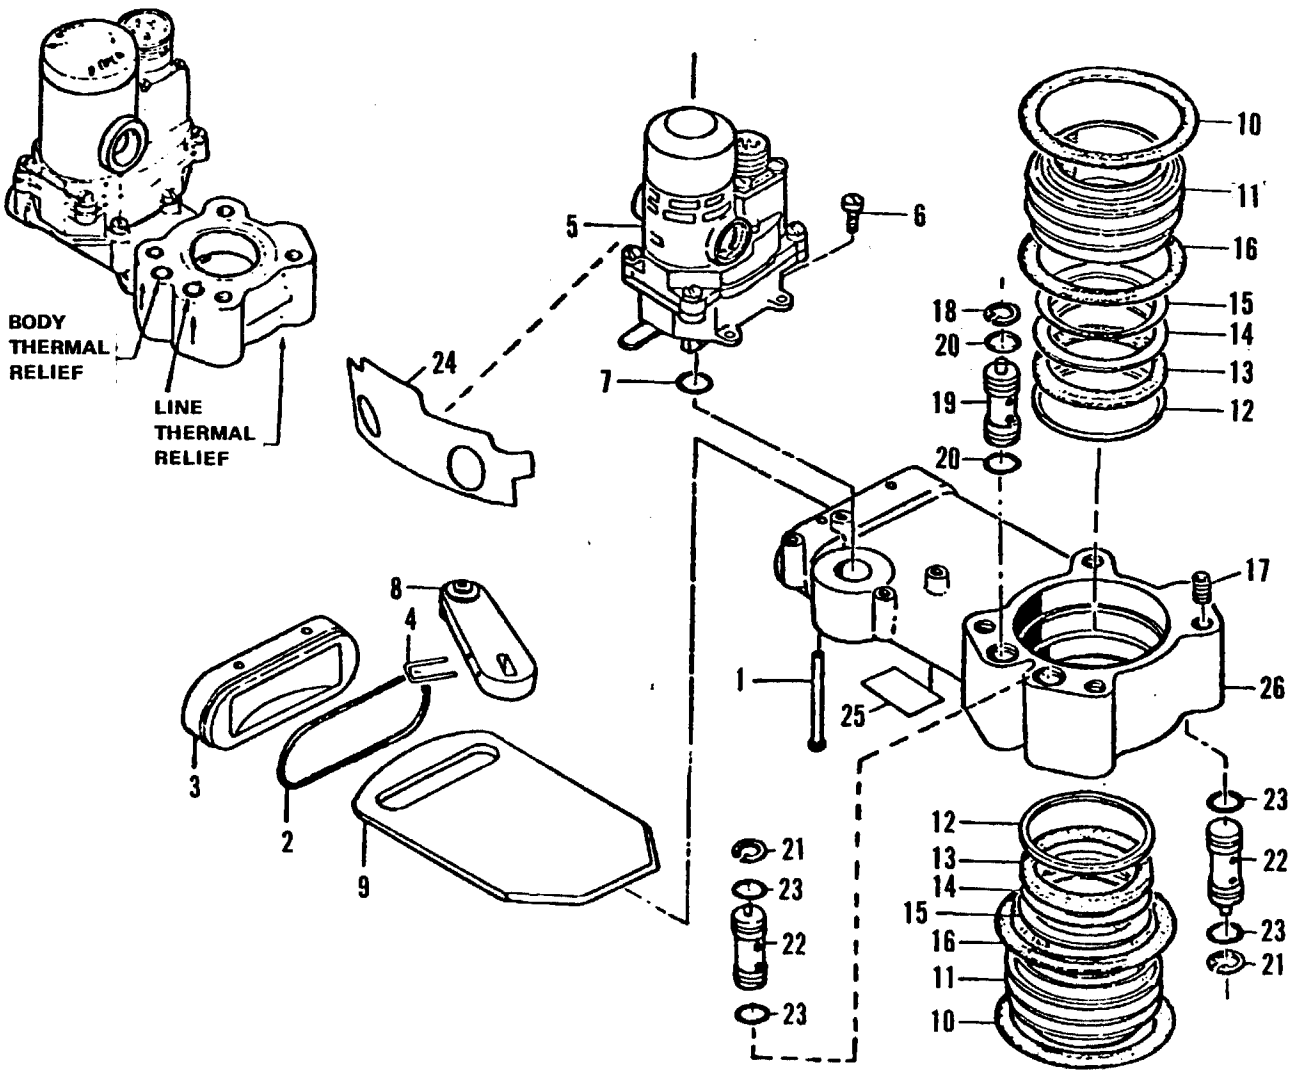


(4) Assemble new line thermal relief (22) to port on side opposite of actuator and apply pressure to valve on the actuator side. Thermal relief valve shall operate the same as in step 3.

Test Set-up
Figure 1

9. Trouble Shooting

A. Trouble	Possible Cause	Correction
Valve Inoperative.	Bad connector or switch, motor brushes worn.	Remove actuator and see "Actuator Overhaul".
Time of operation	Valve slide (9) drags.	Check slide for lubrication and point of drag.
	Actuator Assy. (5) drags.	Repair or replace actuator.
Retainer (11) leakage.	Packing (16).	Replace.
End cap (3) leakage.	Packing (2).	Replace.
Internal leakage.	Seal ring (13). Spring (15).	Lubricate or replace.
External leakage.	Cracked body (26).	Replace.
Thermal relief does not open or reseat properly.	Clogged thermal relief.	Increase pressure to thermal relief max. to clear, then recheck.
	Relief spring or seals in thermal relief (19 or 22) bad.	Replace thermal relief assy (19 or 22). Do not repair.



Thermal Relief Test Set-up
Figure 2

10. Storage Instructions

A. Store in a sealed heavy plastic bag or carton with desiccant enclosed.

Duty	Intermittent

2. Disassembly (see Figure 3)

A. Disassemble in the order of key index numbers assigned to exploded view illustration except as follows:

(1) Do not remove idler shaft (12) from housing (13). If shaft is worn or loose, replace both parts as an assembly.

(2) After disassembly of actuator housing (13), move indicator arm (33) to center position to assist removal of switch arm (21).

(3) Do not disassemble switch plate assembly (11), switch arm (21), spacer plate assembly (22) or gear housing assembly (35) further than indicated in exploded view. If damaged or worn, assemblies should be replaced in their entirety

(4) Refer to motor overhaul manual for motor (10) procedure.

3. Cleaning

A. Wash all metal parts in mineral oil base cleaning solvent and dry with compressed air or a clean, lint-free cloth.

CAUTION: DO NOT IMMERSE OR WASH MOTOR (10) OR SWITCH PLATE ASSEMBLY (7) IN CLEANING SOLVENT.

WARNING: IF MINERAL OIL BASE SOLVENT IS NOT AVAILABLE AND SUBSTITUTION IS NECESSARY, AVOID BREATHING SOLVENT VAPORS AN SOLVENT CONTACT WITH SKIN. OBSERVE FIRE PRECAUTIONS. D NOT DIRECT COMPRESSED AIR AGAINST THE SKIN.

4. Inspection

A. Under strong light and magnification, inspect all parts for cracks, breaks frayed wiring, or other signs of obvious damage or excessive wear. Also make the following detailed inspection:

(1) See Table to check gear tolerances. Maximum diametrical clearance mating surfaces of idler gear (14), idler shaft (12), input gear (17), pin (18), gears (24), planetary (25), gears (26) and planetary (27) to be 0.005 inch.

(2) Table of Gear Tolerances

Part and Index No.	Measure Across	Over Wires (in. dia.)	Dimensions (in.) Max.	Min
*Gear (14) 9785D	Teeth	0.027	0.7254	0.7218
9785M	Teeth	0.027	0.7225	0.7190
9785K	Teeth	0.027	0.7210	0.7175
9785V	Teeth	0.027	0.7179	0.7142
9785X	Teeth	0.027	0.7194	0.7158
	Splines	0.030	0.2757	0.2743
**Gears (17)	Teeth	0.027	0.7254	0.7218
	Splines	0.030	0.2757	0.2743
Gears (24,26)	Teeth	0.027	0.6277	0.6252
Planetary (25)	Splines	0.030	0.2775	0.2745
Planetary (25,27)	OD (3 bearing studs)	--	0.1860	0.1847
Gear Housing Assy (35) Ring Gear	--	0.0225	1.4008	± 0.001

*Dimension given for standard gear (14); undersize dimensions for select gears are given in parts list.

**Hole diameter for gear (17) is 0.094 to 0.095 inch.

(3) Check that idler shaft (12) is tight in housing (13), and for 0.0925 to 0.0935 inch diameter.

(4) Check spacer plate assembly (22) for damage to plate or seal ring.

(5) Place idler gear (14) and bushing (15) into position to mesh idler gear with motor shaft. Backlash shall be 0.001 to 0.005 inch maximum.

(6) Check spring (19), free length to be 0.475 inch; working height to be 0.358 inch + 0.000, -0.020 inch and load at working height 1.0 pound + 0.000, -0.250 pound.

(7) Inspect actuator housing (13) and gear housing (35) with fluorescent penetrant per MIL-I-6866A. Inspect planetaries (25,27) with magnaflux per MIL-I-6868.

(8) Bearing pin (23) head thickness shall be 0.015 to 0.017 inch.

(9) Inspect connector (4) for bent or broken pins and signs of arcing.

(10) Check microswitches on switch plate assembly (7) for operation. Place leads of an ohmmeter across terminals of each microswitch. Actuate switch buttons and check continuity. If condition indicates long usage and many operations, replace switch plate assembly (7).

5. Repair or Replacement

A. Minor scratches or grooves may be polished out of iron parts with crocus cloth and from aluminum parts by aluminum oxide abrasive cloth. Follow by a thorough cleaning to remove all traces of abrasive.

B. Replace all parts which are defective and cannot be repaired to meet the requirements of the inspections given in paragraph 4.

C. Replace packings (5, 11, and 31) at each overhaul.

D. If motor (10) or idler gear (14) is replaced, idler gear must be select fit between motor shaft and input gear (17) to establish backlash of 0.001 to 0.003 maximum. The idler gear is available in a standard pitch diameter, and in 0.003, 0.006, 0.008 and 0.010 inch undersized pitch diameters to provide the required fit.

E. Measure across top of contact ears of switch arm assembly (21) for a gap of approximately 1/4 inch equidistant from center line. Replace if out of tolerance.

F. If output planetary (27) or clutch ring (28) is replaced, clutch ring must be select fit to output planetary during reassembly in accordance with paragraph 7, step C.

G. Replace pin (29) at reassembly.

6. Lubrication

A. Lubricate teeth of all gears and bearing surfaces of planetaries (25,27) with a very light film of "Aero" Lubriplate grease (Fiske Bros Refining Co., Newark, New Jersey), available from ITT General Controls, Inc. under part No. 105185A.

CAUTION: EXCESSIVE GREASE ON GEARS MAY CAUSE CRITICALLY SLOW ACTUATION AT LOW TEMPERATURES.

B. Lubricate all packings and seals with a light film of "Aero" Lubriplate grease during assembly.

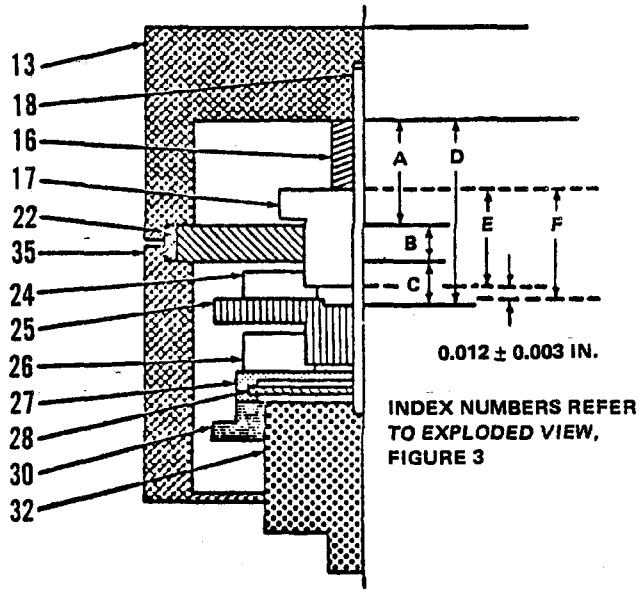
C. Apply a heavy coat of Lubriplate No. 630AA grease (Fiske Bros Refining Co.), available from ITT General Controls, Inc. under part No. 105185B, before installing clutch ring (28). Apply additional grease on both sides of clutch rings after installation.

D. Do not permit any grease around switch plate assembly (7), electrical con nector (4), motor (10) or in switch compartment.

7. Reassembly (see Figure 3)

A. Reassemble in the reverse order of disassembly, noting the following:

(1) Before assembly of components, check that actuator housing (13) and gear housing assembly (35) bear uniformly against seal assembly (22)



(2) Indicator arm (33) should turn freely without binding against either side of housing travel area. In the event of binding against lower ring, carefully pry away, using a non-metallic flat tool. Take care to prevent cracking or damage to finish.

B. Bend ends of pin (29) back and flat to secure in place after installing through arm (33) and output shaft (32). Check to see that pin ends do not scrape against housing (35).

C. Space between clutch ring (28) ears shall be 0.165 to 0.180 inch after reassembly. Select fit clutch ring to this requirement. The clutch ring is available in standard size and in several oversized and undersized dimensions varying in increments of 0.001 inch for correct fit.

D. Clearance between plate assembly (22) and upper bearing pins (23) shall be 0.005 to 0.015 to prevent binding of gear train against spacer plate assembly (22). If required clearance is not present, tap internal components lightly into housing to settle parts. If clearance is not obtained, replace parts as necessary to lower stack.

E. If actuator housing (13), gears (24,26), planetaries (25,27), stop ring (30), output shaft (32), plate assembly (22) or gear housing assembly (35) are replaced, spacer (16) shall be select fit as follows (see figure 1 for dimensioned cross-section):

Selection of Input Gear Spacer
Figure 1

(1) Measure and record dimension A, distance from actuator housing (13) lower land surface to bottom of pin (18) boss housing.

(2) Measure and record plate assembly (22) thickness, dimension B.

(3) With all components (parts 19 through 34) installed in gear housing (35), measure and record dimension C, distance from gear housing (35) upper land surface to bottom of depression in center of input planetary (25).

(4) Add dimensions A, B and C to obtain dimension D and record.

(5) Measure thickness of input gear (17), dimension E. Add 0.012 $\pm$ 0.003 inch to obtain dimension F and record.

(6) Subtract dimension F from dimension D. The difference is the required thickness of spacer (16). The spacer is available in a standard thickness and in several oversized and undersized thicknesses varying in increments of 0.001 inch for correct fit.

F. Install packing (11) under motor (10) and hold in place with one screw (8) through hole near idler shaft. Place large insulation sleeving over motor wires and solder wires to correct terminals on switch plate assembly (7). Use 50/50 solder, composition SN50; all wire joints must be secure and sound. (See Figure 2 for Wiring Diagram.)

G. Place safetywire, MS20995NC20 in holes in switch plate assembly (7) before installing in housing (13) with screws (6).

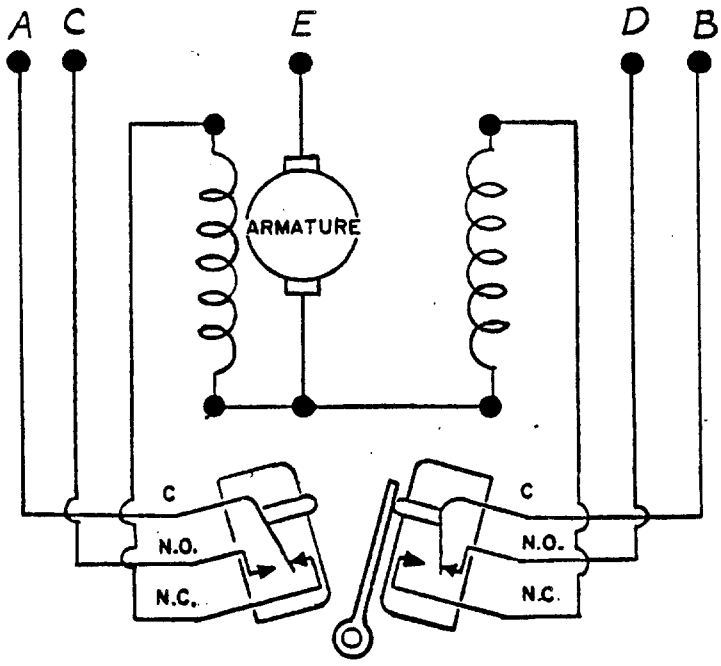
H. When assembling switch plate assembly (7), put red motor wire under switch plate assembly and under pin boss in actuator housing (13) to enable alignment of pin (18). Be sure insulator tabs located on outside edges of switch plate assembly (7) are positioned between wire solder connections to switch and ID of housing (13).

I. Locate connector (4) key adjacent to motor (10).

J. Hold actuator together by hand and test with operating voltage to verify that switch arm ears depress microswitches to stop motor at end of $92^{\circ} \pm 3^{\circ}$ rotation of output shaft (32). Assemble screws (1).

K. Invert actuator assembly until output end of shaft (32) is straight up. Tap unit lightly to settle parts. In this position, check operation for $92^{\circ} \pm 3^{\circ}$ rotation of output shaft (32), applying operating voltage. If actuator assembly overrides $92^{\circ} \pm 3^{\circ}$ rotation, replace stop ring (30).

L. Secure screws (1) with safety wire MS20995NC20, screws (2) with safetywire MS20995NC20, and screws (8) with safetywire MS20995NC20.



8. Test Procedure

A. Perform tests with actuator assembly mounted on AV16B Series motor operated gate valve body or equivalent. Be sure actuator assembly attachment holes line easily with gate valve body holes.

B. Use test body without packings, seals, retainers, or thermal reliefs.

C. Continuity Test: Check electrical continuity of circuits (see Figure 2). Indicator arm shall move to the open position when pin "A" is energized and to close position when pin "B" is energized. When in open position, pins "A" and "C" are connected. When in closed position, pins "B" and "D" are connected. Pin "E" is common.

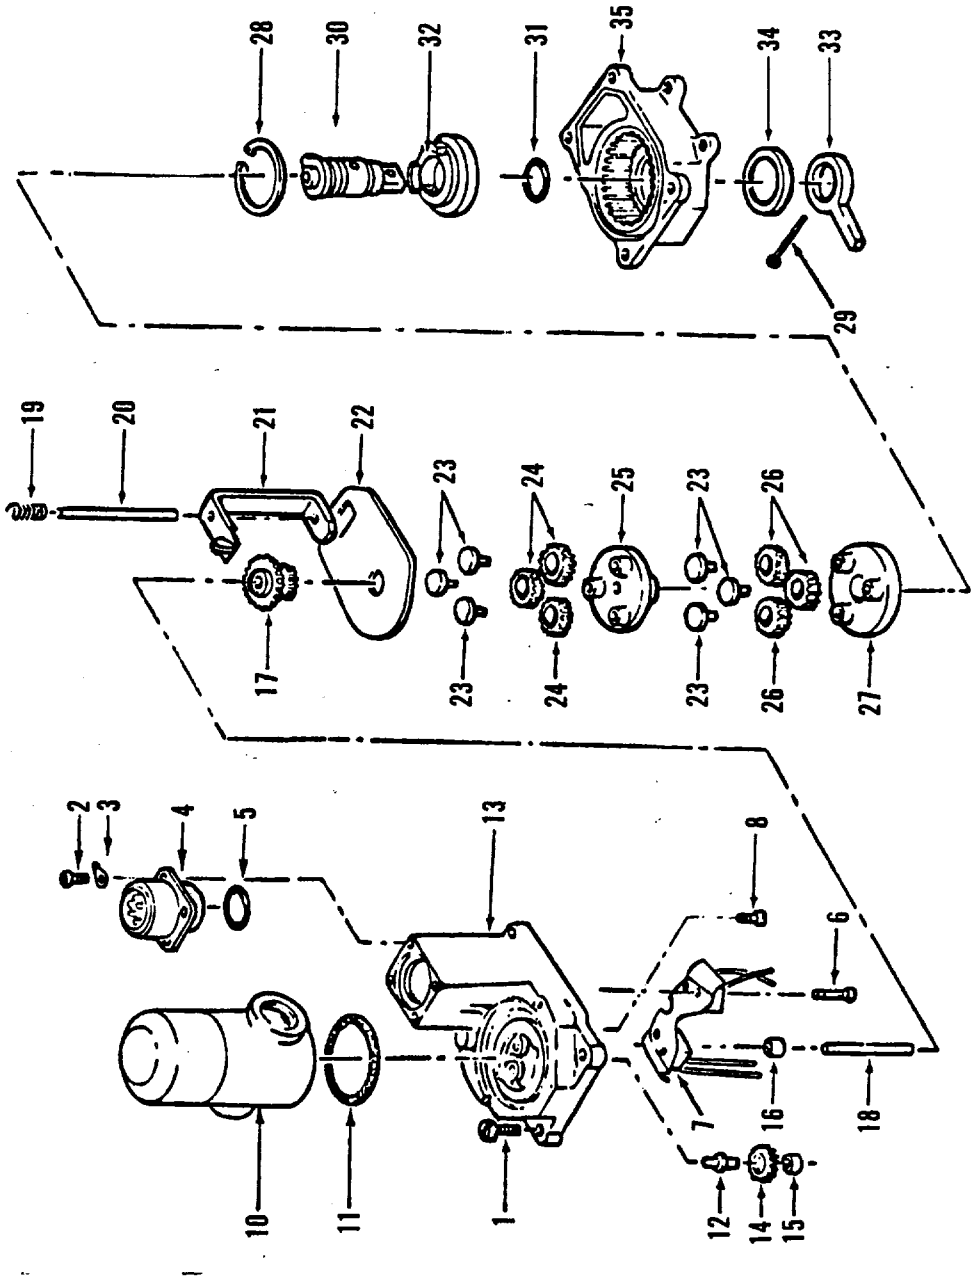
D. Functional Test: Apply 27 ± 1 volt dc, cycle actuator assembly five times at no load. The actuator assembly shall operate freely with no evidence of binding or sticking. Starting amperes shall be 5.0 maximum and running amperes shall be 2.0 minimum. Operating time in either direction, opening or closing, shall be 0.50 minimum to 1.00 maximum seconds.

Wiring Diagram (Shown in Closed Position)
Figure 2

9. Trouble Shooting

Trouble	Possible Cause	Correction
Motor will not operate.	Broken wire or connection.	Replace or resolder wire.
	Faulty microswitch.	Replace switch plate assembly (7).
	Motor burned out.	Replace motor (10).
Operating time exceeds maximum.	Excessive drag of gear train.	Check fit of gears (14, 17, 24, 26) and clutch ring (28).
Motor does not shut off at end of travel.	Bent ears of switch arm assembly (21).	Replace switch arm assembly (21).
	Faulty microswitch.	Replace switch plate assembly (7).

10. Storage Instructions



Store in a heavy plastic bag with desiccant enclosed.

Actuator Assembly 106788B107
Figure 3

OVERHAUL MANUAL FOR DIRECT CURRENT MOTOR 106785B100

1. Specifications

Rated loads at +24°C (+75°F) ambient temperature:

Voltage	18	27	30
Torque (oz in.)	0.4	1.0	1.125
RPM (at torque)	14,000	18,000	20,000
Starting Current (amp) max.	5.0	7.0	8.0
Running Current (amp) max	2.0	2.6	2.9
Duty Cycle - Intermittent		3 min on, 17 min off	
Rotation		Reversible	
Weight		6.4 oz (max)	

2. Disassembly

A. Disassemble according to sequence of index numbers assigned to the exploded view, observing the following:

(1) Observe position of wire on brush (17) and method of bending end of brush terminal assembly (17) over brush guide (18).

(2) Do not remove field assembly (12) from brush plate (20). When removing field and brush holder plate assembly (12 thru 20), exercise care to prevent breaking the wire leads. If either part is damaged, tag wires to aid in reassembly.

3. Cleaning

A. Clean parts, using a cloth dampened with cleaning solvent, and wipe with a dry, lint-free cloth.

WARNING: USE SOLVENT IN A WELL VENTILATED AREA. AVOID PROLONGED INHALATION OF FUMES. KEEP AWAY FROM OPEN FLAMES.

4. Inspection

A. Inspect parts for excessive wear, cracks, scoring, evidence of corrosion, or other damage.

B. Check brush terminal assembly (17) for wear. Brush length must not be less than 0.112 inch. Minimum length of 0.112 inch is indicated by drilled hole, maximum length is 0.250 inch.

C. Check field assembly (12) for open windings. Apply 1000 volts AC (root mean square) 60 cycles between coil leads and core for one second; there must be no indication of insulation breakdown.

D. Check armature (23) for open or shorted windings. Check by applying 1000 volts AC (root mean square) 60 cycles per second between commutator and shaft for one second; there must be no indication of insulation breakdown. Bearing journals of shaft shall be concentric with each other within 0.001 inch total indicator reading.

CAUTION: TESTS "C" AND "D" SHALL NOT BE REPEATED EXCEPT WITH A MEGGER OR WITH 85% OF FIRST TEST VOLTAGE.

E. Armature assembly pinion diameter across 0.030 wire must be 0.1886 to 0.1926 inch. No broken or damaged teeth allowed.

5. Repair

A. Replace parts which are cracked, excessively worn, scored or corroded, or do not meet inspection requirements.

B. Remove mild corrosion and polish out minor nicks or scores in iron base parts with crocus cloth. Use aluminum oxide abrasive cloth for aluminum parts. Clean parts thoroughly after polishing.

C. Replace packings (3, 6) and bearings (21) at each overhaul.

D. If brush terminal assemblies (17) are replaced, resurface armature commutator with diamond tool. After machining, clean out bar with raking tool.

CAUTION: DO NOT UNDERCUT DEEPER. MINIMUM DIAMETER OF COMMUTATOR IS 0.509 INCH INDICATED BY WEAR GROOVE IN END.

E. Use insulating varnish, Specification MIL-V-1137, Type M, Grade CB, to touch up varnished surfaces of field assembly (12) and armature (23). OD laminations of field assembly must be varnish-free after touchup.

6. Lubrication

A. Apply a light film of grease (No. 44) (Dow Corning Corp., Midland, Mich.) to packing (6) before installing in motor housing cap assembly (5).

B. If bearings (21) are disassembled or replaced, they shall be packed 1/8 maximum with Texaco Unitemp 500 grease, using a nylon brush.

7. Assembly

A. Assemble washer (22) and press bearings (21) to armature (23). Check bearings for push fit to housing (26) and cap assembly (5).

NOTE: This is a precision matched assembly and no looseness is allowed.

B. Assemble stud (25) to housing assembly (26).

C. Line up field assembly (12) with studs (25) making sure black wire is near negative side indicated by mark near brush port on housing (26).

(1) Place line-up rods through stud holes of brush holder plate (20) and through spacers (11) and into stud holes of field assembly (12). Carefully assemble parts to studs (25).

NOTE: To assure that field assembly (12) is in place, look through brush port. End of field assembly (12) will show approximately 1/16 inch past edge of port.

(2) Turn nuts (10) onto studs (25) till snug. If nuts (10) are not properly set, edge of cap will not fit snugly against edge of housing (26).

(3) Place brush into brush holder plate (20) from side port. Be sure wire goes into side slot. Center spring (16) over round end of brush (17) and center round end of bracket (15) over spring. Insert screw (13) through lock washer (14), eye of brush terminal (17) and screw hole of bracket (15), and turn screw securely into brush holder plate (20). Bend terminal end of brush terminal assembly (17) flat over threads of screw (13).

(4) Brush load on commutator must be 50 to 60 grams accomplished by springs (16) that weigh 55 grams $\pm$ 5 percent at 0.400 inch working height. Replace springs (16) if not within tolerance.

D. Assemble armature (23) with bearings (21) and cap assembly (5), to housing assembly (26) with no spacer washers (7) installed. Measure distance from end of splined shaft on armature assembly (23) to lower land surface of cap assembly (5). The exposed shaft length shall be 0.397 to 0.382 inch (see Fig. 2).

E. Select spacer washers (7) available in increments of 0.003, 0.005 and 0.0 inch and place under bearing (21) in housing (26) or in cap (5) to establish correct shaft length.

F. Armature shaft must be concentric with end boss of cap assembly (5) within 0.005 inch total indicator reading.

G. Refer to Figure 2 for spring installation and Figure 3 for part identificatio to determine the proper loading on springs (8) as follows: With parts asser bled in paragraphs D. and E. remaining in housing (26), pull on armature (23) shaft to determine clearance between lower bearing (21) and cap (5).

H. Select spacer washers (7) to establish a clearance (end play) of 0.42 $\pm$ 0.0(inch for Belleville springs (8) and separating spacer washer (9). The clear ance will provide a resultant load of approximately six to eleven pounds aft springs (8) and separating spacer washer (9) are installed as illustrated in Figure 2.

CAUTION: SPRINGS (8), WHICH ARE SAUCER-SHAPED, SHALL BE ASSEMBLED BACK-TO-BACK, WITH INSIDE DIAMETER OF SPRINGS SEPARATED BY SPACER (9). THIS EXERTS FULL PRESSURE AGAINST OUTER BEARING RACE.

I. Assemble packing (6) to cap assembly (5) and secure with screws (4).

NOTE: Stake screws (4) in two places away from critical region of 0.17 inch from OD edges of end cap (5).

J. After assembly of motor, load required to move armature (23) shaft endwise may be checked. Load shall be between six to eleven pounds. If available, check spring load on fixture illustrated in Figure 4.

K. Wipe packings (3) dry and assemble. Add cap (2) and ring (1).

. Test Procedure

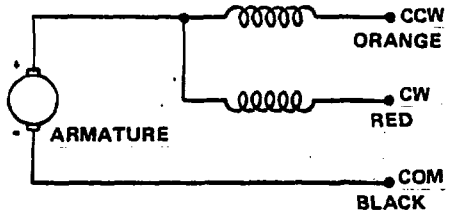
A. Conduct test at ambient temperatures of +24° to +32°C (+75° to +90°F).

B. If new brushes were installed, operate motor thirty minutes at no load, 16 volts DC or AC (60 cps), and reverse direction of rotation every five minutes. Lower temperature by fan or jet of air on motor housing.

C. Load Test: Check motor speed and current in both directions of rotation at voltage and torque loads below. Results may be ten percent under values specified. Maximum test operating time for each direction of rotation must not exceed eight seconds. Use dynamometer for load.

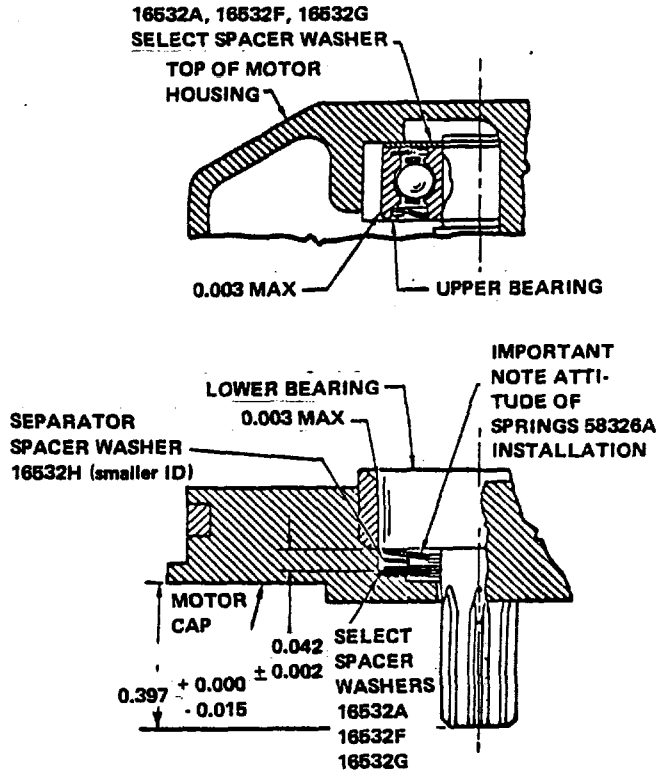
Volts	18	27	30
Torque (oz in.)	0.4	1.0	1.125
RPM (at torque)	14,000	18,000	20,000
Amp (starting((max.)	5.0	7.0	8.0
Amp (running) (max.)	2.0	2.6	2.9

D. Locked Rotor Test: Mount motor in test stand and hold shaft with fingers. Apply 26 ± volts DC and read locked rotor current; it shall not exceed 6.0 amps.



CAUTION: RELEASE SHAFT AT FIVE (5) SECONDS MAXIMUM.

. Trouble Shooting



A. Possible Cause of Failure	Remedy
(1) Brushes binding in guide.	Free brushes.
(2) Wiring incorrect.	Check and correct wiring.
(3) Field or armature grounding bad.	Check and repair connection.

.0. Storage Instructions

Store in a sealed, heavy, plastic bag with desiccant enclosed.

MODEL AV16B1762B

MOTOR OPERATED GATE VALVE

DIFFERENCE DATA SHEET

The basic difference between Model AV16B1762B and AV16B1864B is that Model AV16B1762B is fitted with an Actuator Assembly Type 106788B100 (the AV16B1864B is fitted with Type 106788B107). The limit switches of 106785B100 and not wired for position indication (the switches of 106788B107 are). The actuator type 106788B100 has a four-pin electrical connector MS3102R14S2P (the 106788B107 has a five-pin connector MS3102R14S5P). The AV16B1762B unit is "case-grounded" (the AV16B1864B is not). See Figure 1 for wiring of AV16B1762B.

Table 1. Leading Particulars and Main Features

Pump Rating	450 Pounds per hour at 22 PSI (40 PSIG maximum at zero flow)
Pumping Medium	Aircraft turbine fuel per MIL-T-5624 (JP-4)
Motor Rating	0.13 HP at 9300 RPM
. EMF	28 VDC
. Current Draw	7.25 AMPS maximum
Ambient Temperature Range	-65°F to + 165°F
Fuel Temperature Range	-65°F to + 135°F
Unit Weight	3.9 lb

1. DESCRIPTION AND OPERATION

Model RR12830A is a single element, electric motor driven, centrifugal pumping device designed to perform submerged booster pump duties in aircraft fuel systems. These pumps are manufactured by Lear Siegler, Inc., Romec Division, 241 South Abbe Road, Elyria, Ohio 44035.

A. Pumping Mechanism

A radial-type, centrifugal impeller turning within a voluted fuel passage provides the pumping action.

B. Drive Motor

The drive member is a permanent magnet type dc electric motor.

C. Main Features

Performance characteristics and other pertinent data are listed in table 1.

2. DISASSEMBLY

In the instructions that follow, references to parts and assemblies are followed by parenthetical numbers. These correspond with item numbers assigned to parts listed in the Illustrated Parts List, paragraph 12 and pictured in figure 6.

A. Filter Removal

Unsolder positive (black) brush lead, the shielding and shield cap from filter (2). Disconnect the negative (white lead) from filter terminal stud. Replace filter nut on stud after disconnecting lead. Cut off and discard terminal lug (5). Remove two screws and washers (3 and 4) to free filter (2).

B. Disassembly of Pumping Mechanism

Take out screws and washers (7, 8, 9, 11 and 12, figure 6). This frees pump housing mounting flange (15), inlet strainer (10) and cover spacer (18). Discard preformed packings (16, 17, 19 and 20). Do not remove insert (14) from housing flange (15) unless it requires replacement.

(1) Grasp impeller (21) and back off nut (22). Remove impeller (21), shim (23), key (24), shims (25) and seat seal (27) from motor drive shaft. Remove preformed packing (26) from groove in the ID of seal seat (27) and discard.

(2) Separate pump housing (31) from motor assembly. Discard preformed packing (30). Tap or press seal (29) from pump housing (31). Apply force against the encased side of seal (side toward motor end of pump housing with a wood or plastic dowel. Exercise care when handling seal to prevent chipping or cracking its carbon face.

C. Motor Disassembly

Take out two screws and packings with retainer (34 and 35) and slide off motor cover (33).

(1) Remove two screws and washers (37 and 38), lift brush springs and slide out two brushes (36).

NOTE: Threads of screws (40) are treated with a locking compound. If difficulty is experienced at removal, apply a heated soldering iron to screw head and allow screw to heat up. Effect removal while screw is hot.

(2) Take off two screws (40) and tap off endbell (39) with a plastic or fiber mallet. Disconnect ground by removing screw and washer (41 and 42). Discard rubber plug (44).

(3) Remove armature (47) from the magnetic ring (50). Press off bearings (45 and 46) using an arbor press. Retrieve shim washers (48). Discard rubber plug (49).

(4) Separate end cap (62) from magnetic ring (50) by tapping it off with a fiber mallet. Remove brush holders (55 and 60) only if their replacement is necessary. Brush springs (54 and 59) may be taken off and replaced by removing cotter pins (53 and 58).

(a) If brush holders require removal, a heated soldering iron may have to be applied to screws (52 and 57) to loosen sealant that is applied to threads.

WARNING: PERFORM HAND CLEANING OPERATIONS IN A VAPOR EXHAUSTING CLEANING CABINET OR IN A WELL VENTILATED AREA. AVOID INHALATION OF SOLVENT FUMES AND PROLONGED EXPOSURE OF SKIN TO CHEMICALS. OBSERVE LOCAL REGULATIONS REGARDING THE USE AND HANDLING OF COMBUSTIBLE MATERIALS.

3. CLEANING

Either vapor degreasing or hand cleaning with a petroleum based safety solvent (P-D-680 or similar) are acceptable cleaning methods.

A. Insulated Parts

Use filtered, dehumidified air (40 psi maximum) or a clean, lintless cloth to clean insulated motor parts. If necessary, moisten cloth in solvent (P-D-680) to remove hardened deposits. Immediately after solvent cleaning, blow off part with compressed air and oven dry at 140°F for one hour.

B. Protecting Cleaned Parts

Place cleaned parts in plastic bags or other dust-proof containers until ready for inspection or reassembly. Parts should be protected from impact with other parts or with cleaning and storage containers.

4. INSPECTION/CHECK

Subject all parts to a careful visual inspection after cleaning. Parts exhibiting cracks or fractures should be replaced immediately; welding is not a recommended repair action. Parts con-

tained in repair parts kit should be substituted for parts removed during overhaul, regardless of apparent condition of original part.

A. Aluminum Castings

The castings that make up the main structural members are most susceptible to damage by careless handling or improper maintenance methods. Surface injuries such as nicks, burrs or scratches can propagate fatigue cracks if stressed or cause mismatch of mating parts. Such damage should be blended or dressed out with a suitable abrasive. Careful attention should be given to preformed packing seats, and those areas that form interface with mating parts.

(1) Thread Damage

Damage to tapped threads in aluminum parts may be corrected by blending the entrance chamfer with crocus cloth or oil stone and chasing threads with a suitable tap. One piece, coil type screw thread inserts are replaceable.

(2) Pumping Element Inspection

Examine the impeller and pump housing for scoring, gouging or other evidence of impeller rub. These parts are also susceptable to erosion and cavitation damage which will give the part a dull, sand-blasted appearance. The lead edge of impeller fins is most likely to exhibit this type damage. Minor surface irregularities may be corrected by blending, or in the case of the pump housing, by machining. Since the clearances between impeller and housing greatly affect pump performance, no more than 0.002 inch of material should be removed in reconditioning parts.

B. Rotor Shaft Face Seal

Encased seal (29), figure 6, and seal seat (27) require smooth, flat contact surfaces to prevent fuel from entering the motor. Scoring or roughness to contact surfaces of either part, or chips or cracks to the encased seal carbon insert is cause for rejection, light carbon smear and other minor blemishes may be removed by hand lapping.

C. Armature Inspection

Examine overall condition of armature. Discard armature if commutator exhibits visably raised or lowered commutator bars, evidence of burning such as thrown solder, or deep grooving, scoring and other brush track mutilation. Bearing journals should be smooth and free from circumferential scoring or grooving, and contain no pitting that forms clusters or chains. Surface of commutators that exhibit normal wear may be refinished (see REPAIR). Minor surface irregularities may be removed from bearing journals by buffing. Armature dimensional and electrical inspection requirements are given in the following paragraphs:

(1) Armature Dimensional Inspection

Measure armature runout using vee-blocks and a dial indicator. Runout between bearing journals and between bearing journals and lamination stack shall not exceed 0.001 inch T.I.R. Commutator surface must run true with bearing journals within 0.0005 inch T.I.R. Bar-to-bar variation between any two adjacent commutator bars shall not exceed 0.0002 inch. Replace armature if shaft is bent.

(a) Measure bearing journal diameters. Commutator and drive end journals shall measure no less than 0.2361 and 0.3542 inch respectively.

(2) Armature Electrical Inspection

(a) Grounded Circuits

Test armature for grounds by checking continuity between shaft and each commutation bar. A completed circuit indicates a grounded coil. Inspection may be accomplished using an ohmmeter, test lamp or other low voltage continuity checker. Reject armature if a grounded circuit is indicated.

(b) Shorted or Open Circuits

NOTE: The method of checking out armature that is outlined here requires the use of a meter-indicating external growler. Available equipment and techniques may be used in lieu of procedure given here.

Place the armature on the laminated bed of the growler. Energize the growler. Apply the growler test probes to two adjacent commutator bars. Continue checking each set of bars, moving test probes toward the right. While checking, be sure that the left test probe contacts the bar that was previously occupied by the right probe. Tests are continued until the commutator circumference has been spanned. No meter reading indicates an open circuit. A reading above or below readings for other coils indicates a short circuited coil. Replace armature if fault is indicated.

D. Permanent Magnet Field Checkout

Check out of the field consists of a speed-torque test to determine if the permanent magnet has deteriorated. This is accomplished after motor is assembled, the brushes run-in and commutation is tuned. See paragraph 6.A. and 6.B.

5. REPAIR

Replace all parts condemned during inspection. Substitute parts contained in the repair parts kit for parts removed during disassembly regardless of apparent condition of original part. Where the serviceability of a part is questionable, it should be replaced rather than risk premature pump failure.

A. Restoration of Machined Aluminum Castings

Dress out nicks, burrs, gouges, etc. from machined surfaces of aluminum castings with a suitable abrasive. Flat surfaces that are warped or blemished are reworked with a large, flat mill file or on a surface plate covered with an abrasive sheet. Dress out damage to other areas with an oil stone, abrasive sheet or file as necessary to restore original contour or blend high metal. Preformed packing grooves are reworked circumferentially so as to prevent radial or spiral tool markings that could become a path for leakage.

(1) Thread Repair

Tapped holes may be restored by chasing threads with a suitable tap or die. Blend entrance chamfer to tapped holes to remove burrs or high metal using an oil stone or crocus cloth. Screw threads worn or reworked to an oversize condition where retention capacity is affected are unacceptable. Screw thread inserts are replaceable (see Bulletin 800 available from Helicoil Corp., Danbury, Connecticut, USA).

WARNING: CHEMICAL FILM MATERIALS ARE USUALLY STRONGLY OXIDIZING AND REPRESENT A POTENTIAL FIRE AND EXPLOSIVE HAZARD IN CONTACT WITH PAINT THINNERS. AVOID STORING OR MIXING SURFACE TREATMENT MATERIALS IN CONTAINERS PREVIOUSLY CONTAINING FLAMMABLE PRODUCTS.

(2) Alodine Touch-up of Aluminum Parts

Touch-up metal that has been exposed by reconditioning using the Alodine 1200 process. Alodine may either be sprayed or brushed on a part. Proceed as follows:

(a) Clean part with Deoxidien No. 600 (manufactured by Amchem Products, Inc., Ambler, Pa.).

(b) Keep part wet with Deoxidien for 1 to 5 minutes.

(c) Rinse part thoroughly with clear water.

(d) Brush or spray Alodine 1200 (Amchem Products, Inc., Ambler, Pa.) solution on surface of part and allow it to set from 3 to 5 minutes.

NOTE: Alodine No. 1200 coating is golden and irridescent when dry. The color of the coating however may vary with different aluminum alloys. The coating shall be adherent and free of dust.

(e) Remove excess Alodine with a wet cloth or sponge and rinse thoroughly in water. Allow coating to air dry.

B. Shaft Face Seal Restoration

Contact surfaces of shaft seal components (27 and 29, figure 6) should be lapped to obtain a smooth, polished, uniform finish.

(1) Resurface contact surface of seal seat (27) on a cast iron lap charged with a fine grit lapping compound. Select a lapping compound that will produce a 4 microinch finish. Avoid applying finger pressure to piece while lapping; to insure flatness, part should be lapped under its own weight. After resurfacing, thoroughly wash off all traces of all lapping compound. Avoid touching the polished surface with bare hands after lapping.

(2) Lap the carbon contact surface of encased seal (29) as in the previous paragraph except use an uncharged lapping plate wetted with naphtha. Encased seal contact surface requires a 4 microinch finish.

C. Armature Reconditioning

Resurface and true-up the armature commutator. Mount the armature in a lathe using a flexible collet in the head stock and a live bearing center in the tail stock. Chuck the collet on the bearing journal at the commutator end of the armature. Be sure that the journal is not damaged when chucking. Tighten the tail stock sufficiently to prevent end play. Bearing journals must be aligned and concentric within 0.0005 inch T.I.R.

(1) Rough Turn

Adjust a carbide tipped tool in the post on the commutator center line to 0.003 inch below to avoid chatter. Set machine for a commutator surface speed of 600 to 800 feet per minute. Adjust longitudinal tool feed to 0.004 to 0.006 inch per revolution. Take as many cuts as necessary to 'clean-up' the commutator. Depth of cut per pass must not exceed 0.005 inch. Provide a light flow of air over the armature to keep chips off the commutator.

(2) Commutator Slots

Undercut the mica insulators between the commutator bars to a depth of 0.020 inch using a 0.032 inch wide, 0.312 inch (maximum) diameter saw blade. Slots must be centered as close as possible on the interbar insulators. Slots should be as wide as the insulator, and run from the outboard edge of the commutator to the riser, but must not cut into the riser.

(3) Finish Turn

Finish turn the commutator with a diamond tipped tool having a 0.005 inch point radius (maximum). After undercutting, remount the armature on the lathe as instructed before. Adjust the tool on the commutator centerline to prevent grooving and drag-over. With the commutator surface of 600 to 800 feet per minute, and a tool feed of 0.0010 to 0.0015 inch per revolution, take light cuts across the commutator until it is 'cleaned-up' 100 percent. Depth of cut per pass shall not exceed 0.002 inch. After turning remove

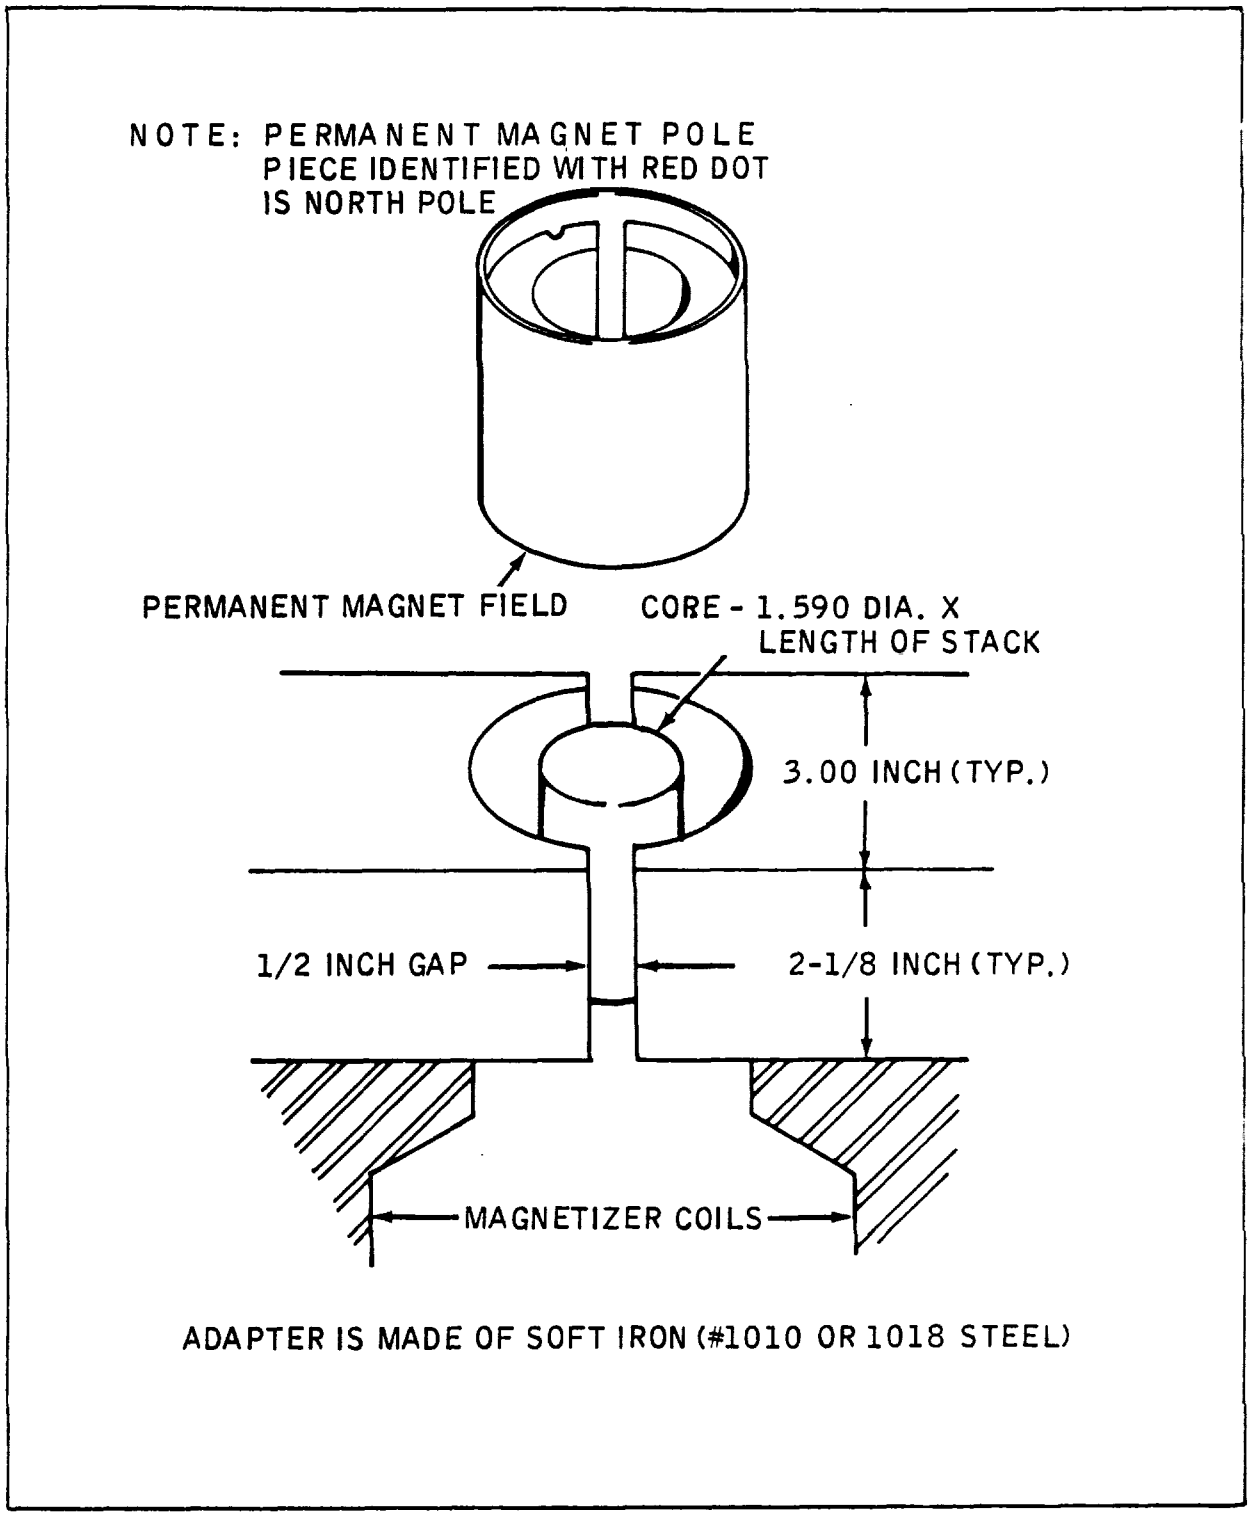

Figure 1. Remagnetizing Permanent Magnet Field

chips and mica dust with a clean, wax-free fiber brush.

NOTE: The minimum commutator diameter given in the following paragraph is the absolute minimum. As the commutator approaches this dimension, a judgement decision must be made as to whether the part should be continued in service. Consideration should be given to the amount of material removed in resurfacing, and the total operating time the unit has accumulated since last overhaul.

(4) Checkout

At completion of resurfacing operations dimensionally check the commutator. Commutator must be concentric with the bearing journals within 0.0005 inch T.I.R. Bar-to-bar variation between any two adjacent bars shall not exceed 0.0002 inch. Minimum commutator diameter is 0.900 inch. Commutator shall exhibit a surface finish of 8 to 32 microinches.

D. Field Remagnetization

The field magnet may be remagnetized using an electrocoil magnetizer. Fabricate an adaptor and set the field up for magnetization as shown in figure 1. Apply current until magnet field is saturated.

6. ASSEMBLY

Reassembly will generally follow the reverse of disassembly. Lubricate preformed packings with petroleum jelly as assembly progresses to reduce risk of damage to the packing, and ease installation.

A. Motor Assembly

(1) Brush Holder Assembly

Fit brush springs (54 and 59, figure 6) to brush holders (55 and 60) as shown in figure 2. Secure brush springs with cotter pins (53 and 58).

(2) Rear End Cap Assembly

Apply "Locquic Primer T" (manufactured by Loctite Corporation, Newington, Conn.) to threads of screws (52 and 57) and allow them to dry. Position brush holders (55 and 60) on end cap (62); make sure that

insulator (61) is positioned under the positive brush holder. Apply "Loctite Sealant Grade AA" (manufactured by Loctite Corp., Newington, Conn.) to threads of screws (52 and 57). Attach brush holders. Tighten screws to 6.5 to 7.0 inch pounds torque.

(3) Ball Bearing Assembly

Press ball bearings (45 and 46) onto journals of armature (47) using a suitable ram adaptor to transmit force from the arbor ram to the inner bearing races. Ram adaptor may be fabricated from a piece of tubing having a cross section approximately the same size as bearing inner race. It must be faced off square at both ends and deburred to prevent misalignment or contamination of bearings. Adaptor should be long enough to prevent the arbor ram from impacting armature shaft when bearing seats.

(4) Armature End Play Adjustment

Assemble end cap (62), armature with bearings (45 through 47), magnet ring (50) and endbell (39). Measure armature shaft end play using a dial indicator. Select fewest number of shims (48) required to limit end play to 0.004 to 0.007 inch.

(5) Final Motor Assembly

Separate components temporarily assembled in preceding paragraph. Install shims (48) and plugs (44 and 49), ground harness lug to the inside of endbell (39) using screw and washer (41 and 42) and reassemble motor.

NOTE: One end of magnet ring (50) is identified with a prick punch mark on its outside diameter. Marked end of magnet ring takes its position adjacent to end cap (62).

(a) Visually align (within 0.020 to 0.040 inch) the prick punch mark on magnet ring (50) with center line of one of the holes for screw (40) in end cap (62).

(b) Apply "Locquic Primer T" to threads of screws (40). After primer is dry, apply "Loctite Sealant Grade AA" to screw threads. Primer

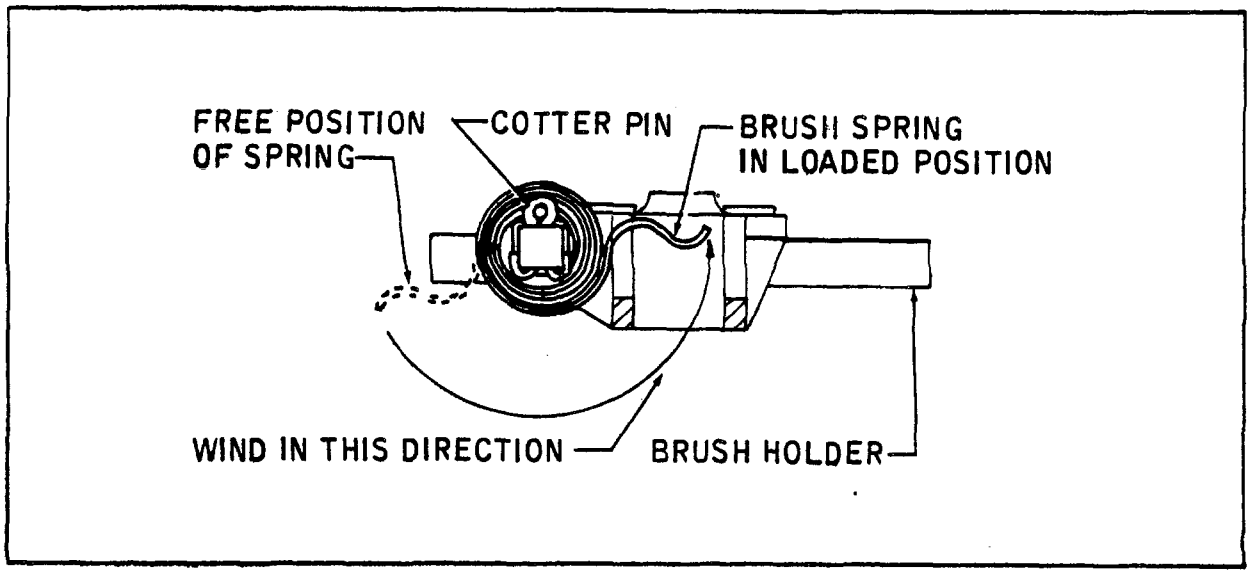

Figure 2. Brush Spring Installation

and sealant are products of Loctite Corp., Newington, Conn. Fit screws (40) through holes (in end cap) and thread them into holes in endbell (39). Tighten screws to 12 to 15 inch-pounds torque and allow sealant to cure for two hours at room temperature.

(c) Lift brush springs (54 and 59) and install brushes (36). Make electrical connections per figure 3 using screws and washers (37 and 38). Tighten screws to 8 to 11 inch-pounds torque.

B. Motor Checkout

Before assembling pump components, run-in brushes and check out motor.

(1) Brush Run-in

Apply 14 VDC to motor and check for clockwise rotation facing drive end of motor. Run-in brushes for 8 hours minimum at 14 VDC. Fan cool motor during brush run-in.

Table 2. Motor Performance Values

Voltage	Torque	Current AMP Max.	Speed RPM Min. - Max.
28 VDC	13.8 oz in.	8.0	9500 10,000

(2) Motor Checkout

Check out motor on a dynomometer. The method of mounting motor on dynomometer shall include a means of thermally isolating motor from any metal heat sinks (such as the use of a wooden mounting yoke, rubber or plastic shims, etc.). Prior to checkout, motor temperature shall be stabilized at ambient room temperature (60° - 90°F). The motor shall be run under rated load for one minute prior to taking meter readings. Readings shall be taken as close to conclusion of test run as practicable in order to obtain uniform frame temperatures. Required motor performances is given in table 2.

NOTE: Motor speed may be adjusted if necessary. Loosen screws (40) and rotate end cap (62) in direction of armature rotation to decrease speed.

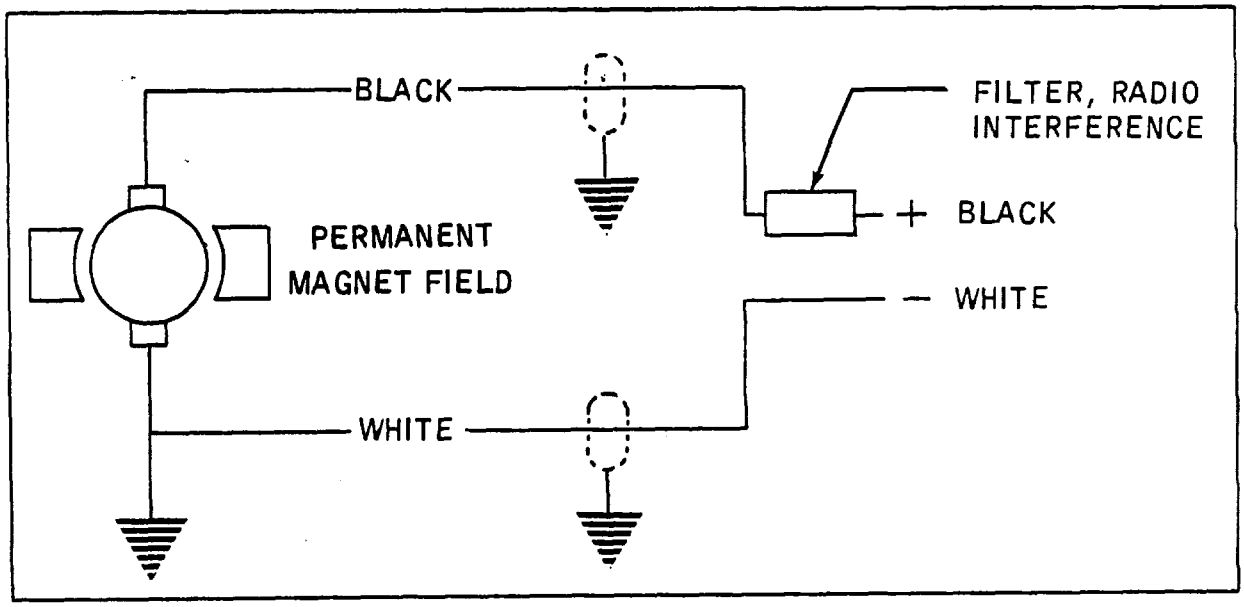

Figure 3. Schematic Motor Diagram

(3) After motor checkout, install preformed packing (43) on endbell (39). Slide motor cover (33) over the assembly. Treat screws (34) with Loctite primer and sealant as described in paragraph 6.A. (2). Secure motor cover with screws and packings with retainer (34 and 35). Tighten screws to 12 to 15 inch-pounds torque.

C. Pumping Element Assembly

Install preformed packing (28) in groove of seal (29). Press seal (29) into its cavity in pump housing (31). Seal is installed with its carbon face adjacent to impeller (21). Exercise care when installing seal to prevent damage to its carbon face.

(1) Impeller Installation

Fit motor assembly to pump housing. Assemble impeller (21) and associated parts (27, 24, 23 and 22) to motor shaft as shown in figure 4. With depth micrometers, measure impeller clearance from face of pump housing to impeller vanes. Select shims (25) required to limit clearance to 0.010 to 0.012 inch. Take off impeller, motor and associated parts, install shims (25) and preformed packings (26 and 30) then reassemble. Tighten impeller nut (22) to 12 - 15 inch pounds torque.

D. Final Assembly

Line up holes in motor mounting flange with those in pump housing (31), spacer cover (18) inlet strainer (10) and mounting flange housing (15). While stacking parts, thread wires through openings in castings and install preformed packings (19, 20, 16 and 17) around lead exit and seal drain.

(1) Apply "Locquic Grade N" cleaner to screws (7, 8 and 11), and to their receiving holes. Allow 10 minutes for cleaner to dry, then apply "Loctite Grade AV" sealant to screw threads. (Loctite and Locquic are products of Loctite Corporation, Newington, Conn.). Install screw and tighten screw (11) to 12 - 15 inch-pound, and screws (7 and 8) to 20 - 25 inch-pounds torque. Cure time for sealant is six hours at room temperature or ten minutes at 212°to 250°F.

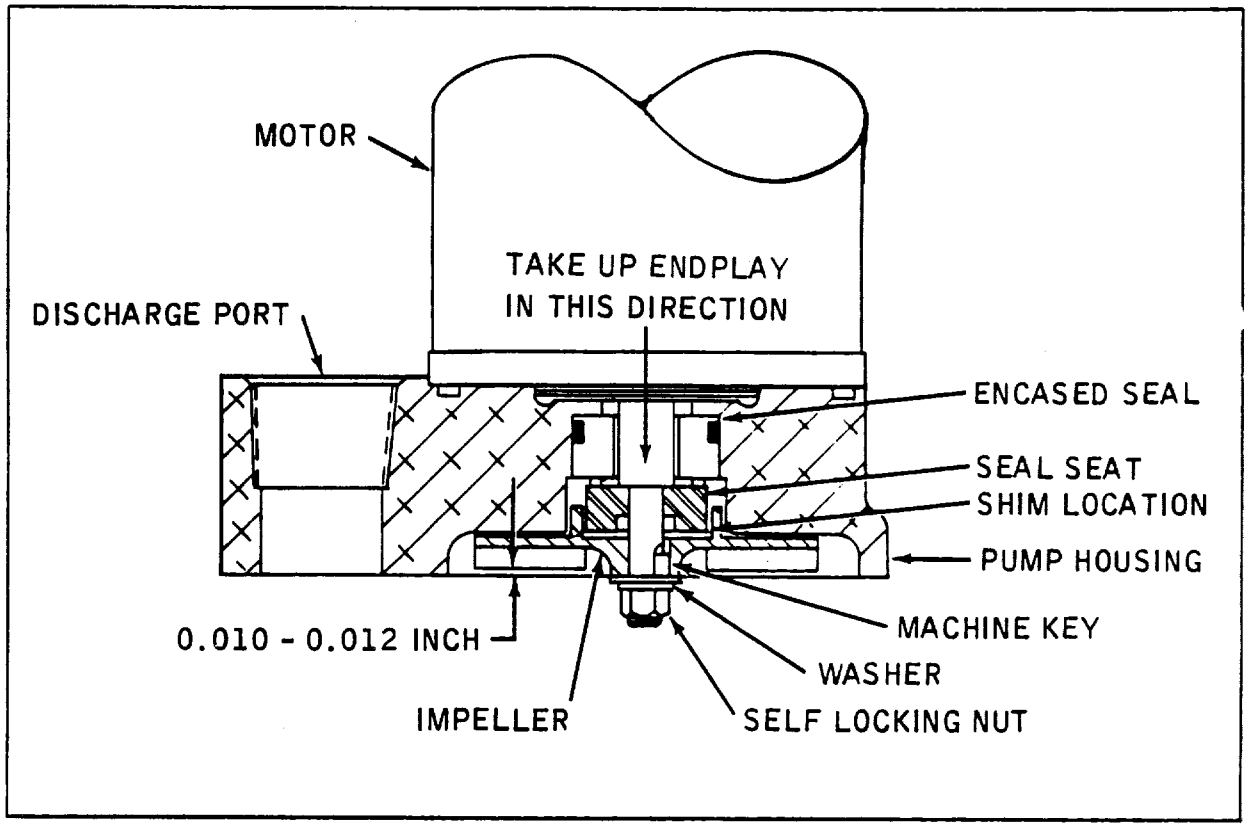

Figure 4. Impeller Shimming

(2) Filter Connections

Clean and apply sealant to screws (3) and their receiving holes as directed in preceeding paragraph. Attach filter (2) and tighten screws to 12 - 15 inch-pounds torque. Crimp terminal lug (5) over the negative brush lead so that it makes contact with both the conductor and the shielding. Attach negative lead to ground terminal stud on filter. Solder positive lead to filter motor terminal, the lead shielding to the shield cap, and the shield cap to the terminal cover. Use solder that conforms to Composition Sn 60 or Sn 63 of Federal Specification QQ-S-571.

7. FITS AND CLEARANCES

Critical dimensional data is listed under INSPECTION, paragraph 4.

8. TESTING

A. Test Conditions

(1) Pumping Medium

Fluid used for testing shall be solvent conforming to Military Specification MIL-F-7024A, Type II. Solvent must be clean and free of all foreign matter.

(2) Fluid Temperature

Temperature of test solvent shall be maintained at $80^{\circ} \pm 10^{\circ}F$ during break-in run and calibration.

(3) Fluid Quantity

Amount of fluid used for conducting tests shall be that amount required to produce a 10 inch head above pump mounting flange.

(4) Power Input

Operational tests shall be conducted with 27 volts DC applied to motor leads.

(5) Test Setup

Test installation shall consist of a tank suitable for mounting the pump and necessary instrumentation for monitoring flow (PPH) discharge pressure, voltage, current and fluid temperature. All instruments shall have an accuracy within $\pm$ 2% of true reading. Test setup is shown schematically in figure 5.

B. Break-In Run

Operate the pump at 460 to 560 PPH flow for 30 minutes.

(1) During break-in there shall be no fluid leakage through discharge port, seal drain port, tank drain port, castings, gaskets or around motor leads.

C. Performance Test

Operate unit and adjust flow control valve to flow rates given in the first column in table 3. Pump shall meet the pressure and current requirements given in the table for each flow setting.

(1) During performance test there shall be no fluid leakage through discharge port, seal drain port, tank drain port, castings, gaskets, or around motor leads.

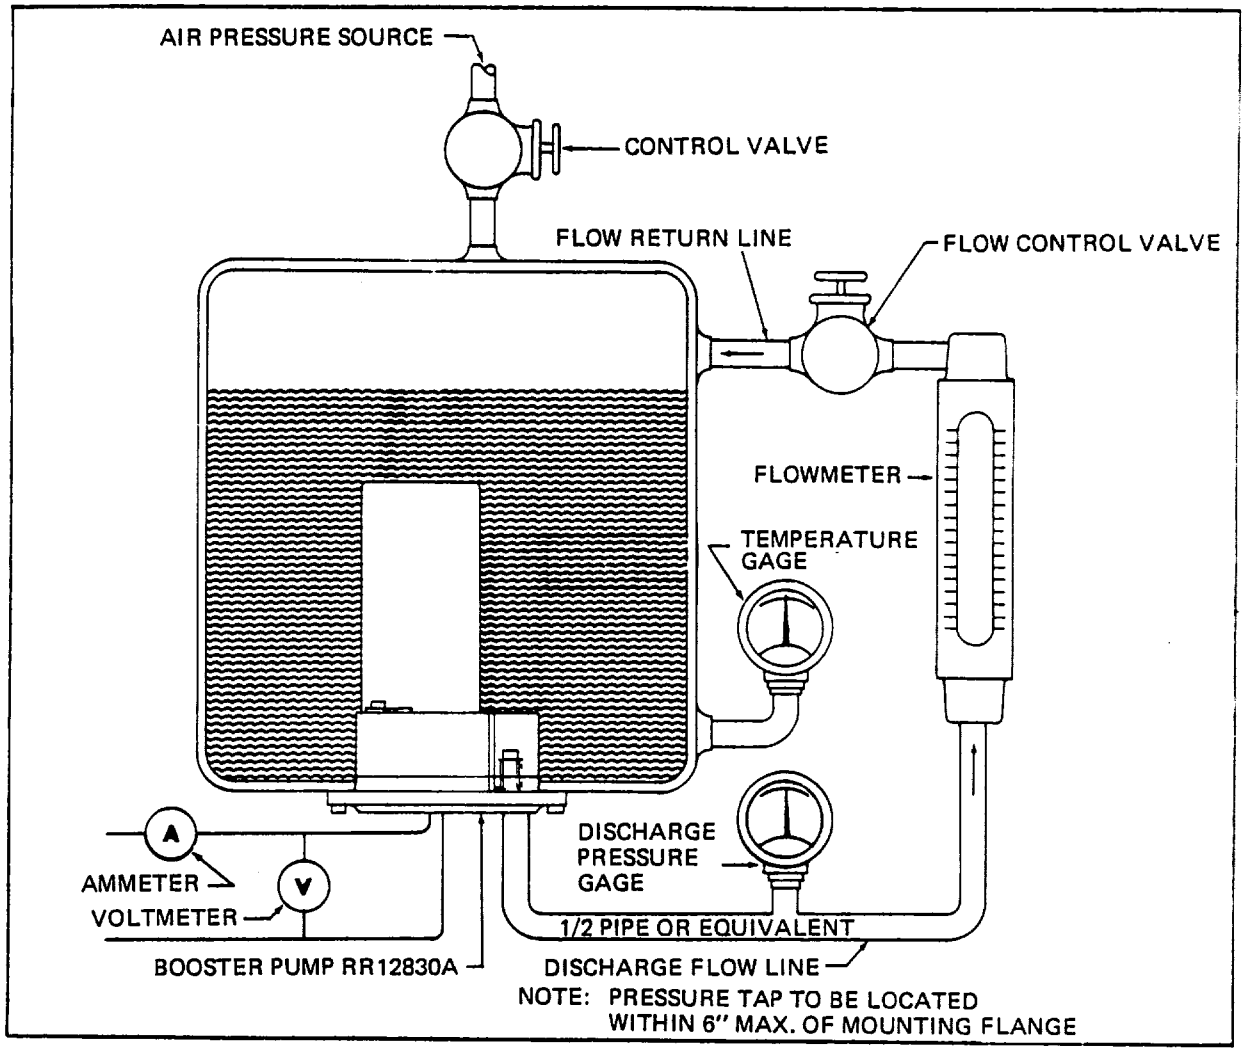

Figure 5. Schematic Test Setup

Table 3. Performance Test Values

Flow (PPH)	Discharge Pressure (PSI)	EMF (VDC)	Current (AMP)
0	40 maximum	27.0	8.0 maximum
450	22.0 minimum	27.0	8.0 maximum

D. External Leakage Test

De-energize pump, close off flow control valve and apply 15 PSI air pressure within the tank for a period of 10 minutes.

(1) During pressurization period there shall be no fluid leakage through discharge port, seal drain port, tank drain port, castings, gaskets or around motor leads.

9. TROUBLESHOOTING

Table 4 lists the most common faults, their probable causes and the corrective action to be taken to return the pump to a serviceable condition.

Table 4.

Troubleshooting (Sheet 1 of 4)

TROUBLE	PROBABLE CAUSE	REMEDY
1. Leakage		
a. From lead wires or seal drain.	Damaged shaft seal, damaged or missing preformed packings.	Disassemble and inspect packings and parts associated with shaft seal per paragraph 5.B. Repair or replace parts as necessary.
b. From castings or other areas.	Damaged packings; cracked castings, etc.	Replace faulty parts as necessary.

Table 4.

Troubleshooting (Sheet 2 of 4)

TROUBLE	PROBABLE CAUSE	REMEDY
2. Unit fails to start.		
a. No current voltage reading.	Open circuit in test setup.	Trace external circuit to power source. Reset breaker or replace fuse.
b. Low voltage reading.	Improper voltage.	Apply proper voltage.
c. high current	Excessive friction.	Remove the 3 flange holding screws (items 7 and 8) and pull away the flange and space cover and check impeller for fre dom of rotation. If this fails, disassemble unit and inspect for binding, mis-alignment or a bent armature shaft. Take corrective actic as necessary.
3. Unit stops running after a short time.	Failure of supply voltage, overload relay set too low.	Apply proper vo tage,replace fuses,orreset overload relay.

Table 4.

Troubleshooting (Sheet 3 of 4)

TROUBLE	PROBABLE CAUSE	REMEDY
4. Attempts to start, but overload relay trips out.	Weak motor field.	Replace or remagnetize field magnet ring.
	Overload relays set too low.	Reset relay.
5. Runs Slow	Line voltage low.	Apply proper voltage.
a. High or erratic current reading.	Poor commutation.	Confirm that brushes have been properly run-in (see paragraph 6.B. (1).) Check for: (1) sticking brushes; (2) proper spring action; (3) foreign matter on brushes or commutator; (4) high mica commutator insulation; (5) rough or eccentric commutator; (6) lead wires interfering with brush spring action; (7) damaged brush leads. Take necessary corrective action
	Electrical fault.	Check for open, grounded or short-circuited armature. Take necessary corrective action.

Table 4.

Troubleshooting (Sheet 4 of 4)

	TROUBLE	PROBABLE CAUSE	REMEDY
6.	Overheating/ noisy operation.	Same as 2.c.	
7.	Low system flow/pressure.		
	a. Electrical instrument readings normal.	Excessive impeller clearance.	Adjust clearance per paragraph 6.c. (1)
		Motor brushes insufficiently	Insure motor brushes are seated per paragraph 6.B. (1)
	b. High current reading.	Same as 5. a.	
	c. High current reading/noisy operaion.	Same as 2. c.	
8.	High pressure at zero flow.	Insufficient clearance between impeller and flange.	Adjust clearance per paragraph 6.c. (1)
		High motor speed	Reduce motor speed per paragraph 6.B. (1)

10. STORAGE INSTRUCTION

At completion of tests, drain test fluid from pump and plug the discharge and seal drain ports (not shown in parts list). Wipe outside of unit and package with a dehydrating agent in a clean, dust-free container. Packageing recommendations are contained in ATA Specification 300.

11. SPECIAL TOOL, FIXTURES AND EQUIPMENT

Only standard shop tools are required to accomplish overhaul.

2. ILLUSTRATED PARTS BREAKDOWN

A. Purpose

This parts list is intended for use in provisioning, requisitioning, storing and issuing replacement parts and units, and in identification of new and reclaimed parts. Each assembly breakdown is illustrated with exploded views prepared in disassembly relationship.

B. Arrangement

All the assemblies and parts are arranged in the order of disassembly with the exception of the Attaching Parts which follow immediately after the item to be attached. Sub-assemblies of parts are indented to indicate their relationship to the complete assembly. Associated with each parts list is an exploded view illustration. These illustrations serve to show the relative position of the various assemblies and parts and to identify fully all assemblies and parts. Where a sub-assembly requires an additional exploded view to show the breakdown of the detailed parts, a cross reference is provided to assist in locating the detailed parts of the sub-assemblies. The column used in the Parts List are as follows:

C. Figure and Index Number Column

The first index number identifies the figure number of the illustration. The second number is the item and locates the part on the illustration. Item numbers are assigned in the order of disassembly for each exploded view illustration.

D.

Romec's part numbers are prefixed by the letters RA, RB, RD, RG, RR and RS. All government standard parts will be listed without manufacturer's codes in the nomenclature column.

E. Nomenclature Column

This column lists the titles and modifiers of a part in accordance with manufacturer's drawing title, and other data characteristics where applicable. Government Standard Parts are described by a single identifying noun.

F. Indention

For proper identification of detailed assemblies and installations, the listings for each exploded view illustration have a column arrangement. Each assembly or installation (if broken down) is listed in the next column to the right; and conversely, the next higher assembly or installation of any part assembly may be determined by locating the first assembly or installation directly above in the first column to the left.

G. Attaching Parts

Attaching parts for any assembly or sub-assembly are listed in the same column immediately beneath the item to be attached and precede any detailed parts of that item. In general, attaching parts are listed only for those items that are frequently removed.

H. Units Per Assembly Column

Quantities listed in this column are, in the case of assemblies, the total quantity used per unit of equipment at the location indicated, while the sub-assembly and detailed parts indented under the assemblies only show the quantities used per one assembly. Therefore, the quantity specified is not necessarily the total quantity used per unit of equipment. Refer to the Numerical Index for the total quantities used per unit of equipment.

OVERHAUL MANUAL

LEVEL CONTROL VALVE

Part No. 1321-536250

1. Description and Operation

The bottom level control valve is installed in an aircraft fuel tank and is used to shutoff the flow of fuel at a predetermined tank level during aircraft refueling operations. The valve contains a float assembly, which when raised by the fuel level, automatically closes a poppet and shuts off fuel flow.

Service Medium	Aviation Fuels per MIL-G-5572 and MIL-J-5624, Grades JP-4 and JP-5
Temperatures:	
Ambient	-65 to +160°F (-53.9 to +71.1°C)
Fluid	-65 to +135°F (-53.9 to +57.7°C)
Pressures:	
Operating	0 to 60 psig
Proof	125 psig
Leakage:	
Internal	31 cc per minute (maximum) at 0 to 50 psig
External	Zero from 0 to 125 psig
Weight	0.63 pounds

2. Disassembly

A. Disassemble according to sequence of index numbers assigned to the exploded-view illustration (figure 1).

B. Do not attempt to remove stud from body (18).

C. Do not disassemble poppet assembly (24). If damaged or defective replace in its entirety.

D. Note and record number of washers (10 and 11) removed to facilitate reassembly.

3. Cleaning

   A. Wash all parts in dry-cleaning solvent, Federal Specification P-D-680 and dry with a clean, lint-free cloth or moisture free compressed air at 10 psig. Place cleaned parts in a dust-proof container until ready for inspection.

      WARNING: USE SOLVENT IN A WELL-VENTILATED AREA. AVOID BREATHING FUMES. KEEP AWAY FROM OPEN FLAME.

4. Inspection

   A. Inspect all parts for cracks, breaks or other signs of excessive wear or damage. Ensure all ports are clean and unobstructed and that all threads are clean and undamaged.

   B. Roll spring (7) on a flat surface and check for distortion. Spring (7) must compress to 0.128 inches with a 1.50 to 2.00 pound load.

   C. Spring (21) must compress to 5/16 inch under a load of 5 to 7 ounces.

5. Repair

   A. Replace all parts that are damaged and cannot be repaired to meet inspection requirements.

   B. Polish out minor surface scratches and imperfections in other than microfinish surfaces, with crocus cloth, Federal Specification P-C-458 (ferrous materials only), or aluminum oxide abrasive cloth, Federal Specification P-C-451 (aluminum and aluminum alloy parts only).

   C. Touch up reworked areas with a chemical film, Military Specification MIL-C-5541 or equivalent.

6. Assembly

   A. Reassemble in reverse sequence of index numbers assigned to the exploded-view illustration, observing the following:

   B. Torque seat (14) into body (18) to 40 inch-pounds maximum.

   C. Do not safetywire screws (16) until completion of testing.

7. Fits and Clearances (not applicable)

8. Testing

Test with air and solvent, Specification P-D-680, from a 0 to 125 psig, 0 to 20 gpm source maintained at 26.6 ±5.6 °C (80 ± 10°F). Proceed with tests as follows:

A. Proof Pressure. With valve mounted upright in a suitable test fixture and submerged in test solvent, apply an increasing pressure to 125 psig. There must be no external leakage. Disregard leakage from seat and pilot. If air leakage is observed, invert valve and retest with solvent pressure at inlet port.

B. Leakage. Apply 60 psig solvent pressure to inlet, with valve in inverted position. Total internal leakage must not exceed 31 cc per minute.

C. Sensing Level. Mount valve in an upright position and establish solvent flow of one gpm at inlet port. Valve must shut off due to normal floatation of float. The sensing level must be 3-1/4 ±3/16 inch measured up from the mounting flange. Record the measurement.

D. Pressure Drop. Mount valve upright on a one-inch diameter calibrated pressure tap. Connect fluid source to inlet, and establish 20 gpm flow through valve. Net pressure drop must not exceed 2 psi.

E. If valve fails to meet requirements of any of these tests, disassemble, clean, and re-inspect components, replacing those found defective or suspected of malfunction. Then repeat entire test procedure.

F. After satisfactory completion of all tests flush valves with fuel, Specification MIL-J-5624, cap ports and secure float assembly down with a piece of cardboard. Store in a dust proof container.

9. Storage Instructions

A. At the conclusions of testing drain all excess fluid from unit.

B. Stamp valve with cure-date of parts in accordance with ANA Bulletin 438.

C. Cap port against entry of foreign matter.

10. Special Tools, Fixtures and Equipment (none required)

11. Illustrated Parts Breakdown.

OVERHAUL MANUAL

SWING CHECK VALVE

Part No. 2650157

1. Description and Operation

This valve is of the swing check (flapper) type, spring-loaded to the closed position. The flapper uses a soft seat for sealing.

When pressure in excess of the cracking pressure is applied against the spring-loaded flapper, the flapper swings off its seat permitting flow through the valve in the direction of the "FREE FLOW" arrow which is stamped on the valve body. At pressures below the cracking pressure, or if pressure is applied in the opposite direction, the flapper closes, and the soft seat effectively closes the valve.

Operating Medium	Air and Fuel per MIL-G-5572 and MIL-F-5624
Temperature Range	-65° to +160°F(-53.9 to 71.1°F)
Pressures:	
Operating	50 psig
Proof	75 psig
Burst	125 psig
Cracking	8 inches H_2O max
Leakage	
External	None from zero to proof pressure
Internal	None above 3 inches H_2O (air) in checked flow direction with wet seat
Ports:	
Inlet	MS33677-1/2
Outlet	MS33656-10
Weight	0.17 pounds

2. Disassembly

Disassemble according to sequence of index numbers assigned to the exploded-view illustration (figure 2).

NOTE: Do not attempt to disassemble swing assembly (5). If damaged or defective, replace in its entirety.

3. Cleaning

Wash all parts, except swing assembly (5), in dry-cleaning solvent, Federal Specification P-D-680 or equivalent and dry parts thoroughly with a clean, lint-free cloth, or compressed air at 10 psig.

WARNING: USE DRY-CLEANING SOLVENT IN A WELL-VENTILATED AREA. AVOID BREATHING FUMES. KEEP AWAY FROM OPEN FLAME.

Clean swing assembly (5) with a cloth moistened with solvent.

4. Inspection

A. Anodized surfaces of body (1) and cap (6) should be clean and undamaged; ensure threads are clean and undamaged and there is no evidence of corrosion on interior surfaces.

B. Seating surface on cap (6) for swing assembly (5) must be smooth; no nicks or scratches which might prevent proper seating or cause damage to soft seat.

C. Outisde diameter of hinge pin (3) must not be worn below 0.0535 inch at any point; no visible distortion when rolled on a surface plate.

D. Spring (4) data:

(1) Must wind up to nominal working position (189^{o}) under a load of 0.00783 to 0.00957 inch-pounds.

(2) Must not bind on a 0.054 inch diameter pin when wound up 90^{o} beyond nominal working position; when released must exhibit no evidence of permanent set.

E. Swing Assembly (5) data:

(1) Soft seat must have no nicks or tears; cure date must be current.

(2) Inside diameter of holes in arm for hinge pin (3) must not be worn over 0.0565 inch diameter.

5. Repair

A. Replace all rubber components at each overhaul.

B. Polish out minor surface scratches and imperfections with crocus abrasive cloth, Federal Specification P-C-458 (ferrous material only), or aluminum oxide abrasive cloth, Federal Specification P-C-451 (aluminum and aluminum alloy parts only). Reclean all polished parts in accordance with paragraph 3.

C. Touch up reworked areas with a chemical film, Military Specification MIL-C-5541 or equivalent.

D. Replace any defective parts that cannot be repaired to meet inspection requirements.

6. Assembly

A. Reassemble in reverse sequence of index numbers assigned to the exploded view.

7. Fits and Clearances (not applicable)

8. Testing

A. Test Specifications:

(1) Test Medium: Air or solvent, Federal Specification P-D-680

(2) Temperature: +60 to 100°F (+15.6 to 37.8°C)

(3) Pressure Range: 0 to 75 psig

B. Test Procedures

(1) Visual

(a) With outlet port down, the torsion spring (4) must have sufficient force to return swing assembly to its seat after manually unseating.

(2) Internal Leakage

(a) Prior to performing the internal leakage test wet swing assembly (5) with solvent.

(b) With the valve in the vertical (upright position) connect outlet port to the air pressure source.

(c) Gradually apply air pressure to the outlet port and apply a small amount of solvent to the inlet port (enough to cover the swing assembly approximately

1/8 inch) and observe for leakage. Leakage can be observed as bubbles appearing in solvent. There shall be no internal leakage from 3 inches H_2O.

(d) Slowly increase pressure over a 30 second period (minimum) to 75 psig; observe for leakage during pressure increase. Time required to increase pressure from 3 inches H_2O to 20 psig shall not be less than 20 seconds. There shall be no internal leakage from 3 inches H_2O to 75 psig.

(3) Proof and External Leakage

(a) Connect valve as noted in paragraph (2)(b); submerge the valve in solvent and apply 75 psig air pressure.

(b) Observe for external leakage or distortion of part. There shall be no external leakage or permanent set shall result from test.

(4) Cracking Pressure

(a) Mount valve as shown in figure 1 (valve vertical and swing assembly on top).

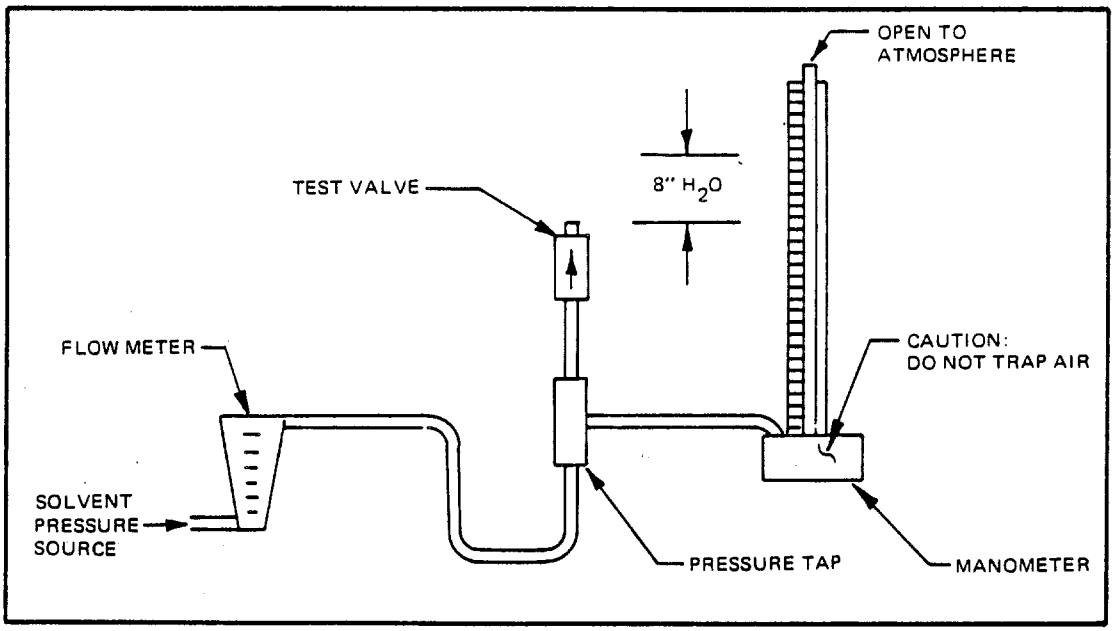

Figure 1. Cracking Pressure Test Setup

(b) Connect to solvent pressure source. Slowly apply pressure to the inlet port until a flow of 190 cc per minute is obtained from outlet port. Cracking pressure shall be 8 inches H_2O maximum with 190 cc per minute solvent.

(5) Test Results

(a) If valve fails to meet any requirement, repair or replace defective components and repeat all tests.

9. Storage Instructions

A. Upon completion of testing, drain all excess solvent from valve.

B. Cap ports against entry of foreign matter.

C. Stamp valve with cure-date of the installed rubber parts in accordance with ANA Bulletin 438.

10. Special Tools and Fixtures and Equipment (none required)

11. Illustrated Parts Breakdown

Liquid Quantity Transmitter Assembly,
Part Nos. 391087-03081, -03082, -03083, -03084, -03084, Assembled View
Figure 1

1. DESCRIPTION, OPERATION, AND DATA.

A. This handbook contains overhaul instructions, and test procedures for Liquid Quantity Transmitter Assemblies with part numbers listed in Table I.

B. The transmitter assembly (see Figure 1) is part of a capacitance gaging system. Such a system mea ures the mass of a liquid by making use of the liquid's dielectric properties. A transmitter assemb consisting of two tubular members separated by an air gap, is immersed in the fuel in such a way th as fuel level drops the dielectric between the members consists of a fuel-air mixture whose ratio is determined by fuel level. The capacitance of the transmitter assembly thus varies with the amount fuel in the tank.

C. Leading Particulars of the transmitter assemblies covered in this handbook are given in Table I.

TABLE I. LEADING PARTICULARS

Part No.	Length	Mounting	Capacitance (pf)	Weight (lbs)
391087-03081	14.50 ± 0.030	Flange	44.2	0.58
391087-03082	14.50 ± 0.030	Flange	37.7	0.58
391087-03083	14.50 ± 0.030	Flange	40.3	0.53
391087-03084	14.50 ± 0.030	Flange	43.9	0.53
391087-03085	14.02 ± 0.030	Flange	34.3	0.58

2. DISASSEMBLY.

Disassembly of the liquid quantity transmitter assemblies is not recommended.

3. CLEANING.

NOTE: See Table IV for special materials.

WARNING: USE METHYLETHYL KETONE IN A WELL VENTILATED AREA. AVOID CONTACT WITH SKIN AND OPEN FLAME.

A. Immerse transmitter components in methylethyl ketone.

B. Allow about 30 minutes for softening of deposits.

C. Agitate transmitter assembly in cleaning solvent to loosen and remove dirt and deposits. Scrub with a non-wire brush.

D. Remove transmitter assembly from cleaning solvent and rinse thoroughly in isopropanol.

E. Dry by means of clean, compressed air at a pressure no greater than 35 psi.

F. Carefully probe recesses with a small, soft, pointed instrument to make sure recesses are clean.

G. If traces of deposit or hole blockage is noted upon inspection, repeat cleaning procedure. Carefully clear blockage using a soft instrument while components are immersed in cleaning solvent.

4. INSPECTION/CHECK.

A. Examine transmitter assembly for dents, cracks, chips, or scoring which may effect electrical characteristics of the unit.

B. Check cable clamps for security of mounting.

C. Check leads for defective insulation and faulty connections.

5. REPAIR OR REPLACEMENT.

Replace preformed packing whenever assembly is replaced in installation. Repair is limited to replacement of the liquid quantity transmitter assembly.

6. ASSEMBLY.

Replace preformed packing, Part No. 398602.

7. TESTING.

A. CAPACITANCE TEST.

NOTE: Take into consideration the tolerance of the measuring equipment when making capacitance measurements.

Using the Automatic Capacitance Bridge, Simmonds Part No. 387011, or the bridge portion of the Field Calibration Unit, Simmonds Part No. 387991-003 (refer to paragraph 10), or equivalent, measure the capacitance between the coaxial and 400-cycle connections of each transmitter. The capacitance of each transmitter must be as shown in Table II.

TABLE II. CAPACITANCE VALUES

Part No.	Capacitance (pf)
391087-03081	44.2 ± 0.5
391087-03082	37.7 ± 0.5
391087-03083	40.3 ± 0.5
391087-03084	43.9 ± 0.5
391087-03085	34.3 ± 0.5

B. INSULATION RESISTANCE MEASUREMENT.

Using the Simmonds Three-Terminal Megohmmeter 388226,or equivalent, measure the insulation resistance between points shown in Table III. Resistance must be as shown.

TABLE III. INSULATION RESISTANCE VALUES

Part No.	Test Point (Megohms) Coaxial Terminal to Ground	Test Point (Megohms) 400-cycle Terminal to Ground	Test Point (Megohms) Coaxial Terminal to 400-cycle Terminal
391087-03081	4	4	1800
391087-03082	4	4	2000
391087-03083	4	4	2000
391087-03084	4	4	1800
391087-03085	4	4	2200

C. INSULATION BREAKDOWN TEST.

Using Insulation Breakdown Tester, Model P-2, or equivalent (refer to paragraph 10), apply 500 volts RMS, 60 cps between the test points indicated in Table III. There must be no insulation breakdown.

CAUTION: PERFORM THIS TEST ONLY ON A CLEAN, DRY TRANSMITTER ASSEMBLY. IT IS A DESTRUCTIVE TEST AND SHOULD BE PERFORMED ONLY ONCE OR TWICE DURING THE LIFE OF THE UNIT.

8. TROUBLE SHOOTING.

If the transmitter assembly fails to pass the tests specified in paragraph 7, check for improper electri connections and for tightness of parts. If these checks fail to provide test compliance, discard and replace unit.

9. STORAGE INSTRUCTIONS.

A. PACKAGING.

(1) It is recommended that the transmitter assembly be stored in the original container, if availal

(2) If the original container is not available, package the transmitter assembly as follows:

a. Completely wrap the transmitter assembly in water-resistant paper. Seal with waterproc tape.

b. Insert the wrapped equipment in a cardboard carton, being sure to adequately cushion the carton on all sides so that the equipment will be held securely in place. Seal the carton with tape.

c. Wrap the carton with water-resistant paper and seal with waterproof tape. Mark the cart "FRAGILE."

d. Affix a label containing the following information:

(i) Transmitter assembly part number.

(ii) Serial number.

(iii) Date of last overhaul.

(iv) Modification standard if applicable.

(v) Note and date of any other component change.

B. LIMITING PERIOD.

The storage period of the transmitter assembly is 18 months.

10. SPECIAL TOOLS, FIXTURES, AND EQUIPMENT.

Item	Description	*Part Number
1	Automatic Capacitance Bridge OR Field Calibration Unit	387011 Simmonds Precision Products, Inc. Tarrytown, New York, U.S.A. 387991-003 Simmonds Precision Products, Inc.
2	**Capacitance Standards Kit	387046 Simmonds Precision Products, Inc.
3	Voltage Breakdown Tester	Model P-2 Industrial Instruments, Inc. Cedar Grove, N.J., U.S.A.

* - Equivalent equipment may be used.
** - The Capacitance Standards Kit is recommended for use in checking accuracy of the capacitance measuring test equipment.

1. SCHEDULE OF OVERHAUL PERIODS.

Item	Manufacturer	Part No.	Period to Overhaul
Liquid quantity transmitter assembly	Simmonds Precision Products, Inc. Tarrytown, N. Y., U. S. A.	391087-03081 391087-03082 391087-03083 391087-03084 391087-03085	18 months elapsed time, or 12,000 flying hours, whichever occurs first.

Liquid Quantity Transmitter
Figure 1

DESCRIPTION AND OPERATION

1. Description (Ref Fig. 1)

   A. The liquid quantity transmitters, part number 391088-*, are components of the DeHavilland DHC-6 Fuel Quantity Gauging System (FQGS). The transmitter consists of two metal tubes, two lead assemblies with plug connectors, a flange and a scuff cap. The two tubes fit together, concentrically, one inside of the other. The inner (high impendance) tube is nickel electroform and the outer (low impedance) is anodized aluminum. Concentricity of the tubes is maintained by teflon insulating spacers distributed along the length of the transmitter. These spacers are retained in place on the outer tube by insulator rings and stainless steel spring clamps.

   B. The leading particulars of the liquid quantity transmitters covered in this manual are listed in Table 1.

2. Operation

   The liquid quantity transmitter is immersed in the fuel and acts as a variable capacitor whose capacitance varies only with a change in the dielectric value of the material between the tubular members. Since the liquid quantity transmitter is used to measure between tubular members will be either all fuel, partially fuel and air or all air, depending upon the amount of fuel in the tank. The capacitance is determined by the proportions of fuel and air. As a result of this condition, the capacitance will vary as the fuel level in the tank varies. The capacitance signal is transmitted to an indicator-amplifier-bridge which amplifies the signal and displays on a dial the quantity of fuel in the tank.

TABLE 1
LEADING PARTICULARS

Part Number	L Dim Inches	Capacitance Dry	Mounting
391088-002	14.5	43.1	Flange
391088-003	14.5	36.8	Flange
391088-004	14.5	39.4	Flange
391088-005	14.5	42.9	Flange
391088-006	14.0	33.4	Flange

DISASSEMBLY

1. **General**

   A. Test the liquid quantity transmitter as described in the testing section before disassembly, to help locate trouble. If the unit passes all tests satisfactorily, overhaul is not recommended.

   B. Do not disassemble the unit beyond the point necessary to repair or replace damaged or defective part. Refer to applicable IPL Fig. 1 thru 5 for individual transmitter.

2. **Transmitter** (Ref IPL Fig. 1 thru 5)

   A. Remove and discard gasket (2) and cable tie (3).

   B. Do not remove identification plate (4) unless replacement is necessary.

   C. Remove screw (6) lockwasher (7) and wire clamp (8).

   D. Unscrew retaining nut (9) and remove 400 cycle lead assembly (5) bushing (10) two clamps (11) two flat washers (12) and gasket (13).

   E. Loosen retaining nut part of shielded cable assembly (14) and remove shielded cable assembly.

   F. Cut ends from two cross pins (15) and remove.

   G. Remove two spacer clamps (16) and extract spacers (17 and 19).

   CAUTION: TO ASSURE REASSEMBLY, SEPARATE EACH SET OF SPACERS AND NOTE LOCATION OF EACH SET ON OUTER TUBE ASSEMBLY.

   H. Remove scuff cap (18) and split ring (20) and separate inner tube assembly (21) from outer tube assembly (22).

CLEANING

1. **Materials Required**

NOTE: Equivalent substitutes may be used for listed items.

MATERIAL	NUMBER
Oakite NST (Inhibited, non-silicated, non-etching alkaline detergent)	Fed. Spec. P-C-436b

2. **Equipment Required**

Steel Detergent Tank

Steel Clear-Water Rinse Tank

Toothbrush (or equivalent)

Circulating Air Oven

3. **Cleaning Procedure**

A. Fill suitably-sized detergent tank with hot (120° to 130°F) de-ionized water and Oakite NST (5 to 10% Oakite NST by volume).

B. Immerse tank unit(s) in detergent solution for 30 to 40 minutes. Agitate tank unit(s) in tank. Remove any residual deposits with toothbrush or similar stiff brush.

C. Fill suitably-sized clear-water rinse tank with unheated, de-ionized water.

D. Transfer tank unit(s) from detergent tank to clear-water rinse tank as quickly as possible to avoid the detergent solution from drying on the tank unit(s).

E. Tank units should remain in the rinse tank for at least five minutes to ensure complete removal of alkaline residue.

NOTE: Rinse tank water should be changed periodically.

F. Remove tank unit(s) and rinse thoroughly with running cold water.

G. Suspend cleaned tank unit(s) in circulating air oven and bake at 120° to 130°F for at least 2 hours.

H. As an alternate drying method, use clean, compressed air at a pressure no greater than 15 psig.

WARNING: DO NOT DIRECT COMPRESSED AIR AGAINST HUMAN BODY.

I. Carefully probe each flood hole, as well as all recesses, with a small, pointed instrument to make sure the holes are not plugged and all recesses are clean.

J. If traces of hole blockage or deposits are noted upon inspection, repeat cleaning procedure.

INSPECTION/CHECK

1. **General**

   When performance of inspection/check procedure indicates repair is required, see REPAIR. For part replacement see DISASSEMBLY and ASSEMBLY.

2. **Transmitter**

   A. Visually inspect identification plate for damage and legibility of markings.

   B. Visually inspect transmitter for deterioration, corrosion and fungus.

   C. Visually inspect components for cracks, dents, chips, scratches and scoring.

   D. Visually inspect cables for cracks, wear or defective solder joints.

REPAIR

1. **General**

This section contains repair procedure for the transmitter; for replacement of parts see DISASSEMBLY and ASSEMBLY.

2. **Materials**

MATERIAL	NUMBER	VENDOR
Trichloroethylene	Federal Specification O-T-634	- - -
Iridite	14-2	83574

3. **Flange Assembly and Pressure Plate Touchup** (Ref IPL Fig. 1)

A. Degrease the scratched area of the outer tube assembly with trichloroethylene.

B. Apply iridite 14-2 (2-4 oz/gal. concentration) with a brush or cotton swab for 30 seconds; swab must be wet at all times.

WARNING: IF IRIDITE IS SPILLED ON HANDS OR CLOTHING, RINSE WITH WATER IMMEDIATELY.

C. Rinse touchup area with demineralized water using a swab or brush. Dry with clean cheese-cloth or air.

ASSEMBLY

1. **General**

The procedure listed below (Ref IPL Fig. 1) has been chosen as being representative for all transmitters. Refer to applicable IPL Figures 1 thru 5 for individual transmitters.

2. **Material**

MATERIAL	NUMBER
Solder	Federal Specification QQ-S-571 Sn63WRMAP2
Alcohol, Isoprophyl	T-T1-735A No. 2
Adhesive	8400
Tubing Insulated	050029-004

3. **Transmitter** (Ref IPL Fig. 1)

A. Assemble inner tube assembly (21) into outer tube assembly (22).

B. Place split ring (20) onto outer tube assembly and insert three spacers (19) and secure with one spacer clamp (16).

C. Place scuff cap (18) onto outer tube assembly and insert three spacers (17) and secure with one spacer clamp (16).

D. Insert two cross pins (15) thru inner and outer tube assemblies. Do not flare cross pins at this time.

E. Insert terminal, part of shielded cable assembly (14) thru hole in flange of outer tube assembly (22) and seat it firmly into socket in end of inner tube assembly (21). Tighten retaining nut, part of shielded cable assembly into flange.

F. Slide a 2 1/2 inch length of insulated tubing over wire of 400 cycle lead assembly (5) and assemble lead assembly, retaining nut (9), bushing (10), two clamps (11) two washers (12) and gasket (13) to outer tube assembly (22). Tighten retaining nut.

G. Solder 400 cycle lead assembly to terminal on outer tube assembly.

H. Remove solder flux with isoprophyl alcohol and a stiff non-metallic brush.

I. Apply a drop of 8400 adhesive to end of 400 cycle lead to prevent wicking of fuel.

J. Attach wire clamp (8) with screw (6) and lockwasher (7).

K. Leak test per testing section.

L. If identification plate (4) was removed, stamp the information on a new plate, remove the protective backing and attach to flange.

M. Attach cable tie (3).

N. Reverse the tip in a 150 watt soldering iron and using the blunt, round end of tip flare the ends of cross pins (15).

O. Test per testing section.

FITS AND CLEARANCES

(Not Applicable)

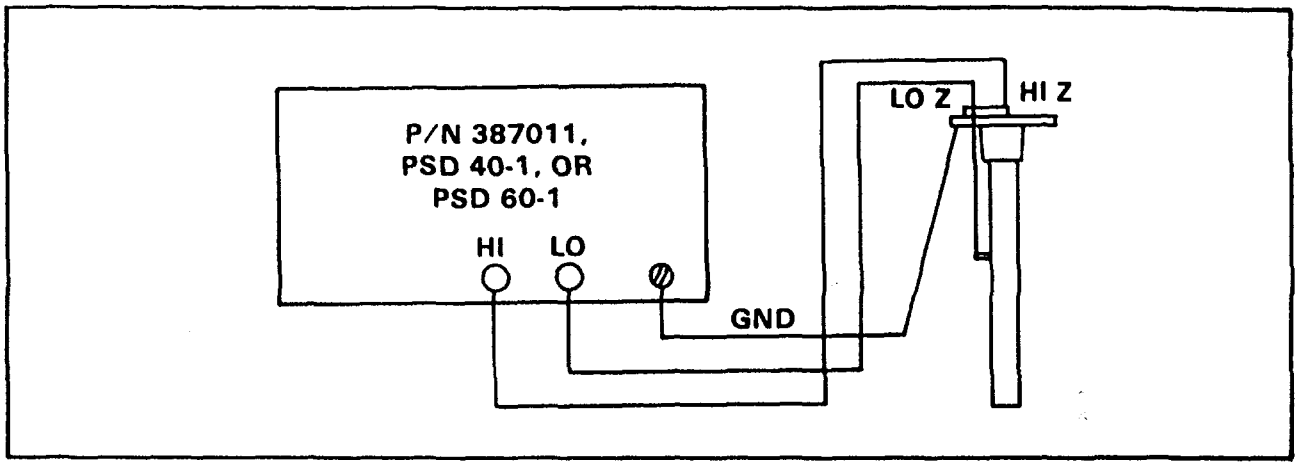
TESTING

1. **Materials**

MATERIAL	NUMBER
Stoddard Solvent	ASTM D484-52

2. **Capacitance** (Ref Fig. 701)

A. Using capacitance bridge, (Simmonds Precision 387011), Field Calibration Unit PSD 40-1 or PSD 60-1, (or equivalent), measure the capacitance between the coax (Hi-Z) terminal and the 400 cycle (Lo-Z) terminal.



NOTE: Mounting flange must be grounded to test set.

B. The capacitance reading shall be as listed below:

TRANSMITTER	CAPACITANCE
391088-002	43.1 $\pm$ 0.5 pf
391088-003	36.8 $\pm$ 0.5 pf
391088-004	39.4 $\pm$ 0.5 pf
391088-005	42.9 $\pm$ 0.5 pf
391088-006	33.4 $\pm$ 0.5 pf

3. **Insulation Resistance**

A. Using megohmmeter (General Radio GR1862B or equivalent), turn the power switch to OFF. Place the Volts of Unknown switch to 500, and Multiplier switch to DISCHARGE.

Test Setup
Figure 701

B. Connect the Low probe to the ground (Flange) terminal and the High probe to the Hi-Z terminal. Turn the power switch to ON.

C. Turn the Multiplier switch to one (1) for 1 minute. The meter reading shall be greater than 2 (20 megohms).

D. Repeat steps A. thru C. with the test probes connected as directed below:

LOW PROBE	HIGH PROBE	METER READING
GND terminal	Lo-Z terminal	20 megohms
Hi-Z terminal	Lo-Z terminal	20 megohms

E. If above readings are below the acceptable limit (20 megohms) perform the following test with Simmonds Precision three-wire megohmmeter part number 388226.

(1) With megohmmeter Range switch in OFF position connect the probe as follows:

MEGOHMMETER	TRANSMITTER
Hz probe	Hi-Z terminal
Lz probe	Lo-Z terminal
G probe	Gnd terminal

(2) Place the Range switch to 1X position.

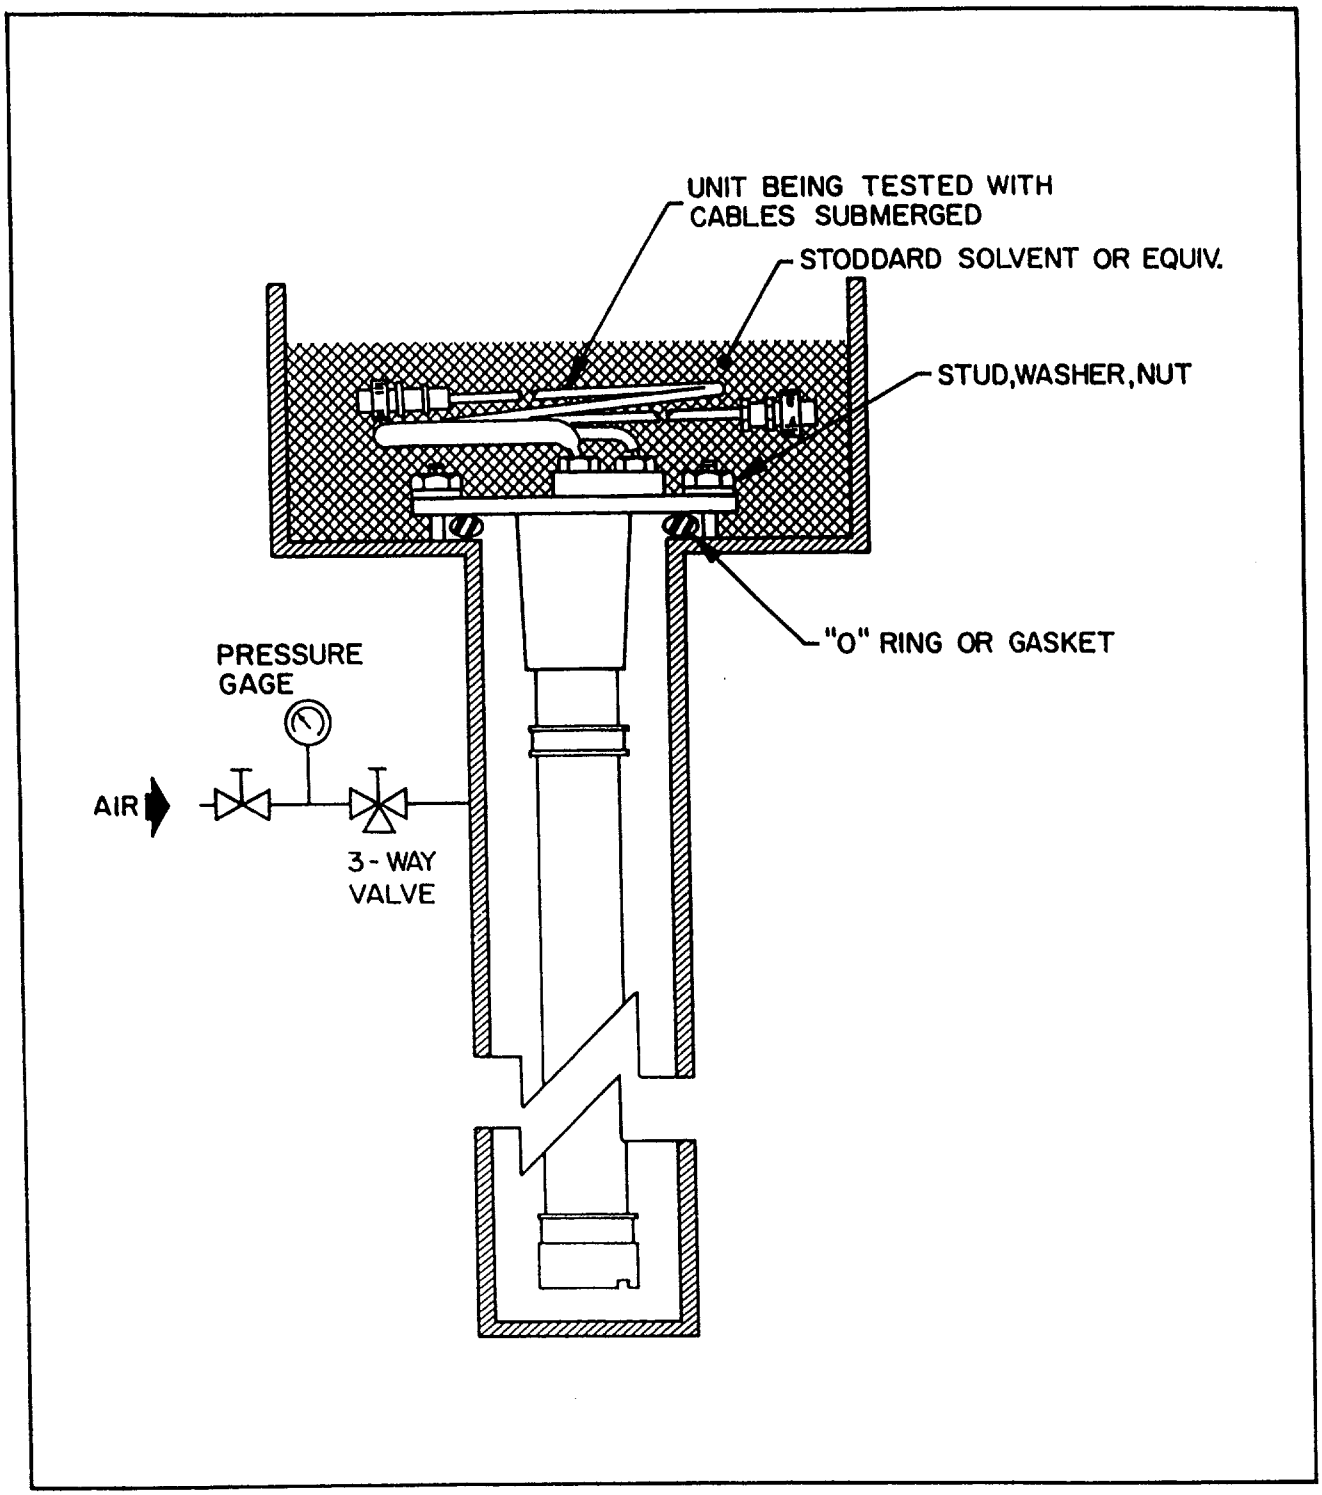
(3) With Mode switch on the megohmmeter positioned as directed, the meter readings shall be greater than indicated in the following table:

MODE SWITCH	METER READING
LZ - HZ	20 megohms
LZ - G	1 megohm
HZ - G	1 megohm

4. **Leak Test** (Ref Fig. 702)

A. Mount transmitter in leak test fixture Ref Figure 702 or equivalent.

B. Apply 15 psig air pressure to the leak test fixture.



C. Flood the flange and cables of the transmitter with stoddard solvent.

D. No evidence of leaks shall appear for a minimum of 3 minutes.

E. Exhaust air from leak test fixture.

F. Drain stoddard solvent from leak test fixture.

G. Remove transmitter from leak test fixture and blow dry with clean dry compressed air 35 psig maximum.

Leak Test Fixture
Figure 702

TROUBLESHOOTING

If transmitter meets all of the testing requirements, see TESTING, overhaul is not recommended. If transmitter fails to meet testing requirements refer to the applicable steps in Table 801.

TABLE 801
TROUBLESHOOTING

SYMPTOM	PROBABLE CAUSE	REMEDY
1. Transmitter fails capacitance test.	A. Dirty or contaminated transmitter.	A. Clean transmitter, see CLEANING.
	B. Defective transmitter.	B. Replace defective transmitter or components.
2. Transmitter fails insulation resistance test.	A. Dirty or contaminated transmitter.	A. Clean transmitter, see CLEANING.
	B. Defective cables, spacers, or hardware.	B. Isolate defective component - replace as required.
	C. Defective transmitter.	C. Replace defective transmitter or components.
3. Transmitter fails high potential test.	A. Dirty or contaminated transmitter.	A. Clean transmitter, see CLEANING.
	B. Defective Cables.	B. Replace cables.
	C. Defective transmitter.	C. Replace defective transmitter or components.

STORAGE INSTRUCTIONS

1. **General**

It is recommended that the transmitter be stored in the original container, if available, for a storage life of 18 months.

2. **Materials**

MATERIAL	COMMERCIAL SPECIFICATION
Polyethylene bag	L-378
Full pack package	PPP-B-636
Waterproof tape	PPP-T-76

3. **Signal Conditioner**

A. Place transmitter in polyethylene bag and seal bag.

B. Place bagged transmitter in suitable sized full pack package.

C. Seal package with waterproof tape.

D. Mark package FRAGILE.

E. Store in dry area.

SPECIAL TOOLS, FIXTURES, AND EQUIPMENT

1. All tests shall be conducted at an ambient temperature of 77 ± 18 degrees F, atmospheric pressure of 30 ± 2 inches of mercury, and relative humidity of 90 percent or less.

2. No special tools are required for overhaul of the transmitter. Test equipment is listed in Table 1001.

TABLE 1001
TEST EQUIPMENT

PART NUMBER	NOMENCLATURE
472090-007 or equivalent (Simmonds Precision, Instrument Division, Vergennes, Vermont)	Unit, Field Calibration
-- or --	
PSD 40-1 or PSD 60-1 (Simmonds Precision, Product Support Division, Ft. Lauderdale, FL)	Test Set, AC Field Calibration
GR1862B or equivalent (General Radio)	Megohmmeter

LIQUID QUANTITY INDICATOR ASSEMBLY

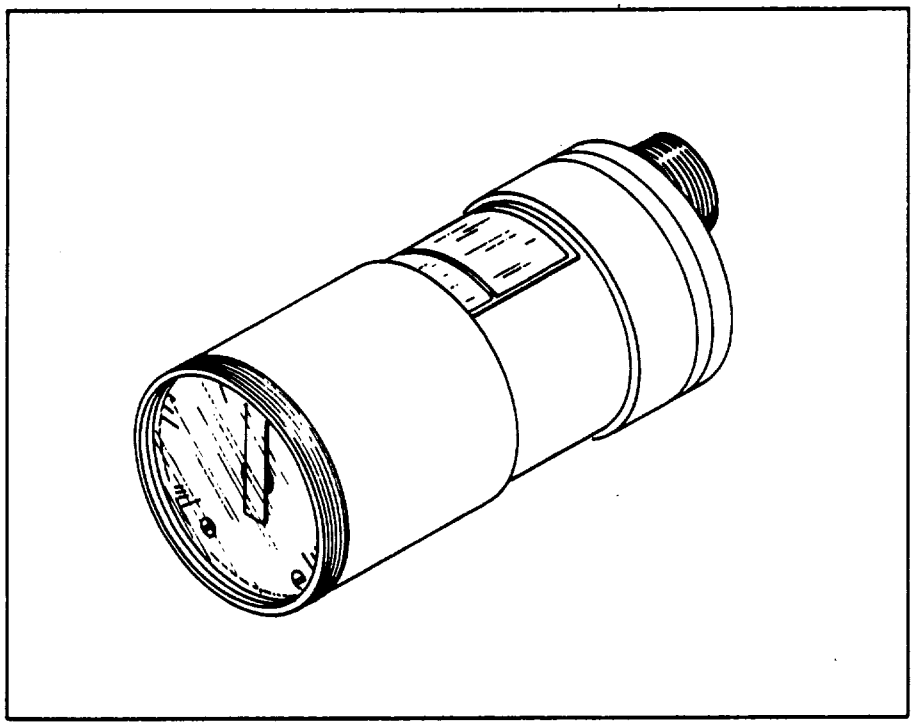
Simmonds Part Nos. 393000-01703 and 393000-01704

1. DESCRIPTION AND OPERATION

A. DESCRIPTION.



The Liquid Quantity Indicator Assembly, Part Nos. 393000-01703 and 393000-01704 (see Figure 1), is a pointer type, transistorized indicator-amplifier-bridge, enclosed in a metal cylindrical housing. The unit is one of the components of the capacitance fuel quantity gauging system.

B. OPERATION.

(1) Input power for the indicator assembly is 28 vdc at 0.22 ampere. An inverter assembly provides the necessary 115 vac for indicator operation.

(2) Fuel quantity is indicated utilizing an external capacitor type sensing element tank unit as the variable component of the indicator bridge circuit. This sensing element tank unit is located in the aircraft fuel tank. The bridge circuit output signal is cascade amplified in a four stage transistor amplifier. The amplified signal is fed to one winding of a two-phase eddy current motor. Signal voltage present at the control winding and excitation voltage present at the reference winding causes the motor to drive the indicator pointer to a reading relative to the quantity of fuel remaining in the tank.

(3) The indicator assembly power supply circuitry includes a dc to ac inverter assembly to supply the required ac operating voltages. Ac voltage is coupled from the inverter assembly to a transformer. Dc power for the transistor amplifiers is obtained directly from the input voltage.

Liquid Quantity Indicator Assembly, Part Nos. 393000-01703 and 393000-01704
Figure 1

Mating Connector	MS3106-16S-1S	MS3106-16S-1S
Range	0-1375 lbs	0-1425 lbs
Mounting	Clamp	Clamp

2. DISASSEMBLY

A. GENERAL.

(1) Conduct tests as outlined in paragraph 7C to determine malfunction and required overhaul. If unit meets all the requirements of testing, overhaul is not recommended.

(2) Disassemble the unit in accordance with exploded and orthographic views, Figures 2 through 6. The numerical sequence of parts shown in these views follows the order of disassembly, except that attaching parts follow the parts they attach.

(3) Do not disassemble beyond the point necessary to make the required repair or replacement of parts.

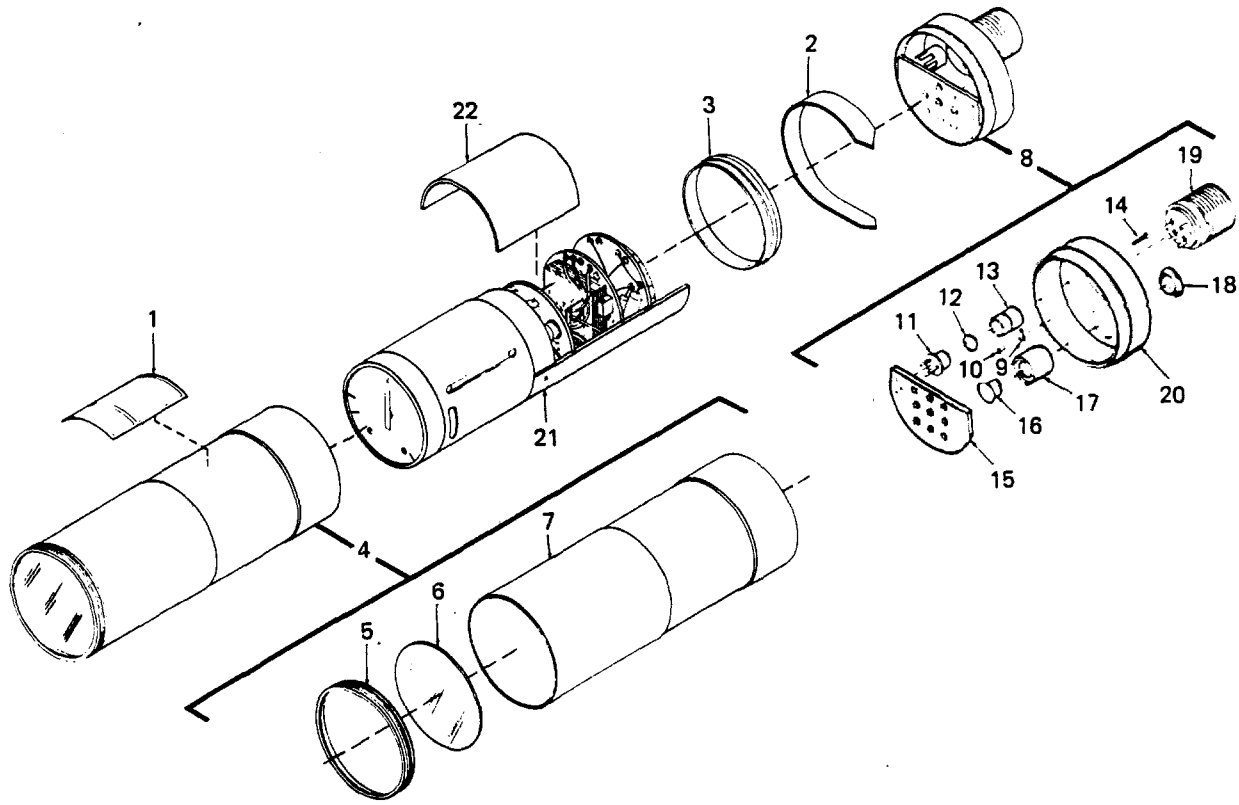
(4) Unsolder and label wiring during disassembly.

B. DISASSEMBLE LIQUID QUANTITY INDICATOR ASSEMBLY. (See Figure 2.)

(1) Identification plate (1) is cemented around housing (7). Identification plate should only be removed if the housing is to be repaired or refinished or if the markings are illegible.

(2) If replacement is required, remove dial window (6) from between rim front (5) and housing (7) using an induction heater.

(3) Remove indicator subassembly (21) as follows:



a. Using a pointed tool, locate end of solder sealing band (2). With a pair of pliers, strip off solder sealing band and discard. Remove lock ring (3).

CAUTION: DO NOT PULL ON END PLATE ASSEMBLY (8). IT IS WIRED TO INDICATOR SUBASSEMBLY. WIRES CONTAIN ONE-HALF INCH OF SLACK.

b. Carefully slip end plate assembly (8) from end of housing (7) and let it hang from slack wires. Remove indicator subassembly (21).

(4) If replacement is required, remove transistors (11), transistor insulators (12) and retainer (13) by removing screws (14).

CAUTION: USE ADEQUATE HEAT SINK PROTECTION WHEN UNSOLDERING TRANSISTORS.

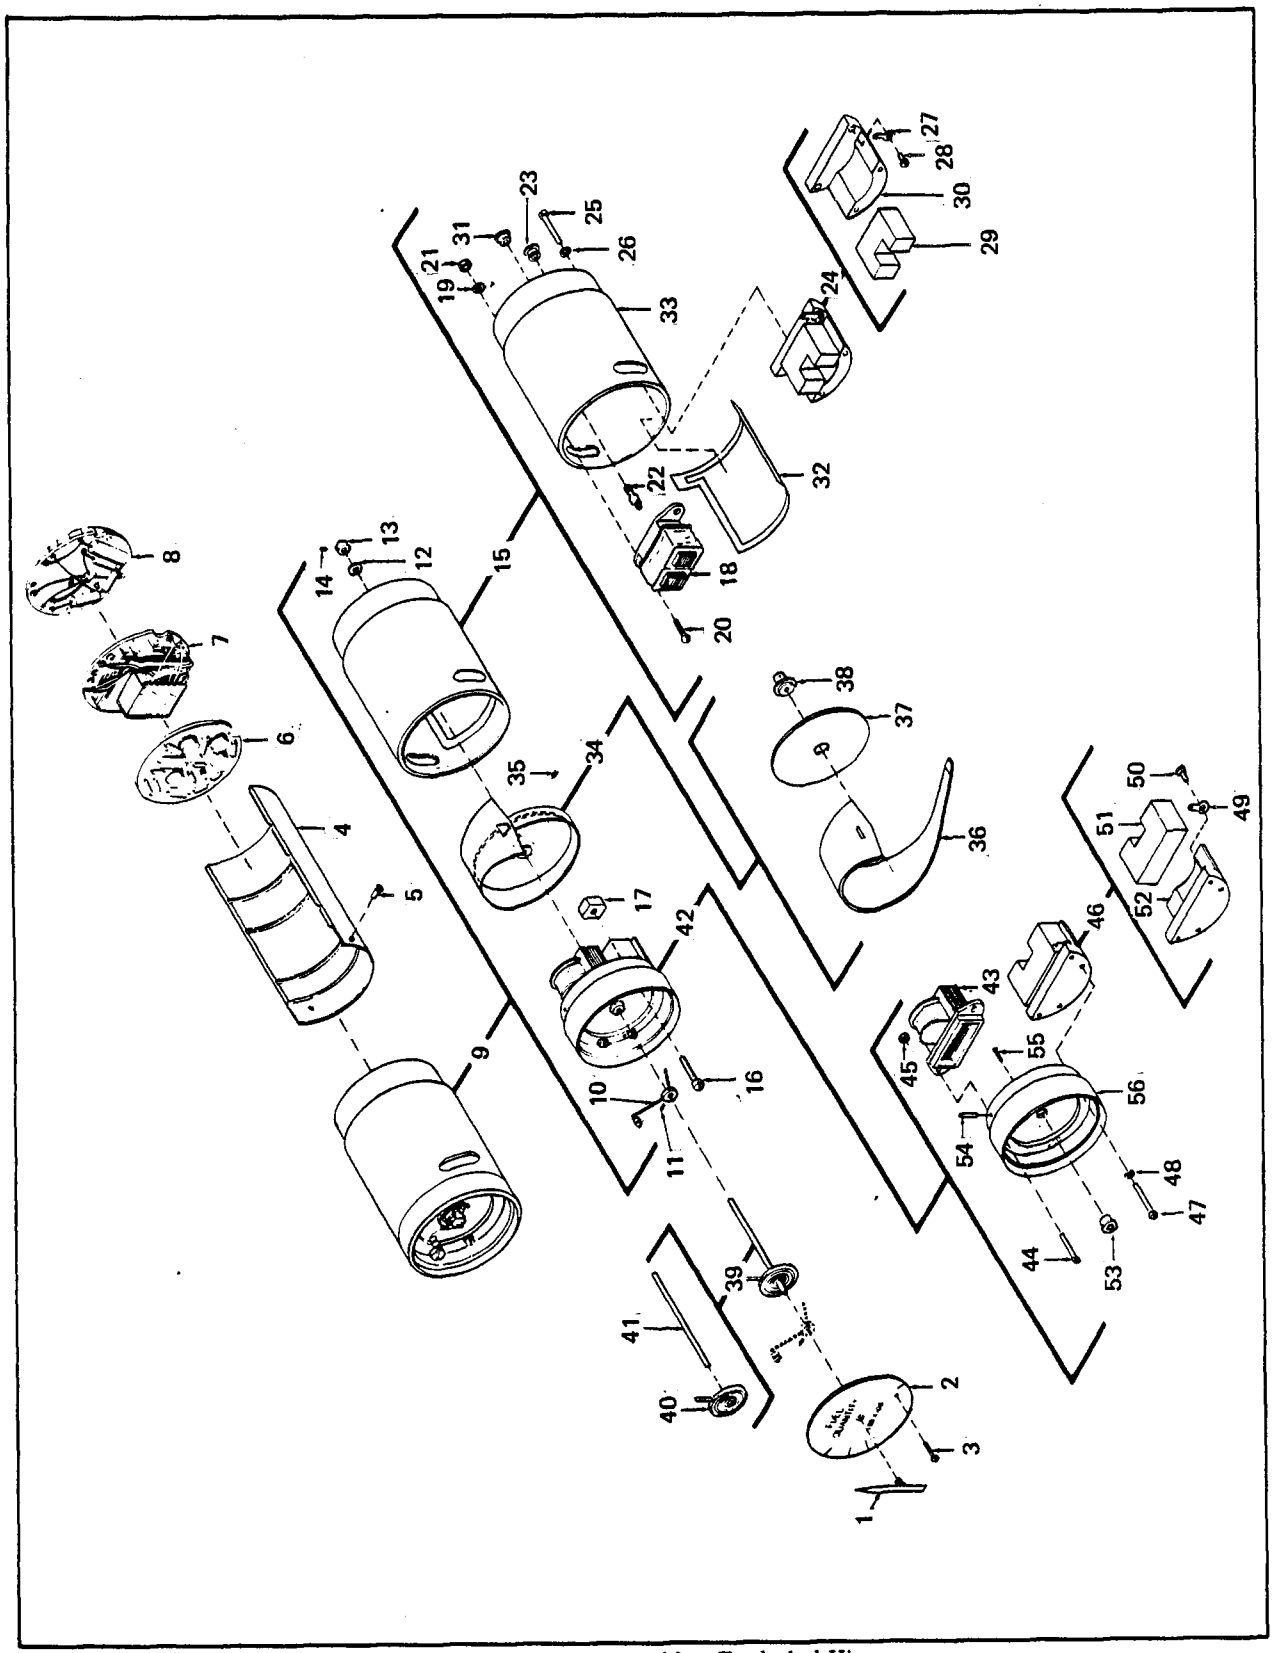
Figure 2



(5) Detach end plate assembly (8) by unsoldering attaching wires.

(6) Remove terminal board assembly (15), variable resistor assembly (16), retainer (17), cover retainer (18).

(7) If replacement is required, unsolder connector (19) from end plate (20) using an induction heater.

(8) Remove lug (9) from end plate by unsoldering eyelet (10).

(9) Remove shell (22).

C. DISASSEMBLE INDICATOR SUBASSEMBLY. (See Figure 3.)

(1) Using long-nose pliers or a similar tool, grip pointer assembly (1) at its hub on shaft (40) and remove.

(2) Remove screws (3) securing scale dial (2).

(3) Remove circuit cradle (4) from capacitor (motor) (9) by removing eyelets (5).

(4) Remove amplifier assembly (6), bridge assembly (7), and inverter assembly (8) from circuit cradle. See Figures 4, 5, and 6 for disassembly.

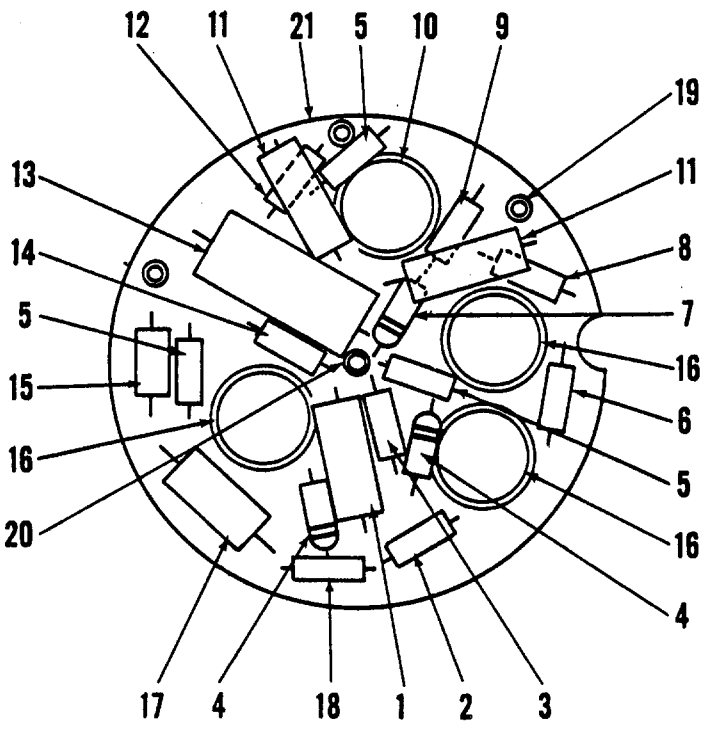
(5) Remove stop assembly (10) from shaft assembly (39) by removing setscrew (11). Unsolder hairspring (40).

(6) Detach motor housing subassembly (15) from front housing subassembly (42) by removing screws (16) and nuts (17). Loosen setscrew (14) and remove collar (13) and washer (12).

(7) Remove motor coil assembly (18) by removing screws (20) and stop nuts (21). Terminal lug (19) may also be removed. Remove feedthru (22) and rubber grommet (23).

(8) Remove capacitor plate No. 2 (24) by removing screws (25) and lock washers (26). Disassemble capacitor plate by removing screw (28) to release terminal lug (27). If required for replacement or repair, separate magnet (29) from magnet base (30) using a pointed instrument.

(9) Remove bearing (31) from motor housing (33). If required for replacement or repair, coaxial element (32) may also be removed.



(10) Remove rotor assembly (34) from shaft assembly (39) by loosening setscrew (35). Remove ground cylinder (36). It is recommended that rotor disk (37) not be separated from rotor hub (38).

(11) Slide out shaft assembly (39) from bearing (53). If required for replacement or repair, remove hairspring (40) from shaft (41).

(12) On front housing subassembly (42), remove front motor coil (43) from front housing (56) by removing screws (44) and stop nuts (45).

(13) Remove capacitor plate No. 1 (46) by removing screws (47) and lock washers (48). Disassemble capacitor plate by removing screw (50) to release terminal lug (49). If required for replacement or repair, separate magnet (51) from magnet base (52) using a pointed instrument.

(14) Remove bearing (53), spirol pin (54), and rivet (55) from front housing (56).

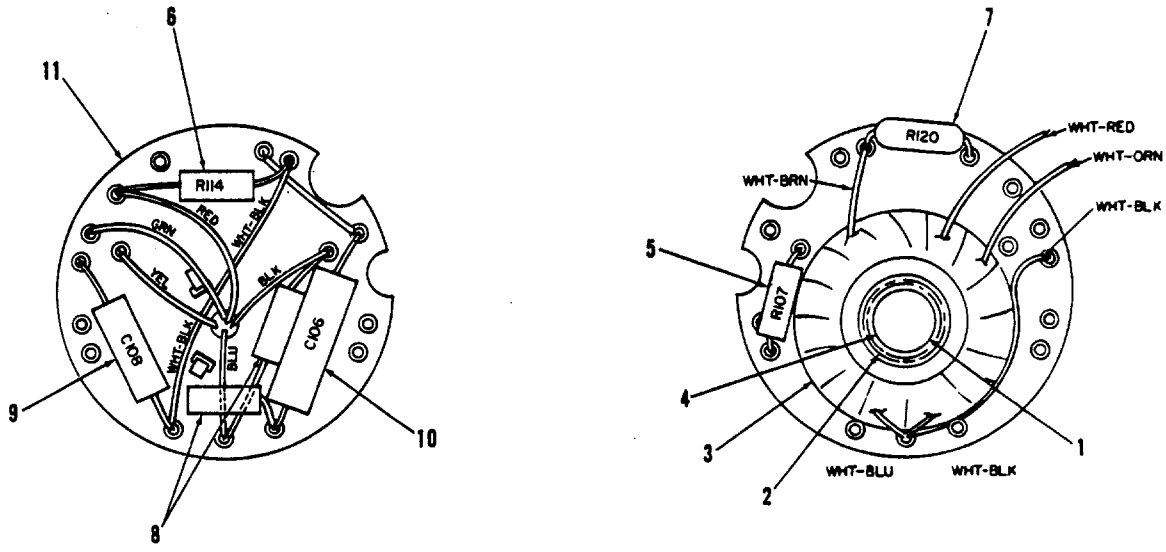
D. DISASSEMBLE AMPLIFIER ASSEMBLY. (See Figure 4.)

(1) Disassembly of amplifier assembly is not recommended unless replacement or repair is required.

(2) Remove components (1 through 18) from amplifier board (21), if required.

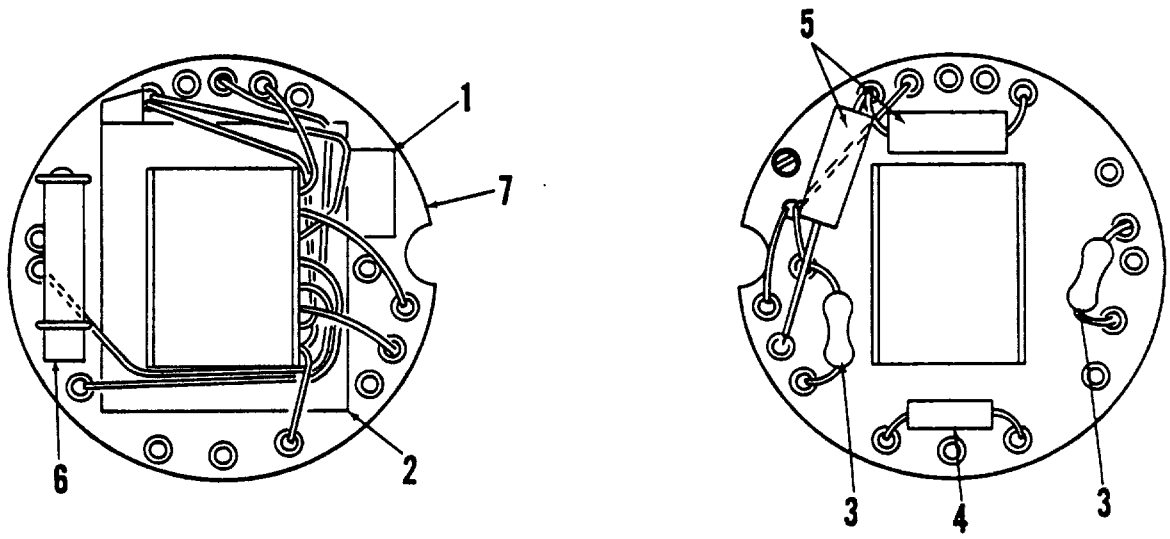
E. DISASSEMBLE INVERTER ASSEMBLY. (See Figure 5.)



(1) Disassembly of bridge assembly is not recommended unless replacement or repair is required.

(2) Remove components (1 through 10) from chassis assembly (11), if required.

F. DISASSEMBLE BRIDGE ASSEMBLY. (See Figure 6).



(1) Disassembly of inverter assembly is not recommended unless replacement or repair is required.

(2) Remove components (1 through 6) from chassis assembly (7), if required.

3. CLEANING

A. Remove excess solder from housing assembly (4, Figure 2) by heating with a soldering iron. Use wire brush to remove melted solder. Clean housing assembly with a solution of warm water and soap.

B. Clean dial window (6, Figure 2) with cotton swabs and a solution of mild water and soap.

C. Clean all non-electrical parts using a solvent such as trichloroethylene. Dip a stiff, non-wire brush into solvent and wash parts thoroughly. Do not dip parts in solvent.

D. Clean all electrical parts by blowing out dust and dirt with clean, dry, compressed air (approximately 5 psi). If necessary, use a clean, lint-free cloth moistened with trichloroethylene.

E. Dry all parts with clean, compressed air, and/or a clean, lint-free cloth.

F. Ultrasonic cleaning equipment may be used, if available.

4. INSPECTION/CHECK.

A. Inspect housing assembly (4, Figure 2) for dents, punctures or other structural damage. Surface where solder sealing band (2, Figure 2) fits should be smoothly and lightly tinned with no blobs of solder.

B. Examine dial window (6, Figure 2) for cracks and scratches.

C. Check scale dial (2, Figure 3) for legibility.

D. Examine connector (19, Figure 2) for loose, broken or missing pins.

E. Check rotor assembly (34, Figure 3) for freedom of movement. Inspect ground cylinder (36) for security of mounting to rotor, and for nicks.

F. Check hairspring (40) for proper operation.

G. Check amplifier board (21, Figure 4) for peeling of copper from backing and for breaks or shorts caused by solder blobs or excess flux.

H. Check wiring for evidence of damaged insulation.

I. Check for burned electronic components.

J. Check threads for damage.

5. REPAIR

A. GENERAL.

(1) Check components as described in paragraph 7B. Replace any components that fail to meet test requirements.

(2) Replace any threaded parts that show signs of stripped, worn or damaged threads.

(3) Replace any parts that fail to meet requirements of testing in paragraphs 7B and 7C.

(4) Use solder composed of 63% tin, 37% lead rosin core, unless otherwise specified.

B. HOUSING ASSEMBLY.

(1) Minor dents in housing assembly (4, Figure 2) may be straightened with a mallet and suitable blocks. If damage is severe, replace housing assembly.

(2) If dial window (6, Figure 2) is scratched, cracked or broken, replace it following procedures given in paragraph 6F, step (6).

(3) Remove excess solder in solder sealing band area by heating housing (4, Figure 2) with a 200-watt iron and using a wire brush to remove softened solder.

C. WIRING.

(1) Replace any damaged wiring. Refer to notes on wiring diagram Figure 12.

(2) Resolder any terminals that show evidence of poor soldering.

6. ASSEMBLY.

A. GENERAL.

(1) Assembly is essentially the reverse of disassembly. Follow the reverse order of key index numbers assigned to the exploded and orthographic views, Figures 2 through 6.

(2) As assembly proceeds, connect wiring as shown in Figures 11 and 12. When soldering wiring to eyelets and terminals connected to electrical components use proper heat sink precautions.

(3) Observe polarities when replacing capacitors and diodes.

(4) Use 63% tin, 37% lead rosin core solder for all connections, unless specified otherwise.

(5) See Table IV for Special Tools, Fixtures and Equipment.

(6) See Table V for Special Materials used in assembly.

B. ASSEMBLE INVERTER ASSEMBLY. (See Figure 5.)

If inverter assembly (8, Figure 3) was disassembled, assemble it by following the sequence of key index numbers of Figure 5.

C. ASSEMBLE BRIDGE ASSEMBLY. (See Figure 6.)

If bridge assembly (7, Figure 3) was disassembled, assemble it by following the sequence of key index numbers of Figure 6.

D. ASSEMBLE AMPLIFIER ASSEMBLY. (See Figure 4.)

If amplifier assembly (6, Figure 3) was disassembled, assemble it by following the sequence of key index numbers of Figure 4.

E. ASSEMBLE INDICATOR SUBASSEMBLY. (See Figure 3.)

(1) Replace rivet (55), spirol pin (54), and bearing (53) in front housing (56).

(2) If magnet (51) was separated from magnet base (52), cement the magnet to the base with No. 3199 Pacitite. Replace terminal lug (49), on capacitor plate No. 1 (46), with screw (50). Replace capacitor plate No. 1 with lock washers (48) and screws (47).

(3) Replace front motor coil (43) on front housing (56) using screws (44) and stop nuts (45).

(4) If hairspring (40) was removed from shaft (41), press hairspring onto shaft. Slide shaft assembly (39) into bearing (53).

(5) Replace ground cylinder (36). Place rotor assembly (34) onto shaft assembly (39) and tighten setscrew (35).

(6) If coaxial element (32) was removed, cement element to motor housing (33) using No. 3199 Pacitite. Replace bearing (31) in motor housing.

(7) If magnet (29) was separated from magnet base (30), cement magnet to base with No. 3199 Pacitite. Replace terminal lug (27) on capacitor plate No. 2 (24) with screw (25). Replace capacitor plate with lock washers (26) and screws (25).

(8) Replace motor coil assembly (18) and terminal lug (19) using screws (20) and stop nuts (21). Replace feedthru (22) and rubber grommet (23).

(9) Attach motor housing subassembly (15) to front housing subassembly (42) by replacing screws (16) and nuts (17). Place washer (12) and collar (13) on shaft assembly (39), and temporarily tighten setscrew (14).

(10) Place stop assembly (10) on shaft assembly (39) and temporarily tighten setscrew (11). Make certain that a clearance of 0.020 inch exists between rotor disk (37) and coils (18 and 43). If adjustment of clearance is necessary, loosen setscrews (11 and 14), adjust clearance and tighten setscrews. A shim of 0.020 inch thickness may be used to check clearance. Physically rotate rotor disk and check for 0.005 inch maximum wobble.

CAUTION: MAKE ABSOLUTELY CERTAIN THAT ROTOR DISK DOES NOT RUB AGAINST COILS WHEN TURNED IN EITHER DIRECTION.

(11) Perform motor test as described in paragraph 7B, step (6).

(12) Use special C-washer under hairspring (40). Solder end of hairspring to stop assembly (10). Carefully remove C-washer.

(13) Place inverter assembly (8), bridge assembly (7) and amplifier assembly (6) into grooves of circuit cradle (4).

(14) Wire amplifier assembly (6), bridge assembly (7) and inverter assembly (8) in accordance with Figures 11 and 12.

(15) Cement circuit cradle (4) to capacitor (motor) (9) with No. 3199 Pacitite. Replace eyelets (5).

(16) Replace dial scale (2) with screws (3).

(17) Press pointer assembly (1) onto shaft (41).

F. ASSEMBLE LIQUID QUANTITY INDICATOR ASSEMBLY. (See Figure 2.)

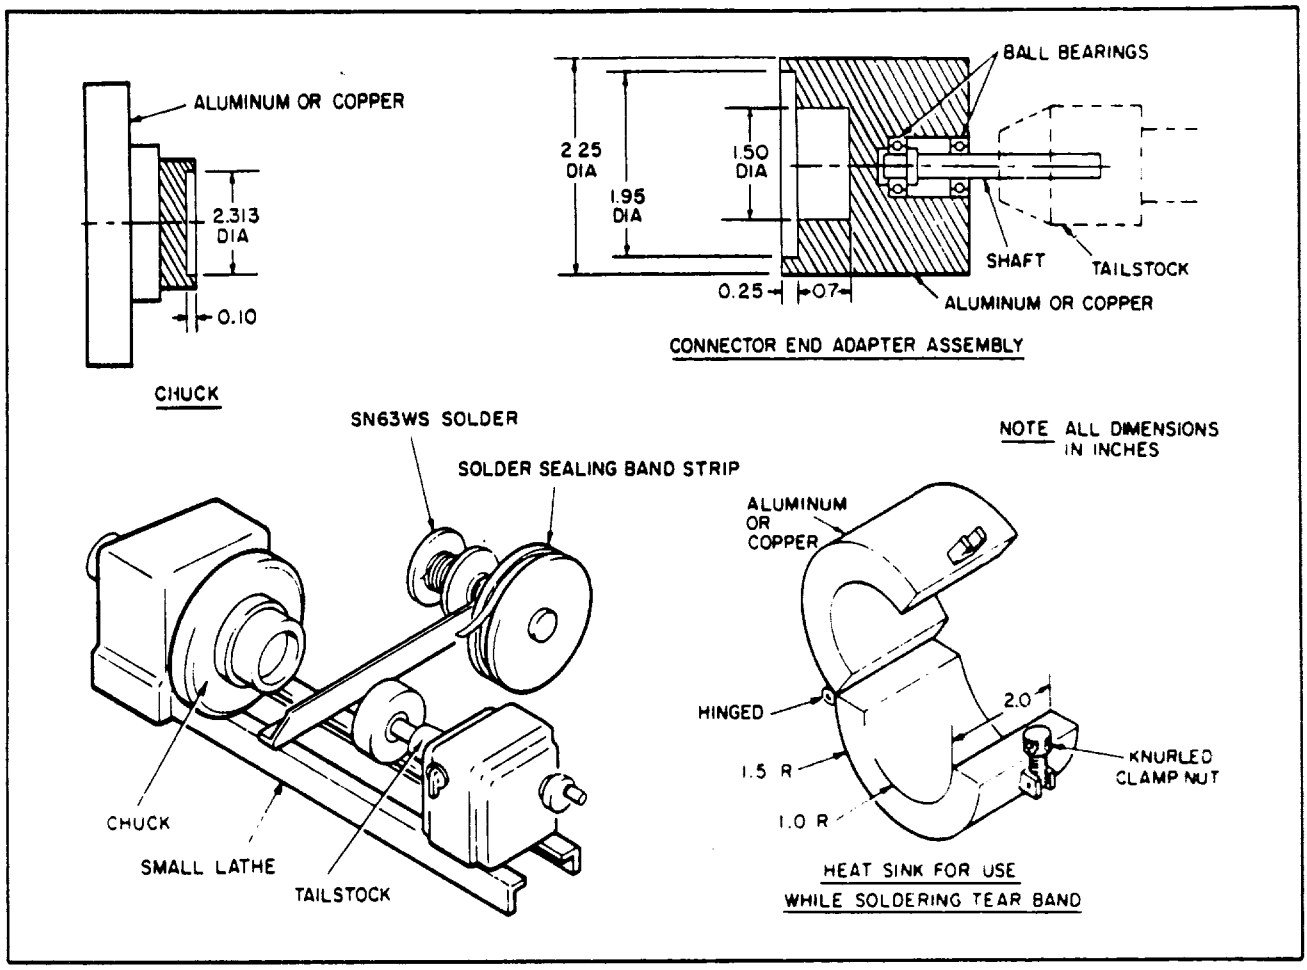
(1) Solder connector (19) to end plate (20) using a 63% tin, 37% lead solid wire solder, No. H200 soldering flux and a carbon filament heat lamp oven.

(2) Wash flux from assembly with water heated to 93°C (200°F). Dry assembly thoroughly.

(3) Place variable resistor assembly (16) in end plate (20). Insert retainer (17) and cover retainer (18).

(4) Attach retainers (13) to end plate (20) with screws (14). Cement transistor insulators (12) into transistor retainers using No. 8100 cement. Insert transistors (11) into retainers. Attach lug (9) to end plate with eyelet (10).

(5) Replace terminal board (15) and bring variable resistor assembly and transistor leads through terminal board eyelets.



(6) If dial window (6) was removed, replace as described in steps a. through c.

a. Tin perimeter of rim front (5) using 63% tin, 37% lead, solid solder and No. H200 flux. Carefully insert in leading edge of housing (7). Tin inner perimeter of rim front (5). Install rim front around housing.

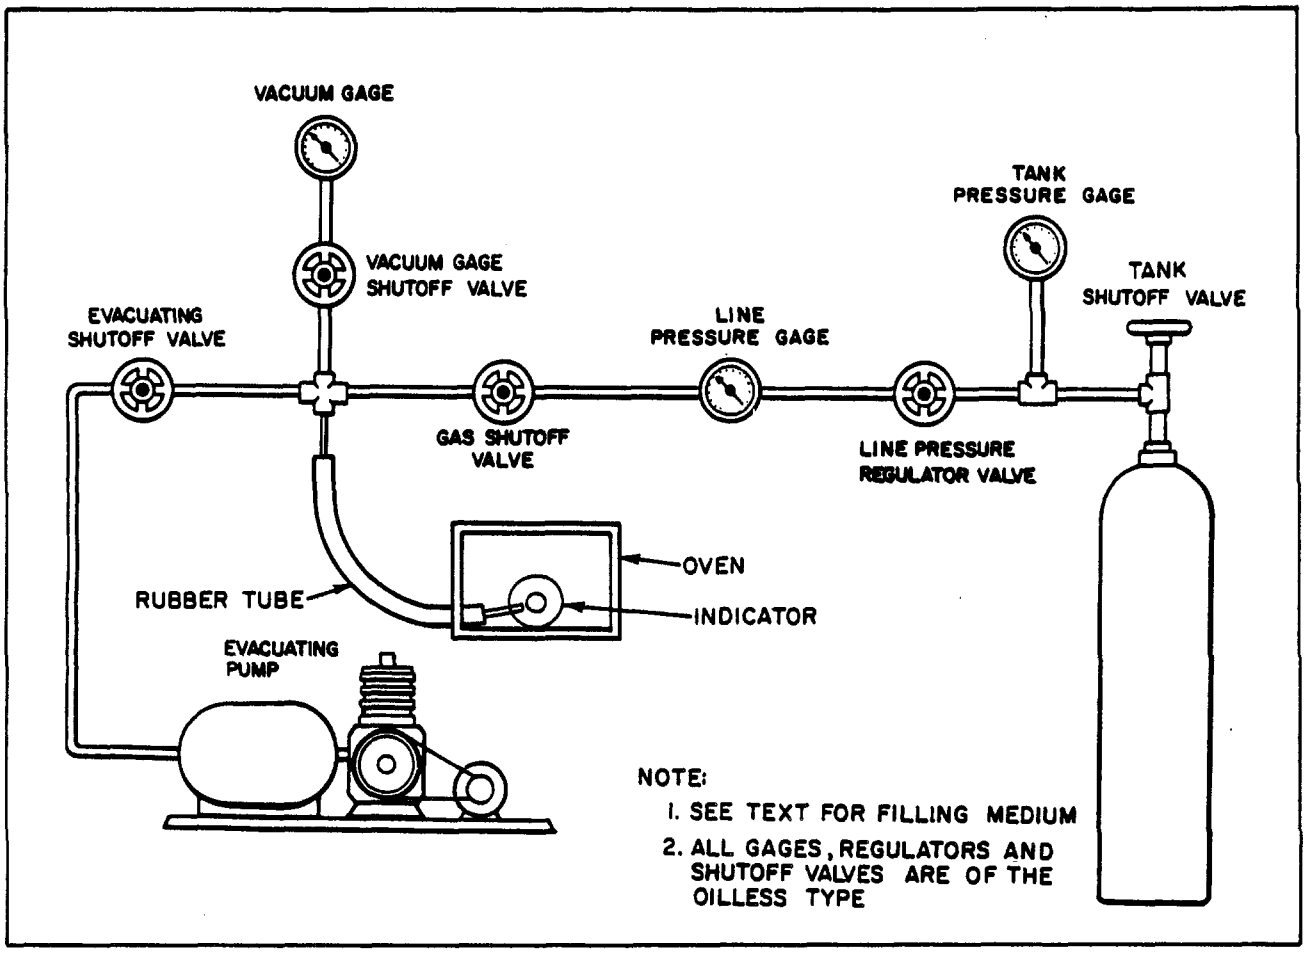
b. Insert housing assembly in an induction heater and apply heat until solder begins to flow. Apply more flux as required to enable solder to flow uniformly and produce a smooth surface between rim front and housing.

c. Wash in water heated to 93°C (200°F) to remove all traces of flux. Dry at 65.5°C (150°F) for one-half hour.

(7) Place both indicator subassembly and housing assembly in an oven heated to 65.5°C (150°F) for one-half hour.

Solder Sealing Band Fixture
Figure 7

(8) Perform test described in paragraph 7C before sealing indicator.



(9) Solder, solder sealing band (2) in place using a fixture such as shown in Figure 7. Mount indicator assembly between chuck and adapter. Fasten heat sink around housing assembly as close as possible to solder sealing band area to protect electrical components inside.

(10) Apply 63% tin, 37% lead wire solder to one surface of solder sealing band (2) covering approximately one inch at a time. Sweat solder sealing band (2) to housing assembly (4) and end plate assembly (8) with a 200-watt soldering iron. Flow solder on liberally, but not to excess. Observe that the outer surface of solder sealing band (2) becomes liquefied and the outer surface of solder sealing band (2) also becomes tinned.

(11) Cut off end of solder sealing band at 45-degree angle allowing overlap of approximately 3/4 inch and seal with solder. Remove from fixture.

(12) Connect indicator assembly to setup shown in Figure 8. Heat oven to 79°C ± 6° (175°F ± 10°).

(13) With GAS SHUTOFF VALVE closed, open VACUUM GAGE SHUTOFF VALVE and EVACUATING SHUTOFF VALVE. Pump out air in indicator assembly until VACUUM GAGE reads 29-inches of mercury. Close EVACUATING SHUTOFF VALVE and VACUUM GAGE SHUTOFF VALVE. Open PRESSURE REGULATOR VALVE until PRESSURE GAGE reads 15 psi. Open GAS SHUTOFF VALVE and fill indicator with 99/10 mixture of dry nitrogen and helium.

Evacuation and Filling Setup
Figure 8

(14) Evacuate and fill indicator assembly a second time. Remove copper tubing and allow pressure within indicator assembly to equalize with outside air pressure. Remove indicator assembly from oven. Use 63% tin, 37% lead solid wire solder to close hole in end plate. Hold soldering iron above hole to prevent fumes from entering indicator assembly.

(15) Test indicator assembly for leakage, using helium leak detector dual complemental bell jar. Test indicator assembly in a vacuum as described in leak detector manufacturer's instructions and in accordance with Specification MIL-G-26988.

(16) Permissible leak rate should not exceed 0.01 microns/cubic foot/hour.

(17) Mask dial window (6, Figure 2) and connector (19, Figure 2).

(18) Apply a primer spray coat of a 4 to 1 mixture of No. DS-C-2936 and CT9-1472 catalyst following manufacturer's instructions. A light even coat is desirable.

WARNING: DO NOT ALLOW CATALYST TO COME IN CONTACT WITH EYES AND SKIN.

Indicator assembly can be touched after 30 minutes air dry at room temperature. Air dry 24 hours at room temperature for complete cure. Spray a coating of No. XFO-1042 special flat black enamel (use No. 5811 thinner if necessary). Paint dries in 30 minutes at room temperature. Remove masking material.

(19) If identification plate was removed, replace with a new one containing proper information.

7. TESTING.

A. GENERAL.

(1) Paragraph 7B contains tests to be performed on individual components found defective during disassembly.

(2) Paragraph 7C contains tests performed on liquid quantity indicator assembly before disassembly or after assembly is complete.

B. TESTS DURING DISASSEMBLY.

(1) Using the ohmmeter section of multimeter, check resistors for proper values. Values may be found in Illustrated Parts List, paragraph 11, and in the legend of schematic diagram, Figure 11.

(2) Measure resistance of variable resistor assembly R101 between black and red leads. Resistance should be 200 ohms ± 10%. Measure resistance of variable resistor assembly R103 between black and red leads. Resistance should be 500 ohms ± 10%. Rotate shaft and check between red and white leads to see that resistance varies smoothly with no jumps.

(3) Check capacitors for shorts using ohmmeter section of multimeter. Check for an open circuited capacitor by placing ohmmeter leads directly across capacitor leads.

NOTE: Be careful not to handle metal portion of ohmmeter leads or erroneous reading will occur.

If the ohmmeter pointer fails to move, the capacitor is open and should be replaced.

(4) Check transistors using transistor tester.

(5) Check diodes for proper forward and reverse current using ammeter section of multimeter. Diodes may also be checked for proper forward and reverse resistance using the ohmmeter section of multimeter, provided the ohmmeter is set to the highest range to prevent diode burn-out.

(6) Motor test.

CAUTION: THIS TEST SHALL ONLY BE PERFORMED IMMEDIATELY AFTER COMPLETION OF PARAGRAPH 6E, step (10). THE GROUND CYLINDER (36, Figure 3) SHOULD NOT BE ASSEMBLED TO THE ROTOR ASSEMBLY (34) WHEN PERFORMING THIS TEST.

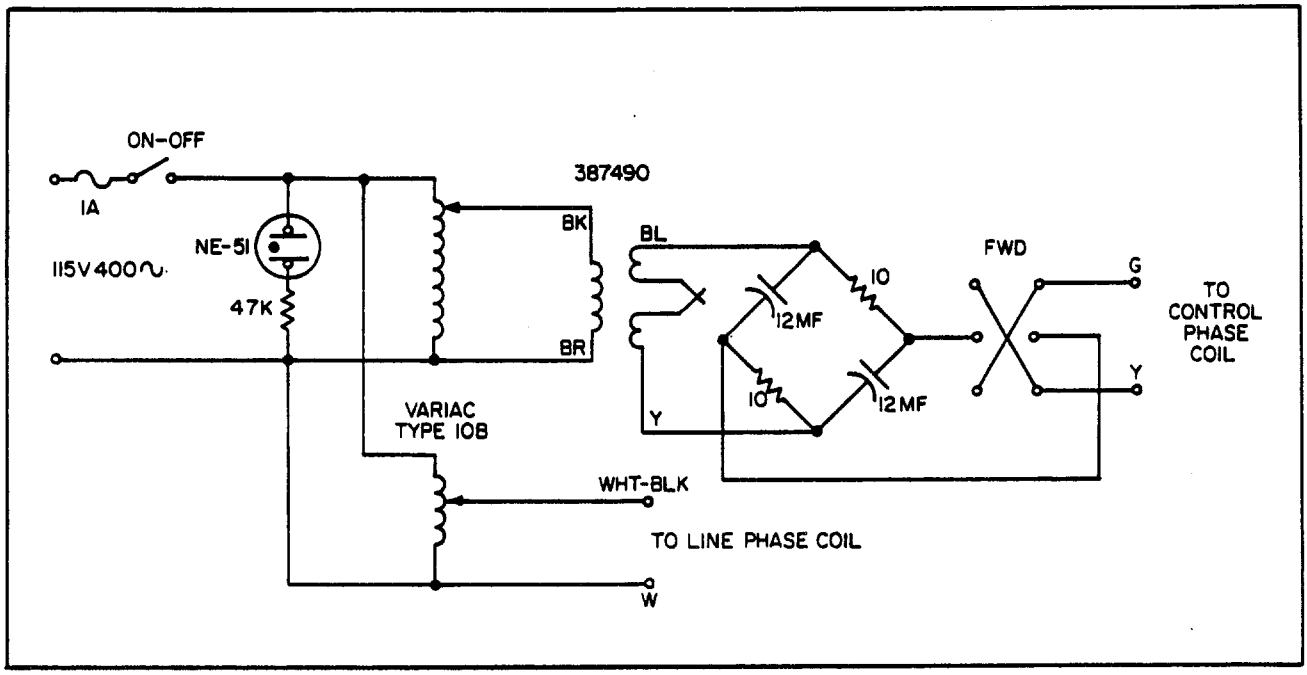
a. Connect capacitor (motor) to test circuit as shown in Figure 9.

b. Apply 22 v, 400 cps to line phase coil and 1 volt, $< 90°$, 400 cps to control phase coil. Rotor disk shall make one complete revolution.

c. Press torque arm on end of shaft (4 gram millimeters).

d. With 22 v, 400 cps applied to line phase coil and torque arm pointed downward, torque arm should make one revolution with a maximum of 7 volts, $<90°$, 400 cps applied to control phase coil.

e. Remove torque arm from end of shaft.



f. Apply 22 v, 400 cps to line phase coil. Apply 4 volts, $<90°$, 400 cps to control phase. Rotor RPM should not exceed 45 RPM.

(7) Indicator assembly Operational Test. (Housing off.)

a. Setup test circuit as shown in Figure 10.

b. Place milliammeter section of multimeter (0-500 ma) in 28 vdc line. Monitor dc input current. It should not exceed 250 ma with 24 vdc applied. Nominal input current is 140 ma at 24 vdc applied.

c. Vary calibration test set capacitance until pointer reads full with 28 vdc applied.

Motor Test Circuit
Figure 9

d. Lower variable power supply voltage to zero volts. Pointer should return to 0 graduation mark.

e. Slowly increase variable dc supply voltage to 18 volts. Pointer should return to full graduation within ± 5 percent.

f. Increase variable dc supply voltage to 30 vdc. Vary test set capacitance until pointer is at center of full graduation. Lower voltage to 20 vdc. Pointer movement should not exceed 2.5 percent.

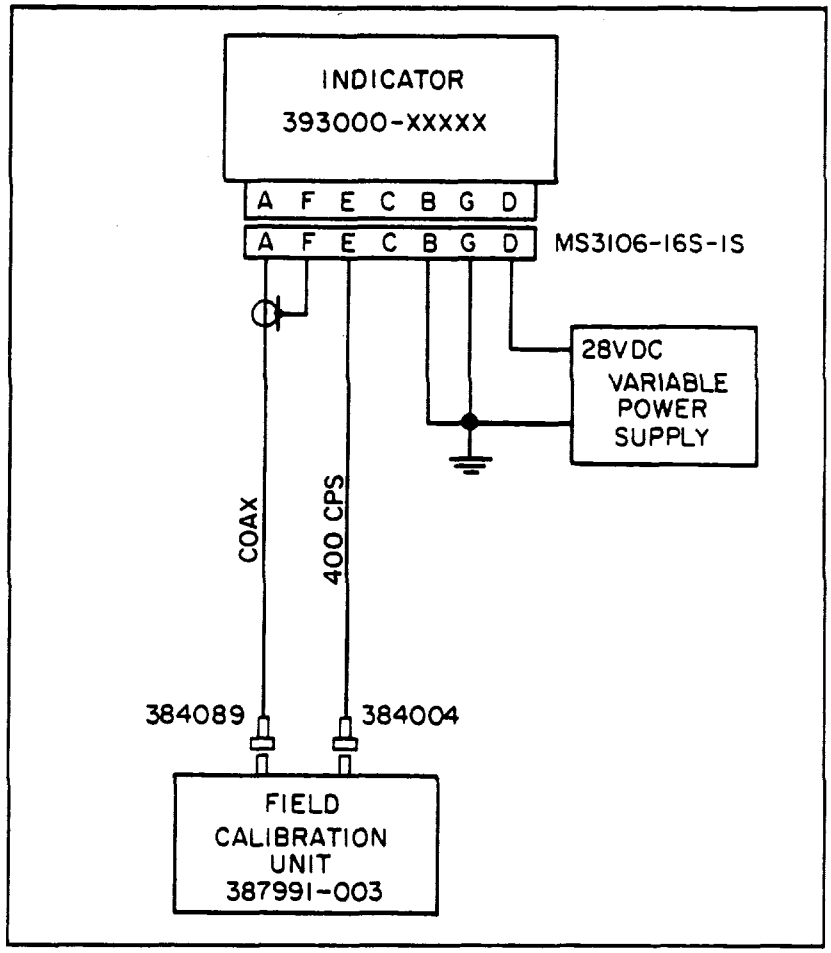
g. If tolerances of steps e. and f. are not met, adjust inverter assembly for optimum performance as follows:

(i) Disconnect power and remove 8.2K resistor R114 from inverter assembly.

(ii) Replace with resistance decade. Set decade to 8.2K.

(iii) Reapply power and vary resistance decade through range of 3.9K to 18K. Determine which resistance value enables tolerances specified in steps e. and f. to be met.

(iv) Replace R114 with resistor of value obtained in (iii) above.



C. TESTING ASSEMBLED UNIT.

(1) Speed of Response Test.

a. Set up test circuit shown in Figure 10.

b. Set the decade section of Field Calibration Unit to empty reading shown in Table II. Adjust empty control (R103), if necessary for a zero reading. Remove power to indicator assembly.

c. Set decade section of Field Calibration Unit to full reading shown in Table II.

Indicator Assembly Test Circuit
Figure 10

d. Apply dc power to indicator assembly and observe time required for pointer to travel over scale. The time should be 2 seconds maximum.

e. Repeat test in a downscale direction. The same limits apply.

(2) Sensitivity Test.

a. Set decade section of the Field Calibration Unit to move pointer to any convenient mid-range reading. Record exact capacitance setting.

b. Decrease capacitance very slowly until indicator assembly pointer just moves. Required indicator assembly sensitivity should be 0.4 pf.

(3) Linearity and Calibration Check.

a. Set up test circuit shown in Figure 10.

b. Set decade section of the Field Calibration Unit to empty reading shown in Table II. Adjust empty control (R103), if necessary for a zero reading.

c. Set decade section of Field Calibration Unit to values shown in Table II. The capacitance settings on the Field Calibration Unit should be within tolerances given.

TABLE II. LINEARITY AND CALIBRATION

INDICATOR PART NO.	INDICATOR READING	CAPACITANCE (PF)	TOLERANCE (PF)
393000-01703	0	176.80	----
	200	207.64	1.35
	400	238.48	1.35
	600	269.32	1.35
	800	300.16	1.35
	1000	331.00	1.35
	1200	361.84	1.35
	1325	381.12	----
393000-01704	0	156.12	----
	200	181.39	1.35
	400	206.66	1.35
	600	231.93	1.35
	800	257.20	1.35
	1000	282.47	1.35
	1200	307.74	1.35
	1425	336.19	----

(4) Leakage Test.

a. Check for leakage using helium leak detector using the detector's bell jar and testing the indicator in a vacuum as described in manufacturer's instructions.

b. Leakage rate must not exceed 0.01 microns/cubic foot/hour.

8. TROUBLE SHOOTING

A. Test complete indicator assembly. (See paragraph 7C.) If indicator assembly meets all tests satisfactorily, overhaul is not recommended.

B. If the indicator assembly fails to meet linearity and calibration values shown in Table II, check for proper transformer (T101) voltages and dc voltages as shown in Table III. Refer to Figures 11 and 12.

C. If unit runs but cannot be adjusted for empty point, check adjustment control.

D. If unit does not operate at all, check for mechanical or electrical damage such as broken wires, defective solder joints and pinched wires.

TABLE III. TEST VOLTAGES

AC TEST VOLTAGES

INDICATOR PART NO.	TEST POINT									
	A	B	C	D	E	F	G	H	J	AA
393000-01703	75.0	26.0	0.0	7.5	5.0	0.0	1.1	8.3	500.0	115.0
393000-01704	75.0	26.0	0.0	9.2	6.0	0.0	1.8	9.6	500.0	115.0

DC TEST VOLTAGES

INDICATOR PART NO.	TEST POINT									
	K	L	M	N	P	Q	R	S	T	U
393000-01703 393000-01704	26.0	0.6	1.2	1.1	19.0	0.6	1.2	0.6	1.3	0.4-0.7

DC TEST VOLTAGES

INDICATOR PART NO.	TEST POINT							
	V	W	BB	CC	DD	Between EE and DD	Between FF and GG	HH
393000-01703 393000-01704	20.0	38.0	0.3	27.6	28.0	0.35	0.35	0.3

9. PACKAGING AND STORAGE INSTRUCTIONS.

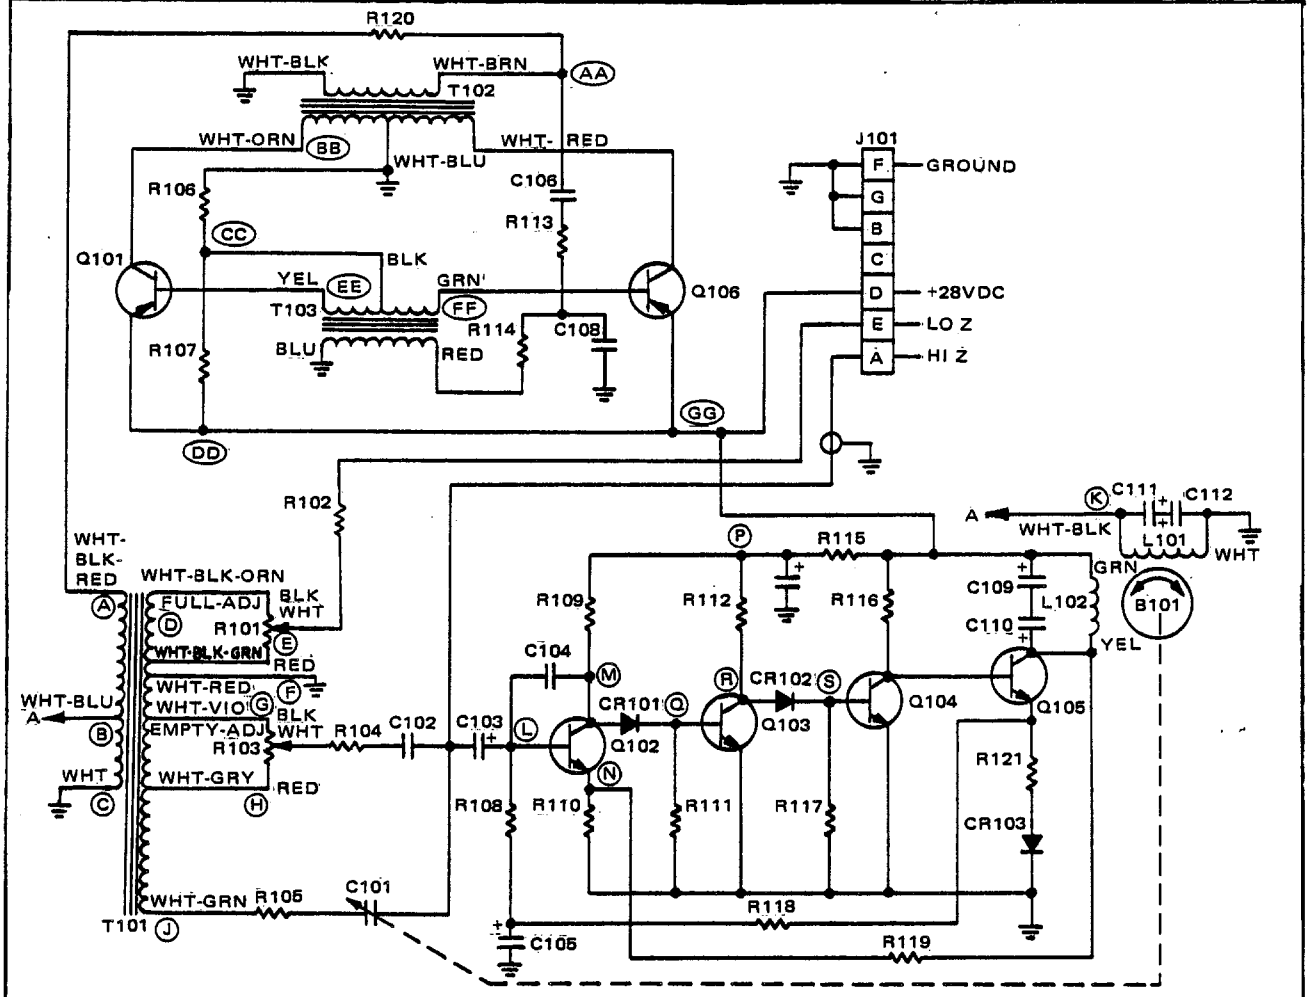
A. It is recommended that liquid quantity indicator assembly be stored in original container, if available.

B. If original container is not available, package liquid quantity indicator assembly as follows:

(1) Completely wrap indicator assembly in water-resistant paper. Seal with waterproof tape.

(2) Insert wrapped indicator assembly in a cardboard carton, being sure to adequately cushion carton on all sides so that indicator will be held securely in place. Seal carton with tape.

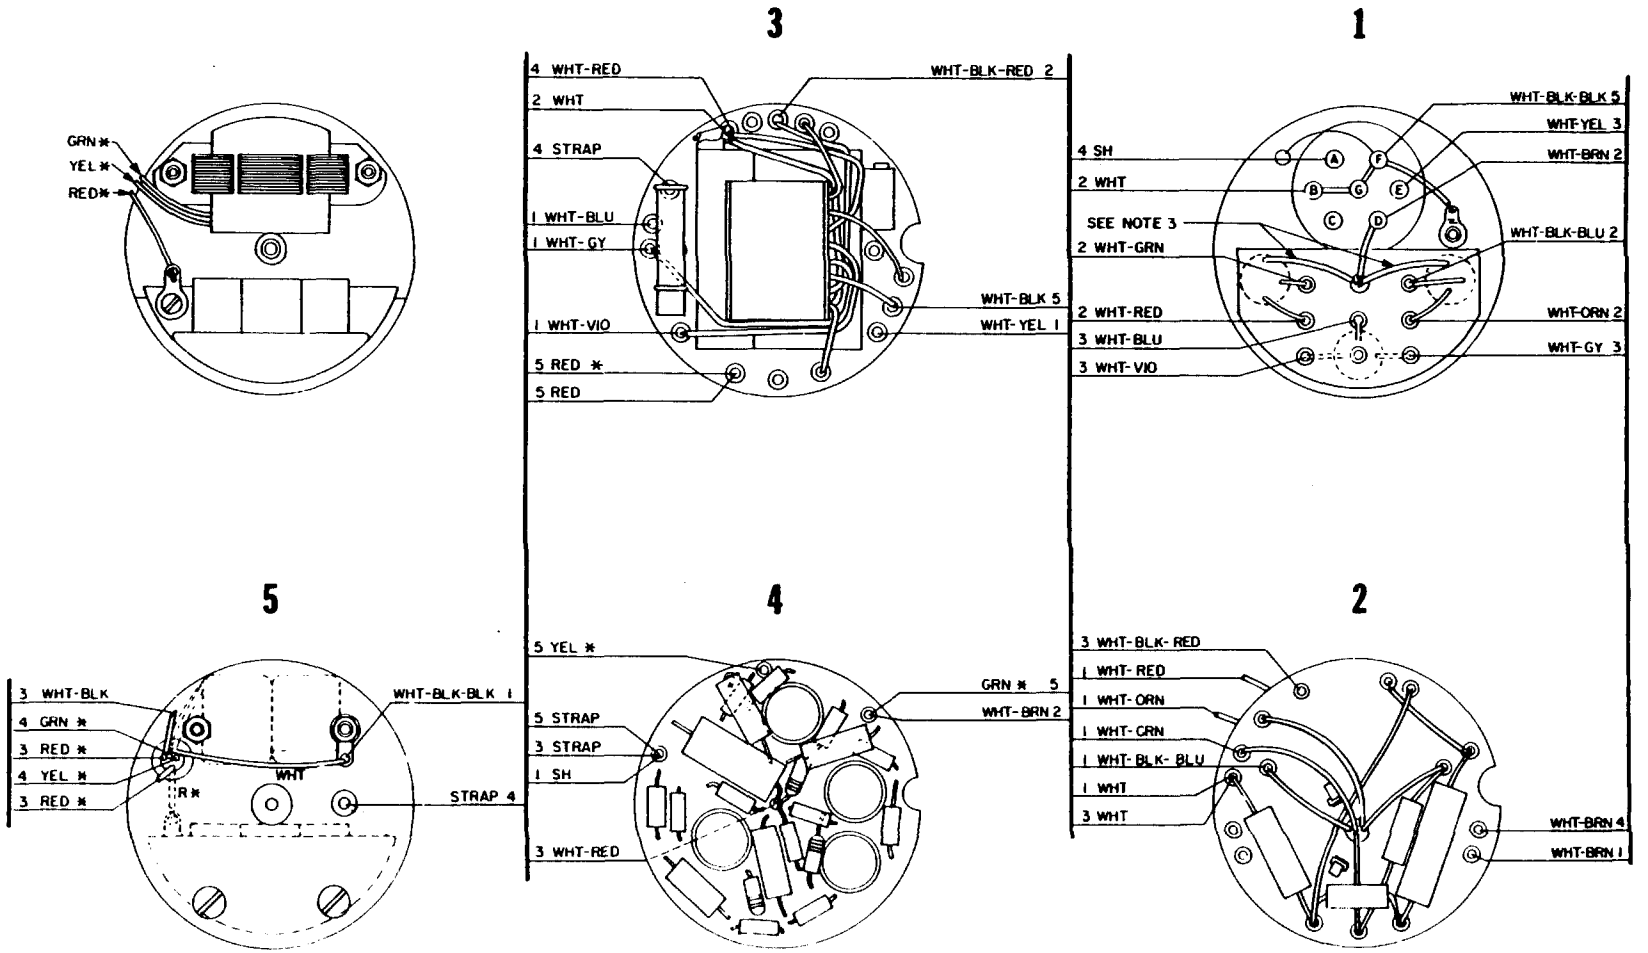
(3) Wrap carton with water-resistant paper and seal with waterproof tape. Mark the carton "FRAGILE."



(4) Affix a label containing the following information:

a. Indicator part number.

b. Serial number.



c. Date of last overhaul.

d. Note and date of any other component changes.

CR101 - Diode, 1N816
CR102 - Diode, 1N816
CR103 - Diode, S320G
C101 - Capacitor (Motor), 463192-001
C102 - Capacitor, 397615-00820

NOTES

1 ALL WIRES MARKED * TO BE TYPE "E" NO 30 AWG 7/38 TEFLON WRAPPED WIRE.

2 FOR HOOKUP WIRE USE TYPE "E" NO 28 AWG 7/36 TEFLON WRAPPED WIRE PER MIL-W-16878

3 SLEEVE LEADS WITH NO 14 THIN WALL TEFLON SLEEVING, BLACK

10. SPECIAL TOOLS, FIXTURES AND EQUIPMENT. The following special tools, fixtures and equipment (see Table IV) are required for performing the procedures described in this handbook.

TABLE IV. SPECIAL TOOLS, FIXTURES AND EQUIPMENT

Item	Description	*Part Number
1	Field Calibration Unit	387991-003 Simmonds Precision Products, Inc. Tarrytown, New York, U.S.A.
2	Induction Heater	T-25-1 Lepel High Frequencies Laboratories New York, New York, U.S.A.
3	Motor Test Unit	TE-175 Simmonds Precision Products, Inc.
4	Helium Leak Detector	MS-9ABC VEECO Instruments, Inc. Plainview, New York, U.S.A.
5	Variac, Variable Auto-transformer	V10B General Radio Co. West Concord, Massachusetts, U.S.A.
6	Variable DC Power Supply	865B Harrison Laboratories Berkeley Heights, New Jersey, U.S.A.
7	Transistor Checker	210 Owen Laboratories Pasadena, California, U.S.A.
8	Multimeter	260 Simpson Electric Co. Chicago, Illinois, U.S.A.
9	Solder Sealing Band Fixture	See Figure 7
10	Evacuation and Filling Setup	See Figure 8
11	Oven	Commercial
12	Carbon Filament Heat Lamp Oven	Commercial

*Equivalent part may be used.

TABLE V. SPECIAL MATERIALS

Item	Manufacturer	Purpose
Trichloroethylene, Specification MIL-O-T-634 (U.S.A.)		Cleaning rosin flux residue and mechanical parts.
Solder 63% tin, 37% lead solid wire, Specification QQ-S-571 (U.S.A.)	Kester Solder Co. Chicago, Illinois, U.S.A.	Solder housing and solder sealing band assembly.
Solder Flux No. H200	Fairmount Chemical Co. New York, New York, U.S.A.	Use with solid wire solder.
Solder 63% tin, 37% lead rosin core, Specification QQ-S-571 (U.S.A.)	Kester Solder Co.	Solder electrical components.
Wire, Type E, No. 28AWG, 7/36 Teflon insulated, Specification MIL-W-16878/4 (U.S.A.)		Point-to-point wire.
Wire, Type E, No. 30AWG, 7/38 Teflon insulated, Specification MIL-W-16878/4 (U.S.A.)		See wiring diagram, Figure 12 for use.
Insulation Tubing, No. 24, Black, thin-wall Teflon, Specification MIL-I-22129.		See wiring diagram, Figure 12 for use.
C-washer, 0.56 in. dia, 0.07 in. thick and 17/64 in. cutout		See Paragraph 6E, step (12).
Primer Paint No. DS-C-2936	Jamestown Finishes Inc. Jamestown, New York, U.S.A.	Prime housing assembly.
Catalyst No. CT9-1472	Jamestown Finishes Inc.	Use with primer paint.
Finishing Paint No. XFO-1042, Special Flat Black	Jamestown Finishes Inc.	Final painting.
Paint thinner No. 5811	Jamestown Finishes Inc.	Use with final paint.
Pacitite, No. 3199	Simmonds Precision Products, Inc. Tarrytown, New York, U.S.A.	Use with coaxial element (32, Figure 3) and circuit cradle (4, Figure 3).
Cement, No. 8100	Simmonds Precision Products, Inc.	Use with transistor insulators (12, Figure 2).
Helium	Commercial	Fill indicator assembly.
Nitrogen, Specification BB-N-411/A (U.S.A.)		Fill indicator assembly.

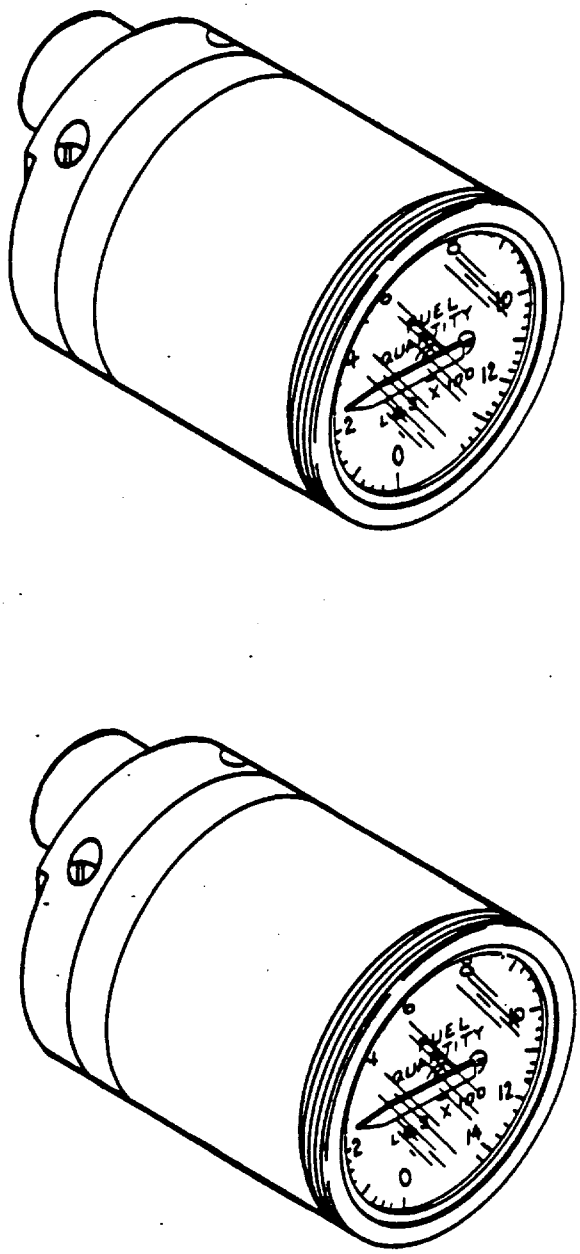

Figure 1. Fuel Quantity Indicator

0-1 DESCRIPTION AND OPERATION

A. GENERAL. The 393004- Fuel Quantity Indicators (Reference Figure 1) are a pointer type, transistorized indicator - amplifier - bridge enclosed in a hermetically sealed housing.

B. INTERNAL COMPONENTS.

1. The indicator is housed in a hermetically sealed, cylindrical case. Within the case is an amplifier-bridge assembly, which consists of a three-stage transistor amplifier, a bridge circuit, power supply circuitry, and an indicator motor which, through a gear box, drives the pointer and the rebalancing element of the bridge circuit.
2. At the rear of the indicator are the "FULL" and "EMPTY" adjustment controls.
3. The indicator motor is a two-phase motor with one winding in phase with the power source while the other winding is energized by the amplifier signal. Direction of rotation depends upon the phase relationship between the two windings.
4. The amplifier portion of the amplifier-bridge circuitry consists of a three-stage transistor amplifier which amplifies the signal received from the bridge circuit to drive the indicator motor. The bridge portion consists of a reference capacitance, a rebalancing potentiometer which restores the system to balance as it is driven by the motor, and the "FULL" and "EMPTY" adjustment controls.

5. The power supply circuitry includes a toroidal transformer which supplies voltage of correct phase and amplitude to the bridge circuit and two crystal diodes connected to taps on the transformer primary. These diodes are connected in a fullwave rectifier configuration and supply DC power to the amplifier.

C. LEADING PARTICULARS. Leading particulars for the indicators covered in this handbook are given in Table I.

TABLE I
LEADING PARTICULARS

PART NO.	OVERALL LENGTH	DIAMETER	WEIGHT	SEALING	DIAL	TANK
393004-060	2.94"	2.0"	0.60 Lbs (0.272 Kgs)	Hermetic	0-1375 Lbs	Forward

LIST OF VENDORS

CODE	VENDORS NAME AND ADDRESS
01121	Allen Bradley Co., 1201 South 2nd Street Milwaukee, Wisconsin
01295	Texas Instruments, Transistor Division Dallas, Texas
06641	Century Fasteners Corporation, 50-20 Ireland Street Elmhurst, New York
56289	Sprague Electric, Marshall Street North Adams, Massachusetts
70318	Allmetal Screw Products Co., Inc., 821 Steward Avenue Garden City, New York
77820	Bendix Corporation, The Electrical Component Division, Sherman Avenue, Sidney, New York

1-1 DISASSEMBLY

A. GENERAL.

1. Conduct tests as outlined in Section 7, to determine malfunction and required overhaul. If unit meets all requirements of testing, overhaul is not recommended.
2. Disassemble the unit according to the exploded and orthographic views (Reference Figures 2 through 6). The numerical sequence of the parts in these views follows the order of disassembly except that attaching parts follow the parts they attach. Do not disassemble the unit beyond the point necessary to make required repair or replacement of parts.

B. DISASSEMBLE INDICATOR (Reference Figure 2).

1. Remove two screws (2) securing identification plate (1). Remove identification plate.
2. Do not remove decal (3) unless required for replacement. Decal is cemented in place and will be damaged if removed.
3. Using a 200 watt soldering iron and heat sink protection (Reference Figure 8) unsolder end of tearband (4). Carefully remove tearband using a pair of pliers and a 200 watt soldering iron.
4. Slide case assembly (5) off indicator subassembly (9). If dial window requires replacement, insert case assembly (5) into an induction heater and unsolder glass (7) from case (6).
5. Remove spacer (8) from indicator subassembly (9).

C. DISASSEMBLY INDICATOR SUBASSEMBLY (Reference Figure 3).

1. Using two soft, pointed, instruments, carefully pry off pointer assembly (1).
2. Remove screws (3) securing dial (2). Remove dial.
3. Remove shaft screw (4).
4. Detach amplifier assembly (5) by removing mounting screws (6) and lockwashers (7). Reference Figure 4 for disassembly of amplifier.
5. Unscrew standoff (9) and remove motor indicator assembly (8).
6. Separate motor (10) from the gear box assembly (14) by removing screws (11), lockwashers (12), and motor clamps (13). If gearbox assembly (14) required disassembly, refer to Figure 5.
7. Remove transformer assembly (15) and spacer ring (16) from end plate assembly (17). Reference Figure 6 for breakdown of end plate assembly.

D. DISASSEMBLE AMPLIFIER ASSEMBLY (Reference Figure 4).

1. Unsolder and remove electrical components (1 through 23). Use proper heatsink protection to insure component safety. It is not recommended to disassemble terminal board (25).

E. DISASSEMBLE DRIVE ASSEMBLY (Reference Figure 5).

1. Remove retaining ring (2).

2. Lift out faceplate (3), cluster and wiper assembly (4), and potentiometer assembly (8). Separate wiper assembly (6), 320° cluster assembly (5), and dog pin (7) only if required for replacement.
3. Detach support plate (11) by removing screws (10).
4. Lift off rear plate (12).
5. Slide off spring shield (13) and remove clusters (14, 15, 16, and 17).
6. Separate the front plate (20) and housing (21) by removing three posts (18) and one key post (19).
7. Do not remove stop pin (22) from housing (21) unless required for replacement.

F. DISASSEMBLE END PLATE ASSEMBLY (Reference Figure 6).

1. Unscrew spade studs (1) from end plate (13).
2. Unsolder and remove resistor (2) and capacitor (3).
3. Remove screws (6), lockwashers (7 and 8), and flat lug (9).
4. Lift terminal strips (4) and trimmers (5) out of end plate (13).
5. Heat end plate (13) to approximately 460°F to remove receptacle (10).
6. Heat end plate (13) to approximately 597°F to remove evacuation tube (11) and bellows assembly (12).

2-1 CLEANING

A. GENERAL.

1. Clean all non-electrical parts using a solvent such as isopropyl alcohol. Dip a stiff, non-metalic brush into the solvent and wash parts thoroughly.
2. Clean electrical parts with a lint-free cloth moistened with isopropyl alcohol and blow dry with clean, dry, compressed air.
3. Mechanical parts such as clusters may be cleaned in an ultrosonic cleaner.
4. After cleaning clusters, lubricate cluster pivots with Dow Corning DC-560, (Dow Corning Corp., Midland, Michigan) or equivalent.
5. All cleaned parts should be stored in clean, labeled containers.
6. All excess solder on case assembly and end plate assembly should be removed by flowing excess solder with a 200 watt soldering iron and wiping clean with a damp rag.
7. Clean dial window with lens tissue and/or a mild dish detergent.

3-1 INSPECTION AND CHECK

A. GENERAL.

1. Visually inspect all parts and wiring for wear, corrosion, damage, and faulty insulation.
2. Inspect all clusters for tooth deformation, stress cracks, and scoring.
3. Inspect screws and other threaded parts for stripped, worn, or otherwise damaged threads.
4. Check all wiring for cold solder joints, cracked or damaged insulation, and/or loose connections.
5. Inspect all electrical components for proper values, signs of over-heating or other damage.
6. Inspect all rotating components for misalignment or wobble.

B. ELECTRICAL COMPONENTS.

1. Using a Simpson 260 (or equivalent) check all resistors for proper values as referenced in the legend of schematic diagram, Figure 13A or 13B.
2. Check all capacitors for shorts and proper values. Reference values found in illustrated parts list and the legend of the schematic diagram, Figure 13A or 13B.
3. Check all transistors on a standard transistor checker.
4. Check all diodes for proper forward and reverse currents.

C. FUEL QUANTITY INDICATOR (Reference Figure 2).

1. Check identification plate (1) for scratches or distorted lettering.
2. Check case assembly (5) for cracks or bad dents.
3. Check glass (7) for scratches or cracks.

D. INDICATOR SUBASSEMBLY (Reference Figure 3).

1. Check pointer (1) and dial (2) for scratched or chipped paint.
2. Inspect the motor (10) for signs of overheating, binding, and shaft wobble.
3. Connect the motor to a test circuit as shown in Figure 11. Mark the output pinion so that it will be visible under a Strobotac.
4. Close switch S1 and adjust Variac T1 until voltmeter M1 indicates 10 volts. The motor speed should be 2350 to 3500 rpm.
5. Adjust Variac T1 until voltmeter M1 indicates 20 volts. The motor speed must not be less than 4000 rpm.
6. Starting at zero, increase T1 until motor rotates. Motor shall rotate in either direction at not more than 1.5 volts.
7. Attach a 1/4" diameter pulley to the motor pinion shaft. Attach a 2" thread to the pulley and a 0.68 gram weight to the thread. Increase voltage until shaft rotates. The weight should rise to the pulley in both directions with no more than 2.0 volts applied.

8. Test gear box assembly (Index #1, Figure 5) by attaching the motor to the gear box with the proper hardware, reference Figure 3. Hold output gear of gear box assembly stationary and increase voltage of the test circuit to 2.0 volts. Release output gear. Gear box should turn freely. Repeat this operation several times in both directions.
9. Apply 500 volts, 60 cycles, to a white or yellow lead and a read or black lead for one minute. Connect all motor leads together and apply 500 volts, 60 cycles between the leads and the motor case for one minute.
10. The insulation resistance between the windings and between each winding and the motor case shall be greater than 500 megohms with 50 volt applied.
11. Check transformer assembly for damaged leads or insulation.

E. END PLATE ASSEMBLY (Reference Figure 6).

1. Trimmers (5) should measure 500 ohms ± 5% between red and black leads. Connect ohmmeter between white and red or black leads. As the trimmer adjustment is turned, the resistance should vary smoothly.
2. Check receptacle for bent or broken pin and damaged glass.

4-1 REPAIR AND REPLACEMENT

A. GENERAL.

1. Inspect and test all questionable components as described in Section 3. Replace any components or mechanical parts that fail to meet inspection and/or test requirements.
2. Replace any mechanical hardware that shows signs of worn or stripped threads.
3. Use solder composed of 60% tin and 40% lead for all soldering unless otherwise noted.

B. CASE ASSEMBLY (Reference Figure 2).

1. Minor dents in the case assembly (5) may be straightened out with a mallet and suitable block. If case is torn, punctured, or severely dented, it should be replaced.
2. If case window (7) is scratched, cracked, or broken, it should be replaced.

C. WIRING.

1. Replace any wiring having damaged conductor and/or insulation. Refer to notes on wiring diagram (Figure 12) for proper size and type of wire.
2. Resolder any solder joints that show evidence of damaged and/or poor soldering.

D. ROTATING COMPONENTS.

1. Replace motor (Index #10, Figure 3) if it fails to meet any of the Inspection and check requirements.
2. Repair of gear box subassembly (Index #9, Figure 5) is not recommended. Only in an emergency should individual components be replaced.
3. Tension of wiper assembly (6) against potentiometer assembly (7) should be 17 grams.

E. END PLATE ASSEMBLY (Reference Figure 6).

1. Replace receptacle (Index #10, Figure 6) and bellows assembly (12) reference Figure 6 and paragraph 5-1-B.

5-1 ASSEMBLY

A. GENERAL.

1. Assembly is essentially the reverse of disassembly. Follow the reverse order of index numbers assigned to the exploded and orthographic views, Figure 2 through 6.
2. As assembly proceeds, connect wiring as shown in Figure 12. When soldering wiring and electrical components, observe proper heat sink precautions. Reference Figure 3, 4, 6, and 12 for proper polarity and component layout.

B. ASSEMBLE END PLATE ASSEMBLY (Reference Figure 6).

1. Heat end plate (13) to approximately 597°F and solder bellows (12) and evacuation tube (11) in place with Sn5 solder and SPPI 2204 Solder Flux.
2. Preheat end plate (13) and receptacle (10) to approximately 460°F and solder in place with Sn40 solder and Kester 1544 flux or equivalent.
3. Clean end plate with tricloroethane.
4. Using an insulation resistance checker, measure the resistance from the pins of the receptacle to the end plate. Resistance shall be greater than 10,000 ohms.
5. Assemble trimmers R2 and R4 (5) and terminal strips (4) to end plate with screws (6), lockwashers (7 and 8) and lug (9).
6. Assemble Resistor R3 (2) and capacitor C1 (3) to end plate and wire per Figure 12.
7. Prewire receptacle per Figure 12.

8. Apply grade "E" Locktite or equivalent to the threaded portion of the spade studs (1) and assemble to end plate assembly. Make certain that the flat side of the spade stud faces the inside of the end plate.

C. ASSEMBLE INDICATOR DRIVE ASSEMBLY (Reference Figure 5).

1. Press stop pin (22) into housing (21) until large end of the stop pin is flush with the periphery of the housing.
2. Attach front plate (20) to housing (21) with three posts (18) and one key post (19).
3. Place clusters (14, 15, 16, and 17) into respective pivot holes in front plate (20).
4. Place spring shield (13) around clusters.
5. Place rear plate (12) on posts (18) and key post (19).
6. Attach support plate (11) with screws (10).
7. Place potentiometer assembly (8) into housing (21) and wire per Figure 12.
8. If wiper assembly (6), 320° cluster assembly (5), and dog pin (7) have been disassembled, assemble and realign per Figure 7.
9. Place cluster and wiper assembly (4) inside housing (21). Make certain that the wiper makes good contact with the coil.
10. Hold faceplate (3) in place with retaining ring (2).

D. ASSEMBLE AMPLIFIER ASSEMBLY (Reference Figure 4).

1. Place transipads (24) between terminal board (25) and transistors (23 and 24). Assemble transistors (23 and 24) to terminal board (25) using Sn60 solder and adequate heatsink protection.
2. Assemble components (1 through 21) to terminal board (25) and solder leads with Sn60 solder.

E. ASSEMBLE INDICATOR SUBASSEMBLY (Reference Figure 3).

1. Place ring spacer (16) into end plate assembly (17).
2. Place transformer (15) into end plate assembly (17).
3. Attach motor (10) to indicator gearbox assembly (14) with screws (11), lockwashers (12), and motor clamp (13).
4. Assemble indicator drive assembly (8) to the end plate assembly (16) with standoffs (9). Carefully route leads through the openings in support plate (Index #11, Figure 5).
5. Attach amplifier (5) to the two standoffs (9) with screws (6) and lockwashers (7). Carefully connect all wires to the amplifiers (5), referencing Figure 12.
6. Attach scale dial (2) to faceplate (Index #3, Figure 5) with screws (3).
7. Assemble shaft screw (4) to the cluster and wiper assembly (Index #4, Figure 5).
8. Press pointer assembly (1) to shaft screw (4). Pointer to be aligned during preseal test. Perform test per Paragraph 7-1.

F. ASSEMBLE FUEL QUANTITY INDICATOR (Reference Figure 2).

1. Slide spacer (8) onto indicator subassembly (9) until spacer (8) seats firmly against end plate assembly (Index #16, Figure 3).
2. If glass (7) requires replacement, preheat glass (7) and case (6) a minimum of 1/2 hour at 250° ± 10°F.
3. Make a solder ring, the approximate diameter of the glass, from Sn63 solder.
4. Coat the inside diameter of the front of case (6) with Kester Formula 1547 flux or equivalent.
5. Place glass and solder ring inside case and solder in place with an induction heater.
6. Clean entire case assembly (5) with trichloroethylene.
7. Paint a .300 stripe around the inside of the case directly adjacent to the glass with Jamestown XFO-1042 flat black or equivalent.
8. Assemble case assembly (5) to indicator subassembly (9).
9. Place indicator in tearbanding fixture (Reference Figure 8). Pretin the entire tearband area on both case and end plate with Sn63 solder using a 200 watt iron.
10. Make two 45° cuts on one end of the tearband (4) to form a point. Solder the pointed end of the tearband to the tearband area of the indicator. Wrap the tearband around the indicator and hold firmly in place. Slowly move the hot iron around the indicator. Feed enough solder to the tearband to form a

smooth, even fillet along both edges of the tearband. Allow for 3/4" overlap and cut the end at a 45° angle. Seal the end of the tearband with solder.

11. Make certain there are no wrinkles and/or cracks in the tearband. Care must be taken to avoid overheating the indicator.
12. Clean exterior of unit with acetone or equivalent.
13. Test unit per Section 7.

G. EVACUATING AND FILLING PROCEDURE (Reference Figure 9).

1. Connect a length of 1/16" inside diameter tubing to the fitting of the evacuation setup.
2. Connect the tubing to the evacuation tube.
3. Close the gas shutoff valve. Open the vacuum gage shutoff valve.
4. Open gas shutoff valve and fill the indicator assembly with 10 percent dry helium and 90 percent dry nitrogen until the pressure is approximately 15 psi.
5. Remove the rubber tubing from the evacuation tube allowing the extra gas to escape until the pressure inside the indicator and outside are equalized.

6-1 FITS AND CLEARANCE

A. N/A

7-1 TESTING

A. GENERAL.

1. Testing of all basic components is covered in Section 3-1, Inspection and Check.

2. Preseal and final tests are both covered in Section 7, Testing.

B. FUNCTIONAL TEST.

1. Pointer Alignment.

   a. Connect the indicator assembly to the test circuit shown in Figure 11.

   b. Set decade section of the field calibration unit to the empty capacitance value given in Table III. Connect a voltmeter across the wiper of potentiometer R4 (Index No. 8, Figure 5) and ground pin B. Adjust the decade section capacitance until the voltmeter indicates a null.

   c. Using a soft, pointed instrument, adjust the pointer (Index No. 1, Figure 3) to indicate zero. (Adjustment possible only during preseal testing. Pointer alignment can only be verified during final test.)

2. Travel Time Test.

a. Open switch S1 and set the decade section of the field calibration unit to the full capacitance value given in Table III for the indicator under test. Close switch S1 and observe the time required for full scale deflection. The time must not exceed 30 seconds. Repeat the test in a downscale direction. The same limits apply.

TABLE III
FULL AND EMPTY CAPACITANCE

INDICATOR PART NO.	NOMINAL EMPTY AND FULL SCALE CAPACITANCE (UUF) EMPTY	FULL
393004-060	176.8	388.8
393004-061	156.12	336.19
393004-131	176.8	396.23
393004-132	156.12	335.94

3. Sensitivity Test.

a. Using the test setup of Figure 11, slowly increase the decade section of the field calibration unit to move the pointer upscale to any convenient mid-range readings. Record the exact capacitance setting.

b. Decrease the capacitance very slowly until the pointer moves. Proper indicator sensitivity is determined by the amount of capacitance change required to produce a pointer movement.

TABLE IV
CAPACITANCE VALUES FOR SENSITIVITY TEST

INDICATOR PART NO.	CAPACITANCE (UUF)
393004-060 and -131	.44 UUF
393004-061 and -132	.36 UUF

4. Linearity and Calibration.

a. Set the decade section of the field calibration unit to the zero capacitance value given in Table III for the particular indicator used. If necessary, adjust the "EMPTY" adjusting screw on the indicator so the pointer indicates zero.

b. Set the decade section to the full capacitance value given in Table III for the particular indicator used. If necessary, adjust the "FULL" adjusting screw on the indicator so that the indicator indicates full scale.

c. Set the decade section to move the pointer to each of the dial readings listed in Table V or Table VA for the particular indicator used. At each point, the capacitance must be within the tolerance listed. (Note: approach each point in an upscale direction.)

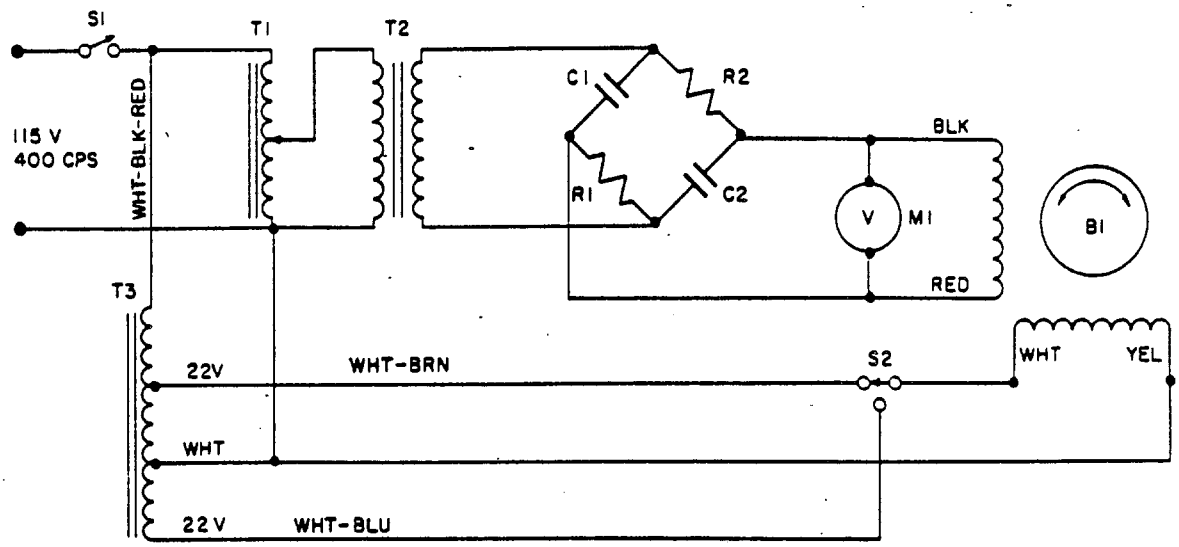
TABLE V
LINEARITY AND CALIBRATION VALUES

POINTER INDICATION	393004-060	393004-061
0	176.80	156.12
200	207.64 ± 1.35	181.39 ± 1.35
400	238.64 ± 1.35	206.66 ± 1.35
600	269.32 ± 1.35	231.93 ± 1.35
800	300.16 ± 1.35	257.20 ± 1.35
1000	331.00 ± 1.35	282.47 ± 1.35
1200	361.84 ± 1.35	307.74 ± 1.35
1375	388.8	N/A
1425	N/A	336.19

TABLE VA
LINEARITY AND CALIBRATION VALUES

POINTER INDICATION	393004-131	393004-132
0	176.80	156.12
1	210.80 ± 1.35	184.00 ± 1.35
2	244.80 ± 1.35	211.80 ± 1.35
3	278.80 ± 1.35	239.70 ± 1.35
4	312.80 ± 1.35	267.50 ± 1.35
5	346.80 ± 1.35	295.40 ± 1.35
6	380.80 ± 1.35	323.25 ± 1.35
6.455	396.23	335.94

C. SEALING.



1. At this point in the test procedure, the indicator assembly should be sealed, evacuated, and backfilled as instructed in Paragraph 5-E.
2. When the indicator assembly has been completely sealed, proceed with tests of Paragraphs 7-D and 7-E.

D. LEAK TEST.

1. Check for leaks in the sealed indicator assembly using a helium leak dectector.
2. The leakage rate must not exceed 10^{-6} milliliters per second.

E. FINAL TEST.

1. Repeat testing described in Paragraph 7-B to insure that the sealing operation has not effected the calibration.

8-1 TROUBLESHOOTING

A. If the indicator assembly cannot be adjusted to "EMPTY" or "FULL", check resistors R2 and R4 respectively.

B. If the indicator assembly fails to meet linearity and calibration values of Tables III through VA, check resistor R6.

C. TEST POINT VOLTAGE MEASUREMENTS (Reference Figure 11).

1. Apply 115 volts, 400 cps to the appropriate pin of receptacle J1 as shown in Figure 11.

2. Using a Simpson 260 (or equivalent) voltmeter, measure the voltage (to ground) at test points labeled in schematic Figures 13A and 13B. Reference voltage readings in Table VI.

TABLE VI
AC AND DC VOLTAGE TEST POINTS

Test Point	DC				AC										
	A	B	C	D	E	F	G	H	I	J	K	L	M	N	P
393004-060 and -131					115	22	0.0	22	18.2	2.0	0.0	28.9	35.4	38.4	47.1
393004-061 and -132					115	22	0.0	22	22.2	2.0	0.0	31.1	38.2	38.4	47.0
393004-060 and -131 and -061 and -132	6.3	1.2	2.0	1.2											

D. If test voltages (Table VI) are incorrect, check transformer T1. Incorrect AC voltages are an indication of a faulty transformer. Incorrect DC voltages are an indication of faulty amplifier components.

9-1 STORAGE AND PACKAGING

A. It is recommended to package the fuel quantity indicator in its original container.

B. If the original container is not available, package indicator as follows:

1. Completely wrap indicator in moisture-proof paper. Seal with moisture proof tape.
2. Insert wrapped indicator in a cardboard carton being sure to adequately cushion carton on all sides so indicator will be held securely in place. Seal carton with moisture-proof tape.
3. Wrap carton with moisture-proof paper and seal with moisture-proof tape. Mark the carton "FRAGILE".
4. Affix a label containing the following information:
   a. Indicator Part Number.
   b. Serial Number.
   c. Date of last overhaul.
   d. Note and date of any component change.

10-1 SPECIAL TOOLS, FIXTURES, AND EQUIPMENT

Part Number	Description	Application
387991-003 (or equivalent)	Field Calibration Unit	Supplies tank unit substitute capacitance.
Model P-2 (or equivalent)	Tester, Voltage Breakdown	Tests motor insulation.
T-25-1 (or equivalent)	Heater, Induction	Flowing Solder
63L-B (General Radio) (or equivalent)	"Strobotac" Stroboscopic Tachometer	Supplies variable speed control of motor.
210 (Ownens Laboratory) (or equivalent)	Checker, Transistor	Tests Transistors.
260 (Simpson Electric Co.) (or equivalent)	Volt-Ohmeter	General purpose, voltage and resistance readings.
Model 1862-B General Radio (or equivalent)	Megohmeter	Measures insulation resistance of Motor.
Model MS-9ABC (or equivalent)	Helium Leak Detector	For checking hermetic seal.
Model W-10 (or equivalent)	Variac	Motor Test Circuit

STORAGE

UNIROYAL (1966) LTD.
Technical Field Service - Fuel Cell Department
Suggested Procedure for Bladder Type Fuel & Oil Cells

TITLE: HANDLING BLADDER TYPE FUEL CELLS

I. General:

A. The purpose of this procedure is to provide a method of handling bladder type fuel and oil cells, including storage, pre-installation inspection, installation, post-installation test for the entire system, removal of the cell in the event it is necessary, pressure test and minor repair.

B. The scope of this procedure should be such as to include all handling and minor repair of bladder type fuel and oil cells.

II. Detailed Requirements:

A. Storage, Inspection, and Handling of the bladder type cell prior to installation.

1. Cells should be stored only at room temperature and with no more than normal humidity. Cells should not be stored except in their original shipping container.
2. Cells should be removed from the shipping container only at time of installation.
3. Inspection of the cell and shipping container after the cell has been removed from the container should be made for any damage which may have occurred due to crating or removal from crate.
4. In transporting the cell from storage or inspection, it must not be picked up by the fittings and should be carried or transported on trucks. Under no circumstances should a cell be dragged, nor should cells be stacked except in their original shipping container.
5. Cells should be transported outside of installation area only in original shipping container.

6. Cells should not be handled with any sharp pointed tools and care should be exercised that the cell is not placed on any sharp edge or point while it is being transported.
7. Care should be taken to protect all projections, such as fittings, etc., of the cell during the handling or transportation.

B. Preparation of cell compartment for installation of bladder type cell.

1. Cell compartment must be thoroughly cleaned of all filings, trimmings, loose washers, bolts or nuts, etc.
2. All sharp edges of the cell compartment should be rounded off.
3. Cell compartments should be inspected just prior to the installation of the cell.
4. Tape over all sharp edges and rough rivets.

C. Installation.

1. Check to be sure cell is warm enough to be flexible.
2. All sharp tools such as screwdrivers, or files, should be prohibited for installation purposes.
3. As soon as the cell is in place in its compartment it should be developed out to its full size and hanger fittings connected. It should not remain in the folded or collapsed condition any longer than absolutely necessary.
4. After cell is developed out to its full size all connections should be made in accordance with instructions. Care should be exercised to check all fittings for proper alignment to avoid unnecessary strain.
5. The sealing or compression surfaces must be assembled when absolutely dry. (No sealing paste to be used.)
   NOTE: Item 6 for factory installation only.
6. When installation has advanced to the point where torque is

to be applied to bolts, nuts and studs, Company Inspection Representative should witness the application or check the torque controlled power tools to be used.

7. Torque shall be applied in the following manner if stop nuts are used.
   (a) The nut should be run on the bolt thread with the fingers until it reaches the locking area.
   (b) The torque wrench should then be applied and the bolt run through the lock.
   (c) A reading should be taken after the bolt has been run through the lock to determine the friction torque and this figure added to the final torque value of 35" lbs ∔ - 5" lbs. (See note X)
   (d) Nuts should be finally torqued to this combined torque value.

   NOTE: When using castellated nuts with cotter pins, turn nuts on with fingers and apply specified torque with torque wrench or torque controlled power tool.

   (X) These torque values are to be considered as recommended values unless otherwise specified on customers' assembly drawings.

8. There should be no repetition of torquing, after its first application under any circumstances, without first backing the nut off completely and procedure of II, C-7 again followed.
9. Special attention should be given to the following.
   (a) Bolt and stud lengths, to avoid "bottoming" on the inside of blind tapped holes or dome nuts.
   (b) Bolt lengths should be checked to avoid the riding of the nut on the shank or unthreaded area.

(c) Either of the above conditions results in an error which results in a loss of compression value on the sealing surface of the molded fittings.

(d) When fastening or unfastening the snap fasteners, great care should be exercised that a straight push or pull is not exerted, but that the fastener is tilted a little to one side before it is snapped or unsnapped.

(e) Internal rubber tubing protectors on hanger studs must be removed and should be saved for re-use on cells which may be removed from the airplane.

(f) Care should be taken to avoid damage to hangers and fittings during installation.

10. After final torque is applied, the cell should be inspected for final fit within its compartment, making certain that the cell is extended out to the structure and no corners are folded in.

11. The final inspection prior to closing the cell should be a close check to be sure the cell is free from foreign matter such as lint, dust, oil or other installation equipment. If cell is not thoroughly clean, it should be cleaned with a lint-free cloth soaked in water, alcohol, or kerosene. No other solvent shall be used.

D. Post Installation Pressure Check. Suggest use of UNIROYAL (1966) Limited Pressure Testing Procedure.

E. Removal of bladder type cell from its compartment.

1. If it is necessary for any reason to remove the cell from the cavity or to deform it inside the cavity, it is suggested that the cell be drained and then flushed, sprayed, or rubbed with light engine oil. The cell should not be removed or handled until 24 hours after the oil has been applied.

2. Upon removal, the following precautions are necessary:

(a) Disconnect all fittings, hangers, snap fasteners, etc.

(b) Collapse cell to as near the completely collapsed condition as is possible.

(c) Care should be exercised when actually removing the cell from its compartment so that the cell does not drag over any sharp edge or projection while it is being removed from the cavity.

III. General Procurement

A. Do not store bladder type cells under any circumstances near heat or in extremes of humidity.

B. Do not allow bladder type cells to remain longer than absolutely necessary in any strong light. When working inside cell do not allow hot light bulb to come in contact with liner. Fluorescent inspection lights are recommended for use with fuel cells.

C. When storing cells, store in such a manner that their shipping containers are placed level, and when necessary to stack more than one high, see that the containers are placed squarely on each other so as to preclude any danger of slipping and the sharp edge of one container perforating another.

D. Do not get inside cells with tools in pockets or with shoes on.

UNIROYAL (1966) LTD.

PRESERVATION OF FUEL CELLS AFTER USE

When synthetic rubber fuel cells are placed in service, the gasoline has a tendency to extract the plasticizer from the inner liner of the cell. This extraction of plasticizer is not detrimental as long as gasoline remains in the fuel cells, in as much as the gasoline itself will act as a suitable plasticizer.

When the gasoline is drained from the fuel cell, the plasticizing effect of the gasoline is lost and the inner liner of the cell begins to dry out and subsequent cracking or checking will occur.

This cracking or checking may penetrate through the inner liner permitting gasoline to diffuse through walls of the cell after the cell has been re-fueled.

To prevent this failure, a thin coating of light engine oil should be applied to the inner liner of all serviceable fuel cells, which have contained gasoline, when it is evident that the cells will remain without fuel for more than ten days, whether installed in airplanes or in storage. The oil will act as a temporary plasticizer and will prevent the inner liner from drying out and cracking.

If it becomes necessary to return the cell to the contractor or the vendor for testing or repair, do not allow quantities of oil to be puddled in the cell as it will make handling and repair much more difficult. Cells should be re-packed as similar to the original factory pack as possible.

UNIROYAL (1966) LTD.

COMPRESSION METAL AND RUBBER MOLDED NIPPLE FITTINGS

COMPRESSION METAL FITTINGS:

Compression metal fittings have been developed by UNIROYAL (1966) LTD. for use with Mareng bladder type fuel cells. Replacement fittings are available by re-ordering by part number from UNIROYAL (1966) Limited.

The torque on the screws in the metal compression fittings should be 35" lbs +/- 5" lbs for 538N construction and 50" lbs +/- 5" lbs for 566R construction.

These torque values are to be considered as recommended values unless otherwise specified on customers' assembly drawings. This torque is sufficient to give positive fitting seal without damage to the fitting or cell material and will give permanent seal as long as the fitting is not disturbed.

Note: No sealing paste or gasket compound should be used with these fittings.

MOLDED NIPPLE FITTINGS:

The molded nipple fitting is a lightweight fitting developed for ease in installation in certain locations in the airplane. In order to get the best service from this type of fitting it is necessary to exercise certain precautions at the time of installation. The specific precautions other than the general care in handling are as follows:

1. The flow tube should be inserted into the fitting until the end is flush with the inside edge of the nipple.
2. The hose clamp should be clear of the end of the fitting by 1/4" where possible.
3. The hose clamp should always be located on the fabric reinforced area of the nipple.
4. The hose clamp should be tightened only finger tight. This tightening should be done at one time. No re-tightening should ever be done unless the hose clamp is loosened completely and allowed to set for 15 minutes before re-tightening.
5. No sealing paste or gasket compound should be used.

6. Apply thin film of Simonize Wax to metal flow tubes to facilitate installation and removal.

   Note: No other lubricants should be used on fittings of this type.

UNIROYAL (1966) LTD.

VARSOL LEAK TEST FOR BLADDER TYPE FUEL CELLS

1. Material and Equipment Required:

   A. Varsol.

   B. Controlled Air Pressure Line.

   C. Closure plates for cells - one with air line connector.

   D. Flexible coupling for air line.

2. Procedures:

   A. Plug fitting holes in cells.

   B. To access door apply plate with air line connector.

   C. Add Varsol to cell, 2 gallons for a small cell, 4 gallons for a large cell.

   D. Connect cell to air line.

   E. Inflate to 1/8 lb air pressure.

   F. Gently roll cell so that the whole of the inner surface becomes covered with liquid.

   G. Inspect cell for leaks (Leaks appear as a smear of oil).

   H. Cell should remain under pressure for 5 minutes.

   I. Inspect cell again for leaks and mark any found with wax crayon.

   J. Deflate cell, empty out Varsol and wipe the excess.

   K. Send cell for shipment or repair as appropriate.

REPAIR PROCEDURE FOR BLADDER TYPE FUEL CELLS
CONSTRUCTIONS US-566R & US-566RL
MANUFACTURED BY
UNIROYAL (1966) LTD.

WARNING

No repairs are to be made on the radius of a cell or in the fitting area of a cell. Cells with such damage are to be returned to the factory for repairs. No damaged areas such as cuts and tears larger than 1" are to be repaired in the field.

REFERENCE

USAF Technical Order No. 6J14-1-3.

REPAIRING THE CELL

A. Outside of Cell

1. Use a piece of synthetic rubber coated fabric UNIROYAL 5200 outside repair material, large enough to cover damage at least 2" from cut in any direction. Buff this material lightly and thoroughly with garnet paper and wash with Methyl Ethyl Ketone (UNIROYAL 3339 solution) to remove buffing dust.
2. Cement buffed side of patch with two coats of UNIROYAL 3200 repair cement. Allow each coat to dry 10 - 15 minutes.
3. Buff cell area to be patched lightly and thoroughly with garnet paper and wash with UNIROYAL 3339 solution to remove buffing dust.
4. Cement buffed area with two coats of UNIROYAL 3200 repair cement. Allow each coat to dry 10 - 15 minutes.
5. Freshen cemented area of patch and cemented area of cell with UNIROYAL 3339 solution.

6. While still tacky, apply edge of patch to edge of cemented area on the cell. With a roller or blunt instrument, roll or press the patch to the cemented area and roll or press it down a half-inch to an inch across at a time so as not to trap air between patch and cell. Lay 50 lbs shot bag over patch which is protected by a piece of Holland Cloth to prevent sticking. Weight should not be removed for 6 hours.
7. Seal coat edge of patch 1/2" with one coat of UNIROYAL 3200 repair cement and allow the cement to dry thoroughly.

B. Inside of Cell

1. After the damaged area has been patched on the outside of the cell and the repair allowed to stand a minimum of 6 hours, the cell is then ready to have the patch applied on the inside of the cell.
2. Lightly and thoroughly buff a piece of cured UNIROYAL 5200/5187 nylon sandwich material large enough to cover damage at least 2" from cut in any direction. Wash buffing dust off patch with Methyl Ethyl Ketone solution (UNIROYAL 3339).
3. Cement buffed side of patch with two coats of cement, UNIROYAL 3200 repair cement, and allow each coat to dry 10 - 15 minutes.
4. Buff cell area to be patched lightly and thoroughly with fine sandpaper (# "O" and then wash off buffing dust with Methyl Ethyl Ketone solution (UNIROYAL 3339).
5. Coat buffed area with two coats of cement, UNIROYAL 3200 repair cement, and allow each coat to dry 10 - 15 minutes.

6. Freshen cemented area of patch and cemented area of cell with Methyl Ethyl Ketone solution (UNIROYAL 3339).
7. While still tacky, apply edge of patch to edge of cemented area, centering patch over cut in cell. With a roller or blunt instrument, roll or press the patch to the cemented area on the cell. Hold part of patch off the cemented area and roll or press it down a half-inch to an inch across at a time so as not to trap air between patch and cell. Apply 50 lbs shot bag to repaired area and do not disturb for 6 hours.
8. Seal coat patch and 1/2" from edge of patch with two coats of UNIROYAL 3200 repair cement. Allow the first coat to dry one hour or more. Wipe patch and cemented area lightly with S.A.E. #10 oil, so that when the cell is in its original position the patch area will not stick to other areas of the cell.

C. Scuffed Fabric

1. Buff area surrounding scuffed fabric.
2. Wash buffing dust from area with UNIROYAL 3339 solution.
3. Apply two coats of UNIROYAL 3200 repair cement to the buffed area, allowing 10 minutes drying time between coats.

OVERHAUL INSTRUCTIONS

WITH

PARTS BREAKDOWN

MANUALLY OPERATED FOUR-WAY HYDRAULIC SELECTOR VALVE (DISC TYPE) Part Nos 20907-1 and 20907-2

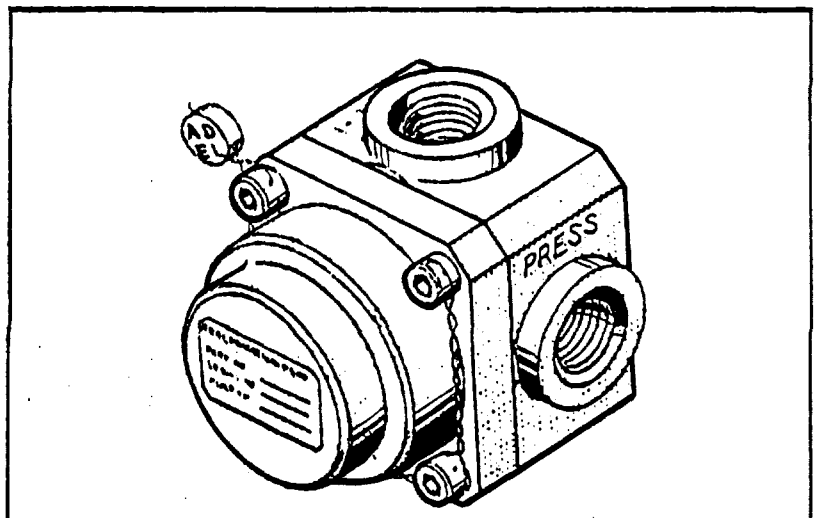

FIGURE 1

1. DESCRIPTION (see Figure 1).

   a. These valves are manually operated to direct the flow of hydraulic fluid under pressure to a double acting hydraulic mechanism, and to return the displaced fluid to the system or reservoir.

   b. Table of Leading Particulars:

System fluid	Hydraulic oil, Specification MIL-H-5606
Operating temperatures	-54°C to +77°C (-65°F to +170°F)
Max operating pressure	3000 psi
Shaft operating torque	17 in. lbs @ 1500 psi, 20 in. lbs @ 3000 psi

2. OPERATION (see Figure 2).

a. Valve shaft is directly connected with chambered valve disc. Rotation of disc controls fluid flow between ports in valve body. Mating surfaces of disc and body are ground optically flat. Internal stops limit travel to 45 degrees on either side of neutral center position.

3. DISASSEMBLY AND CLEANING

a. Disassemble valve in the order of the index numbers in Figure 3, using a clean, well-lighted working surface.

b. As parts are removed, they should be washed thoroughly in an approved solvent, dried with alint-free cloth, and placed in a clean, dust-tight container. Cleanliness is of utmost importance in servicing this valve.

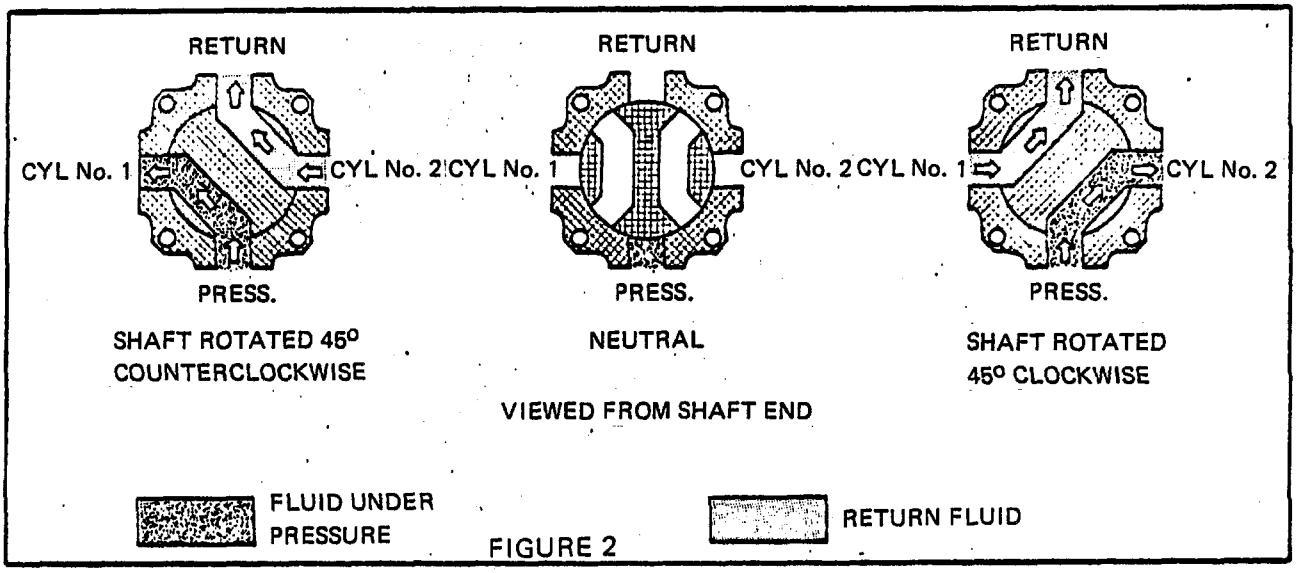

FIGURE 2

Optical flats on disc (17) and body (21) are critical surfaces. The slightest trace of foreign material lodging between these flats will cause valve to malfunction. As continued use tends to more perfectly mate these flats, disc (17) should always be replaced in the same valve body (21) from which it was removed.

c. If a vise is used to hold any part, be sure jaws are adequately padded.

4. INSPECTION, REPAIR AND REPLACEMENT

a. Inspect all parts for excessive wear or damage. Replace worn or damaged parts. Do not attempt repair of any part.

b. Inspect optical flats of disc (17) and body (21) under magnification, if possible. Damage to these surfaces will necessitate replacement of the entire valve.

c. Replace all "O" ring packings and back-up rings, regardless of condition.

5. LUBRICATION

a. System fluid provides adequate lubrication.

6. REASSEMBLY

a. Reassembly is the reverse of disassembly.

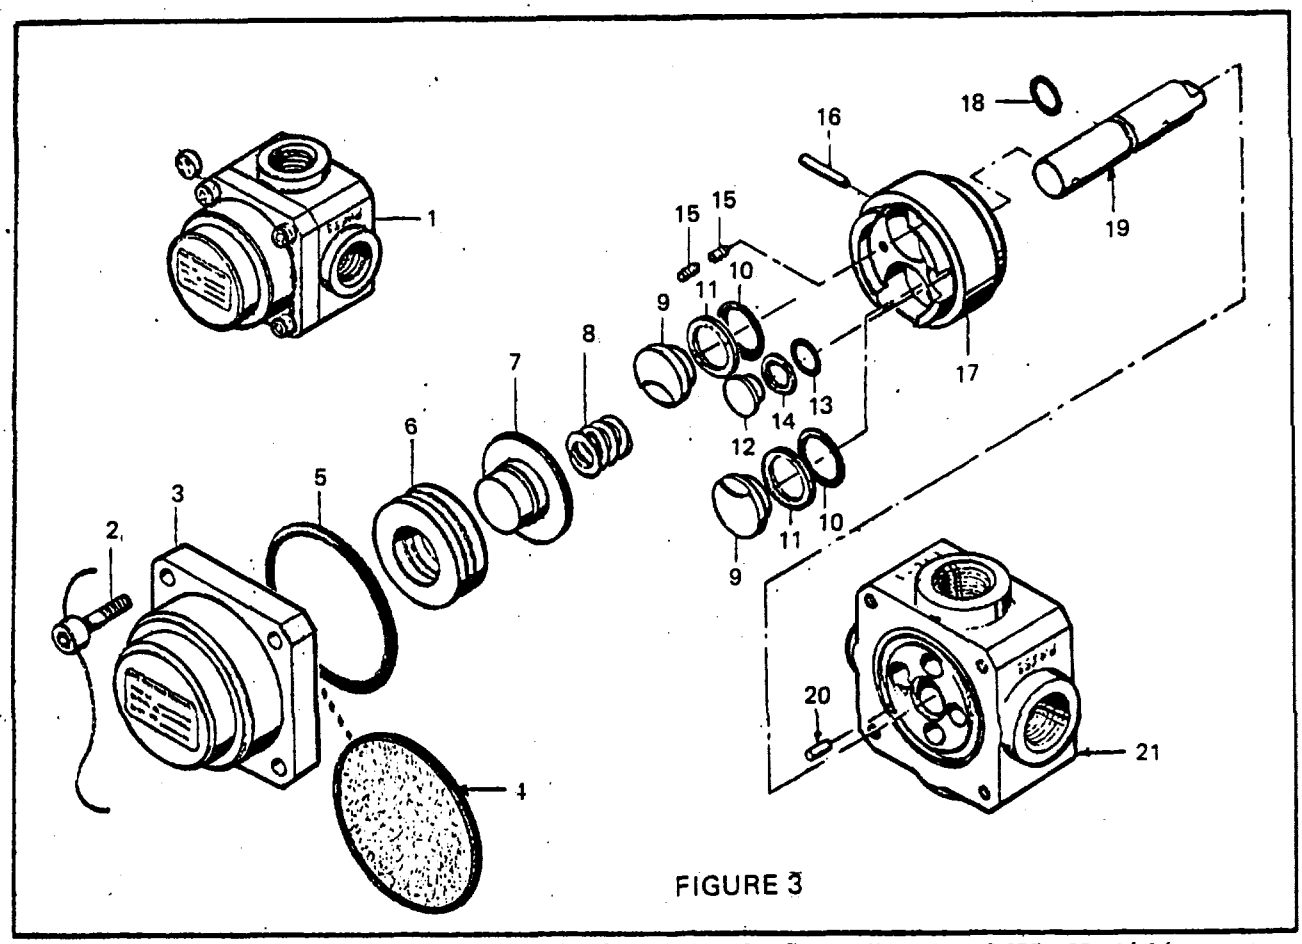

FIGURE 3

b. Moisten all parts with hydraulic oil, Specification MIL-H-5606, and assemble wet. Roll or rotate "O" ring packings to take out all twist.

c. Insert shims (4) as necessary to establish internal clearance of 0.003 to 0.006 inch.

Note

Flush valve thoroughly to remove air and wash out all foreign particles.

No external leakage allowed.

Check for external leakage at points 1 and 2

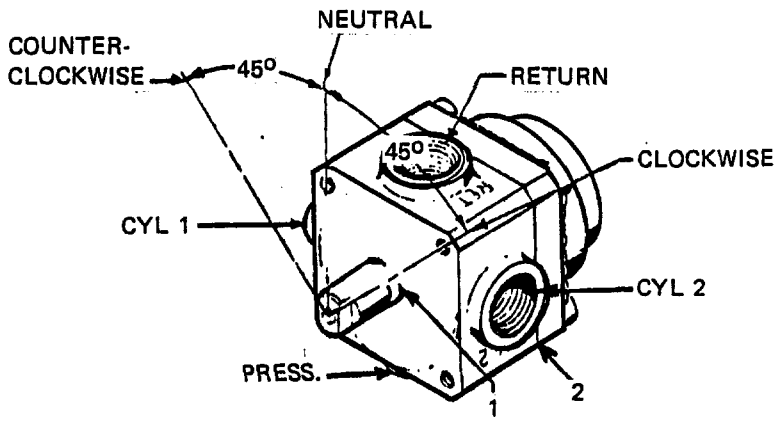

FIGURE 4

TEST PROCEDURES CHART

To Test	Apply Press. at	Plug	Valve Position	Test Press. (psi)	Max Internal Leakage	Remarks
Internal Leakage	Press.	Cyl 1 & Cyl 2	Neutral Counter-clockwise Clockwise	3000	1 drop per min.	Check for leakage at "Return" port in each handle position after waiting 2 min.
Handle Torque	Press.	Cyl 1 & Cyl 2	Counter-clockwise Clockwise	3000	-------	Max torque in either direction 20 in. lbs.
Internal Leakage	Cyl 1	Press. & Cyl 2	Counter-clockwise	3000	1 drop per min.	Check for leakage at "Return" port after waiting 2 min.
Internal Leakage	Cyl 2	Press. & Cyl 1	Clockwise	3000	1 drop per min.	Check for leakage at "Return" port after waiting 2 min.
External Leakage	Press.	Cyl 1 & Cyl 2	Neutral Counter-clockwise Clockwise	4500	-------	No external leakage allowed.
External Leakage	*Press. *Return	Cyl 1 & Cyl 2	Counter-clockwise Clockwise	4500 at press. port 1500 at return port	-------	No external leakage allowed.

*Test pressures as noted to be applied simultaneously for the test.
Note: Do not move handle when 4500 psi pressure is applied to valve for external leakage tests.

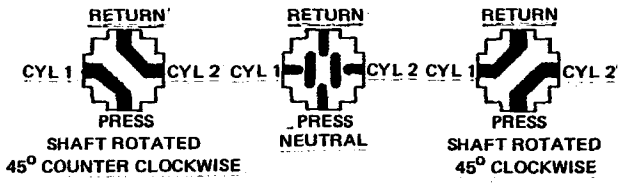
d. Before fully tightening screws (2), turn shaft several times to be sure bearing (6), retainer (7), spring (8) and plugs (9) are properly positioned.

7. TESTING (see Figure 4).

a. Tests must be conducted with filtered hydraulic preservative oil, Specification MIL-O-6083.

b. Valve must be thoroughly bled of air before applying test pressures.

c. Test pressures must be subject to accurate control up to 4500 psi.



d. Conduct tests in sequence shown in Test Procedure Chart.

e. If valve is not to be installed immediately, all ports must be plugged after test to exclude foreign matter.

INTRODUCTION

This manual contains instructions for the overhaul of the De Havilland Reservoir Assembly Part No. C6HF1005.

RESERVOIR ASSEMBLY PART NO. C6HF1005

1. Description and Operation

The reservoir assembly (Figure 1) consists of a welded aluminum alloy body assembly with a filler neck, two suction outlets, a return inlet, a vent, and an adapter ring. A screen and cap are provided at the filler neck, and a view gage is attached to the adapter ring.

2. Disassembly

A. Disassemble Reservoir Assembly (Figure 3)

(1) Remove nut (1), washer (2), screw (3) and unscrew cap (4) with chain assembly (5) from filler neck. Remove O-ring (6) and screen assembly (7) from filler neck.

(2) Do not remove four screws (8) securing view gage assembly (9) to adapter ring except when a replacement view gage assembly is required.

(3) Remove union (10) and gasket (11) from handpump suction boss. Loosen nut (12) and remove elbow (13), O-ring (14) and gasket (15) from suction boss. Loosen nut (16) and remove elbow (17), O-ring (18) and gasket (19) from return boss.

(4) If damaged, remove label (20), label (21) and/or label (22) from body assembly (23).

3. Cleaning

A. General

(1) Clean components by washing or spraying with a dry-cleaning solvent.

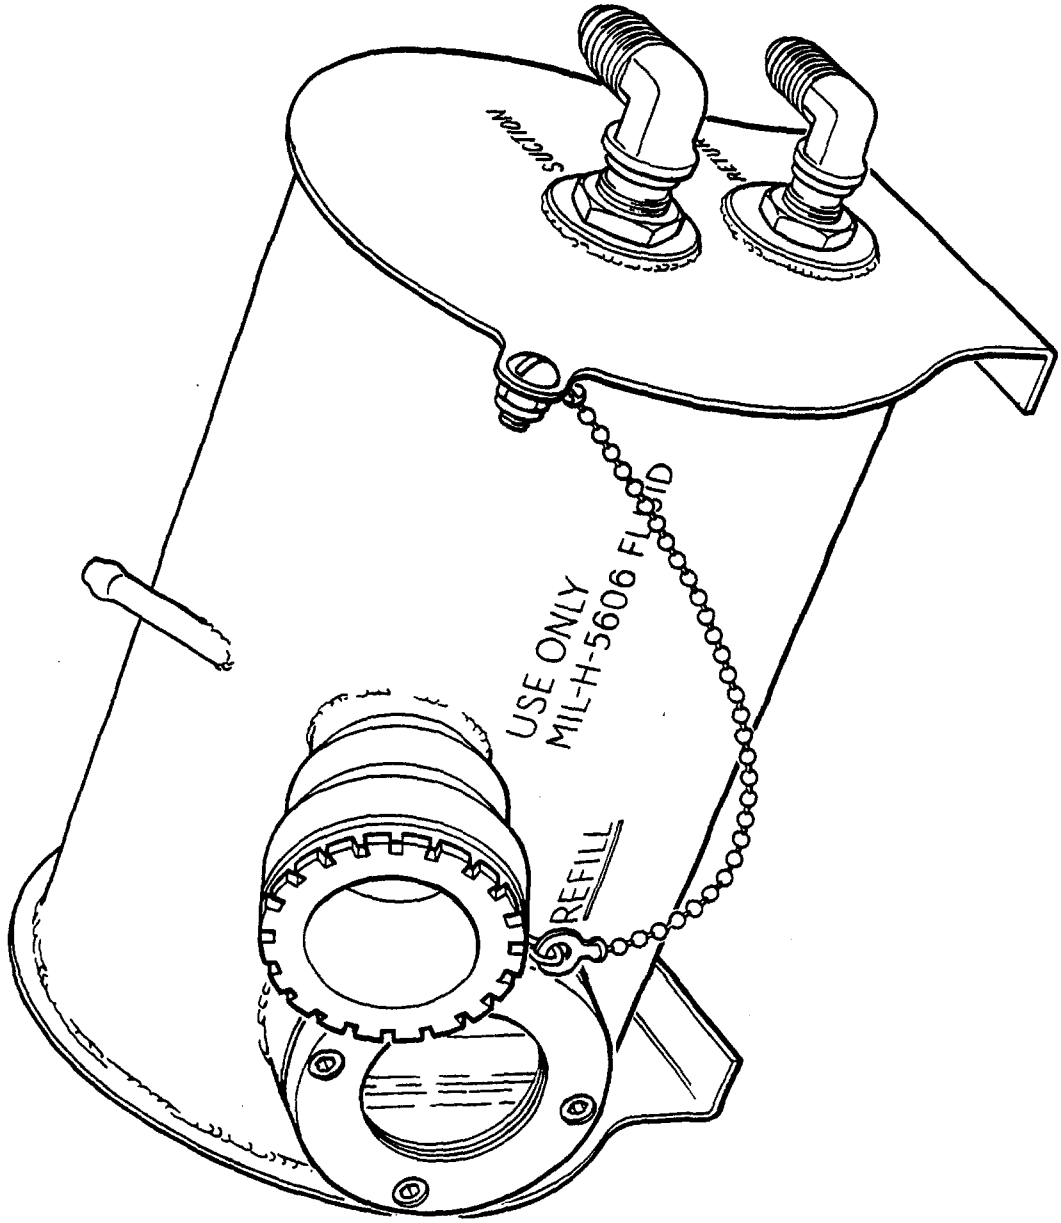
(2) Dry with moisture-free compressed air or a lint-free cloth.

4. Inspection/Check

A. General

(1) Inspect nonmagnetic metal components using the fluorescent penetrant method, or an approved dye penetrant method. Concentrate inspection of body assembly at welded seams and joints.

(2) Inspect all threads for damage and deformity.



(3) Inspect all parts visually for damage such as galls, scores, scratches, excessive wear and corrosion.

(4) Inspect view gage assembly window for discoloration and evidence of leaks.

5. Repair (Figure 3)

A. General

(1) Replace all defective parts.

Reservoir Assembly C6HF1005

Figure 1

(2) When anodized parts have had protective surface treatment damaged or removed, apply a protective coating of Alodine solution No. 1200S to affected area(s), or reanodize the part.

(3) Replace O-rings (6), (14), (18), and gaskets (11), (15), and (19) at each overhaul.

6. Assembly

A. Assemble Reservoir Assembly (Figure 3)

(1) If removed during disassembly, install new label (22), label (21), and/or label (20) to body assembly (23). Refer to Figure 2 for position of labels and cut to suit.

(2) Install gasket (19), O-ring (18), elbow (17) into return boss and secure in position with nut (16). Install gasket (15), O-ring (14), elbow (13), into suction boss, and secure in position with nut (12). Install gasket (11) and union (10) into handpump suction boss.

(3) If removed during disassembly, install new view gage assembly (9). Apply sealant (Titeseal No. 3, Radiator Spec. Co.) to mating surfaces of adapter ring, gasket (part of view gage assembly), and view gage assembly. Position view gage assembly on adapter ring and secure using four screws (8).

(4) Position screen assembly (7), install O-ring (6), and secure cap (4) with chain assembly (5) to filler neck. Secure chain assembly (5) to body assembly (23) using screw (3), washer (2) and nut (1).

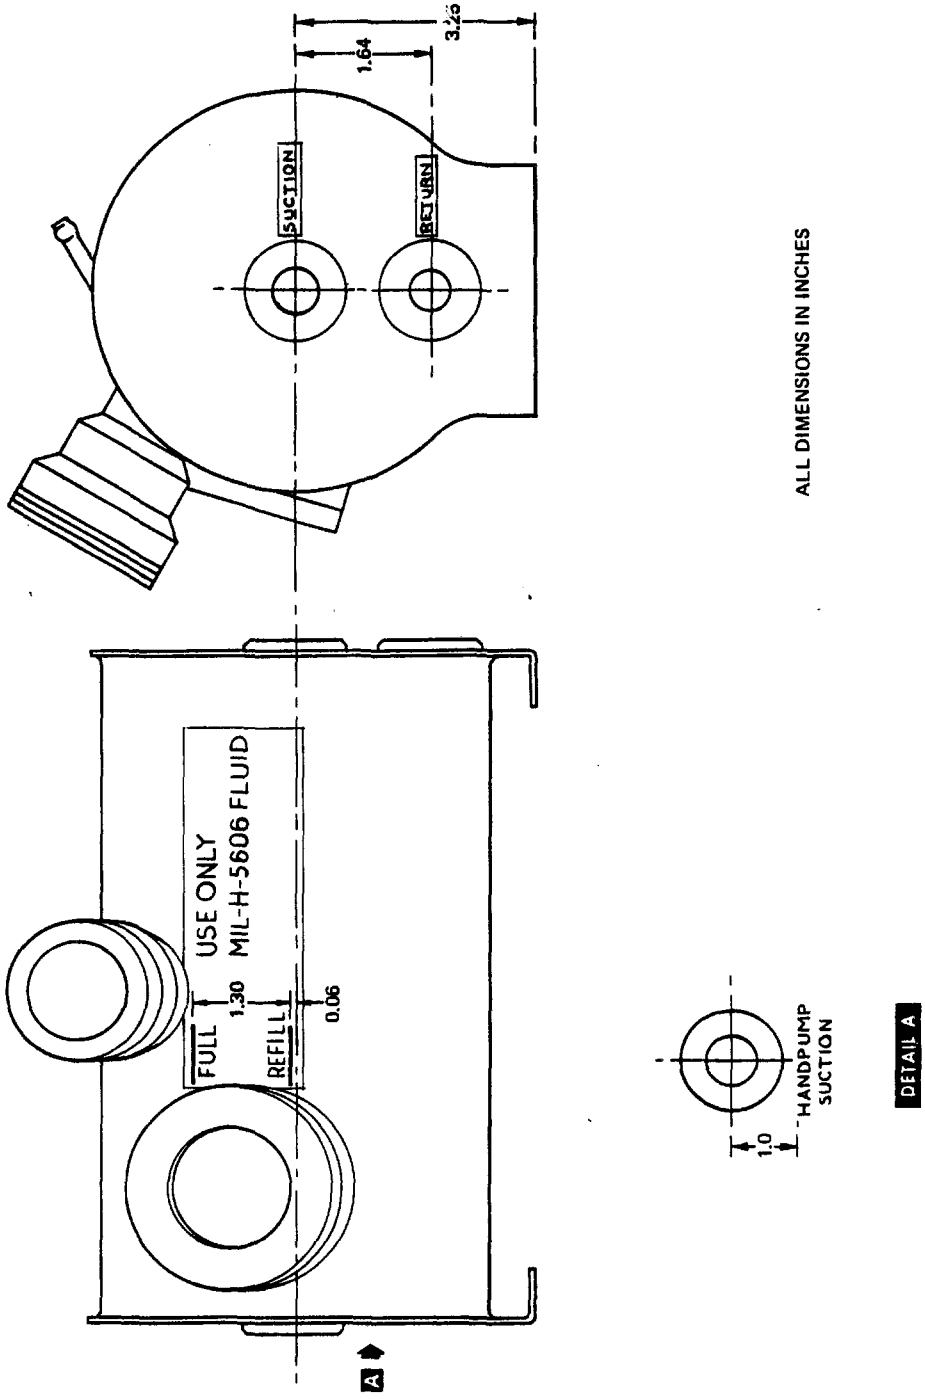
7. Fits and Clearances

Not Applicable

8. Testing

Insure cap is secure on filler neck. Cap handpump suction, suction, and return ports, and apply 6 to 10 psi air pressure at vent on body assembly. There should be no evidence of leakage or permanent deformation.

9. Trouble Shooting



Not Applicable

10. Storage Instructions

A. Preparation

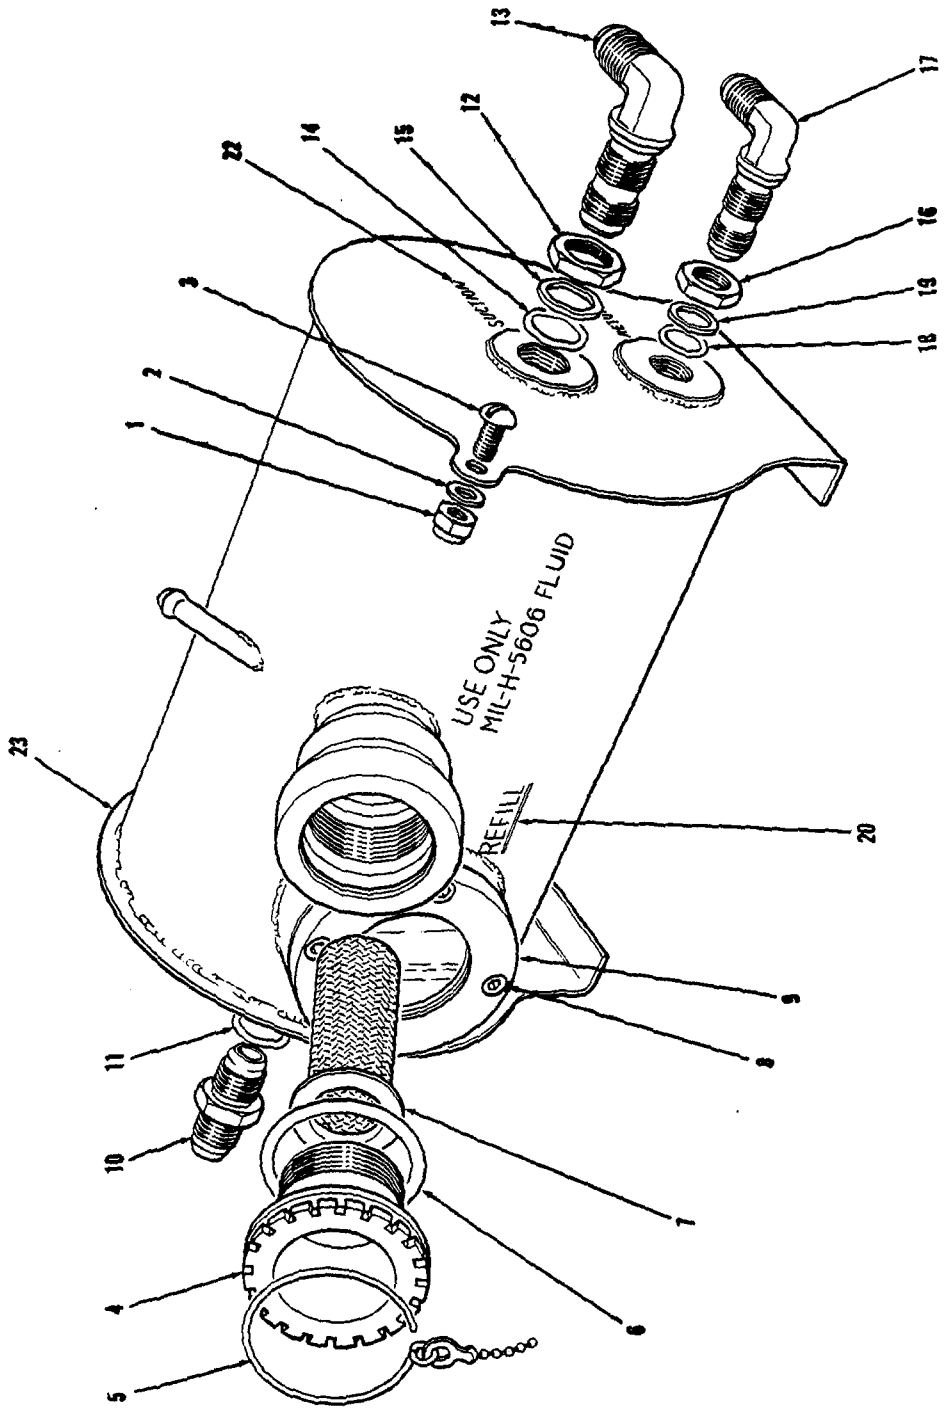
(1) Cap handpump suction, suction, and return ports. Insure cap on filler neck is secure. Seal vent on body assembly.

(2) Wrap reservoir assembly in water vapor resistant barrier material.

Body Assembly - Position of Labels

Figure 2

(3) Affix label giving following information:



(a) Part and serial number.

(b) Date of overhaul.

(c) Inspection.

11. Special Tools

No special tools are required.

INTRODUCTION

This manual contains instructions for the overhaul of De Havilland Reservoir Assembly Part No. C6HF1057.

RESERVOIR ASSEMBLY PART NO. C6HF1057

1. Description and Operation

The reservoir assembly (Figure 1) consists of a welded aluminum alloy body assembly with a filler neck, two suction outlets, a return inlet and a vent. A filter assembly and cap/dipstick assembly are provided at the filler neck.

2. Disassembly

A. Disassemble Reservoir Assembly (Figure 3)

(1) Cut and remove lockwire securing chain around filler neck, and remove cap/dipstick assembly (1). Remove filter assembly (2) from filler neck.

(2) Remove union (3) and gasket (4) from handpump suction boss. Loosen nut (5), and remove elbow (6), O-ring (7) and gasket (8) from suction boss. Loosen nut (9), and remove elbow (10), O-ring (11) and gasket (12) from return boss.

(3) If damaged, remove label (13), label (14), and/or label (15) from body assembly (16).

3. Cleaning

A. General

(1) Clean components by washing or spraying with a dry-cleaning solvent.

(2) Dry with moisture-free compressed air or a lint-free cloth.

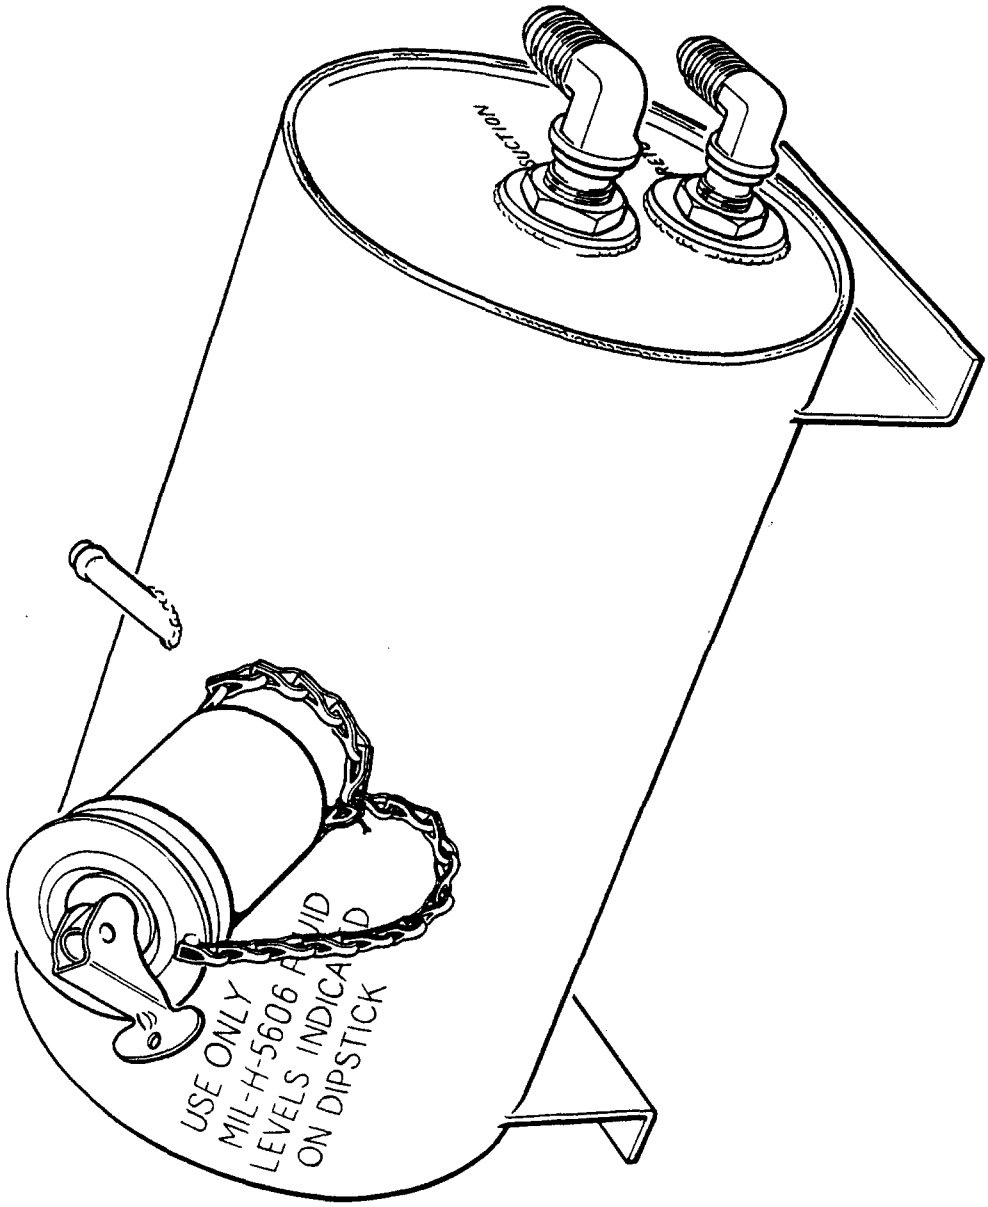
4. Inspection/Check

A. General

(1) Inspect non-magnetic metal components using the fluorescent penetrant method, or an approved dye penetrant method. Concentrate inspection of body assembly at welded seams and joints.

(2) Inspect all threads for damage and deformity.

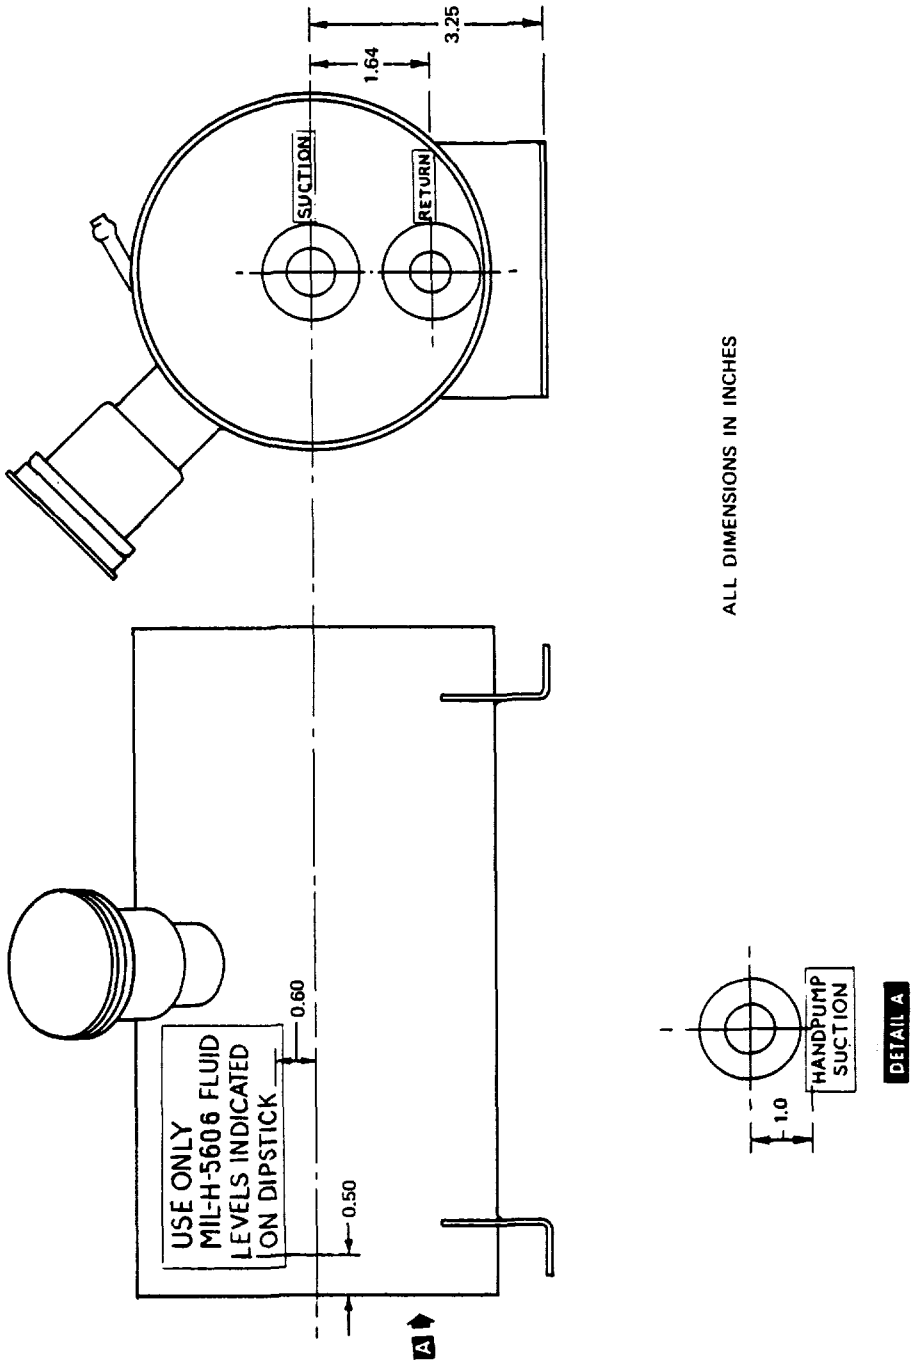
(3) Inspect all parts visually for damage such as galls, scores, scratches, excessive wear and corrosion.



5. Repair

A. General (Figure 3)

(1) Replace all defective parts.



(2) When anodized parts have had protective surface treatment damaged or removed, apply a protective coating of Alodine solution No. 1200S to affected area(s), or reanodize the part.

(3) Replace O-rings (7), (11), and gaskets (4), (8) and (12) at each overhaul.

Hydraulic Reservoir Part No. C6HF1057

Figure 1

Body Assembly - Position of Labels

Figure 2

6. Assembly

A. Assemble Reservoir Assembly (Figure 3)

(1) If removed during disassembly, install new label (15), label (14) and/or label (13) to body assembly (16). Refer to Figure 2 for position of labels and cut to suit.

(2) Install gasket (12), O-ring (11), elbow (10) into return boss, and secure in position with nut (9). Install gasket (8), O-ring (7), elbow (6) into suction boss, and secure in position with nut (5). Install gasket (4) and union (3) into handpump suction boss.

(3) Position filter assembly (2) in filler neck, and secure cap/dipstick assembly (1). Secure chain of cap/dipstick assembly around filler neck using lockwire MS20995-C32.

7. Fits and Clearances

Not Applicable

8. Testing

Insure cap/dipstick assembly is secure on filler neck. Cap handpump suction, suction, and return ports, and apply 6 to 10 psi air pressure at vent on body assembly. There should be no evidence of leakage or permanent deformation.

9. Trouble Shooting

Not Applicable

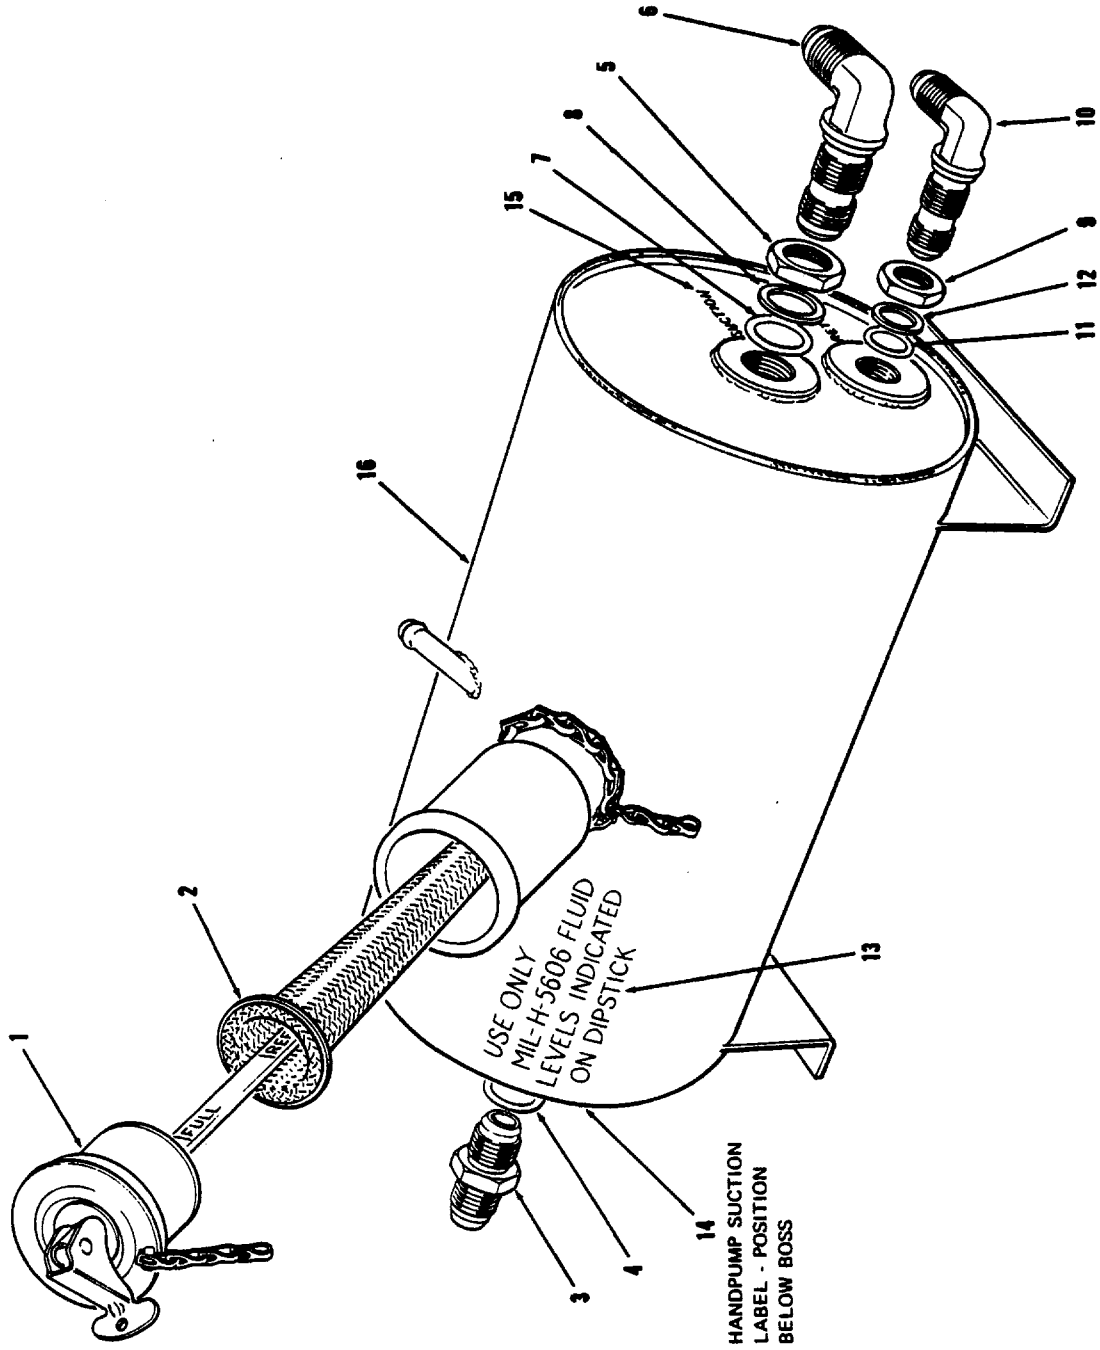
10. Storage Instructions

A. Preparation

(1) Cap handpump suction, suction, and return ports. Insure cap/dipstick assembly on filler neck is secure. Seal vent on body assembly.

(2) Wrap reservoir assembly in water vapor resistant barrier material.

(3) Affix label giving following information:



(a) Part and serial numbers.

(b) Date of overhaul.

(c) Inspection.

11. Special Tools

No special tools are required.

1. GENERAL

1.1 Valve and gauge assembly 12199 is intended for checking and refilling air receivers in pneumatic systems. It has a range of 0-5000 psi.

1-2. Valve and gauge assemblies 12040-1, 12056-1, 12057-1 and 12149 are intended for checking and refilling air preload pressure in hydraulic accumulators.

1-3. Each of the above units consists of a cylindrical housing having a rectangular mounting base and containing a pressure gauge sub-assembly and a standard high pressure charging valve.

2. OPERATING INSTRUCTIONS

2-1. Assembly 12199 is a constant reading unit and will indicate receiver pressure continuously.

2-2. Assemblies 12056-1, 12057-1, 12149 and 12040 are constant reading units and will indicate accumulator air preload pressure or hydraulic system pressure, whichever is greater.

2-3. When charging or discharging air through the high pressure valve (AN6287-1), the AN813-1 must be removed and the 5/8 hex swivel nut loosened approximately two turns. Charging may then proceed by attaching a coupling to the threads exposed by removal of the cap. Discharging involves depressing the internal pin exposed by removal of the cap. Following charging the 5/8 hex swivel nut must be tightened and the cap replaced and tightened.

CAUTION: REPEAT THE 5/8 HEX SWIVEL NUT MUST BE LOOSENED BEFORE ATTEMPTING TO DISCHARGE OR CHARGE THROUGH THE GAUGE ASSEMBLY.

3. INSTALLATION INSTRUCTIONS

3-1. Securing of the assembly to the aircraft is accomplished by means of the four mounting holes in the base of the body. These receive #10 bolts.

3-2. The only plumbing connection required is for the AND 10050-4 boss on the side of the housing. It will receive any fitting having a port corresponding to AND 10056-4 Style E or AND 10057-4 Style E.

4. MAINTENANCE INSTRUCTIONS

4-1. Maintenance of any of the above units between regular overhauls should neither be required or attempted.

5. REMOVAL INSTRUCTIONS

5-1. Before attempting to disconnect the line to the AND 10050-4 port in the housing, all air pressure must be discharged. (See 2.3 and Caution Note, above.)

5-2. Remove the fitting from the AND 10050-4 port.

5-3. Remove the four #10 mounting bolts.

6. OVERHAUL INSTRUCTIONS

6-1. Disassembly instructions

6-1-1. Unscrew the knurled bezel ring from the top of the assembly by hand.

6-1-2. Lift the glass and its gasket from the top of the housing. Discard the gasket.

6-1-3. Place the palm of one hand over the top of the housing, grasping the sides of the housing with the fingers of the same hand. Invert the housing and with the other hand remove the two #8 fillister head screws, their lockwashers and plain washers from the bottom of the housing.

6-1-4. While still holding the housing as described in 6-1-3, above, gently shake the housing until the gauge mechanism falls into the palm of the hand covering the top of the housing.

CAUTION: HANDLE THE GAUGE MECHANISM GENTLY AT ALL TIMES.

6-1-5. Using a thin plastic or wooden rod, remove the MS28782-1 teflon backup ring and the AN6227-1 rubber "O" ring from the bore in the bottom of the inside of the housing. Extreme caution must be observed to avoid scratching the inside of this bore. Discard the "O" ring and backup ring.

6-1-6. Cut and remove the lockwire which secures the AN6287-1 valve to the housing.

6-1-7. Using a 3/4 wrench, remove the AN6287-1 charging valve from the housing.

6-1-8. Remove and discard the 47A1562 "O" ring from the groove in in the base of the AN6287-1 valve.

CAUTION: CARBON TETRACHLORIDE IS NOT TO BE USED IN CLEANING ANY PARTS OF THESE UNITS, OR THE ASSEMBLED UNITS.

6-2. Inspection and Disposition Instructions

6-2-1. Visually inspect the housing for the following and observe the parenthetical disposition instructions.

6-2-1-1. Torn or crossed threads (Discard the housing.)

6-2-1-2. Scratched "O" ring bore in bottom of housing base (Discard the housing.)

6-2-1-3. Scratched countersink or counterbore at entrance of AND 10050-4 boss (Polish to remove scratches.)

6-2-1-4. Anodized surface broken or scratched, other than as described in 6-2-1-1 or 6-2-1-2, above, (Touch up with alodine or iridite.)

6-2-2. Withdraw new AN6227-1 and 47A1562 "O" rings from stock. With the aid of a magnifier, inspect these rings for cuts, nicks, mold marks, feathers or other flaws. (Discard if any of these defects are present.)

6-2-3. Withdraw new MS28782-1 backup rings from stock. With the aid of a magnifier, inspect these rings for feathers, curlings or other flaws. (Discard if any of these defects are present.)

6-2-4. Visually examine the external surface of the small cylindrical protrusion at the bottom of the gauge assembly for sharp edges, nicks, and scratches. (Polish sharp edges, discard the assembly if the surface is scratched.)

6-2-5. Examine the bezel ring for torn or crossed threads and flaked or chipped chrome plating. (Discard if any of these defects are present.)

6-2-6. Examine the glass for chipped or cracked surfaces. (Discard if any of these defects are present.)

6-2-7. In addition to the above, all parts should be examined for foreign matter. Metallic parts may be cleaned by submersion in naptha or methyl-alcohol and air dried. Prior to immersing the gauge mechanism in the solvent, the small port hole in the bottom of the mechanism should be plugged. After immersion, the mechanism should be dried by static ex-

posure to air - do not expedite evaporation by blowing shop air through the mechanism.

6-3. Assembly

6-3-1. Apply a thin film of MIL-G-4343 silicone grease to the 47A1562 "O" ring and the threads of the AN6287-1 valve.

6-3-2. Insert the 47A1562 "O" ring in the groove of the AN6287-1 valve and install the valve firmly in the housing.

6-3-3. Lockwire the valve to the housing.

6-3-4. Apply a thin film of MIL-G-4343 silicone grease to the AN6227-1 "O" ring.

6-3-5. Insert the AN6227-1 "O" ring in the small bore in the bottom of the inside of the housing. Bottom the "O" ring in the bore, using a small plastic or wooden rod. Make certain that the "O" ring is not twisted or spiralled.

6-3-6. Insert the MS28782-1 back up ring in the bore on top of the "O" ring.

6-3-7. Apply a thin film of MIL-G-4343 silicone grease to the base of the gauge mechanism.

6-3-8. Gently insert the mechanism in the housing by applying pressure to the heads of the two small screws which hold the dial to the mechanism, gently center the mechanism in the housing until the protrusion on the base of the mechanism engages the backup ring and "O" ring in the base of the housing. Then apply further pressure to the two small screws to bring the base of the mechanism to rest against the housing. Do not apply pressure to any other part of the dial.

6-3-9. Place a lock washer and then a plain washer on each of the two #8 screws.

6-3-10. Holding the mechanism in place with the fingers of one hand, invert the housing. Rotate the mechanism in the housing until the two #8 threaded holes in the mechanism are aligned with the two #8 clearance holes in the bottom of the housing.

6-3-11. Insert and tighten the two #8 screws with their washers and lockwashers.

6-3-12. Place a new 10143 gasket on top of the housing.

6-3-13. Place the glass on top of the gasket and install and hand tighten the bezel ring.

7. PRODUCTION TEST AND ADJUSTMENT INSTRUCTIONS

CAUTION: FOR P/N 12199 NITROGEN OR AIR MUST BE USED AS THE TEST MEDIUM. OIL MUST NOT BE USED.

7-1. Remove the bezel ring, glass and gasket from the top of the assembly.

7-2. For P/N 12199 apply nitrogen or air pressure to the AND 10050-4 port. Pressure should be increased gradually and maintained at each of the check points noted on Table I for comparison with a standard gauge of known accuracy which is connected in parallel with the 12199 assembly. Readings at each check point must fall within the limits shown on Table I. Following the initial reading at each check point, the 12199 assembly should then be tapped gently and the error again determined. The accuracy limits of Table I must again be maintained.

7-3. When a highest check point pressure is reached, the gauge should be immersed in naptha, methyl alcohol or distilled water, and external leakage checked for a two minute period. If external leakage is noted, the assembly should be returned for Overhaul per 6, above, for replacement of "O" rings and examination of "O" ring sealing areas.

7-4. If no leakage is observed, pressure should be gradually reduced and readings checked per 7-2, above, at each of the check points. Accuracy limits shall again be per Table 1.

7-5. If the calibration test of 7-3 and 7-4 above, reveals any constant error (whether within tolerance or not) the pointer should be removed with a gauge pointer remover. Apply pressure of 2/5 of the range of the assembly as noted by the standard gauge, set the pointer at the exact correct pressure on the assembly and press it on the shaft.

7-6. If the calibration test of 7-2 and 7-4, above, reveals an unacceptable error which increases with increase in pressure, remove the pointer with a gauge pointer remover. Then remove the dial by removing the two small screws in the face of the dial. Loosen, but do not remove the adjustment screw which secures the link to the sector lever. Move the adjustment screw away from the center of the mechanism, thus lengthening the effective length of the lever. Tighten the adjustment screw, replace the dial and pointer and re-run the test.

7-7. If the calibration test of 7-2 and 7-4, above, reveals an unacceptable error which decreases with increased pressure follow the procedure of 7-6, above, with the exception that the adjustment screw should be moved toward the center of the mechanism, thus shortening the effective length of the lever.

7-8. After test, the moisture adhering to the unit as a result of the immersion during 7-3, above should be permitted to evaporate before the glass is replaced. This may be expedited by placing the assembly in a vacuum chamber, but not by blowing compressed air between the dial and the housing.

7-9. After drying, replace the gasket, glass and bezel, securing the bezel by hand.

7-10. The test and adjustment procedures for 12040, 12056-1, 12057-1 and 12149 are identical to those outlined above with the following exceptions:

7-10-1. Hydraulic oil pressure as supplied by a dead weight calibrator or hydraulic test stand may be used in lieu of air pressure for calibration tests (7-2 & 7-4, above). Air or nitrogen may be used if desired, however, (high pressure leakage (7-3, above) should be performed with nitrogen if oil is used for calibration.)

7-10-2. Test pressure check points and tolerances as shown on the following tables should apply.

12040	Table I
12056-1	Table II
12057-1-3	Table III

INSTRUCTION MANUAL WITH PARTS LIST

MODEL 100-689-3

ELECTRIC MOTOR DRIVEN HYDRAULIC PUMP

TABLE I LEADING PARTICULARS

TYPE	Electric Motor Driven Hydraulic
FLUID	Specification MIL-O-5606
CAPACITY	0.5 gpm at 1500 psi discharge pressure
VOLTAGE	27 Volts DC
AMPERAGE	33 amperes maximum
MOTOR RATING	0.7 H.P. at 26 volts DC. 6000 rpm
MOTOR MODEL	A9373M1 Delco Products Division, General Motors Corp., Dayton, Ohio
DUTY CYCLE	Continuous
OVERHAUL CYCLE	500 hours minimum at continuous duty rating
PUMP ROTATION	Counter-Clockwise facing drive end
MOTOR ROTATION	Clockwise facing drive end
AMBIENT TEMPERATURE RANGE	-65° F to +165° F
WEIGHT	7.9 pounds

1. SPECIAL TOOLS.
a. None.

2. DISASSEMBLY.
a. Disassemble in the same order as the key index numbers assigned to the exploded view illustration, Figure 1.
b. Disassembly of the electric motor is not covered in this Handbook. See applicable instructions for motor overhaul.

3. CLEANING.
a. Wash all parts except motor in dry cleaning solvent, Federal Specification P-S-661, and dry with filtered compressed air.

4. INSPECTION.
a. Inspect gears visually for worn or chipped teeth, journals for wear in excess of tolerances shown in Table II, and gear faces for taper.
b. Inspect bearing blocks for scored or worn rollers and gear seating faces. Check all rollers for free turning.
c. Inspect seal faces of retainer for scoring.
d. Inspect coupling and drive gear splines visually for wear. Replace parts if wear is excessive.
e. Inspect all threads for damage.
f. Measure body bore wear or scoring using a dial indicator.

5. REPAIR OR REPLACEMENT.
a. Replace all gaskets and "O" rings at each overhaul.
b. Replace seal seat at each overhaul.
c. Replace bearing block assemblies if rollers are scored, worn, or do not turn freely.

GREAT LAKES MANUFACTURING DIVISION
GENERAL METALS CORPORATION
4223 MONTICELLO BOULEVARD
CLEVELAND, OHIO 44121

d. Refinish bearing block faces within dimensions shown in Table II to clean up gear wear or scoring. Hold surface finish to ten micro-inches.
e. Refinish gear journals, if scored or worn, to dimension shown in Table II. Hold surface finish to six micro-inches.
f. Refinish gear faces, if scored or tapered, to dimension shown in Table II. Gear faces must be parallel within .001 inches total indicator reading and optically flat within six light bands.
g. Refinish seal face of retainer to remove all scoring or scratches. Face must be optically flat within two light bands. A surface finish of two micro-inches is desirable.

6. LUBRICATION.
a. No lubrication is required.

7. REASSEMBLY. (See Figure 1.)
a. Reassembly is the reverse of disassembly.
b. Assemble bearing block assemblies (25) with trapping grooves toward outlet side.
c. Position piston (19) in cover (16) with flat side toward outlet port.
d. After tightening seal retainer assembly (6), stake metal from flange (14) into retainer slots (two places to lock).

8. TEST PROCEDURE.
a. Seal drain port shall be open for all tests.

NOTE

Do not operate emergency pump more than 10 minutes under load.

b. Connect inlet port of pump to reservoir outlet. Connect outlet port to a flowmeter with a gage and shut off valve in the line. Connect motor to DC power source in test bench. Close valve in outlet line and pressurize reservoir to apply 2 psi at pump inlet. There shall be no external leakage and seal drain shall not exceed the rate of 1 drop in 12 minutes with the pump in a static condition.

TABLE II - PERMISSIBLE TOLERANCES

PART	NEW DIMENSION		PERMISSIBLE WORN DIMENSION	NEW CLEARANCE		WORN CLEARANCE
	max	min		max	min	max
Gear Journal	0.3751	0.3748	0.3743			
Gear Thickness	0.1000	0.0995	0.0990	Thickness of gears must be equal within 0.0002 inches.		
Gear Tooth Dia.	0.8120	0.8115	0.8110	0.0003	0.0013	0.0008
Body Bore	0.8128	0.8123	0.8135			
Bearing Block Thickness	0.460	0.455	0.450			

TABLE III - TROUBLE SHOOTING

TROUBLE	PROBABLE CAUSE	REMEDY
Seal Leak	Defective seat assembly	Replace.
	Defective seal face in retainer assembly.	Repair or Replace. See Paragraph 5g.
Low Capacity	Excessive gear clearance.	Replace gears or body as necessary to obtain clearance shown in Table II.
	Piston not seating properly on bearing block.	Position per Paragraph 7c.
	Low voltage	Check power supply.
	Gears not seating against bearing blocks	Check bearing blocks and gears. Sides must be flat and parallel.
	Defective "O" rings on bearing blocks.	Replace.

c. Open valve in outlet line. Energize pump motor and restrict outlet pressure to 1500 psi. Regulate pump inlet pressure to "0" psig. Allow pump and motor to operate in this condition for 3 minutes. During the last 1/2 minute of the 3 minutes run, observe flow and amperage drain. The flow shall be 0.5 gpm minimum and amperage drain shall not exceed 33 amps. Seal drain leakage shall not exceed an equivalent rate of 5 cc/hr. (5 drops in 3 minutes) while pump is operating.

d. Energize pump motor with 27 plus or minus .5 volts DC input and restrict "Outlet" pressure to 1500 psi. Pressurize reservoir to apply 26.7 psia at pump "Inlet". There shall be no external leakage and seal drain leakage shall not exceed the rate of 2 drops per minute.

e. Relieve pressure. Remove pump from test bench. Do not drain oil from pump. Cap ports and plug seal drain port.

MODEL 100-689-4
ELECTRIC MOTOR DRIVEN HYDRAULIC PUMP

The manufacturer of the hydraulic pump has changed the motor from a Delco to a Delaval unit 4100-689004. The hydraulic pump itself is unchanged. The new motor is identical and the parts completely interchangeable with those of the Delco. The following is a cross reference to these part numbers:

SERVICE BULLETIN

MODEL 100-689-4

ELECTRIC MOTOR DRIVEN HYDRAULIC PUMP

OVERHAUL IMPROVEMENT - REPLACEMENT PARTS

1. PLANNING INFORMATION:

A. EFFECTIVITY:

All: Delaval Part Number 100-689-4

B. Reason: Internal parts of pump assembly must be matched to pump body for proper performance. Spare parts are now procurable in matched sets only.

C. Description: This Bulletin provides data to buying and overhaul activities for proper parts to be used in repair of effected assemblies.

D. Approval: FAA Approval not applicable.

E. Manpower: This change may save up to 100% in overhaul time.

F. Materials: Parts identified below may be obtained from:
Delaval Special Products Division
Delaval Turbine Inc.
4223 Monticello Blvd.
Cleveland, Ohio 44121 U.S.A.

PART NUMBER	NOMENCLATURE
217-083	Gear Housing & Bearing Assembly

2. ACCOMPLISHMENT INFORMATION:

A. Parts are precision machined in matched sets to assure proper performance. During assembly operations,care must be exercised to assure that similar parts of prior manufacture do not become mixed.

B. Orientation of Bearings in Body must be maintained.

3. MATERIAL INFORMATION:

A. P/N 217-083 Assembly replaces separate items. P/N 204-461 Body; 204-260 Dowel; 204-457 Bearing Block (2).

4. ACTION

Insert this Service Bulletin in Chapter 29 of PSM 1-63-6 immediately before the Manual for Model 100-689-4 Electric Motor Driven Hydraulic Pump.

W-106-1-13	W-106-1-13	Clamp Fixture, Bench	To hold accumulator during overhaul.
X-106-1-13-1	X-106-1-13-2	Blocks, Clamp Fixture	To hold accumulator during overhaul.

Figure 2. Table of Special Tools

1. SPECIAL TOOLS.

Special tools required for overhaul of these accumulators are listed in Figure 2, Table of Special Tools.

2. DISASSEMBLY.

Note

Before removing half mounting rings, note method of lock-wiring for reference during reassembly.

a. Remove lock wire that secures half mounting rings (1, Figure 6) to shell (13) and end caps (2 and 3); remove mounting rings.

b. Install accumulator in a suitable holding device equivalent to special tools, Bench Clamp Fixture, Part Number W-106-1-13, with Clamp Fixture Blocks, Part Number X-106-1-13-1 or X-106-1-13-2. (Refer to Figure 2.) Use End Cap Assembly Wrench, Part Number Y-106-1-16, during removal of end caps (2 and 3, Figure 6). Disassemble in the sequence of index numbers assigned to the exploded view illustration. If the identification band (12) is removed, it must be kept with the unit from which it was taken; it bears the serial number and part number.

CAUTION

The holding device should be such that it encases with nearly equal tightness the entire circumference of the accumulator shell. Uneven tightness such as vise jaws will distort the shell.

Note

Many repair parts for equipment covered in this publication are provided in the form of kits. See Parts Breakdown for details. Presence of a new part in the applicable kit eliminates the necessity of cleaning, inspecting, or reworking the equivalent used part removed from the assembly being repaired; therefore such instructions have been omitted from this manual. Activities shall replace all parts (regardless of condition) which are removed in the process of disassembly with all like parts furnished in the kit. If an installed part is not defective, it need not be removed solely for the purpose of replacement by a corresponding kitted part. Residue from kits and removed parts in this category shall be administratively condemned. The instructions which follow cover removed parts not supplied in kits and kitted parts (if any) which require cleaning, inspecting, or testing prior to installation.

3. CLEANING.

a. Clean all metal parts in cleaning solvent, Federal Specification P-S-661. Dry thoroughly after cleaning with filtered, compressed air.

4. INSPECTION.

a. Inspect ID of shell (13, Figure 6) and OD of piston (10) for scratches, burrs, or other damage affecting free sliding action of the piston in the shell. Inspect the shell, piston, retainers (4), and end caps (2 and 3) for cracks, deformation, or any other structural damage. Check threads for good condition.

b. Conduct non-destructive inspections outlined in Figure 3.

c. Proper fit of piston (10, Figure 6) in shell (13) is determined by test; there are no wear points to measure.

5. REPAIR OR REPLACEMENT.

a. Replace damaged parts unless minor repair will restore to serviceability. Do not attempt repair of the ID of the shell (13, Figure 6), as low spots can affect operation.

b. Replace backup rings (7), packings (6 and 8), and alining rings (9) at each overhaul regardless of condition.

PART IDENTIFICATION			TYPE OF NON-DESTRUCTIVE TEST	TEST PROCEDURE	ACCEPTABLE LIMITS
NAME	USED ON ACCUMULATOR PART NO.	PART NO.			
Hydraulic and Gas End Caps	1356-583314 and 1356-583315	1456-593843 and 1456-593844	Fluorescent Penetrant Inspection (per Military Specification MIL-I-6866)	Check for imperfections per Military Specification MIL-I-6866	Minor surface defects not detrimental to parts strength and serviceability
	1356-583317	1456-593846 and 1456-593845			
Shell	1356-583314	1456-537504	Magnetic Particle Inspection (per Military Specification MIL-I-6868)	Check for imperfections per Military Specification MIL-I-6868	Minor surface defects not detrimental to parts strength and serviceability
	1356-583315	1456-593837			
	1356-583317	1456-593839			

Figure 3. Table of Non-Destructive Inspection for Non-Kitted Parts

6. LUBRICATION.

a. Apply a light coating of hydraulic fluid (refer to the applicable test fluid as specified in paragraph 8) to ID of shell (13, Figure 6), to ring grooves of piston (10) and caps (2 and 3), to packings (6 and 8), and to threads of shell to facilitate assembly.

7. REASSEMBLY.

a. Reassembly is the reverse of disassembly except as noted below. Use Bench Clamp Fixture, Part Number W-106-1-13, with Clamp Fixture Blocks, Part Number X-106-1-13-1 or X-106-1-13-2, to hold the shell during reassembly. (Refer to Figure 2.) It is vital that all parts be completely clean. Check each part before installing it. Install new packing (6, Figure 6), with a backup ring (7) at each side of it, into center groove of piston (10). Install one alining ring (9) in each outer groove of piston (10).

CAUTION

Check the assembly of piston, packings, backup rings, and alining rings to assure that each is in its proper location as shown in Figure 4.

b. Carefully insert the assembled piston into the shell (13, Figure 6) using Tapered Sleeve, Part Number X-106-1-10 or X-106-1-11. (Refer to Figure 2.)

c. Install a Retainer Guide, Part Number X-106-1-7 or X-106-1-8, into each end cap to assure alinement during assembly of packings (6, Figure 6) and retainers (4). Tighten screws (5) so that retainers bottom against end caps while a 0.010-inch thick gage (or shim) is held between the retainer and the underside of the screw heads. Lock-wire screws using MS20995C20 wire and remove special tools and gages. If properly assembled, expansion of packings will keep retainers against screw heads, leaving a 0.010-inch gap (maximum) between retainers and end cap. If it is necessary to reposition screws for alining lock wire holes, tighten screws to obtain proper position.

d. Carefully screw the shell (13) into the end caps (2 and 3), making sure that the face of piston (10) is toward hydraulic end cap (2), until metal-to-metal contact at bottom is obtained. Hold the accumulator by the flats on one end cap and tighten the other to 1400 to 1500 pound-inches torque using Bench Clamp Fixture, Part Number W-106-1-13; Clamp Fixture Blocks, Part Number X-106-1-13-1

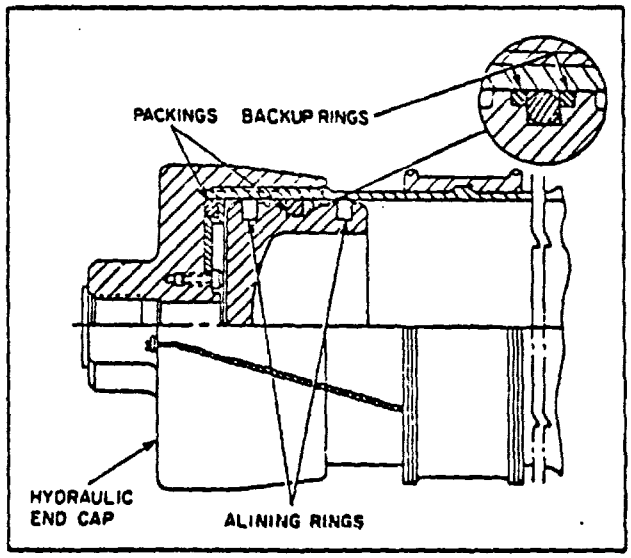

Figure 4. Sectional View of Hydraulic Accumulator

or X-106-1-13-2; and End Cap Assembly Wrench, Part Number Y-106-1-16. (Refer to Figure 2.)

c. Position the half mounting rings (1, Figure 6) over the circumferential ribs nearest the ends of the shell, with the ring inside slots straddling the small slots in the ribs. Lock-wire the half mounting rings to the shell as noted at disassembly. Use lock wire MS20995C32.

f. Check that identification band (12) is in place on the shell. If a new identification band is installed, transfer all identification data from old band.

8. TEST PROCEDURE.

WARNING

Nitrogen (or dry air) is under pressure during the following tests; exercise extreme caution when performing tests.

CAUTION

This accumulator is designed for use with hydraulic fluid, Military Specification MIL-H-5606, or preservative fluid, Military Specification MIL-H-6083. Tests should be performed using the fluid for the system in which the accumulator is to be installed, if known, to prevent contamination of the system. Tag the accumulator after test to identify the type fluid used for testing.

a. PREPARATION FOR TESTING. Provide a source of nitrogen (or dry air) capable of supplying pressures from 0 to 3000 PSIG. The nitrogen (or dry air) shall be continuously filtered through a 10-micron, or finer, filter.

b. Provide a source of hydraulic fluid capable of supplying controlled pressures from 0 to 6000 PSIG. The hydraulic fluid shall be continuously filtered through a 10-micron, or finer, filter.

Note

Use nitrogen (or dry air) and hydraulic fluid, Military Specification MIL-H-5606 or MIL-H-6083, to perform the tests described in the following paragraphs.

c. PISTON SEIZURE TEST. Determine the position of the piston (10, Figure 6) with respect to the end caps (2 and 3); connect the pressure source (nitrogen, dry air, or hydraulic fluid) to the end cap (2 or 3) nearest to the piston (10).

d. Slowly apply pressure, not in excess of 50 PSIG, to the accumulator until the piston (10) moves the entire length of the shell (13). There shall be no evidence of seizing or binding.

e. Connect the pressure source to the opposite end cap of the accumulator and repeat the procedure outlined in paragraph 8d, moving the piston (10) in the opposite direction.

f. Repeat the procedures outlined in paragraphs 8c through 8e. If more than 50 PSIG pressure is required to move the piston (10) during any part of the test, an improper fit or damage to surfaces is indicated.

g. After completion of test, connect pressure source to the end cap nearest the piston (10) and apply pressure to move the piston (10) to the approximate center of the shell (13).

Note

Do not actuate the piston (10) manually.

h. PROOF PRESSURE TEST. With the accumulator piston (10) positioned in the approximate center of the shell (13) (refer to paragraph 8g), fill the hydraulic end and gas end of the accumulator with hydraulic fluid. Plug one of the end cap ports and connect the other to the hydraulic fluid source with a pressure gage capable of indicating pressure from 0 to 6500 PSI.

WARNING

Be certain that all air is removed from the accumulator and connecting lines and that connections and plugs used are capable of withstanding 6250 PSIG pressure.

i. Apply 6000 to 6250 PSIG hydraulic pressure and hold for 5 minutes. There shall be no external leakage, evidence of damage, or deformation.

CAUTION

At the conclusion of the proof pressure test, hold the accumulator by the flats on one end cap while tightening the other to 1400 to 1500 pound-inches torque. Use Bench Clamp Fixture, Part Number W-106-1-13; Clamp Fixture Blocks, Part Number X-106-1-13-1 or X-106-1-13-2; and End Cap Assembly Wrench, Part Number Y-106-1-16. (Refer to Figure 2.)

j. *INTERNAL GAS LEAKAGE TEST. Connect a* nitrogen (or dry air) source to the accumulator at the gas end cap (3, Figure 6) and slowly apply pressure until the piston (10) bottoms lightly against the hydraulic end cap (2).

k. Connect the port of the hydraulic end cap (2) to a setup to measure leakage in an inverted glass graduate or a U-tube arrangement.

l. Apply 175 to 225 PSIG pressure to the gas end cap (3) port. Maintain pressure for 3 minutes

PART NUMBER	MAX LEAKAGE
1356-583314 and 1356-583315	0.1 milliliter free air
1356-583317	0.15 milliliter free air

Figure 5. Table of Internal Leakage Limits

and measure leakage. Leakage shall not exceed limits shown in Figure 5, Table of Internal Leakage Limits.

m. Increase the pressure to 1900 to 2100 PSIG. Maintain pressure for 3 minutes and measure leakage. Leakage shall not exceed limits shown in Figure 5, Table of Internal Leakage Limits.

n. EXTERNAL GAS LEAKAGE TEST. Connect nitrogen (or dry air) source to the accumulator hydraulic and gas ports.

o. Submerge the accumulator in water.

CAUTION

Exercise care to prevent water from entering and making contact with an internal surface of the accumulator by applying gas pressure prior to submersion and maintaining until after submersion.

p. Apply 175 to 225 PSIG pressure to the hydraulic and gas ports simultaneously. Maintain pressure for 5 minutes while observing water for evidence of leakage as indicated by air bubbles. There shall be no evidence of external leakage. Allow escape of trapped air before starting 5-minute test period.

q. Increase the pressure to 2900 to 3100 PSIG and maintain pressure for 5 minutes while again observing for evidence of leakage. There shall be no evidence of external leakage. Ignore the escape of trapped air during pressure rise.

r. TROUBLESHOOTING. Since there are no adjustments to be made, units that fail the tests outlined in paragraphs 8c through 8q must be rejected and returned to overhaul for diassembly, inspection, and replacement of defective parts. Then reassemble and retest.

s. STORAGE INSTRUCTIONS. After completion of testing, drain accumulator of excess hydraulic fluid; then install protective plugs in the hydraulic end cap (2) and gas end cap (3). Lock-wire the end caps to the shell using lock wire MS20995C32.

t. Tag the accumulator to identify the hydraulic fluid (Military Specification MIL-H-5606 or MIL-H-6083) with which it has been tested.

u. Mark assembly date on identification band (12) in accordance with ANA Bulletin 438. Use a permanent etching ink.

v. Wrap accumulator in waterproof paper prior to storing or shipping.

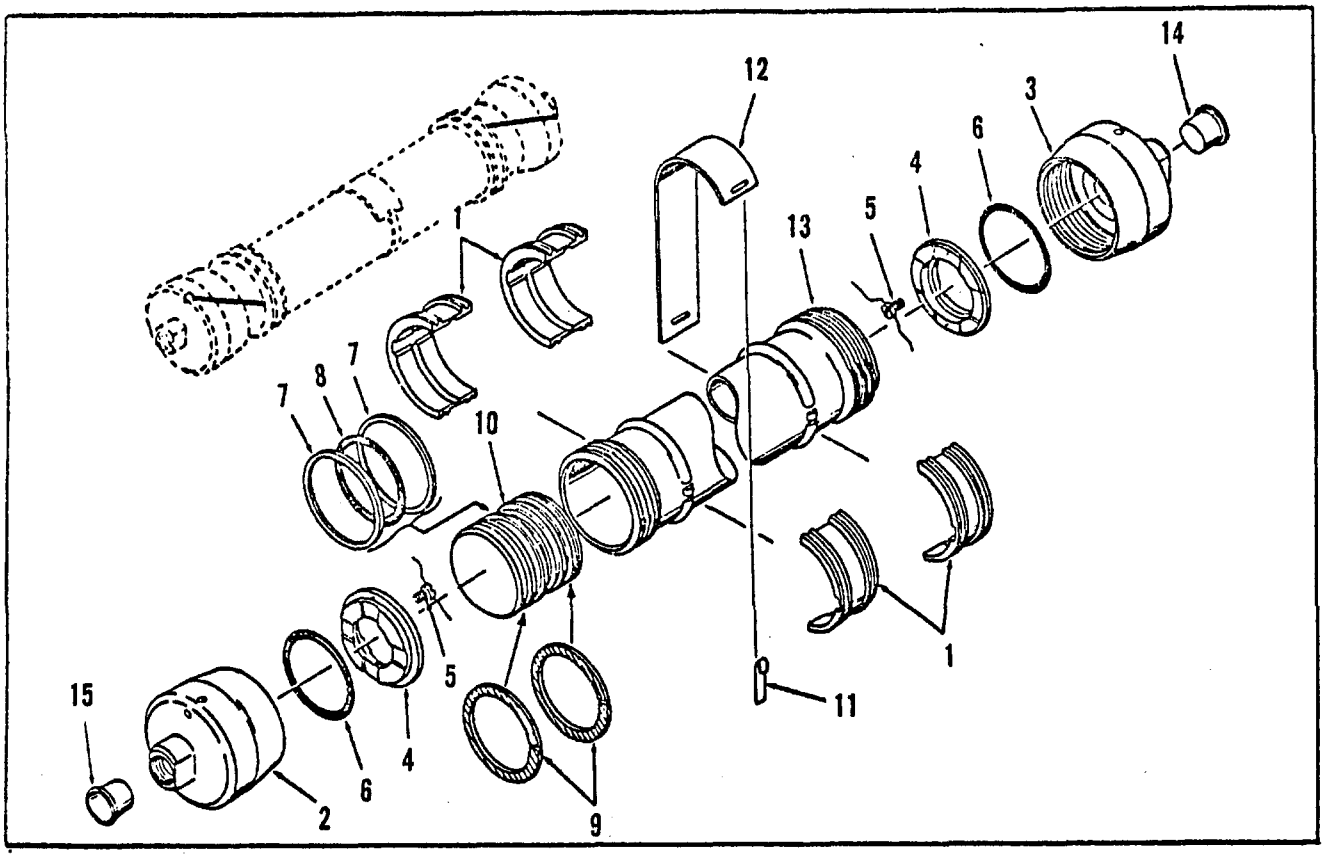

Figure 6. Exploded View of Hydraulic Accumulator

Note

This parts list reflects the use of repair kits intended to provide the user with most replacement parts usable at major overhaul and at minor repair. Certain replacement parts are stocked only in kits. Those procurable parts not in kits are stocked in their appropriate class. Standard parts and parts having multi-application, are stocked in their appropriate class, and may also be stocked in kits. Do not order kit parts from separate stock to serve the purpose of a kit.

Note

Parker-Hannifin assigned part numbers for commercial parts are listed parenthetically in the Description column.

9. SOURCE CODE DEFINITIONS.

Note

The source code definitions are extracted from AFLCM 65-3.

f. Code "C"--Cure-Dated Parts Kit. Code "C" is applied to kits containing parts that have a specific period of time (cure-date) to remain in storage without affecting their serviceability and are subject to deterioration due to aging or exposure. The cure-date for the kit is established on the shortest life item within the kit. C-Kit contains parts required for maintenance and overhaul and will be used in conjunction with Overhaul (Code "D") Repair Kits and/or Minor or Field (Code "F") Repair Kits, as applicable.

SERVICE INSTRUCTIONS WITH

ILLUSTRATED PARTS BREAKDOWN

FOR

HYDRAULIC RELIEF VALVE

PNEUDRAULICS, INC.

PART NUMBER 1000-4

PREPARED BY THE ENGINEERING DEPARTMENT OF

PNEUDRAULICS, INC. MONTCLAIR, CALIFORNIA U.S.A.

INTRODUCTION: This report covers the service instructions for the PneuDraulics, Inc. Model 1000, 1100, and 1200 Series Main System Hydraulic Relief Valves in all tube sizes and pressure classes. A Spare Parts List for the specific model is included as Section 6.

SCOPE: The following information is presented in the various sections of this report.

Section 1: General Description of Function

Section 2: Cleanliness, Assembly, and Handling Safeguards

Section 3: Assembly and Disassembly Procedures

Section 4: Field Rework Procedures

Section 5: Functional Test Procedures

Section 6: Spare Parts List

SECTION I

GENERAL DESCRIPTION AND FUNCTION

1.0 INTENDED USE:

The PneuDraulics, Inc., Main System Relief Valves are designed to Military Specification MIL-V-8813 and are intended for use in either Type I (-65°F to +160°F) or Type II (-65°F to +275°F) Aircraft Hydraulic Systems to provide for relief of excessive hydraulic system pressures.

1.1 OPERATION:

Operation of the PneuDraulics, Inc., Main System Relief Valves is completely automatic. If the hydraulic pressure in the hydraulic system increases to the valve pressure setting, the valve will open at a predetermined and adjusted pressure level and pass flow; thus, preventing further increase in hydraulic system pressure within the limits defined by Military Specification MIL-V-8813 for each class valve. As the system pressure decreases, the valve will close or reseat at a predetermined point and maintain a pressure tight seal against leakage.

SECTION 2

CLEANLINESS, ASSEMBLY, AND HANDLING SAFEGUARDS

2.0 CLEANLINESS SAFEGUARDS:

It is necessary to maintain a normal degree of cleanliness when assembling and handling the PneuDraulics, Inc., Relief Valve, as is the case with all precision hydraulic devices. The safeguards listed below must be recognized and observed.

2.0.1 Assembly Area:

The assembly and disassembly area, which includes the work benches, should be segregated if possible from any area where drilling, filing, or grinding, etc., operations are performed in order to prevent assembly of contaminants into the valve.

2.0.2 Cleanliness Cautions:

2.0.2.1 Open ports on the valve, when not in use, should be plugged with metal port closures.

2.0.2.2 Do not assemble dirt into a valve. All parts should be dust and dirt free prior to assembly. Parts should be washed in solvent and thoroughly cleaned just prior to assembly. The solvent used for cleaning should be replaced periodically, dependent upon how dirty it becomes. All solvent and oil containers should be flushed out to remove metallic chips, lint, and other contamination which will collect.

2.0.2.3 Careful use of rags is important. Rags are to be used to "mop" up oil, debris, etc. If a rag is used to wipe out a bore or to wipe off a part, the rag must be absolutely clean, dry, and free of lint.

2.1 ASSEMBLY SAFEGUARDS:

2.1.1 General:

Precision hydraulic components are delicate pieces of equipment and must be treated as such.

2.1.2 Clamping:

Cylinders or any unit which has working parts, such as a piston, should never be clamped in a vise, except at obvious wrench pads which may be provided. Clamping in a vise is sufficient to cause binding of the working parts when assembling or disassembling, which will cause scoring or galling. Cylinders should always be held in a vise by use of special bored wooden blocks which fit the O.D. of the unit and distribute the vise pressure around the circumference.

2.1.3 Torqueing:

Caution must be exercised in excessive torqueing of threaded parts. Threaded parts should be well lubricated with clean hydraulic fluid prior to assembly.

2.1.4 Any highly polished surface, internal or external, is easily mutilated by dirt particles. All sliding surfaces of the valve, as well as "O" ring sealing surfaces, must be protected against mutilation, scratches, etc., and the assembly of dirt into the unit.

2.1.5 Never FORCE a valve together. All valves are engineered and manufactured to tolerances which allow easy assembly. If the valve does not assemble freely, then some part is not in its correct position for assembly. Disassemble and compare the part locations and positions with the assembly procedure and the assembly drawing.

2.2 HANDLING SAFEGUARDS:

2.2.1 General:

The critical functional parts of the relief valve which can be damaged due to improper handling are the seat, poppet, sleeve, and probe. The following cautions should be observed in the handling or storing of these parts.

2.2.2 Seat Handling:

The spherical lapped surface at the base of the cone on the seat is the sealing surface. This sealing surface is relatively well protected from damage due to its protected location. If this lapped surface becomes damaged, rough, scratched, or nicked, the valve will no longer function as it is intended. This surface must be thoroughly cleaned prior to assembly into the valve, as contamination will cause serious damage.

2.2.3 Poppet Handling:

The extreme corner on the small end of the poppet is the sealing surface. This surface must be protected at all times. If this surface becomes nicked, the valve will no longer function as it is intended. The small end of the poppet should always be protected with a clean plastic closure or, if this is not available, with a piece of tape.

2.2.4 Sleeve Handling:

The interior sliding surface of the sleeve must be thoroughly cleaned prior to assembly or valve operation will not be satisfactory. The sleeve should be handled with caution so that it does not become squeezed or egg-shaped.

2.2.5 Probe Handling:

The probe must be handled with extreme caution so that the small end does not become scratched or nicked. Also, the probe must be placed in a protected position so that it does not become bent or proper valve operation will be impaired.

3.0 INTRODUCTION:

This section explains the correct sequence of assembly and disassembly of the Model 1000, 1100, and 1200 Relief Valves. The exploded view (Figure 1), and the following instructions, should be referred to when any assembly or disassembly is undertaken. The safeguards of Section 2 of this document must be observed.

3.1 ASSEMBLY INSTRUCTIONS:

The following instructions indicate the correct method of assembly of the relief valve. Item numbers refer to those indicated in the exploded view (Figure 1). Clean all parts in solvent, and lubricate with clean hydraulic fluid prior to assembly. Refer to Section 6 for part number of any part which requires replacement.

3.1.1 To Complete Sub-Assembly "A":

3.1.1.1 Make End Cap Sub-Assembly (1) by assembling Backup 2 and Packing 3 to End Cap 1. The Packing to be toward the small end.

3.1.1.2 Make Seat Sub-Assembly (4) by assembling Backups 5 and Packing 6 to Seat 4. One (1) Backup to be to each end of Seat 4, with the Packing between.

3.1.1.3 Place End Cap Sub-Assembly (1) in a vise, clamping on the wrench flats provided. Clean Seat Sub-Assembly (4), lubricate with clean hydraulic fluid, and then with the lapped surface up, carefully place in the recessed internal bore of (1). After cleaning the Sleeve Assembly 7, place in the recessed internal bore, with the small lipped end up, and carefully push down. This will push the seat into the correct position within its bore. Next, assemble the Retainer Nut 8 to (1) by threading on. The Sleeve 7 lip will extend through the I.D. of 8. Be certain that the Nut 8 bottoms securely on shoulder of Sleeve 7.

3.1.1 To Complete Sub-Assembly "A": (Continued)

3.1.1.4 Remove the assembly created in the preceding paragraph 3.1.1.3 from the vise. Clean and assemble in solvent, and blow dry with clean air. Clean the Poppet 10, and dip in clean hydraulic fluid, then place in the bore of Sleeve 7 with the small end entering first. Hold in place with a finger over the end and, holding the assembly with the open port up, place the Probe 11 in the port, and carefully push down until it enters the Probe hole in the Poppet 10. Next, place the Inlet Nut 12 into the port and thread down into position. Exercise caution in tightening the Nut 12 so that misalignment of the Probe will not occur. When tightened securely, the Poppet 10 must be free to rotate 360° and must be free to move fore and aft without binding. Move the Poppet 10 in and out, and test for freedom. If any interference is observed, loosen Nut 12 and retighten. When freedom is achieved, Sub-Assembly "A" is complete.

3.1.2 To Complete Sub-Assembly "B":

3.1.2.1 Make Body Sub-Assembly (13) by threading the Adjustment Screw 14 into Body 13. The small end of Screw 14 must be toward the large open end of the Body 13. The Screw 14 is to be assembled from the large open end of Body 13 and backed into place with an Allen Wrench inserted through the port in the opposite end for Model 1000; either for Models 1100 and 1200.

3.1.2.2 Complete Sub-Assembly "B" by clamping body Sub-Assembly (13) in a vise on the wrench flats provided, with the large open end up. Then, carefully insert Spring Adapter 15. Make certain that the flat side of Adapter 15 is down and that 15 fits over the extension on Screw 14 and is flush.

3.1.2 To Complete Sub-Assembly "B": (Continued)

3.1.2.2 (Continued)

Next, drop Spring 16 into place, and ascertain that the I.D. of the Spring 16 fits over the extension diameter of Adapter 15 and is flush. Next, place Spring Guide 17 on the upper end of Spring 16. The spherical surface on Guide 17 must be up toward the open end of the body. Center Guide 17 as closely as possible to the centerline of the Body bore by eye. This completes Sub-Assembly "B". Leave it in the vise and complete final assembly as noted below.

3.1.3 To Complete Final Valve Assembly:

3.1.3.1 With Sub-Assembly "B" completed and clamped in the vise per paragraph 3.1.2 of this document, carefully invert Sub-Assembly "A" and insert into "B". Take care that the Poppet 10 does not drop out. Lubricate the threads with clean hydraulic fluid, and carefully thread "A" into "B" until it is flush on the shoulder. Take care that the backup ring does not cam out as the end cap is assembled into the body. If any resistance is observed, remove and inspect. When "A" has been securely threaded into "B", the valve final assembly is complete. Cap the ports with metal closures.

3.1.4 Functionally test and adjust the valve per the procedure outlined in Section 5 of this document.

3.2 DISASSEMBLY INSTRUCTIONS:

The following instructions indicate the correct method of disassembly of the relief valve. The item numbers refer to the exploded view (Figure 1). In general, disassembly is the reverse of assembly.

3.2.1 Remove Sub-Assembly "A":

3.2.1.1 Place the valve in a vise, and clamp on the wrench flats on the return port end. Remove the lockwire and lead seal from the End Cap. Loosen Sub-Assembly "A", unscrew from Body, and remove. If poppet 10 does not come out with "A", carefully remove it from the body and re-insert in bore in "A". This will afford protection to the poppet.

3.2.2 To Disassemble Sub-Assembly "B":

3.2.2.1 Remove Sub-Assembly "B" from the vise and invert onto the bench. Guide 17, Spring 16, and Adapter 15 will fall out. If Adapter 15 does not fall out, a few light taps on the bench will make it do so.

3.2.2.2 The Body 13 and Screw 14 may be separated if desired or required by screwing 14 into the bore of 13 from the outlet port, using an Allen Wrench.

3.2.3 To Disassemble Sub-Assembly "A":

3.2.3.1 Carefully remove Poppet 10 from the assembly, cover the sealing surface, and place the Poppet in a safe location.

3.2.3.2 The Sleeve Assembly 7 can be removed from the Assembly "A" without disturbing the alignment of the Probe by loosening and removing Nut 8 and then removing Sleeve 7.

3.2.3.3 To remove Seat 4, the Inlet Nut 12 and probe 11 must be removed. Place the Probe in a protected location in order to prevent damage. To remove Seat 4, insert a rod (0.28 dia.) through the Inlet Port on End Cap 1 and, with light pressure, push Seat 4 out of its bore. Place Seat in a protected location to prevent damage. Disassembly is now complete, except for removal of "O" rings and backups which is to be done in accordance with standard procedures.

SECTION 4

FIELD REWORK PROCEDURES

4.0 INTRODUCTION:

The manufacturer does not recommend field rework of any of the component parts of the relief valve. Replacement parts may be obtained from the Manufacturer either as details, or as sub-assemblies, as called out in the Spare Parts List, Section 6.

4.1 Replacement of parts in the valve is to be accomplished in accordance with the procedure of assembly and disassembly outlined in Section 3 of this document.

4.2 After part replacement and reassembly of the valve, the valve shall be tested in accordance with the procedures of Section 5 of this document.

SECTION 5

FUNCTIONAL TEST PROCEDURES

5.0 INTRODUCTION:

This section defines the test procedures which are to be applied to each relief valve after assembly per Section 3 of this document.

5.1 TEST CONDITIONS:

5.1.1 The test setup will be in accordance with Figure 2 below, or equivalent. The test fluid shall be MIL-H-5606 or MIL-H-6083, controlled between 80°F and 110°F during all tests. The test fluid shall be continuously filtered, using a standard AN rated 10 micron filter or equivalent.

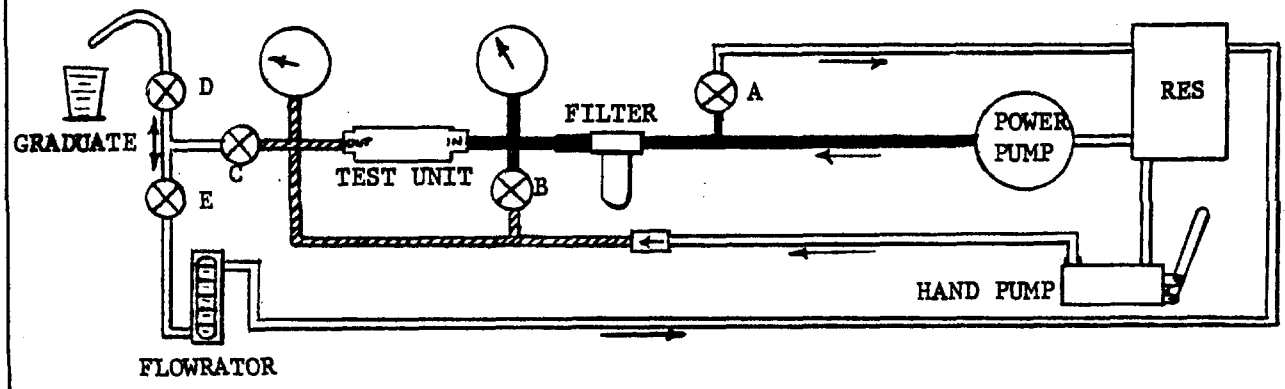

FIGURE 2

5.2 PRESSURE ADJUSTMENT PROCEDURE:

The test unit shall be adjusted to the desired rated flow pressure setting or lead seal pressure. If the valve does not have a lead seal pressure specified or required, it shall be adjusted to the maximum rated flow pressure setting of its class.

5.2.1 Connect the test unit into the circuit of Figure 2, but leave the outlet of the unit open to atmosphere. Open Valve A and close Valve B; then, start the power pump. Refer to Chart A, and determine the approximate cracking pressure which is required in order to obtain the specified rated flow pressure required for the test unit which is being adjusted.* By means of Valve A, increase the inlet pressure to the unit, and observe the flow out of the outlet. Adjust the unit through the outlet, using a standard Allen Wrench, until the approximate cracking pressure has been obtained.

CHART A

CRACK PRESSURE RANGES FOR VARIOUS VALVE CLASSES

Valve Class	Approximate Crack Pressure Range	Approximate Crack Pressure Difference From Rated Flow Differential Pressure
A	420 to 750	40 to 60 PSI
B	785 to 1290	65 to 80 PSI
C	1170 to 2100	120 to 160 PSI
D	1900 to 3500	200 to 300 PSI

* P/N 1000-4 is a Class "C" Valve.

5.2 PRESSURE ADJUSTMENT PROCEDURE: (Continued)

5.2.2 Connect the outlet of the unit into the circuit. Close Valve D, open Valves C and E. Increase the inlet pressure to the unit until flow is indicated on the flowrator. Manipulate Valves A and C until the unit is passing the rated flow through the flowrator with 200 ± 25 PSI back pressure. Record the actual inlet and outlet gage readings, and subtract the outlet gage reading from the inlet gage reading. This value is the rated flow differential pressure. Compare the value obtained with the desired pressure adjustment. Reduce the inlet pressure, open the unit outlet to atmosphere, and increase or decrease the crack pressure of the unit by the amount of error in actual versus desired pressure adjustment. Reconnect the unit outlet, and repeat the above procedure until the desired rated flow differential pressure has been obtained.

5.3 ACCEPTANCE TEST PROCEDURE:

The following acceptance test procedure shall be applied after the unit has been adjusted to the desired rated flow differential pressure setting per paragraph 5.2 of this document.

5.3.1 Pressure Setting Test and Reseat Test:

5.3.1.1 With the unit connected into the test circuit of Figure 2, open Valves A, C, and E; close Valves B and D; and start the power pump. Increase the inlet pressure and adjust the outlet pressure by manipulation of Valves A and C until the unit is passing rated flow through the flowrator at 200 ± 25 PSI back pressure. Record the inlet and outlet gage readings. Subtract the outlet gage reading from the inlet gage reading. This is the lead seal pressure.

5.3.1 Pressure Setting Test and Reseat Test: (Continued)

5.3.1.2 Determine the allowable reseat pressure for the unit under test by subtracting the value given in Chart B from the lead seal pressure.

CHART B

MAXIMUM PRESSURE DIFFERENTIAL BETWEEN FULL FLOW AND RESEAT

Valve Class	Maximum Pressure Spread Between Full Flow and Reseat Pressures
A	100 PSI
B	160 PSI
C	270 PSI
D	460 PSI

5.3.1.3 Reduce the inlet pressure to the reseat pressure determined in paragraph 5.5.1.2 above. Open Valve D, and close Valve E, and time. The unit shall reseat and the leakage shall not exceed the maximum values specified in Chart C for the tube size unit under test.

CHART C

MAXIMUM LEAKAGE AT MINIMUM RESEAT PRESSURE

Valve Tube Size	Maximum Leakage Allowable as Measured During 3rd Minute of a 3 Minute Waiting Period
-4	4.5 cc/minute
-6	4.5 cc/minute
-8	6.0 cc/minute

5.3 ACCEPTANCE TEST PROCEDURE: (Continued)

5.3.2 Decreasing and Increasing Pressure Leakage Test:

5.3.2.1 After checking the reseat pressure per paragraph 5.3.1.3 of this document, decrease the unit inlet pressure to 3/4 and 1/2 of the lead seal pressure. Leakage at these pressures shall not exceed the values given in Chart D for the tube size unit under test.

CHART D

MAXIMUM LEAKAGE AT PRESSURES BELOW RESEAT PRESSURE

Valve Tube Size	Maximum Leakage Allowable as Measured During 3rd Minute of a 3 Minute Waiting Period
-4	1.5 cc/minute
-6	1.5 cc/minute
-8	2.0 cc/minute

5.3.2.2 Gradually increase the inlet pressure to the unit to 3/4 of the lead seal pressure. Leakage shall not exceed the values given in Chart D.

5.3.2.3 Increase the inlet pressure gradually to the reseat pressure obtained in paragraph 5.3.1.3 of this document. Leakage shall not exceed the values given in Chart C for the tube size unit under test.

5.3 ACCEPTANCE TEST PROCEDURE: (Continued)

5.3.3 Proof Pressure Test:

5.3.3.1 With the unit connected into the circuit per Figure 2. Open Valves A, C, and E; close Valves B and D; start the power pump. Increase the inlet pressure to the unit by throttling Valve A until flow is noted at the flowrator. Manipulate Valve B and cycle the handpump until all traces of air have been purged from the system. Reduce the inlet pressure by opening Valve A; then, close Valve C, open Valve B, and shut down the power pump.

5.3.3.2 By means of the handpump, increase the pressure at the inlet and outlet of the unit to 4500 PSI at a rate not exceeding 25,000 PSI per minute, and hold the pressure for one (1) minute. There shall be no evidence of external leakage, failure, excessive distortion, or permanent set. Reduce the pressure by cracking Valve C, and then repeat the above procedure.

5.3.4 Reverse Flow Leakage:

5.3.4.1 At the conclusion of paragraph 5.3.3.2 above, reduce the pressure by cracking Valve C, and then close Valve B. Disconnect the line from the inlet port of the test unit. With Valve C closed, increase the pressure at the outlet port of the unit by means of the handpump until the rated flow has been reached. Leakage out of the unit inlet port shall not exceed the values indicated in Chart D for the tube size unit under test.

5.3.5 Final Adjustment Check:

5.3.5.1 At the conclusion of paragraph 5.3.4.1 above, bleed off pressure by opening Valve C, and reconnect the unit inlet line. Repeat paragraph 5.3.1 to determine that no deterioration has occurred due to application of proof pressure.

5.3 ACCEPTANCE TEST PROCEDURE: (Continued

5.3.6 Lockwire and Affix Lead Seal:

5.3.6.1 The acceptance test on the unit is now complete. Cap the ports on the unit, lockwire per the assembly drawing, and affix the lead seal, impressed with the lead seal pressure to which the unit has been adjusted.

5.3.7 Inspection Stamps, Cure, and Assembly Dates:

5.3.7.1 Affix rubber stamped Inspection Final, Function, and Pressure Test stamps to the unit. Be certain that the assembly date and rubber cure date rubber stamps have been applied.

INSTALLATION, OPERATION, AND MAINTENANCE INSTRUCTIONS

PART NUMBER 50220

DESCRIPTION:

The PTI Technologes Inc. Type PR-401-3 hydraulic filter has an operating capacity of 1/2 gpm of hydraulic oil Specification MIL-H-5606 or Hydrolube (H-2) per specification MIL-F-7083 at 90° to 110°F with a maximum differential pressure of 6 psi.

The filter has an operating pressure of 3000 psi, a test pressure of 4500 psi minimum for two minutes, and a bursting pressure of 7500 psi minimum.

The element assembly filtering surface is approximately 14.6 square inches of chemically treated paper. The element paper is supported for the full length by a spring to further reinforce the convolutions. The estimated weight of the complete unit is 0.5 pounds.

There is a relief valve incorporated in the head assembly which is set to open at 50 ±5 psi differential pressure.

The inlet and outlet connections are located in the head below and at right angles to the two mounting holes. The thread sizes for these connections are 7/16-20 UNF-3 (female) threads per AND-10050-4. The diameter of each mounting hole is 0.2658 per AND-10387.

DISASSEMBLY:

To disassemble filter, proceed as follows:

a. Remove lockwire and clamp filter head assembly in a vise.
b. Using a 5/8-inch open-end wrench, unscrew case assembly from head assembly.

c. The element can easily be removed from center bushing in head assembly by gently rocking it back and forth. DO NOT rotate element, as this may damage convolutions.

CLEANING AND INSPECTION:

a. Clean head and case thoroughly and inspect parts for damage to threads or material. Any parts with damaged threads should be replaced.

b. Gaskets should be replaced at each overhaul.

COPYRIGHT NOTICE
Copyright 1995
PTI TECHNOLOGIES INC.
an ESCO Company
ALL RIGHTS RESERVED

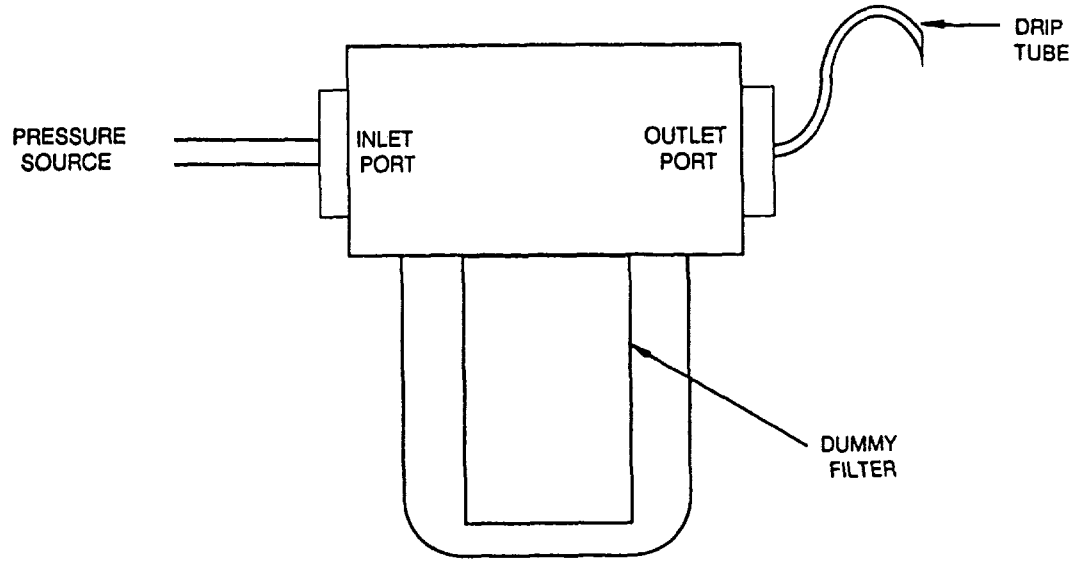
c. Element should be replaced at each overhaul. If replacement elements are not available, old element may be reused after special cleaning (to be done in emergencies only). Plug or mask open end of element to prevent the entry of dirt to the inside of the element convolutions. Clean element in a solution of 50 percent benzene and 50 percent lacquer thinner or 100 percent chloroform. As a substitute for benzene a 50 percent solution of toluene may be used with an equal portion of lacquer thinner. A soft brush or mild air blast may be used in conjunction with whichever solution is used.

CAUTION: DO NOT use a wire brush or scraper to clean element as this will damage the element convolutions beyond repair. Handle element cleaning operation with extreme care.

d. To inspect element, insert a small light in center of element convolutions to inspect for minute holes in element paper. Check both ends of element for damage.

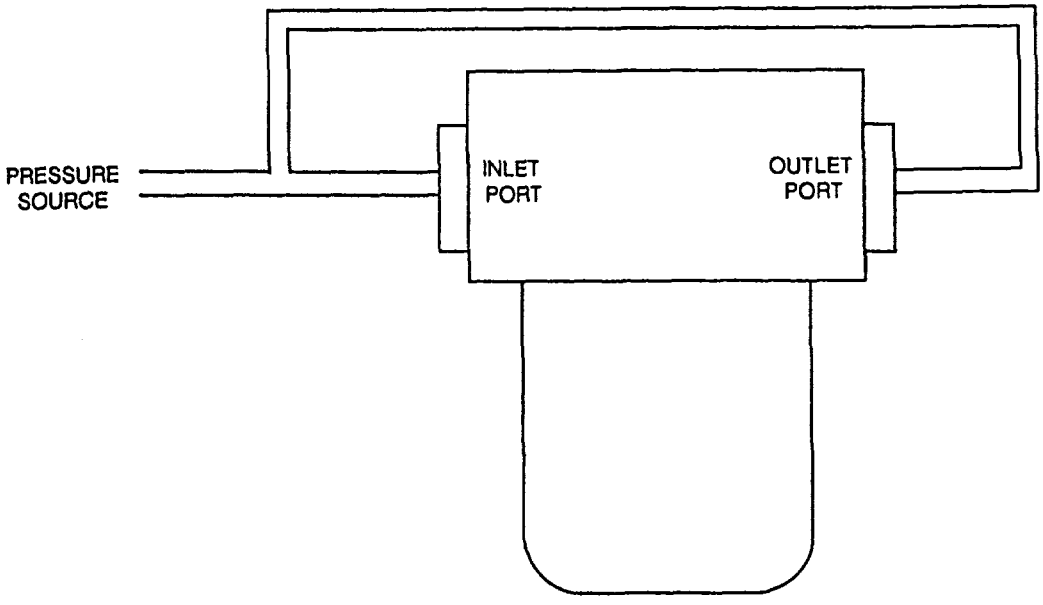
REASSEMBLY:

Reassembly is the reverse of disassembly. When filter is completely reassembled and tested, replace safety wire. When installing filter, ensure inlet and outlet connections are in same direction as the arrow on the head assembly. There are no special tools required for the disassembly or reassembly of this filter.



TEST:

To test relief valve, proceed as follows:



a. Disassemble filter and remove element.
b. Install dummy filter element in place of filter element and install case assembly.
c. Slowly apply hydraulic pressure to inlet port until fluid flows from the outlet port. the relief valve shall open at 50 ±5 psig (see figure 1).
d. Reduce pressure below 32 psig then raise to 40 psig. Leakage shall not exceed 2.0 cc per minute.
e. Raise inlet to 55 psig leakage shall exceed 4cc per minute.
f. Disassemble filter assembly. Remove dummy element and replace filter element. Reassemble filter assembly.

To test filter assembly for external leakage, proceed as follows:

a. Fill filter assembly with hydraulic fluid ensuring there is no trapped air.
b. Apply 4500 psig min. hydraulic pressure to both the inlet and outlet ports simeltaneously (see figure 2).
c. There shall be no set or external leakage allowed. (note hydraulic fluid less than one drop is considered to be zero.)
d. Install lockwire and two NAS 818-4 shipping plugs.

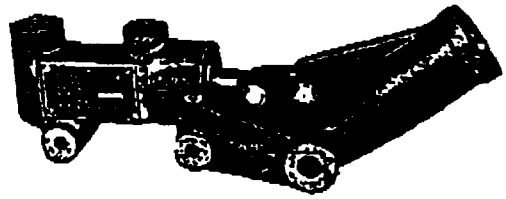
INSTALLATION OPERATION MAINTENANCE



Service Instructions

for

TELEDYNE REPUBLIC HYDRAULIC HAND PUMPS

914 — AN6201-1 915 — AN6248-2

916 — AN6248-3

GENERAL

This Manual covers operation and maintenance instructions for Republic Hand Pumps 914, 915, AN6201-1, AN6428-2 and AN6248-3. These pumps are of the double-acting positive-displacement type.

Models 914 and AN6201 deliver 1.25 to 1.50 cu. in. per cycle (2 strokes) up to 1500 psi maximum, 915 and 916 AN6248-2 and AN6248-3 deliver .7 cu. in. minimum per cycle (2 strokes) up to 3000 psi.

Under AN6201-1, AN6248-2, and AN6248-3 ordering part numbers these pumps meet military specification MIL-P-5515, and are designed for use with hydraulic oil MIL-H-5606. Under Republic catalog numbers 914, 915, and 916, these pumps are standard for use with hydraulic oil MIL-H-5606, but the O-rings and seals may, on special order, be specified for use with fuels, and a wide variety of chemicals and liquids.

INSTALLATION

The Hand Pump, as received, is completely assembled and ready for installation. Visually inspect for possible shipping damage. Do not remove the port connectors until the pump is to be installed.

CAUTION

During installation do not permit any foreign matter to enter the ports.

Installation dimensions are shown in Figures 3 and 5. Ports are marked IN and OUT. Make plumbing connections by installing the ½ in. OD tube fittings and connecting lines to the IN or suction port, and the ⅜ in. (914/AN6201-1) or the ¼ in. (915/AN6248-2/916/AN6248-3) tube fittings to the OUT or discharge port, using a suitable gasket. Ports are SAE straight thread (AN10050 or MS33649) O-ring seal tube connections. Gaskets used should be dimensionally equivalent to AN6290-8, -6 and -4, respectively.

Make sure all connections are tight.

OPERATION

Liquid is forced through the pump by moving the handle between the two extreme positions.

When the pump handle is moved from the vertical to the horizontal position, as in piston stroke A (see schematic Fig. 7) chamber C1 draws fluid in through inlet or suction port check valve, while chamber C2 discharges fluid through outlet or discharge port. When the handle is returned to vertical position, as in piston stroke B, the volume of fluid in chamber C1 is transferred to chamber C2 through the piston check valve. Since chamber C2 holds half the volume of chamber C1, half the fluid in chamber C2 is discharged through the outlet port, and the other half is held for use in the following stroke A.

PRINCIPLE OF OPERATION

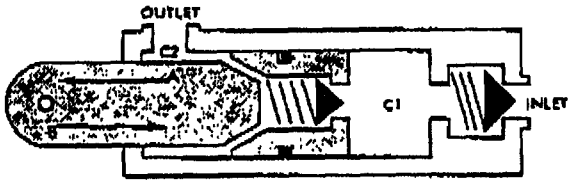

Fig. 7

MAINTENANCE

External leakage around the piston (2, Figs. 4 and 6), may often be stopped by further tightening of the gland (17).

If excessive force is required to actuate the pump, check the system pressure.

Should it become necessary to service the pump it can be completely disassembled and reassembled in the field.

Failure to build up pressure is probably caused by defective piston seals, or an inoperative check valve. Handle creep indicates leakage past the check valve. Most leakage is due to defective or incorrectly installed O-ring packings. Often foreign matter in the pump causes unsatisfactory service, which can be corrected by cleaning.

There is available a Field Repair Kit of replacement parts (Tables 1 and 2) which contains all the O-rings, back-up rings, springs, etc., necessary for complete overhaul of the standard pumps (for use with hydraulic oil MIL-H-5606). Figures 4 and 6.

DISASSEMBLY

All work should be done in as clean an area as is available. Figures 4 and 6 show the order of disassembly.

Remove handle. Place pump in a vise, bearing on the body at the ends of the mounting bosses.

To remove inlet valve, with a wrench (Fig. 4), or a wide screwdriver (Fig. 6), unscrew valve seat (7) from inlet port. Poppet (4) and spring (3) may then be removed.

Although the internal parts in each pump are identical, it is desirable that they be retained as parts of the same valve assembly. Therefore, if poppets are not to be renewed, identify poppets (4), seats (7) and O-rings, so they will be reassembled into the same valve bore from which they were removed.

To remove outlet valve, disconnect handle pivot (19) by releasing links (25) at the flat end of piston (2). Remove cotter pin (27), releasing washers (24) and spacer (26).

With a spanner wrench, unscrew the piston gland (17) and pull out the piston assembly. Remove scraper ring (16), O-rings, etc. Place piston (2) in a vise, gripped on the flats. With a wide screwdriver, unscrew valve seat (7) from valve in end of piston. Remove poppet (4) and spring (3). Remove O-rings and back-up rings.

Wash all parts in an approved oil base cleaning solvent (Fed. Spec. P-S-661). Dry with a clean, lint-free cloth, or use compressed air, if available.

WARNING

Use solvent in a well-ventilated area.
Avoid prolonged inhalation of fumes.
Keep away from open flames.

Check all parts for cracks, breaks and other obvious signs of damage and excessive wear. Springs must have no visible distortion when rolled on a surface plate. Examine all O-rings for cuts, tears, cracks and swelling. Imperfect rings should be replaced. To clean clogged passages, use a hardwood rod. Do not use metal.

After cleaning, if reassembly is not immediate, put a light film of preservative oil (Spec MIL-H-6083) on parts, and place in a dust-free container until ready for inspection and reassembly.

REASSEMBLY

It is wise to replace springs, O-rings and back-up rings at each overhaul, and Republic has kits of Recommended Replacement Parts available for this purpose. Tables 1 and 2.

Use extreme care during reassembly to prevent dirt particles from entering the pump that would score internal metal parts or sealing surfaces. Coat all rubber parts with a suitable lubricant before assembly. Handle O-rings with care, especially when passing them over threads or sharp edges. Twisting, small cuts or nicks may result in leakage after installation. Make sure O-rings and back-up rings are installed in the proper relationship to each other, and to pressure direction, as shown in the sectional views (Figs. 3 and 5).

Apply one or two drops of light oil to the three handle pivot pins (20, 23) as required.

XW20101-DHC6 OVERHAUL MANUAL

Electric Windshield Wiper System for DHC6 Twin Otter

1. Description. This section contains a general description of the Alco Electric Windshield Wiper System XW20101-DHC6, manufactured by Alco Controls Division, Emerson Electric Co., St. Louis, Missouri, U.S.A. for the DHC6 Twin Otter aircraft.

   A. The system includes all necessary components to provide a clear area on the pilot and the co-pilot windshields.

   B. The wiper system consists of a Motor, two Converters, two Flexible Drive Assemblies, two Arm Assemblies, two Link Assemblies, two Wiper Blades.

   C. For clarity this manual discusses each component individually and includes sections covering the motor and the converter.

2. Operation. A CONTROL SWITCH (not an Alco part) is utilized to turn the wiper system on and off and select fast or slow blade speed. Slow motor speed is obtained by selecting a circuit with a resistor in series with the motor. A momentary park position on the control switch completes the circuit and causes the wiper to automatically return to the "stow" position. When the control switch knob is released, the switch returns to off position shutting down power to the wiper.

   A. The ELECTRIC MOTOR has an output shaft at each end and provides the power for operating both the pilot and the co-pilot wiper. It contains an automatic reset thermal protector to de-energize the motor in event of overload. Radio noise filters are contained in the base of the motor. The motor also contains a gear train driving a cam to operate the parking switch to automatically stow both wiper blades when the control switch is turned to "Park" position.

   B. FLEXIBLE DRIVE ASSEMBLIES are connected to the motor and to the converters to transmit the rotary output of the motor to each converter. These assemblies consist of a flexible drive shaft enclosed in a flexible casing. A threaded fitting on each end of the casing is the attaching means to the motor and the converters.

C. The CONVERTERS reduce the rotary speed input and convert the rotary motion to oscillating motion to drive the wiper arms. The motor contains a worm and gear train driving a linkage assembly to accomplish this purpose.

D. The ARM ASSEMBLIES, LINK ASSEMBLIES and WIPER BLADES are used to clear a suitable area on the windshield. The arm assembly is mounted on the converter shaft. The link assembly pivots on a stud adjacent to the converter pierce point. The arm assembly and the link assembly are secured to the wiper blade in a manner to drive the blade in a pantograph motion. See Figure A.

E. A resistor (not Alco-supplied) is in series with the wiper motor for slow speed operation.

LEADING PARTICULARS

Motor Operating Voltage	27 volts
Motor Speed	11,600 RPM (Approx.)
Converter Stroke Angle	90° ± 2°
Blade Speed (Fast)	160 Strokes per minute (Approximately)

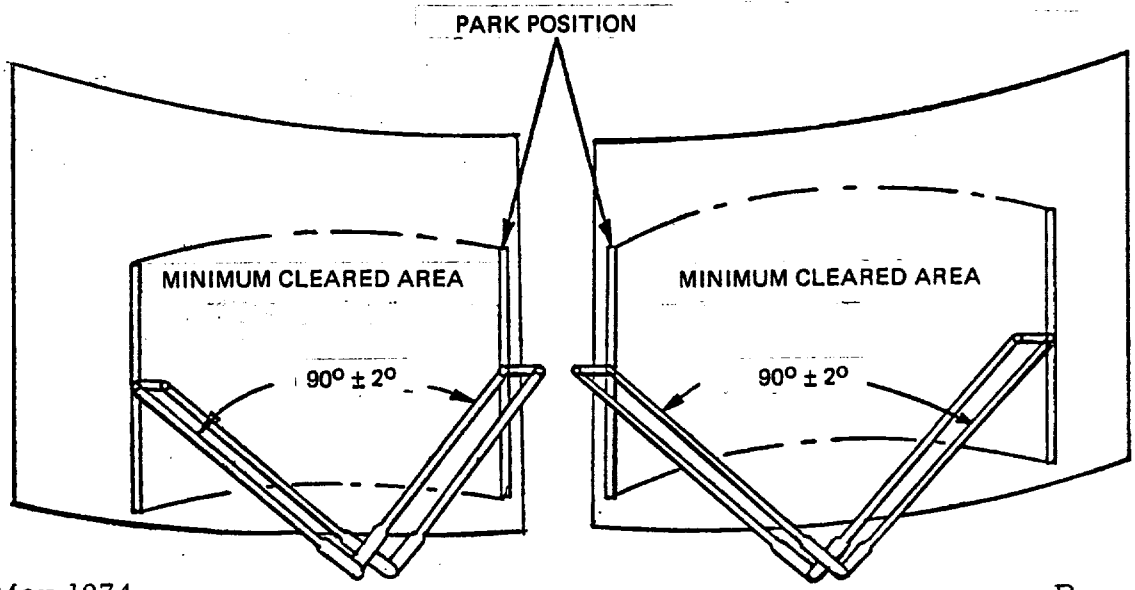

Figure A

3. System Disassembly. The relationship of the wiper components is shown in Figure 1 in the overhaul instructions which follow.

ELECTRIC MOTOR ASSEMBLY

1. Disassembly (See Figure 3 Parts Section)

   A. Disassemble in the general order shown by the index numbers on the motor illustration following.

   B. Remove brush and clip assembly (33).

   C. Soldered electrical leads may be disconnected as necessary. It is suggested that leads be marked for identification to facilitate reassembly.

   D. Remove shaft gear (12), bearings (21) and rotor assembly (22), as a unit and then disassemble if necessary.

2. Cleaning.

   A. Clean all metal parts with the exception of the rotor (22), brush and clip assembly (33) and barrel assembly (50) with cleaning solvent, Federal Specification P-S-661a.

   B. Dry with compressed air or clean lint-free cloth.

   C. Rotor assembly (22), particularly the commutator, should be cleaned with a dry brush. Commutator should be wiped clean to remove any film deposit.

3. Inspection.

   A. Visually inspect all parts for obvious defects or excessive wear. Particular attention should be given to gear and pinion teeth, gear posts and bores.

   B. Check bearings which should be free running. Bearing fits should be snug but not tight at room temperature.

   C. Check windings on rotor assembly (22) and stator windings of barrel assembly (50) for broken leads and frayed insulation.

D. Check commutator for excessive wear and inspect for smooth, clean surface.

E. Check brushes on brush and clip assemblies (33) and discard if worn excessively. Check brush holder assembly (35) spring pressure which should be adequate for positive contact.

F. Parking switch (18) may be checked by depressing and releasing the switch actuating plunger. A test lamp across the terminals will indicate whether or not the switch is operating satisfactorily. Check the switch for loose terminals. Check the cam assembly (6) for wear and replace if necessary.

4. Repair or Replacement.

A. Solder electrical connections and replace defective parts at re-assembly.

5. Lubrication.

A. MIL-G-3545 grease is to be used on all gear shafts and gear teeth. A light film is to be applied to the cam operating surface.

6. Reassembly.

A. Rewire motor in accordance with wiring schematic, Figure B. Use solder QQ-S-571, SN50 Type ARWP3 or commercial equivalent.

B. Assemble thermal protector (40) and snap ring (41) to barrel assembly (50), then solder leads to thermal protector.

C. Assemble all parts (31 through 39) and solder leads to terminals. Do not insert brushes into holders at this time. This assembly is the brush end bell assembly.

D. Assemble brush end bell assembly to the barrel assembly. When secured, fix all leads snugly against the barrel assembly. Leads to the connector (29) should be threaded through the opening in the barrel assembly before the electrical end bell assembly is placed into position.

E. Replace the bearings (21) and shaft gear (12) on the rotor assembly, if replacement is necessary. The shaft gear is to be pressed on to the drive shaft with the inside diameter chamfered end leading. Insert this assembly into the barrel assembly. Seat the bearing properly in the brush end bell assembly.

Figure B

F. Attach parking switch (18) to end bell and idler shaft assembly (19) with screws (16) and lockwashers (17). Thread leads to parking switch through end bell assembly, then assemble the electrical end bell assembly to the barrel assembly with bolts (13) and lockwashers (14). Dowel pins will locate the end bell assembly properly upon the barrel assembly.

G. Insert brushes into brush holders.

H. Complete assembly as shown on exploded view.

I. Conduct a performance test to determine satisfactory operation, then install closures on connector and shaft openings if unit is to be stored. Sealing tape may be used if closures are not available.

7. Test Procedure. Connect the motor as shown in the windshield wiper wiring diagram, Figure B, and perform the following operational tests. A trouble shooting chart follows the test procedure.

A. Turn the power on and turn the switch to LOW position. If new brushes have been installed, allow the motor to run for approximately six hours. It may be necessary to have air flowing across the resistor (utilize a fan) for cooling.

B. After brush run-in, inspect brushes to be sure they are moving properly in the brush holders and that at least 90% of the brush area is contacting the commutator.

C. Check for excessive running noise and vibration.

D. Lock the rotor in a stationary position and turn the switch to HIGH. Thermal protector must deenergize motor circuit in less than 30 seconds. Allow thermal protector to complete one on-off cycle.

E. With switch in "HIGH" position, check torque when the motor is operating at a speed of 10,000 rpm. It shall be no less than .6 in.-lb. Current shall not exceed 5.5 amperes.

F. Operation of the Parking Switch in the motor shall be checked in the following manner:

Operate the motor at 8 volts applied across the terminals "A" and "C". When speed stabilizes, connect a 6-volt automotive lamp across leads "B" and "C". The lamp shall light in regular pulsations.

TROUBLE	PROBABLE CAUSE	REMEDY
1. Motor fails to start.	a. Defective power supply.	Check power to motor and correct trouble where necessary.
	b. Defective thermoprotector.	Use an ohmmeter and check for continuity through the thermoprotector. Replace thermoprotector if circuit is open.
	c. Field or armature circuit.	Use an ohmmeter and check for open windings or shorted leads.
2. Motor runs noisy or vibrates excessively	a. Defective motor components.	Check rotor shaft for correct alignment, commutator and bearings for wear. Check for loose gears and chipped or broken gear teeth and for lubrication of gears. Replace any defective component.
3. Thermoprotector fails to de-energize motor.	a. Defective thermoprotector.	Replace thermoprotector.
4. Thermoprotector de-energizes motor but fails to complete cycle.	a. Defective thermoprotector.	Replace thermoprotector.
5. Excessive current consumption when motor operates under load and motor fails to reach minimum speed.	a. Arcing at brush and commutator due to bad brush contact or worn brushes.	Adjust brush tension for proper contact or replace brushes. Commutator dirty or glazed causing poor contact with brushes. Clean commutator.
	b. Field strength below normal.	Same reasons indicated above. Also check power supply for correct voltage.
	c. Shorted commutator segments or short in rotor windings.	Check with ohmmeter.
6. Motor fails to stop in "PARK" position.	a. Defective parking switch.	Check for closed circuit with control switch in "PARK" position. Replace switch if circuit is open.
	b. Defective cam assembly or any gear not secure to its pinion.	Check cam assembly to see if it is depressing the parking switch actuating plunger. Check for loose gears.

CONVERTER ASSEMBLY (See Figure 2, Parts Section)

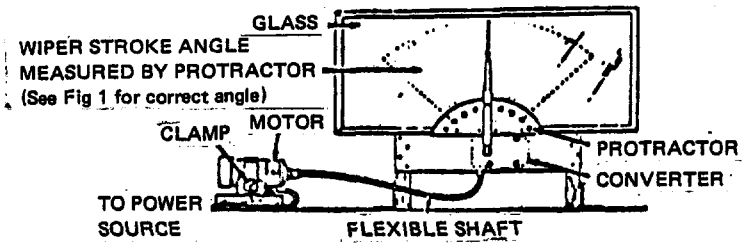

Figure C
Converter Test Diagram

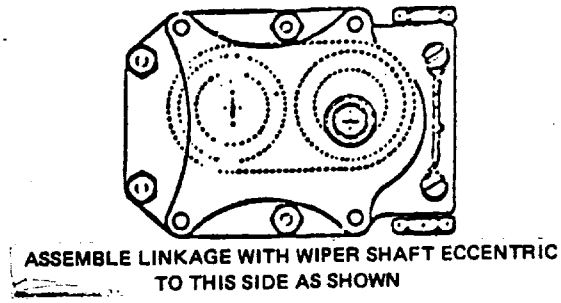

Figure D
Assembly Converter Linkage

1. Disassembly.

   A. Disassemble in the order shown by the index numbers in the exploded view, Parts Section. Scrap all locknuts.

   B. Cover plate (7), sleeve (8), "O" ring (9), and sleeve (10) may be removed from the housing as a unit. Sleeve (8) and "O" ring (9) are then removed from sleeve (10). Do not remove sleeve from cover plate unless it is to be replaced. The sleeve is staked in place and damage may result during removal.

   C. Remove any bearings that are not free running except in Item 13 (converter linkage assembly). This assembly must be replaced as a unit.

2. Cleaning.

   A. Wash all metal parts, except bearings, with cleaning solvent, Federal Specification P-S-661a or equivalent.

B. Dry with compressed air or clean lint-free cloth.

3. Inspection.

A. Inspect all parts for obvious defects or excessive wear.

B. Check condition of all parts of the converter linkage assembly. Examine serrations, gear teeth and shafts for wear or damage; examine the link for distortion; check the bearings for roughness.

4. Repair or Replacement.

A. Replace "O" ring.

B. Replace defective or worn parts in reassembly.

5. Lubrication. Fill housing with grease conforming to MIL-G-23827 on reassembly.

6. Reassembly.

A. Reassemble in the reverse order of disassembly.

B. Apply sealing compound to all mating surfaces of the housing assembly and cover plates during reassembly. Sealing compound should consist of a mixture of 8 parts EC801 to 1 part EC807 Accelerator, both manufactured by Minnesota Mining and Mfg. Co.

NOTE: Mix only enough compound for sealing one unit at a time.

C. Assemble the converter linkage assembly in the housing with wiper shaft eccentric to the side as shown in Figure D.

D. Stake screws securing idler cover plate (16) and nameplate (19). Stake nylon sleeve (8) to sleeve (10) after reassembly.

E. Lock wire screws (3) to each other.

F. Operate the unit and observe that the stroke is 90° ($\pm$ 2°) and that the wiper is operating smoothly. Install end caps if unit is to be stored. Sealing tape may be used if end caps are not available.

FLEXIBLE DRIVE ASSEMBLY (See Figure 4, Parts Section)

1. Disassembly. Disassembly is clear from observation of Figure 4.

2. Cleaning. Clean all parts with cleaning solvent, Federal Specification P-S-661a.

3. Inspection.

   A. Visually inspect all parts for obvious defects such as kinks, or unraveling of flexible casing and flexible shafting.

   B. Check flexible shaft to see if it is binding against the casing.

   C. Check flexible casing and ferrule connections. Discard if connection is loose.

   D. Discard flexible shaft if worn. Discard if the drive ends are not square.

   E. Inspect couplings for wear, discard if necessary.

4. Repair or Replacement. Replace worn or defective parts. If casing assembly must be replaced, it is recommended that the complete flexible drive assembly be replaced.

5. Lubrication. Lubricate flexible shaft with grease conforming to MIL-G-3545.

6. Reassembly. Install end caps to prevent loss of couplings, or seal ends with sealing tape.

OVERHAUL AND TEST INSTRUCTIONS

The foregoing covers overhaul and test instructions for the individual components comprising the wiper system. Individual units failing to meet the test conditions should be overhauled and retested.

Special tools or test equipment are not needed.

MAINTENANCE

There is no scheduled maintenance for the system as installed on the aircraft. The wiper blades should be replaced at the judgment of the flight officers. At time of blade replacement, the upper bushings in the arm and link should be examined. The blade studs must turn freely in these bushings. If not, replace the wiper arm or the link rod end. At this time the bushing in the hub end of the link should also be examined for wear. Replace the link if wear is excessive or if it does not pivot freely at the lower end.

The other units of the system should be removed during base overhaul of the aircraft, although "on-condition" removal is becoming a widely accepted practice on Alco wipers and may be a better practice for this aircraft.

Following are instructions for installing the arms, links and blades on the aircraft:

1. Prior to installation of the arm, blade and link, relieve the spring tension on the arm by placing a pin through the cross hole in the arm channel just above the hub.

2. Operate the wipers at slow speed and determine an approximate position on the serrated shafts for the wiper arms. Install the arm and tighten the allen head cross bolt in each arm hub.

3. Operate the wiper at slow speed. Turn the switch off allowing the arms to "coast" to a stop as closely as possible to the desired inboard end of the stroke. Several tries may be necessary to judge this "coast".

4. Adjust arm position, if necessary, as follows:

   A. Note that the adjustment sleeve in Arm Hub has 50 teeth inside (one every 7.2°); 51 outside (one every 7.06°). Difference, then is .14°. This .14° change of arm position corresponds to 1/16-inch change at the top of the arm.

B. Estimate the error of the position of the arm and multiply by 16. Example: Error 3/8-inch to right; 3/8 multiplied by 16 is 6.

C. Remove the arm and sleeve. Rotate the sleeve within the arm the calculated number of teeth, rotating in the same direction that the arm must be moved. In the example above, rotate six teeth counter-clockwise.

D. The arm should now locate on the shaft in the approximate desired position.

E. Tighten the allen head cross bolt in the arm hub.

F. Install the link assembly and the blade and remove the pin from the arm assembly, align the blade to contact the glass.

G. With the windshields wet, observe the pilot and the co-pilot wiper patterns. Adjust the arm position as outlined above or if the sweep of the arm is not satisfactory.

H. Adjust the link length if the pantograph pattern is not satisfactory.

5. Loosen the allen head cross bolt in the arm. Press the arm hub and the adjustment sleeve onto the converter shaft spline so that the bottom of the counter bore in the hub, the top of the adjustment sleeve and the top of the converter spline shaft are flush. Tighten the allen head cross bolt holding the arm in this position. Install the washer and the arm counter bore and install the safety bolt through the washer and screw it into the converter shaft.

6. Lock wire.

7. Adjust the arm pressure (wrench XW20509 is available) by turning the adjusting screw near the arm hub clockwise to decrease pressure or counterclockwise to increase pressure. Arm pressure should be 4.5 pounds measured by hooking a scale beneath the arm-blade attachment point. Pull the scale at a right angle to the glass. When the blade rubber begins to leave the glass, read the scale.

8. A retaining ring (Item 2 on the Parts List for the converter) must be in place on each converter. This prevents the adjusting sleeve and the arm from rubbing the converter sleeve. If these retaining rings are not in place, install new ones.

9. With the windshields kept wet, operate the wipers and observe that rain clearance is satisfactory both at high and low speeds.

10. Turn the control switch through the off position to the park position. If either wiper stops away from the park position, disconnect the flexible drive at the motor, manually rotate the drive until the wiper is in park position and reconnect. This must be done for both the pilot and the co-pilot wiper. (Manual rotation is easier if the arm is pulled away from the glass by inserting the cross pin as in Item 1 above.)

11. Lock wire in all required locations.

PARTS CATALOG

Replacement parts and complete systems for additional installations may be ordered by means of the replacement parts list and exploded view drawings of the complete system and component parts.

Each part is illustrated for easy identification and the accompanying parts list contains the part number, description and quantity required for replacement. The index number, preceding the part number, is keyed to the corresponding part in the illustration. Index numbers are assigned to parts in the general sequence of disassembly and also serve as a guide for removal and replacement. Figure 1 shows the relationship of the components and also shows a breakdown of the arm assembly and the link assembly. A breakdown of the converter, motor and flexdrive is shown in Figures 2, 3 and 4 respectively.

SYLZ 50157

1.0 Description and Operation

Barber-Colman part number SYLZ 50157 is a Temperature Controller designed to control the temperature of an electrically heated windshield. The Controller utilizes an electral signal from a sensor embedded in the windshield to give the proper output signal to a power contacter which in turn applies or removes voltage from the windshield.

Reference: Barber-Colman Drawing SYLZ 50157, Sheet 3 and YL 1578, Sheet 1.

2.0 Specifications

1. Type of Control --------- ON-OFF
2. Input Voltage ---------- 20-32 VDC
3. Maximum Output --------- 500 MA Max. Inductive @ 28 VDC
4. Control "off" Point ----- 104°F
5. Differential ----------- 5°F
6. Operating Temperature Range ----- -65°F to +165°F
7. Sensor------------------- AVK 1160 or equivalent
8. Sensor Operating Power --- Less than 50 Milli Watts
9. Transient Protection ----- +80V
10. Reverse Voltage Protection ------ NO
11. Inductive Load Protection ------ YES
12. Over Temperature Protection ------ NONE
13. Failed Sensor Protection -------- Open-Short Circuit

Specification (continued)

14. Over Temperature/Failed Sensor Warning Signal ---------- NONE
15. Warning Signal Output ---------- NONE
16. Construction ---------- Repairable Assembly
17. Size ---------- 3.687" Max. X 4.062" Max. X 2" Max.
18. Weight ---------- Approx. 8 oz.
19. Connector Type -------- Mates with MS3106-20-275

3.0 Inspection

Inspect visually for evidence of abuse such as: cracks, deformities, damaged threads etc., to determine suitability for reuse. If further inspection is indicated, remove cover by removing (4) attaching screws.

After disassembly inspect all wire and solder joints for loose connections or damaged insulation, or if there is evidence of over heating.

4.0 Functional Testing

4.1 Connect the control box to the test fixture as shown in Figure I. S1 closed, S2 open.

4.2 Set TR1 to 315 ohms, DS1 should be on. Increase TR1 until DS1 goes out. This should be 333 ±1.3 ohms. Decrease TR1 until DS1 just comes on. This should be 4 ± 1.7 ohms below where DS1 went out.

4.3 Continue decreasing TR1 to 180 ohms. DS1 should still be on. Increase TR1 to 315 ohms. Open S1, DS1 should go out. Close S1. DS1 should come on. Close S2. DS1 should go out. Open S2, DS1 should come on.

4.4 Satisfactory completion of this test indicates that this unit is electrically suitable for service.

5.0 Repair

The design of this Control Box limits repairs to removal of slight dents and metal deformities in metal parts such as the cover or the base plate. All other items should be repaired on a replacement basis.

5.1 Trouble shooting may be accomplished by a qualified electronic technician using standard tools, the test fisture in Figure I and by refering to Barber-Colman drawing YL 1578 and Figure II alternately. The unit may be returned to the factory for repair. Replace parts found defective during testing. See Figure II and Figure III for identification of electronic components.

6.0 Calibration Instructions

6.1 Connect the control box to the test fixture as shown in Figure I.

6.2 Set TR1 at 333 ohms, set calibration potentiometer R2 on printed circuit board full CW. DS1 should be on. Rotate R2 CCW until DS1 just goes out. Decrease TR1 until DS1 just comes on. Record this reading. Increase TR1 until DS1 just goes out. TR1 should read 333 ±1.3 ohms. Reading of where DS1 just came on should be 4 ± 1.7 ohms. below where DS1 just went out.

6.3 Decrease TR1 until DS1 comes on, continue decreasing TR1 to 180 ohms. DS1 should still be on. Increase TR1 to 315 ohms. Open S1, DS1 should go out. Close S1, DS1 should come on. Close S2, DS1 should go out. Open S2, DS1 should come on.

6.4 Satisfactory completion of this test indicates that this unit is electrically suitable for service.

7.0 Assembly

Reassemble all parts which were removed during disassembly. Before assembly of cover, calibrate and test Control Box as outlined in Para. 6.0.

8.0 Special Tools

Test fixture in accordance with Figure I.

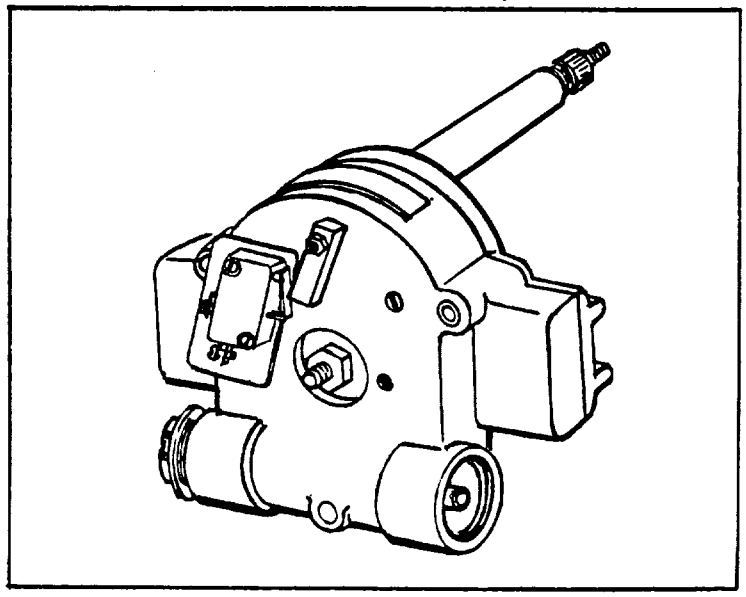
DESCRIPTION AND OPERATION



1. General

A. This manual contains the overhaul instructions for Windshield Wiper Converters Part Number Series 14-91355 and 14-91455, manufactured by Curtiss-Wright Corporation, Marquette Metal Products Co., Cleveland, Ohio. (See figure 1.)

2. Description

A. A complete Electric Windshield Wiper System consists of an electric motor, flexible drive shaft, converter assembly, drive arm, wiper blade, toggle switch, and a bottle of C-W 100 dust repellant static eliminator and cleaner. This electro-mechanical system is designed for installation on vehicle windshields to increase the range of visibility. Arrangement of the components comprising each system is accomplished in accordance with the detailed installation drawing for specific vehicle application.

B. The electric motor used in the windshield wiper system receives its power from the vehicle electric power system. Moving the toggle switch activates the electric motor of the wiper system. The toggle switch also features a park position for the wiper blade. Line protection is accomplished by using a 10 AMP customer supplied circuit breaker mounted in line with the power source and toggle switch.

Assembled View of Windshield Wiper Converter
Figure 1

3. Operation

A. Activate the windshield wiper system by placing the circuit breaker in the ON position. Start the wiper blade action by moving the toggle switch to the ON position. When operating on a wet surface the windshield wiper will perform at its maximum speed of approximately 250 strokes per minute.

CAUTION: THE WINDSHIELD WIPER BLADE SHALL NOT BE OPERATED ON A DRY SURFACE EXCEPT WHEN INCIDENTAL TO STARTING PRIOR TO ENTERING RAIN AND STOPPING AFTER RAIN.

CAUTION: FOR AIRCRAFT APPLICATIONS: DO NOT OPERATE WINDSHIELD WIPER SYSTEM WHEN INDICATED AIR SPEED EXCEEDS 150 MILES PER HOUR.

NOTE: During wiper operation an overload will cause the circuit breaker to automatically return to the OFF position. A thorough examination of the windshield wiper installation must be accomplished after the vehicle returns to its service base to ascertain the cause of the malfunction.

B. Stop the wiper blade action by moving the toggle switch to the OFF position. Park the wiper blade by moving the toggle switch to the PARK position; hold this position until the wiper blade is fully at rest in its parked position. Releasing the toggle switch will automatically return it to the OFF position.

C. Deactivate the windshield wiper system by placing the circuit breaker in the OFF position.

4. Remove Electric Windshield Wiper System From Vehicle

A. The Electric Windshield Wiper System is removed from the vehicle as subassemblies. Remove blade assembly and tie rod (if so equipped). Remove drive arm, flexible drive assemblies, converter, and motor.

5. Installation Instructions

A. Install a 10 AMP trip free circuit breaker, similar to type MS 25017, with the input side connected to the main bus bar. Use AN-18 cable size copper wire conforming to Specification, MIL-W-5086 (ASG), or equivalent. All wiring shall conform to CAM-18 and AIA Design Manual on aircraft electrical installations.

6. Adjustments

All adjustments are accomplished before the Electric Windshield Wiper System has been installed on a vehicle. Refer to ASSEMBLY.

A. Adjust length of drive arm.

(1) If drive arm is an adjustable length type, loosen lock on drive arm and adjust to desired length.

B. Adjust blade-to-arm angular relationship.

(1) Rotate the blade holder located on the outermost end of the drive arm to desired angular relationship.

CAUTION: DO NOT BEND OR TWIST THE DRIVE ARM OR WIPER BLADE.

C. Adjust blade-windshield load.

(1) If drive arm has an adjustable spring mechanism, turn adjustment screw to obtain 1-1/2 to 3 pounds blade load at all points within the wipe area. Where provided, an additional adjustment may be required by loosening or tightening the elastic stopnut that retains the "T" Bolt located in the mounting head adjacent to the shaft nut.

NOTE: Only the windshield wiper converter and motor are subject to overhaul. Refer to applicable manual for motor overhaul. If damaged, replace rubber insert of blade assembly. The metallic structure of the blade assembly, tie rods, drive arm, and flexible drive assemblies are not repairable and are to be replaced if damaged.

DISASSEMBLY

1. General

A. These procedures provide complete disassembly when required. Disassemble unit as necessary to accomplish repair using appropriate instructions detailed herein.

B. The parts listed in Table 101 must be discarded at each overhaul regardless of condition.

2. Disassemble Windshield Wiper Converter Assembly (See IPL figure 1.)

A. Removal of Switch and Shutoff Cam.

(1) Remove two screws (5), washers (6), lift off switch (4) and switch gasket (7). For model 14-91355-34 remove actuator (3).

NOTE: Switch gasket (7) is not used on model 14-91355-34.

(2) Remove screw (9), washer (10) and lift off shutoff cam (8).

NOTE: Some models use self-locking nut (9) to secure shutoff cam (8).

B. Removal of Drive Arm Shaft And Cover Assembly.

(1) Separate drive arm shaft and cover assembly (-12) from housing and bearing assembly (37) by removing four screws (13). Lightly tap housing (-42), using a soft-faced hammer, at separation line and lift drive arm shaft and cover assembly (-12) off roll pins (-41). Remove gasket (23), rack spacer (24) and converter rack (25).

C. Disassemble Drive Arm Shaft And Cover Assembly.

(1) Remove retaining rings (14 and 15), slide off drive shaft gear (16) and pinion spacer (17). Remove drive arm shaft (18) from cover assembly (22). Remove seal (19) or packing (21).

CAUTION: DO NOT DISASSEMBLE COVER ASSEMBLY (22). EXCESSIVE DAMAGE OR WEAR TO THE COMPONENT PARTS OF COVER ASSEMBLY (22) WILL REQUIRE REPLACEMENT OF THE ASSEMBLY.

NOTE: Do not attempt to remove spacer (-20).

D. Removal of Drive Plate Assembly.

(1) Remove two screws (27) and pull drive plate assembly (26) off worm gear assembly (31) dowel pins.

E. Removal of Worm Gear Assembly.

(1) Secure pivot bolt (30) with a screwdriver and remove nut (28). Remove seal (29) from pivot bolt (30). Pull worm gear assembly (31), pivot bolt (30) and worm gear spacer (32) from housing and bearing assembly (37).

CAUTION: DO NOT REMOVE DOWEL PINS FROM WORM GEAR. ANY EXCESSIVE WEAR OR DAMAGE TO COMPONENTS WILL REQUIRE REPLACEMENT OF WORM GEAR ASSEMBLY (31).

F. Disassemble Housing And Bearing Assembly.

(1) Unscrew worm shaft cap (33) and remove retaining ring (34) from housing (-42).

(2) Push worm shaft (36) through longitudinal bore of housing (-42) and remove retaining ring (38).

(3) Remove ball bearing (35) from worm shaft (36).

(4) Remove ball bearing (39) and ball bearing (40) from housing (-42).

CAUTION: DO NOT REMOVE ROLL PINS (-41) FROM HOUSING (-42). EXCESSIVE DAMAGE OR WEAR TO COMPONENTS WILL REQUIRE REPLACEMENT OF THE ASSEMBLY.

CLEANING

1. Cleaning Materials Required

Refer to Table 201 for cleaning materials required.

TABLE 201. REQUIRED CLEANING MATERIALS

Brush, bristle, non-metallic	Commercially available
*Solvent	Fed. Spec. P-D-680
Cloth, clean, lint-free	Commercially available
*Detergent, aqueous anionic No. 815MX	Brulin & Co., Inc. 2920 Martindale Avenue Indianapolis, Ind. 46207
*Detergent, aqueous anionic No. 1300A	Diamond Chemical Co. 56 North Hill Avenue Pasadena, California 91106

NOTE: (a) Equivalent substitutes may be used for above items.

* (b) Alternate materials. Solvent P-D-680 is for use only in well ventilated work areas. Detergents No. 815MX and 1300A are for use in areas that are not well ventilated.

2. Cleaning Procedure

WARNING: SOLVENT P-D-680 IS TOXIC AND FLAMMABLE. AVOID PROLONGED CONTACT WITH SKIN AND KEEP AWAY FROM OPEN FLAME. USE ONLY IN A WELL VENTILATED AREA.

A. Cleaning of Parts

(1) Wash all metallic parts in cleaning solvent (or detergent) using a non-metallic brush to loosen caked dirt.

NOTE: When using either detergent 815MX or 1300A for an immersion bath solution, mix with four parts (by volume) of water. For general cleaning purposes detergent may be mixed with up to 20 parts of water.

(2) If detergent is used, rinse cleaned parts. Dry all parts using a lint-free clean cloth and/or compressed air at 20psig maximum.

WARNING: AVOID DIRECT CONTACT WITH SKIN WHEN USING COMPRESSED AIR.

(3) Do not immerse switch (4, IPL figure 1) in cleaning solution. Clean with a dry lint-free cloth.

INSPECTION/CHECK

1. General

   A. Visually inspect all components for thread damage.

   B. Visually inspect all parts for excessive scoring, cracks, breaks, corrosion, distortion, and other obvious signs of damage.

   C. Use a 10-power magnifying glass to inspect all aluminum castings for cracks. Use flourescent penetrate inspection in accordance with AMS 2645 to check suspected areas.

2. Inspection/Check

   A. Inspect individual parts as indicated in Table 301, Inspection Requirements.

   B. Check dimensional tolerances against requirements outlined in FITS AND CLEARANCES, Table 601, Wear Limits.

   C. Inspect all parts for cleanliness, cracks, deterioration and obvious signs of damage.

      NOTE: Where inspection for burrs, nicks and scratches is required, these are defined as material raised above the parent metal, which if not removed would prevent complete and proper mating of parts. Where nicks or scratches allow bare metal to show through a protective finish, note defect and assign part for rework during repair. Dents must not impair finish or the functional operation of any part of the assembly.

   D. Inspect all threaded parts for crossed or damaged threads. Reject part if thread damage exceeds 50 percent of one thread.

      NOTE: If damage to one thread is 50 percent or less, note defect and assign for rework during repair.

   E. Inspect switch (4, IPL figure 1) for cracks, damaged or corroded terminals or leads, and signs of overheating. Switch part number 1SE3 (14-01480-00) pretravel shall not exceed 0.050 inch; switch part number 2TMT-6-Y (14-01357-00) pretravel shall not exceed 0.047 inch. Switches must be replaced if not within these limits.

   F. Check worm gear assembly (31) runout.

      (1) Assemble worm gear assembly (31), worm gear spacer (32), pivot bolt (30) and nut (28) to housing (-42).

(2) Rotate worm gear assembly (31) and check runout with a dial indicator. Total indicator reading shall not exceed 0.003.

TABLE 301. INSPECTION REQUIREMENTS

PART NUMBER AND ITEM NUMBER (See IPL figure 1)	METHOD OF INSPECTION	CHECK	REQUIREMENTS
Nameplate (2)	Visual	Security & Legibility	Secure & Legible
Switch (4)	Ohmmeter	Resistance	If Resistance exceeds one Ohm, replace switch.
Drive Shaft Gear (16)	Visual	Uniformity of Contact	Contact uniformity must be 75 percent or greater of the working profile.
	Visual	Tooth Profile For Spalling	No visible damage.
	Visual	Tooth Erosion	Erosion shall not exceed 0.010 inch in depth.
Drive Arm Shaft (18)	Visual	Serration wear or damage	No visible damage.
	Visual	Journal for wear or bent shaft	No damage. Refer to Table 601, Wear Limits.
Cover Assembly (22)	Visual	Sleeve, bushing and pin security	No physical looseness.
	Visual	Cracks, signs of wear	No visible damage.
Converter Rack (25)	Visual	Uniformity of contact	Contact uniformity must be 75 percent or greater of the working profile.
	Visual	Tooth profile for spalling	No visible damage.

TABLE 301. INSPECTION REQUIREMENTS (CONTINUED)

PART NUMBER AND ITEM NUMBER (See IPL figure 1)	INSPECTION	CHECK	REQUIREMENTS
Converter Rack (25) (Continued)	Visual	Tooth erosion	Erosion shall not exceed 0.010 inch in depth.
	Visual	Drive slot for excessive wear, damage or scoring	No visible damage. Refer to Table 601, Wear Limits.
Drive Plate Assembly (26)	Visual	Dowel pin security	No physical looseness and no wear.
	Visual	Cracks, signs of wear	No visible damage.
Pivot Bolt (30)	Visual	Journal galling, scoring, discoloration or phonographic grooving	No visible damage.
Worm Gear Assembly (31)	Visual	Uniformity of contact	Contact uniformity must be 75 percent or greater of the working profile.
	Visual	Tooth profile for spalling	No visible damage.
	Visual	Tooth erosion	Erosion shall not exceed 0.010 inch in depth.
	Visual	Dowel pin security	No physical looseness
Worm Shaft Cap (33)	Visual	Cracks or chips or warpage	No visible damage.
Input Drive Worm Shaft (36)	Visual	Journals for discoloration, wear, scoring or bent shaft	No visible damage. Refer to Table 601, Wear Limits.
	Visual	Tooth profile for spalling	No visible damage.

TABLE 301. INSPECTION REQUIREMENTS (CONTINUED)

PART NUMBER AND ITEM NUMBER (See IPL figure 1)	INSPECTION	CHECK	REQUIREMENTS
Input Drive Worm Shaft (36) (Continued)	Visual	Tooth Erosion	Erosion shall not exceed 0.010 inch in depth.
	Magnetic Particle	Cracks, strains and fatigue	No visible damage.
Housing And Bearing Assembly (37)	Visual	Bearing bores for discoloration, wear or scoring	No visible damage.
	Visual	Retainer grooves for chips or cracks	No visible damage.
	Visual	Roll pin security	No physical looseness.

REPAIR

1. General

   A. Replace all parts which do not pass inspection, are damaged beyond simple repair, or show signs of excessive wear. Simple repair will be limited to polishing minor burrs, nicks, scoring, and scratches with number 400 grade abrasive cloth. For micro-finished surfaces, polish with number 600 grade crocus abrasive cloth.

   B. Clean all reworked parts in accordance with instructions detailed in CLEANING and re-inspect and check as detailed in INSPECTION/CHECK. Touch up all metal areas of anodized aluminum parts exposed during repair with alodine 1200 or equivalent.

   C. Do not repair parts listed in Table 101. These parts must be replaced at each overhaul regardless of condition.

ASSEMBLY

1. General

   A. These procedures provide for complete assembly of the windshield wiper converter when all parts were removed during DISASSEMBLY.

   B. Prior to assembly of the windshield wiper converter measure approximately 50 CC's of grease, Specification MIL-G-3278, mixed with 10 percent (by weight) of colloidal graphite and one percent (by weight) of molybdenum disulfide, Type C. Apply grease to components as specified throughout assembly and pack remaining quantity of grease in housing (-42) cavity.

      CAUTION: BE CERTAIN TO LEAVE AN AIR POCKET WHEN FILLING HOUSING (-42) CAVITY WITH GREASE.

2. Assemble Windshield Wiper Converter Assembly. (See IPL figure 1.)

   A. Assemble Housing And Bearing Assembly.

      (1) Lubricate and insert ball bearing (40) and ball bearing (39) into housing (-42).

      (2) Lubricate and install ball bearing (35) on worm shaft (36).

      (3) Position retaining ring (38) on worm shaft (36) and insert this assembly into housing (-42) through longitudinal bore.

      (4) Insert retaining ring (34) in housing (-42) and install worm shaft cap (33).

         NOTE: Do not tighten worm shaft cap (33). During installation of the Electric Windshield Wiper System on the vehicle, the worm shaft cap (33) can be located at either end of housing (-42).

   B. Install Worm Gear Assembly.

      (1) Apply lubricant on worm shaft (36) and worm gear assembly (31). Slide worm gear assembly (31) and worm gear spacer (32) on pivot bolt (30).

         NOTE: Chamfered edge of worm gear spacer (32) must face worm gear assembly (31).

      (2) Insert assembled worm gear assembly (31), worm gear spacer (32) and pivot bolt (30) into housing (-42).

(3) Slide seal (29) on pivot bolt (30) and secure with nut (28).

C. Install Drive Plate Assembly.

(1) Slide drive plate assembly (26) on worm gear assembly (31) dowel pins and secure with two screws (27). Lightly lubricate drive pin extending from drive plate assembly (26).

NOTE: Use crank and rotate worm shaft (36) until pin in drive plate assembly (26) is located in a vertical position closest to the worm shaft.

D. Assemble Drive Arm Shaft And Cover Assembly.

(1) Insert packing (21) or seal (19) into cover assembly (22).

(2) Carefully slide drive arm shaft (18) in cover assembly (22).

CAUTION: DO NOT NICK PACKING (21) OR SEAL (19).

(3) Install pinion spacer (17) and drive shaft gear (16) on drive arm shaft (18). Secure with retaining ring (15) and install retaining ring (14).

NOTE: Punch mark on drive shaft gear (16) must be visible after installation.

E. Install Drive Arm Shaft And Cover Assembly.

(1) Install gasket (23) on housing (-42). Apply lubricant to drive shaft gear (16), the teeth, vertical slot and guide pin slots of converter rack (25), and face of rack spacer (24).

(2) Place rack spacer (24) and converter rack (25) on the two guide pins of cover assembly (22).

(3) Line up converter rack (25) gear teeth and drive shaft gear (16) so the center tooth of the rack engages with the middle valley in the gear.

NOTE: Drive shaft gear (16) has a punch mark to indicate middle valley of gear section.

(4) Press the two assemblies together being certain the vertical slot in converter rack (25) is in line with the drive pin projecting from drive plate assembly (26). Secure with four screws (13).

CAUTION: DO NOT USE EXCESSIVE PRESSURE WHEN FITTING ASSEMBLIES TOGETHER. UNDUE PRESSURE DURING ASSEMBLY INDICATES MISALIGNED PARTS.

NOTE: Be certain gasket (23) remains in position during assembly.

F. Assembly Check.

(1) After converter is assembled check drive arm shaft (18) for rotational free play. It shall not exceed 5 degrees rotation. If limits are exceeded, disassemble and replace drive train.

G. Assemble Windshield Wiper Converter Assembly.

(1) Position shutoff cam (8) and attach washer (10) and screw (9).

NOTE: Some models use self locking nut (9) to secure shutoff cam (8).

NOTE: Do not tighten shutoff cam (8) attaching hardware.

(2) Position switch gasket (7) and install switch (4) with two screws (5). For model 14-91355-34 install actuator (3).

NOTE: Switch gasket (7) is not used on Model 14-91355-34.

NOTE: Refer to applicable vehicle installation drawing for positioning of switch (4). Proper positioning of switch determines left or right hand parking location.

(3) Insert converter crank, listed in Table 701, Test Equipment, into drive end of input drive worm shaft (36 IPL, figure 1). Turn crank until drive arm shaft (18) reaches its extreme rotation depending on left or right hand parking location determined in paragraph 2G(2).

(4) Slowly rotate shutoff cam (8) until contact is made with switch (4) indicated by an audible click. Hold shutoff cam (8) in this position and tighten attaching hardware.

FITS AND CLEARANCES

1. General

Table 601, Wear Limits, provides a list of permissible wear tolerances for specific components. Any component which does not meet the required limits of Table 601 must be repaired or replaced. Table 602, Torque Limits, indicates the torque requirements of the various attaching hardware.

TABLE 601. WEAR LIMITS

PART NAME AND INDEX NUMBER (See IPL figure 1)	WORN AREA	WORN DIMENSION
Drive Shaft Gear (16)	Gear Face (opposite center punch side)	Must be flat and square with center line of square bore and pitch line of gear teeth within 0.004 TIR, taken over entire gear.
	Square Bore	0.2510 inch maximum
	Gear Teeth (PN 14-01345-00)	Measurement from center line of square hole to top of 0.0864 inch DIA pins not to be less than 0.630 (0.005 inch wear)
	Gear Teeth (PN 14-01457-00)	Measurement from center line of square hole to top of 0.0864 inch DIA pins not to be less than 0.428 (0.004 inch wear)
	Gear Teeth	Chips on tooth surface shall not exceed 1/64 inch. Replace if more than a total of two chipped areas appear on one tooth
Pinion Spacer (17)	Faces	Faces must be parallel to each other within 0.003 TIR.
Drive Arm Shaft (18)	Concentricity	0.2360, 0.3120, 0.375 Diameters and 0.2515 square to be concentric to each other within 0.002 inch TIR.

TABLE 601. WEAR LIMITS (CONTINUED)

PART NAME AND INDEX NUMBER (See IPL figure 1)	WORN AREA	WORN DIMENSION
Drive Arm Shaft (18) (CONT)	Serrations	Serrations shall be straight and smooth. Replace shaft if damaged.
Rack Spacer (24)	Faces	Faces must be parallel to each other within 0.003 TIR
Converter Rack (25)	Faces	Faces must be parallel to each other and flat within 0.004 inch TIR
	Slot Width	0.258 inch maximum
	Gear Teeth	Chips on tooth surface shall not exceed 1/64 inch. Replace if more than a total of two chipped areas appear on one tooth.
	Gear Teeth (PN 14-01352-00)	Measurement from top of horizontal slot over two 0.0864 inch DIA pins not to be less than 0.729 (0.005 inch wear)
	Gear Teeth (PN 14-01456-00)	Measurement from top of horizontal slot over two 0.0864 inch DIA pins not to be less than 0.929 (0.005 inch wear)
Input Drive Worm Shaft (36)	Concentricity	TIR between 0.2502 DIA's and 0.1265 square shall not exceed 0.006. TIR between 0.2502 DIA's and 0.333 pitch diameter shall not exceed 0.002.
	Gear Teeth	Measurement over three 0.035 inch DIA pins not to be less than 0.3760 (0.003 inch wear)
Worm Gear Assembly (31)	Backlash	Backlash not to exceed 0.009 inch when parts are mounted on 1.208 inch center distance

TABLE 602. TORQUE LIMITS

PART NAME AND INDEX NUMBER (See IPL figure 1)	TORQUE LIMIT
Screw (5)	4 to 7 inch pounds
Screw (9)	55 to 75 inch pounds
Nut (9)	55 to 75 inch pounds
Screw (-11)	15 to 25 inch pounds
Screw (13)	55 to 75 inch pounds
Screw (27)	55 to 75 inch pounds
Nut (28)	60 to 100 inch pounds

TESTING

1. General

After overhaul, perform the tests described in the following paragraphs to determine if the Windshield Wiper Converter Assembly performs in accordance with the specific design requirements. If the equipment fails to pass the required tests, the test procedure should be stopped immediately, the cause of the failure determined and corrected as described in Table 801, Trouble Shooting.

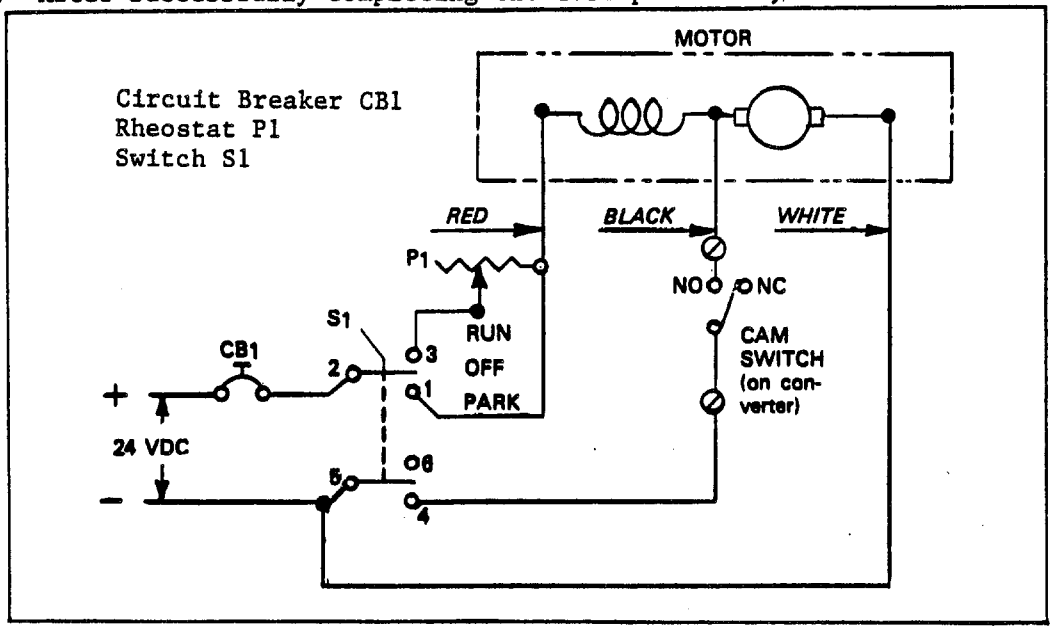
TABLE 701. TEST EQUIPMENT

PART NUMBER	DESCRIPTION
14-19351-00	Converter Crank
14-01321-00 (or equivalent)	Electric Motor, 27 VDC
14-91365-19 (or equivalent)	Cable Assembly (with 1/8 inch square drive end) and (adapter for motor drive)
MS25017-10	Circuit Breaker, 10 AMP
MS35059-31	Toggle Switch, 3-Position
14-91380-00 (or equivalent)	Rheostat, 5 OHM, 25 Watt

2. Manual Test

A. Insert Converter Crank, listed in Table 701, Test Equipment, into drive end of input drive worm shaft (36, IPL figure 1). Turn Converter Crank clockwise and test for freedom of rotation of Windshield Wiper Converter Assembly components. If rotation is binding or restricting refer to Table 801, Trouble Shooting, and re-test.

3. Electro-Mechanical Test



A. Connect Electric Motor, Circuit Breaker, Rheostat, and Toggle Switch listed in Table 701, Test Equipment, as shown in Figure 701, Wiring Diagram. Wire proper leads to switch (4, IPL figure 1) on Windshield Wiper Converter Assembly.

B. Insert Cable Assembly, listed in Table 701, Test Equipment, square end into drive end of input drive worm shaft (36, IPL figure 1). Attach opposite end into Electric Motor and operate Windshield Wiper Converter Assembly for 15 minutes. During this test, there shall be no indication of excessive heat generated from the converter. If any area of the converter feels hot, refer to Table 801, Trouble Shooting, and re-test.

C. After successfully completing the test described in Paragraph 3B, move Toggle Switch to the ON position for several cycles. Move Toggle Switch directly to the PARK position, hold for two seconds and release. The converter should stop in the park position. Repeat ON - PARK sequence several times to observe if proper shutoff cam (8, IPL figure 1) position has been attained. Refer to ASSEMBLY if readjustment is required.

CAUTION: DO NOT HOLD TOGGLE SWITCH IN PARK POSITION FOR MORE THAN TWO SECONDS.

D. After successfully completing the test procedure, stake four screws (13).

Wiring Diagram
Figure 701

TROUBLE SHOOTING

1. General

A list of troubles, probable causes and suggested remedies are listed in Table 801, Trouble Shooting. References are made to IPL, figure 1. After correcting the trouble re-test in accordance with instructions described in TESTING.

TABLE 801. TROUBLE SHOOTING

TROUBLE	PROBABLE CAUSE	REMEDY
Converter Fails To Stop In "PARK" Position	Defective parking switch.	Check for closed circuit with Toggle Switch in "PARK" position.
		Replace switch if circuit is open.
	Incorrect setting of shutoff cam.	Re-set cam shutoff by rotating cam. Refer to ASSEMBLY.
Converter Fails To Operate Or Operation Is Irregular	Flexible coupling not firmly engaged to Motor or converter shaft.	Disassemble and adjust to secure firm seating of flexible coupling.
	Defective flexible drive shaft.	Replace.
	Defective flexible coupling.	Replace.
	No power to Electric Motor.	Check Figure 701, Wiring Diagram.
	Electric Motor wiring not properly installed.	Check Figure 701, Wiring Diagram.
	Failure of Electric Motor.	Replace.
	Defective converter.	Turn square end of converter drive shaft, by hand or crank, continuously in one direction. If jamming or irregular operation, disassemble converter and replace defective parts.

STORAGE INSTRUCTIONS

1. General

   A. If unit is returned to service after a one year storage period it should be checked to assure correct operation.

2. Storage Procedure

   A. For short periods of storage, the unit can be placed in a dust proof plastic bag or container. If the unit is to be stored for long periods of time, it is recommended that it be repackaged in a moisture-proof container with a moisture-absorbing agent such as "Bagged ACTIVATED DESICCANT" per MIL-D-3464B.

1. Introduction

A. Purpose.

This catalog lists and describes the parts required for Windshield Wiper Converters Part Number Series 14-91355 and 14-91455, and is used in conjunction with the Overhaul Manual to serve as an aid to disassembly and reassembly.

B. Usage.

(1) The Detailed Parts List consists of the complete Windshield Wiper Converter listed in disassembly order.

(a) The first column lists the figure and index numbers for all items illustrated in the exploded view.

(b) The second and third columns list the part numbers and description of all assemblies, subassemblies and detailed parts.

(c) The fourth column shows the quantity required per assembly or subassembly.

(d) The fifth column provides for model variations as applicable.

(2) Part Numbering System.

All Marquette Metal Products Co. part numbers used for the equipment being covered are designated by five digit numbers prefixed and suffixed by a two digit number. Government standard parts are prefixed by the letters AN and MS. Purchased parts are listed by the manufacturer's part number. A Marquette Metal Products Co. part number has been assigned to all purchased items and is shown in parenthesis after the description of the part for reference purposes.

(3) Numerical Index.

(a) In the Numerical Index, all parts shown in the Detailed Parts List are arranged in alpha-numerical order. The arrangement sequence of each part begins at the extreme lefthand position and continues left to right, one column at a time, until complete numerical arrangement is determined.

(b) In the first position, the order of precedence is the letters A through Z, then the numerals 0 through 9.

(c) In the second and all suceeding positions, the order of precedence is as follows:

(1) Space (blank column)

(2) Diagonal (slant)

(3) Point (period)

(4) Dash (-)

(5) Letters A through Z

(6) Numerals 0 through 9

NOTE: Alphabetical O's shall be considered numerical zeros. Spaces, diagonals, points and dashes shall not appear in the extreme lefthand position of the part number. They may be used in the second and succeeding positions of the part number and shall take precedence over letters and numerals as indicated above.

(d) The columns used in the Numerical Index are as follows:

(1) PART NUMBER. Parts are listed by their respective part numbers only once, regardless of how many times they appear in the Detailed Parts List.

(2) FORMER PART NUMBER. This column indicates the former part number for each Marquette Metal Products Co. item.

(3) FIGURE AND ITEM NUMBER. For Government standard parts, the figure and item number is shown only for the first listing in the Numerical Index. For all other part numbers, each occurrence is shown.

(4) TOTAL QUANTITY. This column indicates the total quantity of parts for a complete unit of equipment. When a definite quantity cannot be shown, the letters "AR" are used to signify "As Required".

(4) Arrangement of Detailed Parts List.

(a) All assemblies and parts are arranged in the order of disassembly with the exception of attaching parts which follow immediately after the item to be attached.

(b) Subassemblies and parts are indented to indicate their relationship to the complete assembly. Associated with the list is an exploded view illustration. This illustration shows the relative positions of the various assemblies and parts and identifies all assemblies and parts.

(c) The quantities listed in the "Units Per Assy" column are, in the case of assemblies, the total quantity used per unit of equipment at the location indicated, while the component parts indented under the assemblies only show the quantity used per assembly. Therefore, the quantities specified are not necessarily the total used per unit of equipment.

(d) Part variations between models are indicated by letter symbols placed in the "Usable on Code" column of the Detailed Parts List. Where the parts are used on all units of equipment, the column is left blank.

USABLE ON CODE	PARTS LIST NUMBER
A	14-91355 Series (Up to SERNO 6999)
B	14-91355-34 (Up to SERNO 6999)
C	14-91355 Series (SERNO 7000 and Up)
D	14-91355-34 (SERNO 7000 and Up)
E	14-91455 Series (Up to SERNO 6999)
F	14-91455 Series (SERNO 7000 and Up)

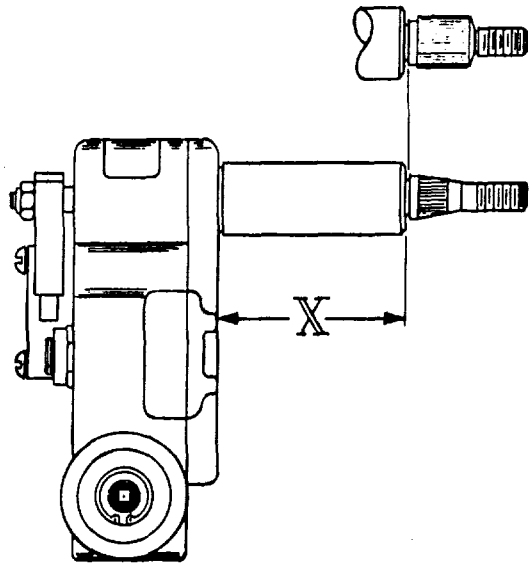
NOTE: Part variations in the Usable on Code column with an "A", "B", or "E" code are for reference identification purposes only. If parts coded "A", "B" or "E" are not serviceable, they are to be discarded and replaced with like parts coded "C", "D" or "F".

(5) Converter Assembly Configuration List.

The configuration list relates the applicable component parts to the converter assembly (-) dash number. The component part numbers shown are for converter assembly serial numbers 7000 and UP only. Refer to Figure 1 for applicable index numbers.

(6) Vendor Codes.

Commercial suppliers are identified by a code in parenthesis immediately following the part description. Code symbols used are in accordance with the Federal Supply Code for Manufacturers, Cataloging Handbook H-4-1, except that each code symbol is preceded by the letter "V". Vendor codes are as follows:



Code	Vendor's Name and Address
V79136	Waldes Kohinoor Inc. 47-16 Austel Place Long Island City, N.Y. 11101
V80207	Unimax Switch Corp. Ives Road Wallingford, Ct. 06492
V81965	Marlin-Rockwell, Div. of TRW Inc. Plainville Works Plainville, Ct. 06062
V86579	Precision Rubber Products Corp. 3110 Oakridge Drive Dayton, Ohio 45417
V88044	Aeronautical Standards Group Dept. of Navy and Air Force
V91929	Honeywell Inc., Micro Switch Division Chicago and Spring Streets Freeport, Illinois 61032
V96906	Military Standards Promulgated by Military Departments Under Authority of Defense Standardization Manual 4120 3M

ELECTRIC MOTOR
FUNCTIONAL TEST INSTRUCTIONS

This manual contains test instructions for the electric motors used in Marquette Division, Curtiss-Wright Corporation wiper system installations. If there is an indication that a unit is not functioning properly, perform tests as indicated. If the unit fails to meet the test requirements, it should be overhauled and retested.

Disassembly and reassembly of the components may be readily determined from the exploded view illustration accompanying the overhaul instructions. Special instructions are given, wherever necessary, for parts requiring special attention. Disassembly of the unit will normally follow the same general order as the key index numbers assigned to the parts in the illustrations.

Test procedures are given first, and where applicable, a trouble shooting chart is provided for localizing the trouble within the unit. Immediately following the test procedures are the overhaul instructions. Motor performance curves are attached at the back of the manual. No special tools are needed for overhaul.

1. FUNCTIONAL TEST PROCEDURE

Connect the motor (refer to Fig. 1 for motor wiring diagram) as shown in the test connection diagram, Fig. 2, and perform the following operational tests. A trouble shooting chart follows the test procedure.

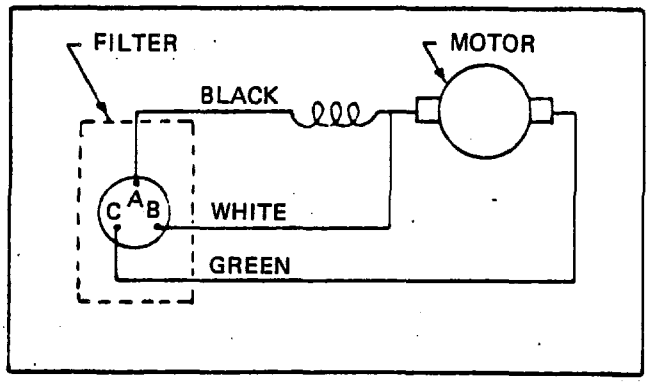
a. Turn the power on and turn switch to SLOW position. If new brushes have been installed, allow motor to run for approximately six hours.

CAUTION

On a long run, resistor box should be watched for overheating.

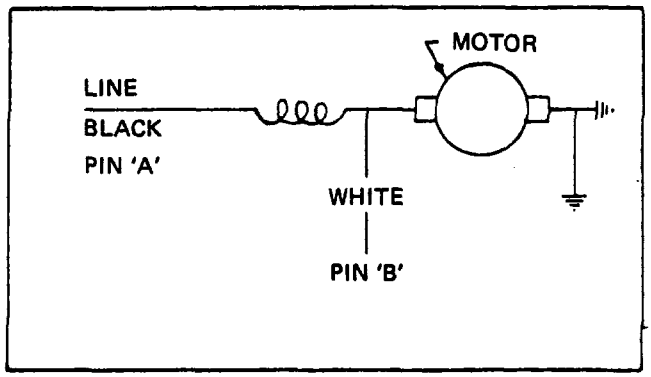
b. After run in, inspect brushes to make certain they are free to move in brush holders and at least 80% of brush area is making contact with commutator.

c. Check for excessive running noise and vibration while running at full speed with no load.



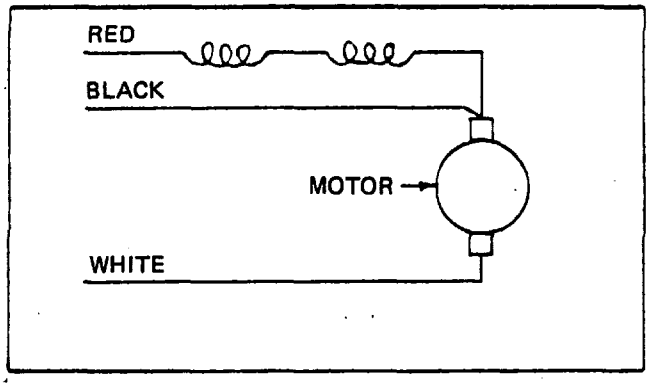
CAUTION

Do not run motor at full speed with no load longer than 30 seconds.



d. Lock the rotor in a stationary position and turn switch to FAST. Circuit breaker must de-energize motor circuit in less than 3 seconds.

e. Apply a load as specified in Table I to the motor and turn switch to FAST. A voltmeter reading taken across the motor input terminals should read as specified in Table I. With the motor hot, ammeter inserted in the line should read as specified in Table I, and motor speed should be RPM minimum as specified in Table I.



f. Turn control switch to PARK position and hold until motor stops. Coasting or creeping is permissible under this load condition.

TABLE II TROUBLE SHOOTING

TROUBLE	PROBABLE CAUSE	REMEDY
MOTOR FAILS TO START	a. Defective power supply.	Check power to motor and correct trouble where necessary.
	b. Defective circuit breaker.	Use an ohmmeter and check for continuity through the circuit breaker. Replace if circuit is open.
	c. Field or armature circuit.	Use an ohmmeter and check for open windings or shorted leads.
	d. Assembly too tight	Check for excessive loading on bearings and shaft. Check for misalignment of parts.
	e. Load excessive	Check for correct load.
	f. Improper electrical connection.	Check electric power supply to motor.
	g. Open external circuit.	Check electric power supply to motor.
	h. Faulty internal wiring.	Check field coils for continuity. Make sure brushes move freely in holders and make contact with the commutator. Check armature windings.
NOISY MOTOR	a. Defective motor components.	Check rotor shaft for correct alignment, commutator and bearings for wear. Replace any defective component.
	b. Insulation rubbing.	Check clearance of insulation.
	c. Armature not concentric.	Replace armature.
	d. Bearing faulty.	Replace damaged bearings.

TABLE II TROUBLE SHOOTING (continued)

TROUBLE	PROBABLE CAUSE	REMEDY
CIRCUIT BREAKER FAILS TO DE-ENERGIZE MOTOR	a. Defective circuit breaker.	Replace the circuit breaker.
EXCESSIVE CURRENT CONSUMPTION WHEN MOTOR OPERATES UNDER LOAD AND MOTOR FAILS TO REACH MINIMUM SPEED.	a. Arcing at brush and commutator due to bad brush contact or worn brushes.	Replace brushes. Commutator dirty or glazed causing poor contact with brushes. Clean commutator.
	b. Field strength below normal.	Same reasons indicated above. Also check power supply for correct voltage.
	c. Shorted commutator segments or short in rotor windings.	Check with ohmmeter.
	d. Rough commutator.	Resurface commutator.
	e. Mica insulation too high between commutator segments.	Undercut mica insulation.
	f. Open circuit in armature.	Replace armature.
MOTOR FAILS TO STOP IN "PARK" POSITION	a. Defective parking switch.	Check for closed circuit with control switch in "PARK" position. Replace switch if circuit is open.

FIGURE 3 EXPLODED VIEW OF HEAVY DUTY TYPE ELECTRIC MOTOR ASSEMBLY

2. DISASSEMBLY (HEAVY DUTY TYPE)

a. Disassembly is in accordance with the key index number assigned to the exploded view illustration except as noted (see Figure 3).

b. Remove the four nuts (2) and the two "U" bolts (3) freeing the motor mount (1) from the motor assembly.

c. Unscrew and remove the end cap, if the motor is used as a single end drive unit. The cap may be on either end.

d. Using a suitable tool, expand the snap ring (9) and withdraw the nuts (8).

e. If name plate (6) is damaged, remove it by taking out the four screws (7).

f. Remove four screws (5), lift up the receptacle or filter (4) and unsolder the lead wires to effect complete removal. Take out four screws to remove adapter plate if applicable.

g. Remove the two screws (11) and then back off the two brush holder screw assemblies (10). Unscrew the two brush holder screws (12) and lift out the two brush and spring assemblies (13).

NOTE

Mark the position of the brush and spring assembly when removing from the brush holder. This will facilitate reassembly in the proper position if the brush and spring assembly is still usable.

h. Remove the shunt (17) by removing screw (15) and washer (16). Remove the two screws (15) and washers (16). Separate the shaft end bracket (14) from the field assembly (21). Tap lightly around

the periphery of the end bracket with a rawhide mallet to aid in separation of the two parts.

NOTE

Inscribe alignment marks on both the shaft end bracket and field assembly to ensure correct positioning during reassembly.

i. Carefully withdraw the armature assembly (19) with the two ball bearings (18) from the commutator bracket assembly. Remove the bearings from the armature shaft, using a suitable bearing puller. Remove the load spring (20) from the commutator bracket assembly.

j. Withdraw the field assembly (21) from the commutator bracket assembly enough to disengage the lead wire clip from the slot in the brush holder assembly (23) and then lift free. Detach the lead and clip assembly (22) from the other brush holder assembly.

k. Take out the two screws (24) that secure the brush holder assemblies (23). Remove the two brush holder assemblies. Pull out pin (25) from the bracket (26) if damaged.

NOTE

Grounding stud is only used on internally grounded motors.

3. CLEANING

a. Wash all parts in cleaning solvent, Federal Specification P-S-661, except for shunt (17), receptacle or noise filter (4), brush holder screw assembly (10), brush and spring assembly (13), armature assembly (19) and field assembly (21). Dry parts immersed in solvent with dry compressed air.

b. Clean insulated wires and other electrical parts with a clean, lint-free cloth dampened with solvent.

CAUTION

Do not soak electrical parts in cleaning solvent.

4. INSPECTION

a. Inspect the armature shaft to ensure that it is not bent, worn or damaged. Check the shaft dimensions in accordance with Table III. If any of the shaft dimensions are not in accordance with Table III, replace them.

TABLE III ARMATURE SHAFT

INSPECT	DIMENSIONS (inches) Min.	Max.
Length of shaft	6.82812	6.85938
Ends across flats	0.147	0.150
End diagonal	0.194	0.196
Bearing surface diameter	0.3148	0.3151

b. Check commutator for roughness, pitting, scoring or excessive wear. If any of these conditions are apparent, resurface the commutator in accordance with paragraph 6. a.

c. Check brushes for excessive wear, signs of arcing or other damage that might result in motor malfunction. Also check the length of the brushes. When new, the brushes are 13/16 inch long. If the brushes have worn to less than 9/16 inch, they should be replaced. See paragraph 6. d. for brush replacement and run-in procedure.

d. Inspect the load spring for corrosion, distortion or permanent set. Measure the force required to compress the spring to 1/16 inch. This force should be between 3 and 7 pounds. If a greater or lesser force is required, replace the spring.

e. Inspect the brush springs for signs of distortion, permanent set or cracking. Check to ensure that the overall length is not greater than 1 5/32 inches or less than 1 3/32 inches.

f. Check ball bearings with a magnifying glass for balls that are pitted. Also for roughness or any other obvious defects.

g. Check all wiring insulation for soundness. Check for grease or other conditions which may cause failure. Inspect all wiring for conditions which may result in open or short circuits.

h. Inspect all threads for signs of damage. Check the screws for damaged heads.

5. TESTING

a. Using an ohmmeter, check the field winding resistance. Resistance at 24°C (75°F) should be 0.370 ohms. Test for grounded coils. Replace the field windings if the resistance is not 0.370 ohms.

b. Test the armature winding for resistance at 24°C (75°F). Resistance should be 0.105 ohms. Replace the armature if the resistance value is not as mentioned.

6. REPAIR OR REPLACEMENT

a. RESURFACING COMMUTATOR. Before resurfacing commutator, assure that the previous overhaul has not reduced the diameter to the minimum limits of 59/64 inch. Using a suitable tool, take the lightest possible cut until the proper clean-up is accomplished.

b. UNDERCUTTING THE MICA. After the commutator has been turned, undercut the mica insulation between the commutator bars to the width of the mica and a depth of 0.032 inch and approximately 1/2 inch long.

c. POLISHING COMMUTATOR. Smooth and polish the commutator by using a piece of heavy manila paper at a speed of approximately 700 surface feet per minute (1725 RPM).

CAUTION

Do not use sandpaper or emery cloth. Keep the commutator free of oil at all times. Thoroughly clean the commutator of all foreign particles with dry filtered compressed air at low pressure. Do not touch the commutator surface after the final finish is obtained. Finger prints will effect the performance of the electric motor assembly.

d. REPLACING BRUSHES. Replace brushes if they are less than 9/16 inch long. If the commutator has been resurfaced, new brushes installed or old brushes installed in the wrong brush holder, the brushes must be run-in until they are approximately 80 percent seated. To seat brushes, wrap a strip of No. 000 sandpaper around the commutator. Install the brushes so that they ride against the sandpaper, then rotate the commutator in the direction of rotation (counterclockwise when viewed from drive end) by hand until the brushes are properly seated).

CAUTION

After seating brushes, carefully clean the commutator of all carbon particles. In particular, clean out the undercut mica spaces between the commutator segments.

7. LUBRICATION

NOTE

The manufacturer of this equipment recommends that the two ball bearings be lubricated with Dow Corning medium grease DC-44.

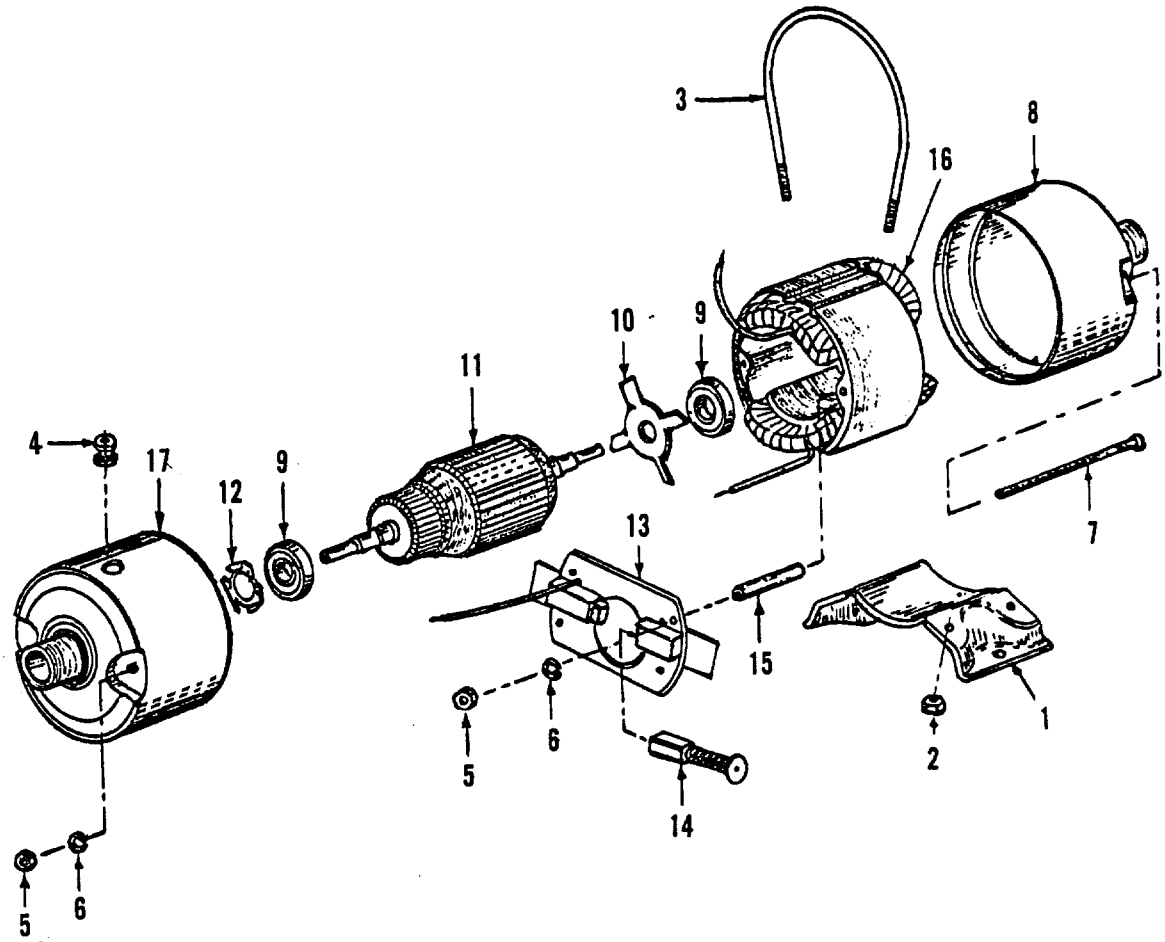
8. REASSEMBLY

a. In general, reassembly is in the reverse order of disassembly with the exception of the following points. Reassemble the motor using the exploded view illustration (see Figure 3).

b. Reinstall the receptacle or filter (4) in the same position that it was prior to disassembly. After soldering the lead wires to the receptacle pins, slide protective sleeving over the connections. Refer to Figure 1 for schematic diagram of internal motor wiring.

NOTE

Paint around clip end of brush holder and adjacent parts of the casting with Westinghouse No. 672 red oil-proof enamel, as recommended by the manufacturer of this unit.



CAUTION

Do not allow paint to run into the clip slots on the brush holder assemblies.

c. Apply one coat of black air-dry paint on any area of the housing from which paint has been chipped.

NOTE

Be careful not to paint the collar portions of the housing adjacent to the ends of the shaft.

FIGURE 4 EXPLODED VIEW OF ELECTRIC MOTOR ASSEMBLY

2. DISASSEMBLY (LIGHT PLANE TYPE)

a. Disassembly is in accordance with the key index number assigned to the exploded view illustration except as noted (see Figure 4).

b. Remove the four nuts (2) and the two "U" bolts (3) freeing the motor mount (1) from the motor assembly.

c. Remove the two outer nuts (5) and washers (6). Separate the commutator end bracket (17) from the assembly. Tap lightly around the periphery of the end bracket with a rawhide mallet if the parts do not separate freely. Feed the three lead wires through the grommet (4) to remove commutator end bracket completely. Remove load spring (12) from end bracket.

NOTE

Inscribe alignment marks on brush box and holder assembly, field assembly and shaft end bracket, to ensure correct positioning during re-assembly.

d. Remove the two inner nuts (5) and washers (6). Withdraw the two screws (7) from the brush box and holder assembly (13) from two spacers (15) and from field assembly (16) and shaft end bracket (8).

e. Separate the shaft end bracket (8) from the field assembly (16). Tap lightly around the periphery of the end bracket with a rawhide mallet to aid in the separation of the two parts.

f. Carefully withdraw the field assembly (16) with the brush box and holder assembly (13) and the armature assembly (11) with two ball bearings (9) and fan (10) from the end housing bracket (8).

g. Remove dust cover washer from front ball bearing (9) where applicable.

To remove armature assembly (11) with fan (10) and bearing (9) from the field assembly (16) push the two brushes (14) inside the brush boxes and withdraw the armature assembly from the brush holder assembly and field assembly.

NOTE

Brushes will spring out from the brush boxes after passing over the front bearing.

h. To remove the brush box and holder assembly (13) from the field assembly (16) unsolder the field leads from the holder and slip from the external lead wires.

i. Remove the bearings from the armature shaft, using a suitable bearing puller.

j. Remove the fan (10) from the armature shaft using a suitable gear, or bearing puller.

3. CLEANING

a. Wash all parts in cleaning solvent, Federal Specification P-S-661. except brush box and holder assembly (13), brush and spring assembly (14), armature assembly (11), and field assembly (16). Dry parts immersed in solvent with dry compressed air.

b. Clean insulated wires and other electrical parts with a clean, lint-free cloth dampened with solvent.

CAUTION

Do not soak electrical parts in cleaning solvent.

4. INSPECTION

a. Inspect the armature shaft to ensure that it is not bent, worn or damaged. Check the shaft dimensions in accordance with Table IV. If any of the shaft dimensions are not in accordance with Table IV, replace them.

TABLE IV ARMATURE SHAFT

INSPECT	DIMENSIONS (Inches) Min.	Max.
Length of Shaft (Single end drive)	4.796	4.828
(Double end drive)	5.580	5.595
Bearing Surface Diameter (over serrations)	.255	.257

b. Check commutator for roughness, pitting, scoring or excessive wear. If any of these conditions are apparent, resurface the commutator in accordance with paragraph 6. a.

c. Check brushes for excessive wear, signs of arcing or other damage that might result in motor malfunction. Also check the length of the brushes. When new, the brushes are 1/2 inch long. If the brushes have worn to less than 3/16 inch, they should be replaced. See paragraph 6. d. for brush replacement and run-in procedure.

d. Inspect the load spring for corrosion, distortion or permanent set. Measure the force required to compress the spring to 1/16 inch. This force should be between 3 and 7 pounds. If a greater or lesser force is required, replace the spring.

e. Inspect the brush springs for signs of distortion, permanent set or cracking. The brushes used in this motor are part of the field assembly, and the only way that replacement can be accomplished is by complete disassembly of the motor and partial destruction of the brush holder assembly.

f. Check ball bearings with a magnifying glass for balls that are pitted. Also for roughness or any other obvious defects.

g. Check all wiring insulation for soundness. Check for grease or other conditions which may cause failure. Inspect all wiring for conditions which may result in open or short circuits.

h. Inspect insulation strips attached to brush box and holder assembly.

i. Inspect threads for signs of damage. Check the screws for damaged heads.

5. TESTING

a. Using an ohmmeter, check the field resistance. Resistance at 24°C (75°F) should be 12V - .208 - 24V - .722 ohms. Test for grounded coils. Replace the field assembly if the resistance is not as mentioned.

b. Test the armature winding for resistance. Resistance at 24°C (75°F) should be 12V - .092 - 24V - .289 ohms. Replace the armature if the resistance value is not as mentioned.

6. REPAIR OR REPLACEMENT

a. Resurfacing Commutator

Before resurfacing commutator, assume that the previous overhaul has not reduced the diameter to the minimum limits of 11/16 inch. Using a suitable tool, take the lightest possible cut until the proper cleanup is accomplished.

b. Undercutting the Mica

After the commutator has been turned, undercut the mica insulation between the commutator bars to the width of the mica and a depth of 0.032 inch and approximately 11/32 inch long.

c. Polishing Commutator

Smooth the polish the commutator by using a piece of heavy manila paper at a speed of approximately 700 surface feet per minute (3600 RPM).

CAUTION

Do not use sandpaper or emery cloth. Keep the commutator free from oil at all times. Thoroughly clean the commutator of all foreign particles with dry filtered compressed air at low pressure. Do not touch the commutator surface after the final finish is obtained. Finger prints will effect the performance of the electric motor assembly.

d. Replacing Brushes

Replace brushes if they are less than 3/16 inch long. If the commutator has been resurfaced, new brushes installed or old brushes installed in the wrong brush box, the brushes must be run-in until they are approximately 80 percent seated. To seat brushes wrap a strip of No. 000 sandpaper around the commutator. Install the commutator in the direction of rotation (clockwise when viewed from commutator end) by hand until the brushes are properly seated.

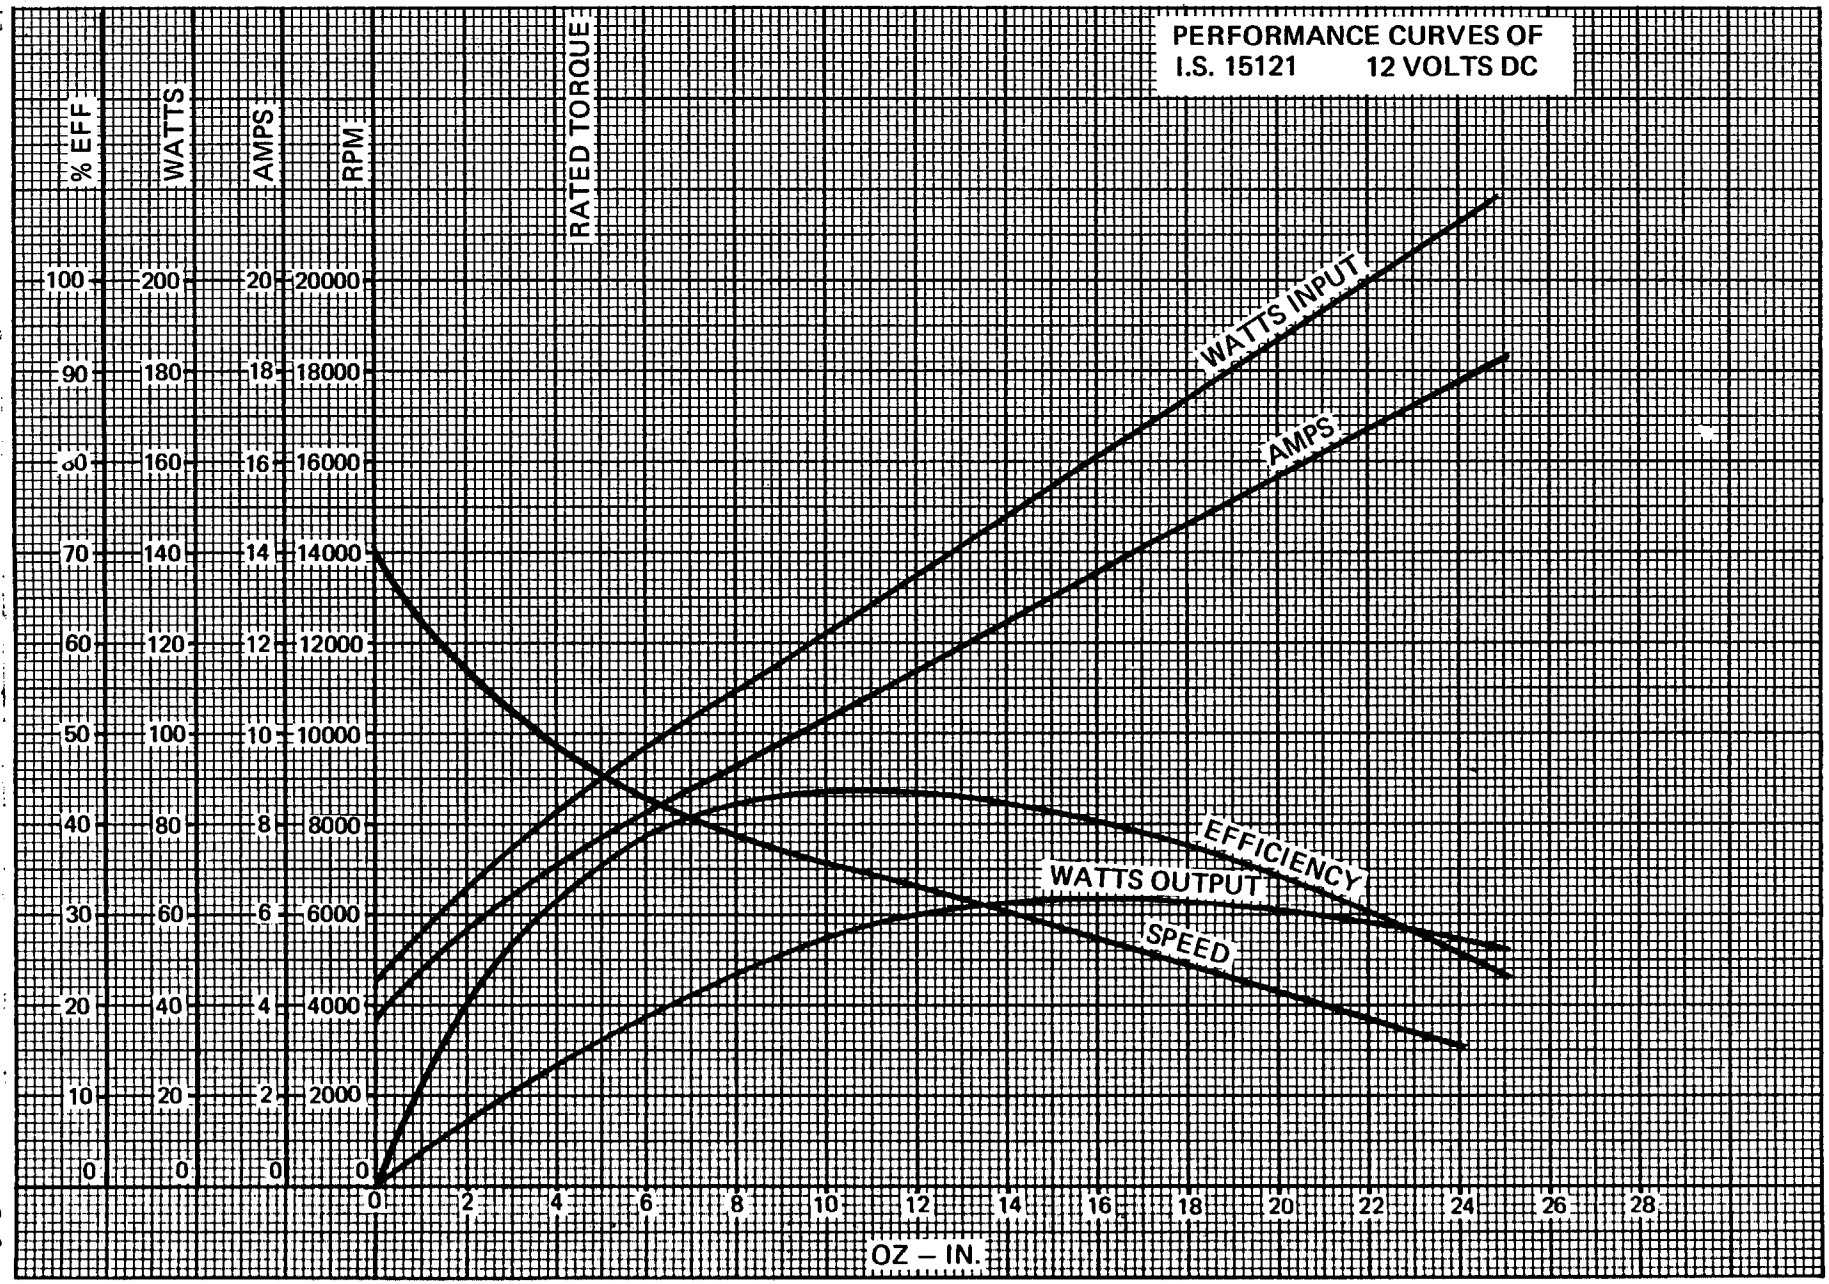
CAUTION

After seating the brushes, carefully clean the commutator of all carbon particles. In particular, clean out the undercut mica spaces between the commutator segments.

7. LUBRICATION

NOTE

The manufacturer of this equipment recommends that the two ball bearings



be lubricated with Dow Corning medium grease DC-44.

8. REASSEMBLY

a. In general, reassembly is in the reverse order of disassembly with the exception of the following points. Reassemble the motor using the exploded view illustration (see Figure 4) up to the point of installing the inner two lockwashers and two nuts.

b. Thread the three lead wires through the commutator end bracket and grommet, before slipping the commutator end bracket over the brush boxes making sure that the insulation strips are folded over the top of the brush boxes, now push the two brackets together and complete the assembly.

These instructions do not purport to cover all details or variations in equipment nor to provide for every possible contingency to be met in connection with installation, operation and maintenance. Should further information be desired or should particular problems arise which are not covered sufficiently for the purchaser's purposes, the matter should be referred to the General Electric Company.

3S2060DM109A1 AND A2

TEMPERATURE CONTROLLER

INTRODUCTION

These instructions cover the Operation and Service for the 3S2060DM109A1 and A2 Temperature Controller shown in Fig. 1 and 2.

These controllers are used with a specially constructed windshield having a temperature sensitive resistance imbedded in the windshield as well as heating elements or a special conductive coating in the windshield which offers resistance to the flow of current, thereby heating up when supplied with power.

The controllers are "fail safe" for failures consisting of disconnecting or burning out of the temperature sensor, or loss of power to the controller. In these cases, the pilot relay will drop out, preventing the windshield from overheating.

The A2 differs from the A1 in that the housing is different and the A2 has the Zener Diode and resistor R12 mounted on the cover (heat sink) where the A1 has them mounted on the component assembly board. See outline and connection diagrams Figs. 3, 4, 8 and 9. The two models are electrically the same.

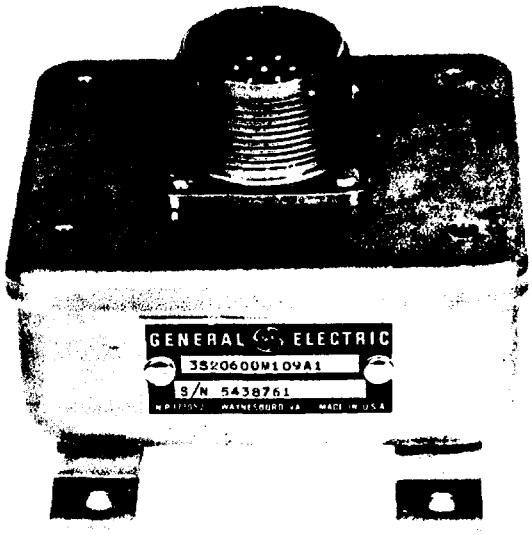

Fig. 1 Assembled View of 3S2060DM109A1 Temperature Controller (6025-349).

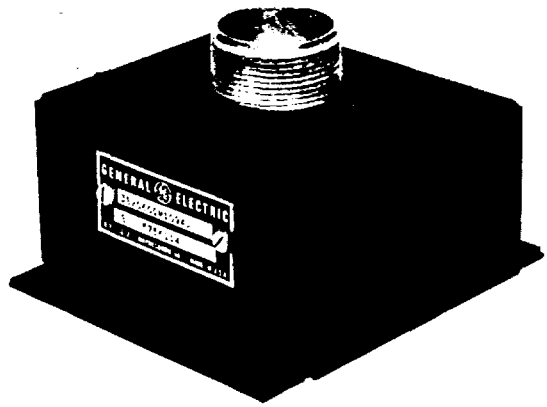

Fig. 2 Assembled View of 3S2060DM109A2 Temperature Controller (SCWP62-180).

LEADING PARTICULARS

Model 3S2060DM109A1

1. Weight ..... 0.80 pounds max.
2. Length ..... 3.70 inches
3. Width ..... 3.55 inches
4. Height ..... 2.85 inches
5. Power Dissipation ..... 7.5 watts
6. Input voltage ..... 22-29 volts, DC
7. Output ..... 0.5 amperes to coil of K1 whose contacts are rated 2 amperes at 115 volts, 400 CPS
8. Ambient Temperature ..... -65°F to +160°F (-55°C to +71°C)
9. Shock ..... 15g's

The A2 leading particulars are the same except the length is approximately 4 inches and the height is approximately 2.5 inches.

INSTALLATION

MOUNTING

The A1 controller has two brackets attached to the base with rivets. Each bracket has two 0.185 inch diameter mounting holes, four holes in all, to accommodate #8 bolts.

The A2 model has two mounting holes in a flange on either side of the cover. These flanges are formed with the cover.

These controllers may be mounted in any position, taking into consideration that:

1. Space must be allowed for making connections to AN connector MS3102A-20-27P.
2. Temperature adjustments are made through the front side of the drawn aluminum housing on the A1 model and through the top cover on the A2 model.
3. The temperature setting is made at the factory before the unit is shipped, so no readjustment should be required. The factory temperature setting is approximately 100°F (38°C). If adjustment is required, see "Adjustment Procedure".

CONNECTIONS

CAUTION

Due to the high sensitivity of this unit, excessive ripple on the DC input from a poorly filtered ground power supply may cause the controller to turn on and fail to turn off. The aircraft battery should always be used to help filter the DC bus.

Electrical connections to the temperature controller are made through connector AN3102A-20-27P on the controller.

Electrical connections to the power supply, sensor in the windshield, and the windshield power contactor should be made in accordance with the interconnection diagrams, Figs. 5 and 6.

CAUTION

When 100 volts, 400 CPS is used to power the heating elements in the windshield, make sure the AC connections are properly shielded and the shielding grounded to prevent interference with electrical instruments on the pilot's instrument panel.

Use proper wire size for connections as called out on interconnection diagrams, Figs. 5 and 6.

This controller weighs a maximum of 0.8 pounds and will not appreciably affect the weight and balance of the aircraft.

CAUTION

All wiring should be checked before the system is energized because any error in connection will damage the controller.

DESCRIPTION

GENERAL

The temperature controller is a transistorized amplifier which compares the resistance of a sensor imbedded in the windshield with a preselected resistance value. If the resistance of the sensor is less than the preselected value, (as in the case of a cold windshield), the pilot relay K1 picks up. The pilot relay controls a contactor (external to the controller) which in turn applies power to the windshield. As the windshield heats up, the resistance of the sensor increases until such time as it is slightly higher than the preset resistance value. The pilot relay then drops out and the contactor disconnects power to the windshield.

The controller has an adjusting potentiometer R14 which allows the selection of the desired operating temperature of the windshield. In order to prevent the contactor from cycling power on and off at rapid rates, especially in cold temperatures, the controller allows the windshield temperature to vary above and below the selected windshield temperature by 10°F (6°C). This means that if a temperature of 100°F (37°C) were selected, the vinyl layer of the windshield would vary from 90°F (32°C) to 110°F (43°C).

A narrower temperature band can be provided if required for a particular windshield installation. Although the controller will operate continuously over an ambient range of -65°F to +160°F (-55°C to +71°C), better control of the windshield temperature can be achieved by mounting the controller in an area of fairly constant temperature. This will minimize drift in nominal temperature of the windshield.

As soon as the heat control switch is placed in the ON position, the temperature controller senses the windshield temperature. If windshield temperature is not within 100 ± 10°F (38 ± 6°C), relay K1, whose contacts are in series with the power supply and the heating elements, will close. This supplies power to the heating element in the windshield, causing the windshield to heat up.

When the temperature of the windshield rises to the upper limit of 100 ± 10°F (38 ± 6°C), relay K1 will deenergize and power will be removed from the heating element.

ADJUSTMENT PROCEDURE

Temperature adjustments are made through the front side of the drawn aluminum housing on the A1 model and through the top cover on the A2 model. The units are set at the factory to regulate a windshield temperature of approximately 100°F (38°C).

If readjustment is required, one turn clockwise will increase the windshield temperature approximately 25°F (13°C).

To check the windshield temperature control point see "Temperature Operating Point Check" under "TEST PROCEDURE".

A resistance of approximately 333 ohms of the windshield sensor corresponds to a temperature of 100°F (38°C).

THEORY OF OPERATION

NOTE

Please refer to the elementary drawing, Fig. 7, when following the Theory of Operation.

GENERAL

The temperature controller is composed of the following parts:

1. Voltage Regulator
2. Difference Amplifier
3. Switch Amplifier
4. Output Switch

VOLTAGE REGULATOR CIRCUIT

The voltage regulator consists of an 18-volt zener diode and voltage dropping resistor R12. Input voltage in excess of 18 volts is dropped across the series voltage dropping resistor R12 maintaining a regulated 18 volts to circuit 2 of the controller.

DIFFERENCE AMPLIFIER

Transistors Q1 and Q2, their respective collector resistances R5 and R6 and their common emitter resistance R7 form a difference amplifier. The voltage divider formed by R1, R2, R14 and R4 is connected across the regulated 18 volts and supplies necessary bias voltages to the bases of transistors Q1 and Q2 through their respective resistors R16 and R8. Resistor R16 is the sensor resistor (temperature sensitive resistor) imbedded in the windshield.

The adjustable rheostat R14 is used to precisely set and determine the voltage difference between the R16 voltage to the base of transistor Q1 and the R8 voltage to the base of transistor Q2. Since R16 is supplied from a slightly higher potential than R8, the voltage to the base of Q1 is reduced to the level of Q2 base by the divider action of resistor R9 with R16. Diode CR5 is used for temperature compensation which is explained in the note at the end of this section.

Assume that the windshield is cold and therefore the resistance of sensor resistor R16 is low. This will increase the R16 current some of which will flow in the base of Q1 turning Q1 further on. The resulting increase in Q1 emitter current flowing through the common emitter resistor R7 will increase the voltage at Q2 emitter as well as that on Q1 emitter. This has the effect of back biasing Q2, turning it farther in the off direction. Turning Q2 further off allows R6 to supply more current to Q3 turning it on.

SWITCH AMPLIFIER-OUTPUT SWITCH

The switch amplifier consists of transistor Q3 and associated circuitry. The output switch consists of transistor Q4 and associated circuitry.

Like transistors Q1 and Q2, the bias voltage to the emitter of Q3 is supplied from the voltage divider circuit.

When Q3 is not conducting, there is no voltage drop across resistor R10 and the voltage on circuit point 15 is the same as the voltage on circuit point 2 which is slightly higher than the voltage at circuit point 13 due to the voltage drop across diodes CR2 and CR3 which is caused by the current thru them and resistor R15, which is directly across 18 volts. With voltage at circuit 15 higher than the voltage at circuit 13, the PNP transistor Q4 is biased off and is sufficiently high to prevent thermal runaway and eventual turn-on of Q4 with diode leakage current through the base and collector of Q4.

As Q3 starts to conduct, due to Q2 being turned off, the voltage at the base of Q4 decreases as the IR drop across R6 increases. This decreases the bias across the emitter (circuit point 13) and the base and Q4 would be biased on and start to conduct.

As Q4 starts to conduct, the collector potential would start to rise, which would allow current to flow from the collector to the base of Q3 through the regenerative path supplied by resistor R13. The increased base current in Q3 would in turn increase its collector current and therefore Q4 base current turning Q4 further on. This "snow-balling" effect causes Q4 to snap on.

When Q4 snaps on, its collector current flows through the relay operating coil of relay K1. The capacitor C3 across K1 prevents rapid changes in voltage across the coil and therefore minimizes relay chatter. The diode CR4 also minimizes relay chatter by providing a free wheeling path for the relay coil current during momentary interruptions of Q4 collector current.

As this is a very sensitive circuit operating at signal levels susceptible to AC pickup, the capacitor C1 was added to keep AC off the base of Q3 and capacitor C2 was added to keep AC off the base of Q4.

The normally opened contacts of relay K1 constitute the controllers output (pins J and K) supplying continuity to actuate a contactor to supply power to the windshield. This power can come from a battery, the aircraft AC system, or a special inverter such as General Electric's 3S2060DV105A1 or A2.

NOTE

The difference amplifier is uniquely balanced such that it usually requires no temperature compensation to maintain proper operation over the temperature range. Such is the case with this difference amplifier; however, as the temperature of Q3 increases, it requires more bias (lower voltage on its base) to prevent its collector current from increasing with no change in the sensor resistance (R16). To increase the bias on Q3, diode CR5 is connected from the base of Q1 through resistor R9 to ground. One of the characteristics of a diode is that as its temperature is increased, its forward voltage drop decreases. This decrease in voltage with increasing temperature decreases the voltage on the base of Q1 tending to turn Q1 off. The resulting decrease in Q1 collector current lowers the voltage drop across R7 and the voltage at the emitter of Q2 tending to turn Q2 further on. This increases the voltage drop across resistor R6 decreasing the voltage on the base of Q3 counteracting the increase in base voltage due to thermal conduction of Q3.

Component values are selected such that Q3 collector current and therefore the snapping point of the Q3-Q4 combination remains constant over the temperature range.

MAINTENANCE

GENERAL

This panel requires no periodic maintenance. Do not remove the cover of this panel except for maintenance or overhaul.

MALFUNCTION MAINTENANCE

If this panel should malfunction, the following procedure should be followed:

1. Remove cover from the equipment.
2. Inspect for loose screws, nuts, or components that might have become loose from vibration.
3. Tighten loose screws, nuts, and components.
4. Replace all malfunctioning or damaged components with approved replacement parts.
5. Replace all wiring and components that show signs of burning, wear, or deterioration.
6. Inspect for bent bracing, missing sleeving, and loose cord ties. Rework where necessary.
7. Thoroughly clean the equipment with gentle blasts of dry compressed air.
8. Modify equipment in accordance with any service bulletins that have been issued since the manufacture of the equipment or since it was last overhauled.
9. If the component causing the panel malfunction has not been discovered by this time, refer to the trouble shooting instructions as an aid in locating the trouble.
10. After complying with the above instructions, test and make adjustments to the equipment in accordance with the test procedure section that follows this section.

COMPONENT TESTING

Resistors and Capacitors - with all leads disconnected from one connection of the resistor or capacitor, measure its value with an impedance bridge. Compare the measured value with the value given in the parts list. If values do not agree, replace the component.

Transistors - test transistors with a Model 575 Transistor-Curve Tracer manufactured by Tektronix, Inc., Portland, Oregon or on equivalent equipment.

Zener Diode - Zener diode must maintain a voltage of less than 19 volts at circuit point 2.

TEST PROCEDURE

WARNING

This test procedure is written for the general guidance of competent and experienced electrical service personnel. It does not purport to include a complete statement of the safety precautions which should be observed in servicing this equipment nor does it attempt to cover all details or provide for every possible contingency to be met in connection with installation, operation or maintenance. The servicing of this equipment by inadequately trained or inexperienced personnel involves risks both to such personnel and the equipment for which its manufacturer cannot accept responsibility.

NOTE

The limits given for the following tests are room temperature values. The accuracy of the measuring instruments must be within the limits shown in the list of test equipment.

The limits given will insure meeting the specification limits under different environmental conditions.

TABLE I

TEST EQUIPMENT REQUIRED

EQUIPMENT	DESCRIPTION
Supply, shop	15-30 volts DC, accuracy ± 0.2 volts fused to 0.5 amperes. Supply must not drop more than 0.2 volts and 0-1.0 ampere with load.
Voltmeter, DC	0-50 volts ± 1.0%.
Ammeter, DC (averaging)	0-0.5 amperes ± 1%.
Resistance	Decade box 0-400 ohms in 0.1 ohm steps. 10 ma rating.
Multimeter	Shop meter.

TEST

With all power disconnected from the controller and using a shop multimeter, measure the pin to pin resistance on AN connector as shown below:

a. Pins J, K, I, C, L, N, H, D, M and G to all other pins - infinity.

b. Pin A to pin E 250 ohms ± 5%.

c. Pin A to pin F 250 ohms ± 5%.

ZENER DIODE TEST

1. Apply 28 volts DC (positive to pin E and ground to pin F) through a 0-0.5 ampere, DC meter.

2. Ammeter should indicate 175-250 ma if value of R12 is 47 ohms and 248-358 ma if R12 is 33 ohms.

3. Adjust input supply to 22 volts DC. Current through ammeter should be 47-123 ma if R12 is 47 ohms and 66-176 ma if R12 is 33 ohms.

4. Adjust input supply to 29 volts DC. Current should be 195-270 ma with a 47 ohm resistance. Current should be 279-388 ma with a 33 ohm resistance.

TEMPERATURE OPERATING POINT CHECK

1. Connect ohmmeter between pins J and K.

2. Apply 28 volts DC (positive to pin E and ground to pin F).

3. Connect the decade resistance box between pins A and B. Set resistance box at 330 ohms.

4. Adjust resistor R14 until relay K1 just picks up. (ohmmeter reads 0 ohms.)

5. Vary the decade resistance box to determine the dead band. The difference between the pickup and dropout resistance should be 7 + 2, -3 ohms.

6. Set decade resistance box to 300 ohms. Vary R14 to determine that relay K1 will pick up.

7. Set decade resistance box to 370 ohms. Vary resistor R14 to determine that relay K1 will pick up.

8. Reset resistor R14 for pickup with a decade resistance box setting of 330 ohms +5, -4 ohms.

9. Adjust the input voltage to 22 volts DC. Relay K1 pickup and dropout points should not differ by more than 1.6 ohms from the values obtained in paragraph 8.

10. Varying the decade resistance box to pick up and drop out relay K1 should result in no relay chattering or buzzing and the dead band should be within ± 0.5 ohm of the value measured in paragraph 5 above.

FAIL-SAFE TEST

1. Adjust the input voltage to 28 volts, and set decade resistance box to pick up relay K1.

2. Open decade resistance box circuit by removing connection from either pin A or pin B. Relay should immediately dropout. (Ohmmeter reads infinity.)

3. With decade resistance box set to one ohm greater than value required to pick up K1, momentarily apply a ground at pin A (jumper pin A to pin F). Relay K1 should drop out. Repeat with ground at pin B.

TROUBLE SHOOTING

If this panel malfunctions, it should be tested and adjusted in accordance with the test procedure in the previous section.

If panel cannot be adjusted, check for:

1. Approximately 18 volts at circuit 2. Must be less than 19 volts.

2. Approximately 9.1 volts at circuit 9.

3. Approximately 9.9 volts at circuit 17.

4. Approximately 11.9 volts at circuit 8.

5. Balanced voltage (5 - 7 volts) on bases of Q1 and Q2 when resistance of R16 is decreased calling for heat.

6. When resistance of R16 is high, no heat required, the voltage difference between circuit 2 and circuit 3 is approximately 1-1/2 volts biasing Q4 off.

RENEWAL PARTS

REPLACEMENT

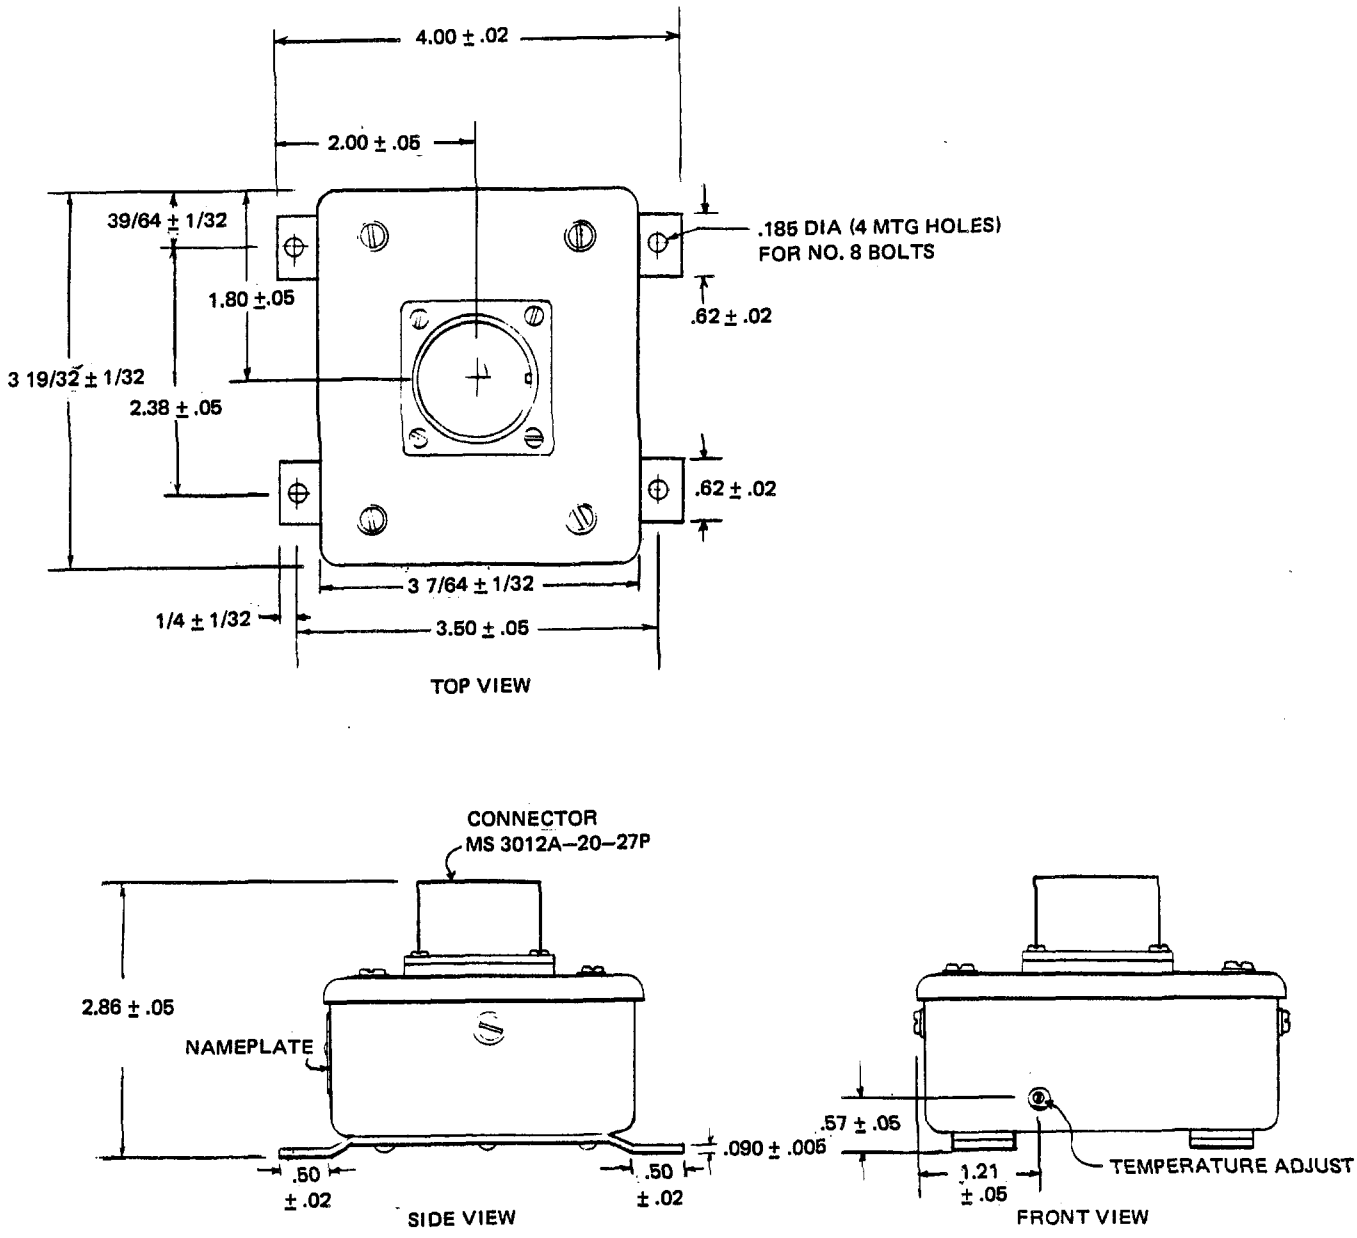
The Specialty Control Department of the General Electric Co., Waynesboro, Va. exercises quality control inspection of its parts and will select the part from a vendor who is qualified at the time a

replacement part is ordered. This refers particularly to magnetic components such as relays, reactors, magnetic amplifiers and transformers which are considered critical parts.

CAUTION

Make certain replaced parts have passed through quality control inspection in accordance with specification drawing shown in part number column in the parts list.

ORDERING



When ordering renewal parts, the following information should be given:

1. Catalog number of the part as stamped on the part itself, with complete description of the part, including its location.
2. Complete nameplate data appearing on the assembly of which the part is a component.
3. If possible, data on original order on which the equipment was first supplied, including all numerical references.

PRINCIPAL RENEWAL PARTS LIST
FOR: 3S2060DM109A1 AND A2

DIAGRAM SYMBOL	QTY. A1	QTY. A2	ORDER NO.	DESCRIPTION
R1	1	1	561A832ZE15	Resistor, 150 ohms ± 3%, 3 Watt
R2	1	1	561A832ZD50	Resistor, 50 ohms ± 3%, 3 Watt
R4	1	1	561A832ZE225	Resistor, 225 ohms ± 3%, 3 Watt
R5,R6	2	2	561A832ZF35	Resistor, 3.5K ± 3%, 3 Watt
R7	1	1	561A832ZF24 or YF24	Resistor 2.4K ± 3%, 3 Watt
R8	1	1	561A832ZE35 or YE35	Resistor, 350 ohms ± 3%, 3 Watt
R9,R10	2	2	561A832ZF47	Resistor, 4.7K ± 3%, 3 Watt
R11	1	1	561832ZF10	Resistor, 1K ± 3%, 3 Watt
R12		1	983B669ZD47	Resistor, 47 ohms ± 3%, 10 Watt
R12	1		561A835ZD33	Resistor, 33 ohms ± 3%, 7 Watt
R13	1	1	561A789H10	Resistor, 100K ± 1%, 1/2 Watt
R15	1	1	561A832ZF50	Resistor, 5K ± 3%, 3 Watt
R16	1	1	Customer's Windshield Sensor Resistor	
C1, C2	2	2	44B253155-001	Capacitor, 4.7 MFD, 35 WVDC ± 20%
C3	1	1	44B253155-002	Capacitor, 22 MFD, 35 WVDC ± 20%
R14	1	1	44B253154-001	Rheostat, 20 ohms ± 10%, .8 Watt
*CR1	1	1	44B253388-007	Zener Diode, 17 Volt, 10 Watt
CR2,3, 4,5,6	5	5	102B3461P1	Diode, 250 MA, 100 PIV
K1	1	1	3S2791G200E9A	Relay

*If CR1 is replaced, use 44B253388-007 and check R12 which should be 47 ohms (some units used 33 ohms).

GENERAL ELECTRIC SERVICE SHOPS

WHEN YOU NEED SERVICE . . . These G-E service shops will repair, recondition, and rebuild your electric apparatus. The facilities are available day and night, seven days a week, for work in the shops or on your premises. Latest factory methods and genuine G-E renewal parts are used to maintain peak performance of your equipment. For full information about these services, contact your nearest service shop or sales office. *Denotes Aircraft Service Shops

Section 1
Introduction

1-1. PURPOSE

This manual has been prepared to provide maintenance and repair procedures for BFGoodrich Electrothermal Propeller De-Icing Systems and components. All data are current as of the publication date of this manual; consult your BFGoodrich distributor for Service Bulletins or other supplemental data which may have been issued subsequently. Warranty claims and any problem not solved by reference to this manual should be referred to BFGoodrich Transportation Products Division, Akron, Ohio 44318.

1-2. APPLICABLE REGULATIONS

All work on the de-icing system must comply with FAA Advisory Circular 43 and superseding FAA releases. Where hardware or components have provisions for safety wiring, make sure that the safety wire is installed in accordance with C.A.R. Part 18 (Ref. C.A.R. 18.30-6(3)) and MS33540.

1-3. SUPPLEMENTAL PUBLICATIONS

Instructions for installation and removal of De-Icers are given in BFG Report No. 59-728. Instructions for the overhaul of brush block and modular brush assemblies are given in BFG Report No. 68-04-714.

NOTE

Some aircraft manufacturers modify the de-icing systems designed by BFGoodrich, making the instructions given in this manual either incomplete or not applicable. Information concerning maintenance of components not supplied by BFGoodrich and concerning operation of systems containing these additional (or substituted) components should be obtained from the aircraft manufacturer or modification station. No maintenance information is given for BFGoodrich components modified without specific written instructions from the BFGoodrich Company.

Section 2
Description

NOTE: DE-ICER OPERATION

It is recommended that propeller De-Icers be turned on when icing conditions are expected rather than after ice has already formed. This prevents inadvertent accumulation of excessively large amount of ice which, upon being shed during the first de-icing cycle, could damage the aircraft.

2-1. DESCRIPTION OF INSTALLATION

The propeller De-Icing System consists of the following components (see figure 2-1):

1. Electrically heated De-Icers bonded to each propeller blade.

2. Slip ring assemblies for power distribution to the propeller De-Icers.

3. Brush block assemblies* to transfer electric power to the rotating slip rings.

4. A timer to cycle electric power to the De-Icers in proper sequence.

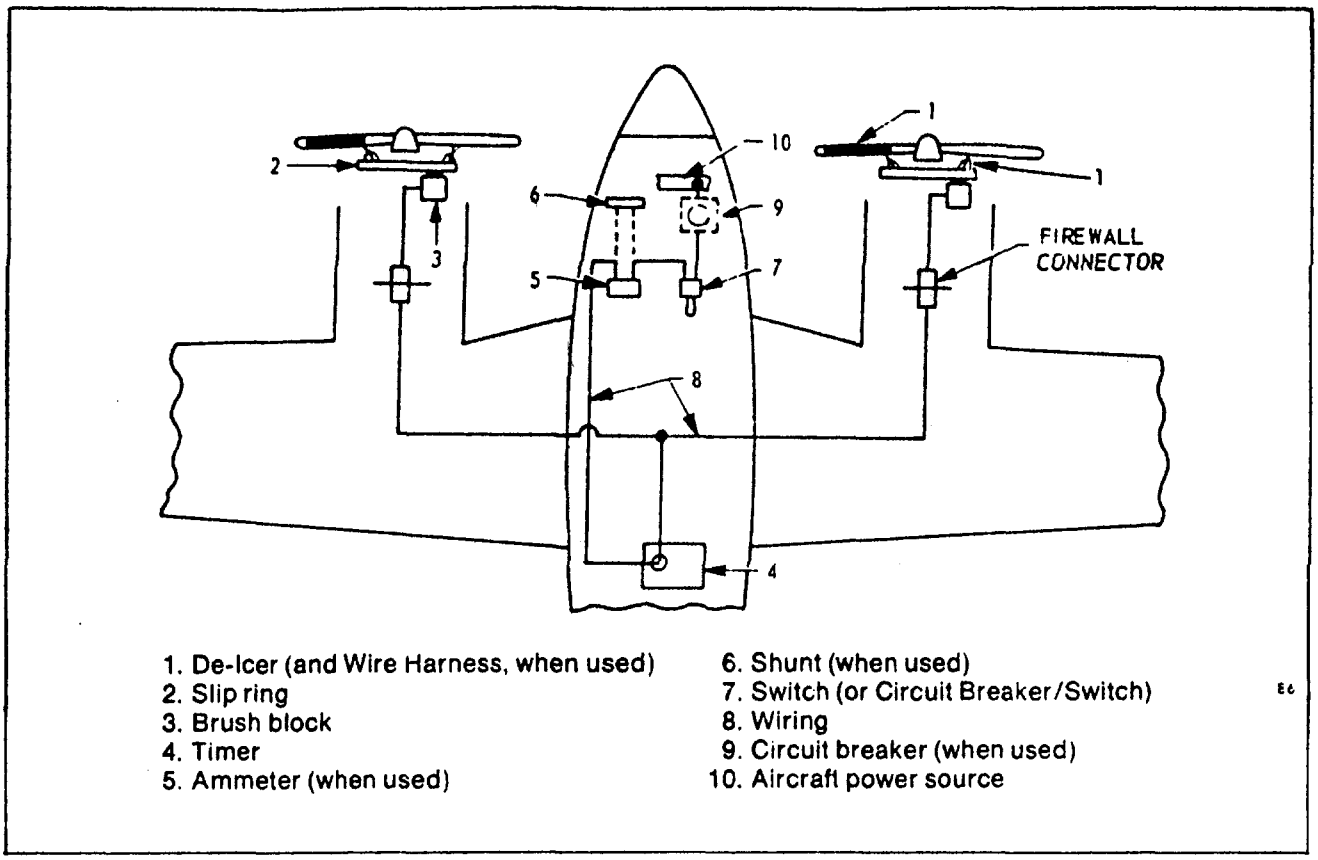
5. An ammeter to indicate that the system is functioning correctly (optional in some systems).

6. An external shunt (some systems use ammeters with internal shunts).

7. A manually operated ON-OFF circuit breaker type switch (some aircraft have a separate circuit breaker and switch, and may use a relay as part of the control circuit also).

8. A wiring harness connecting electrical components.

9. An additional circuit breaker (required by some aircraft).



10. Aircraft power source.

2-2. PRINCIPLES OF OPERATION

The BFGoodrich De-Icing System applies heat to the surfaces of the propeller blades where ice normally would adhere. This heat, plus centrifugal force and the blast from the airstream, removes accumulated ice. (A minimum thickness or weight of ice must be formed before centrifugal force becomes a significant factor in propeller ice removal.)

To conserve electric power and effectively remove ice, power is provided to the De-Icers in timed intervals rather than continuously. (The time lapse between the heating cycles for any given De-Icer element will allow ice to accumulate slightly before removal.) Rotational balance of the propeller or propellers is maintained by heating either the entire De-Icer on each blade of a propeller or corresponding sections of the De-Icers on each blade. The following methods are used:

*Throughout this manual references to "brush block assemblies" may generally be assumed to apply also to "modular brush assemblies".

1. De-Icer (and Wire Harness, when used)
2. Slip ring
3. Brush block
4. Timer
5. Ammeter (when used)
6. Shunt (when used)
7. Switch (or Circuit Breaker/Switch)
8. Wiring
9. Circuit breaker (when used)
10. Aircraft power source

E6

Figure 2-1. Typical Twin Engine De-Icing System

1. DE-ICERS WITH DUAL HEATING ELEMENTS (See Figures 2-2 thru 2-5 for twin engine aircraft; see figures 2-6 and 2-7 for single engine aircraft.)

Each De-Icer has two separate electrothermal heating elements; an inboard and an outboard section. When the switch is turned on, the timer provides power through the brush block and slip ring to all outboard* elements on one propeller** for approximately 34*** seconds (Phase 1), reducing ice adhesion in these areas.

NOTE

The illustrations show two-bladed propellers. The procedure is the same if a third, fourth or fifth blade is added.

*Since the timer does not return to a "home" position when turned off, the heating cycle may begin at any of the four points mentioned but the sequence will be the same as indicated.

**Where systems have two timers operating independently, power is cycled to the propeller De-Icers on each engine separately: as in two separate single engine systems.

***Some aircraft have timers which switch the power every 20 seconds. See Table 4-1, notes, or aircraft manual for unusual system features.

Then the timer switches power to all inboard heating elements on the same propeller for 34 seconds (Phase 2). This outboard-inboard sequence is important since the loosened ice tends to move outward.

For single engine aircraft, this cycle is repeated. For twin engine aircraft, power is switched to the other propeller where the same procedure is followed: First all outboard elements are heated for 34 seconds (Phase 3) and then all inboard elements are heated for the same amount of time (Phase 4). As long as the control switch remains on, the cycle will repeat itself.

2. DE-ICERS WITH SINGLE HEATING ELEMENTS (See figures 2-8 and 2-9 for twin engine aircraft; see figures 2-10 and 2-11 for single engine aircraft.)

In this system, each De-Icer has one electrothermal heating element.

On twin engine aircraft, when the switch is turned on, the timer provides power through the brush block and slip ring to all heating elements on one propeller. Next, the timer switches power to all heating elements on the other propeller for the same length of time. As long as the power switch remains on, this cycle repeats itself.

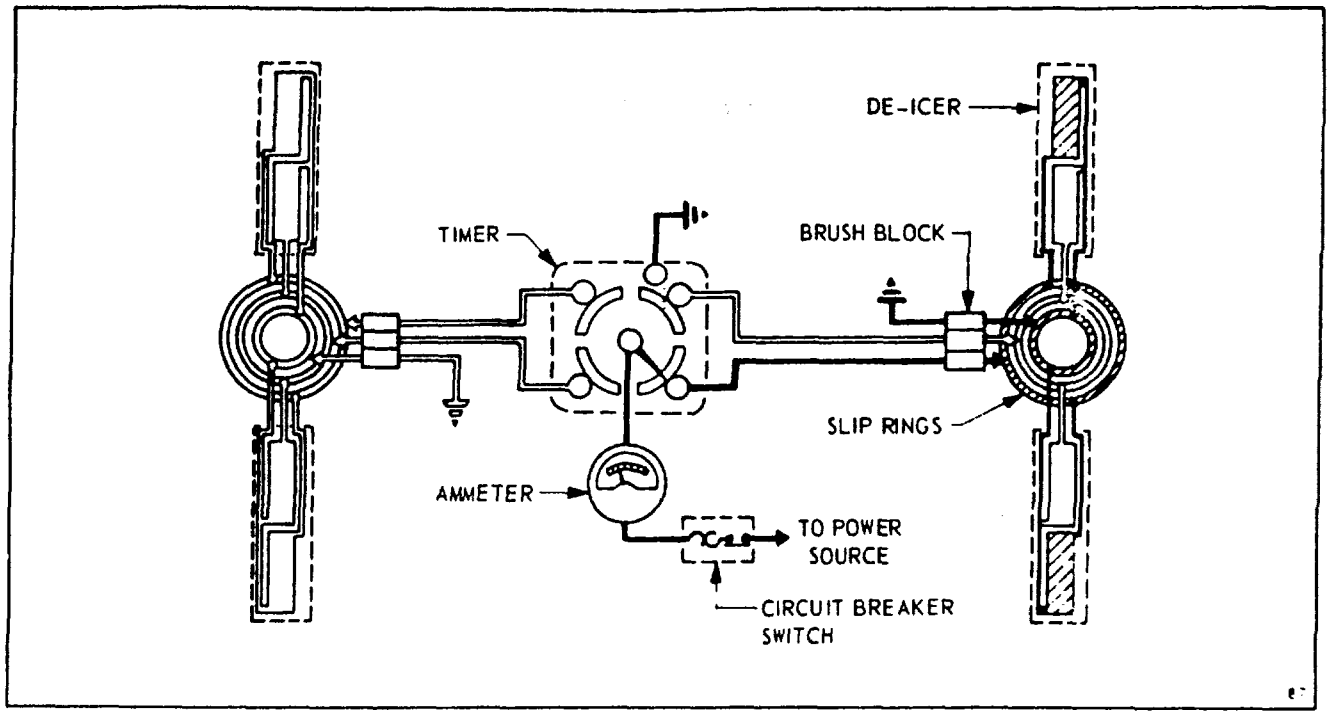


Figure 2-2. Dual Element, Twin Engine Cycle Sequence — Phase 1

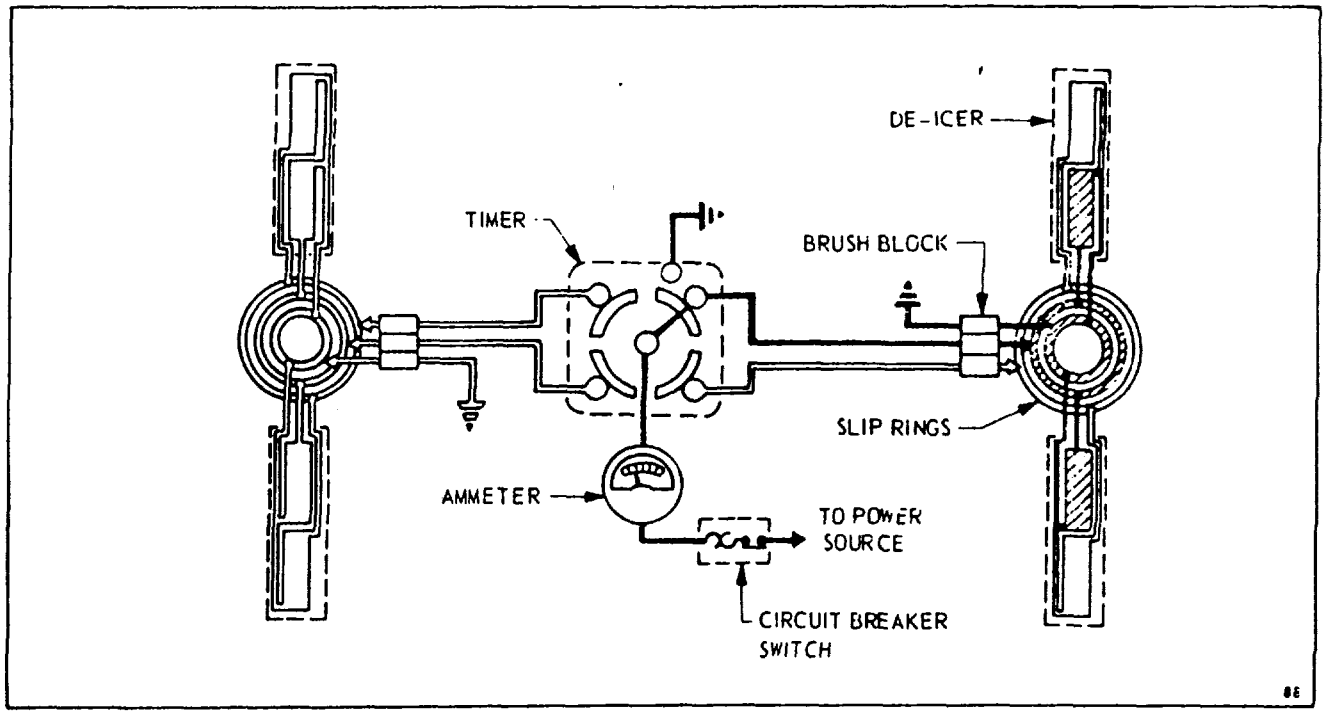

Figure 2-3. Dual Element, Twin Engine Cycle Sequence — Phase 2

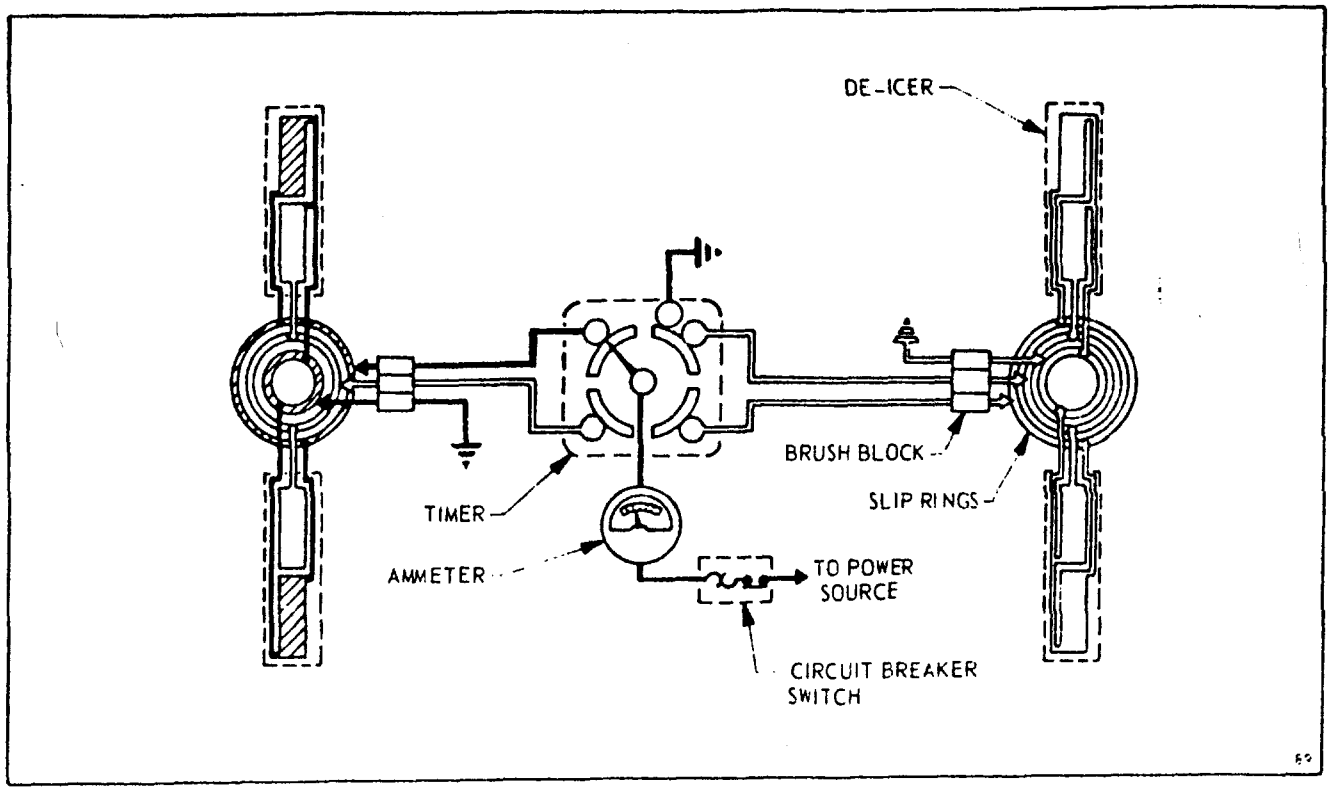

Figure 2-4. Dual Element, Twin Engine Cycle Sequence — Phase 3

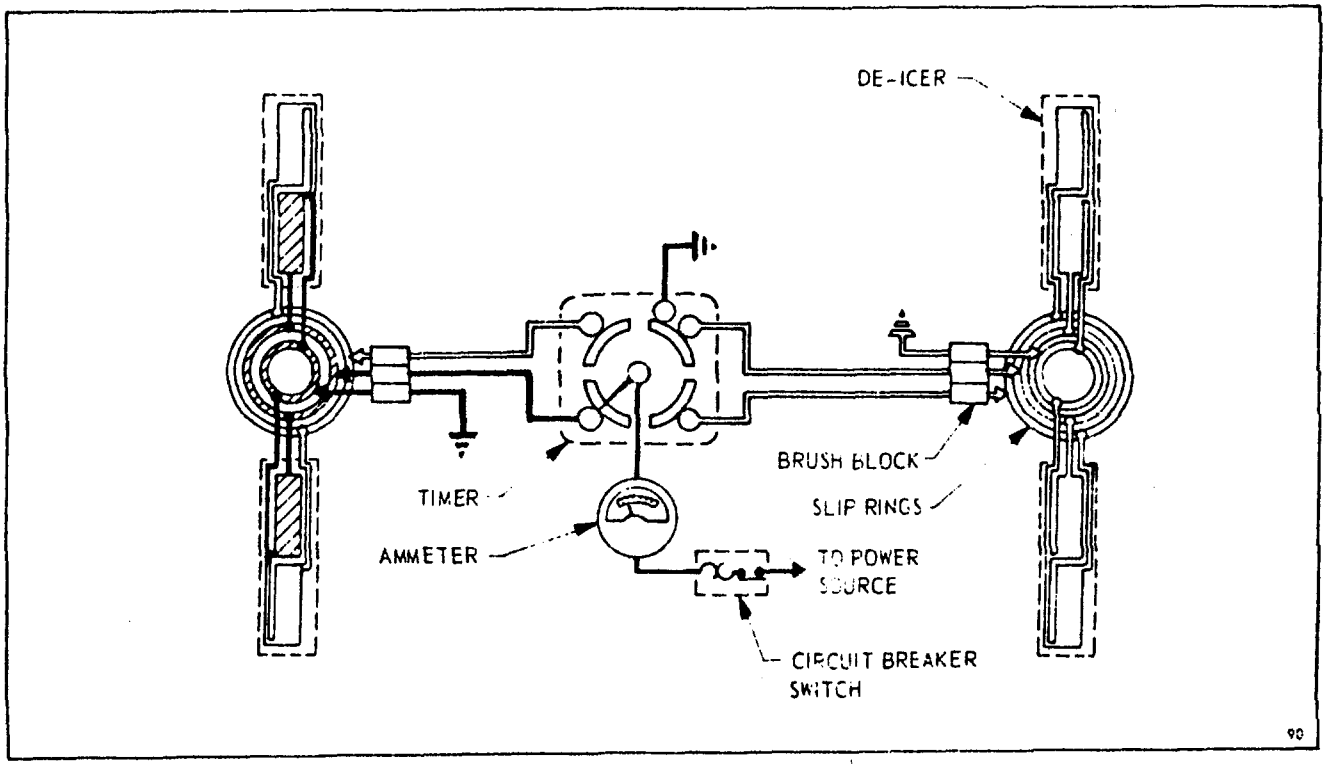

Figure 2-5. Dual Element, Twin Engine Cycle Sequence — Phase 4

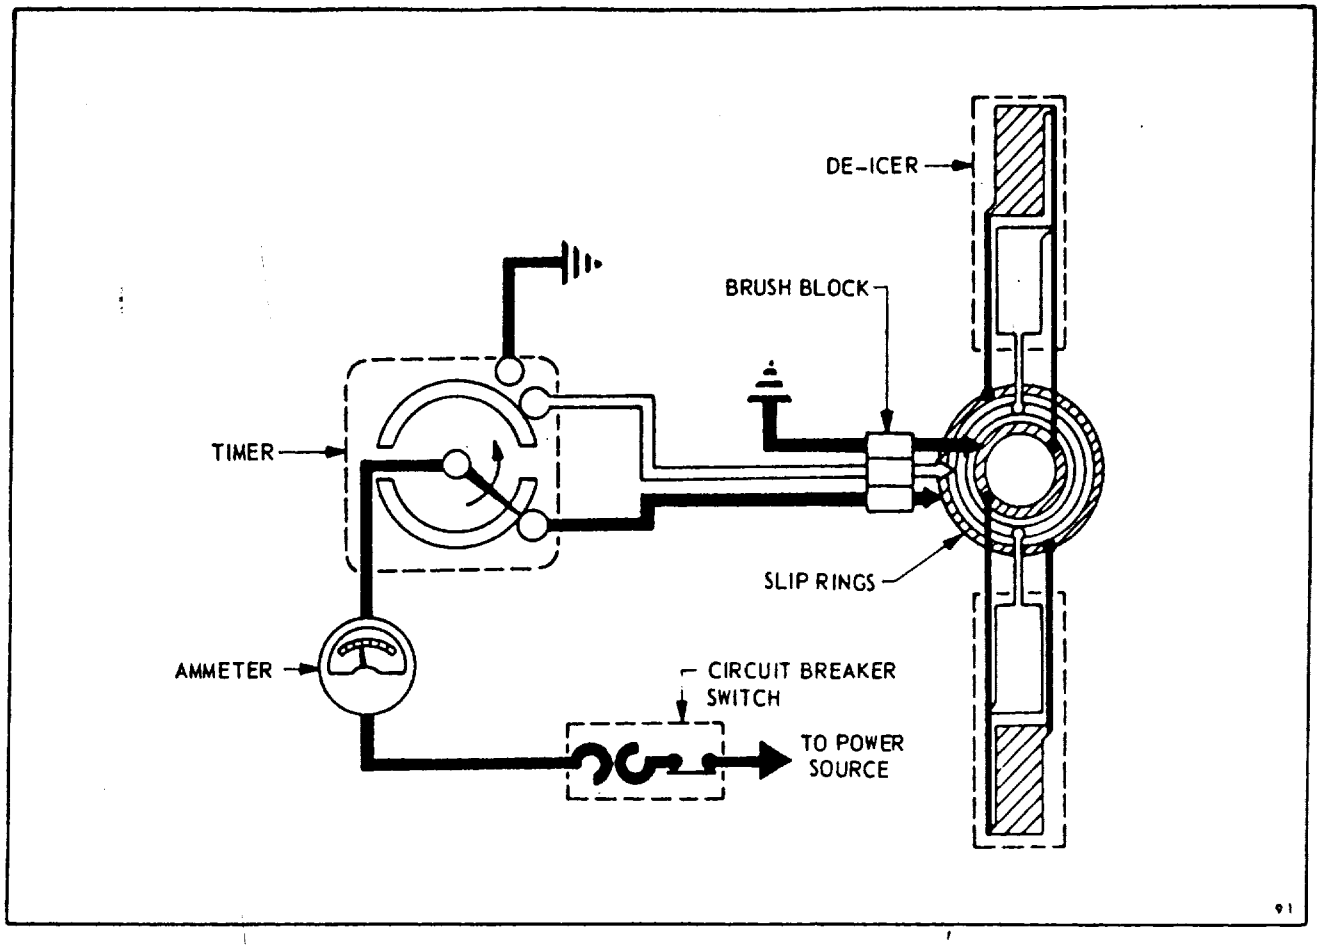

Figure 2-6. Dual Element, Single Engine Cycle Sequence — Phase 1

On single engine aircraft, when the switch is turned on, the timer provides power through the brush block and slip ring to all heating elements on the propeller. Next, the timer switches the power off for an equivalent length of time. This cycle is repeated as long as the switch remains on.

The single element systems are of two types. One type uses a wire element De-Icer energized by AC voltage. The other type uses a metal foil element De-Icer energized by DC voltage. The wire element De-Icer is energized for 34 seconds, whereas the metal foil element De-Icer is energized for 90 seconds.

2-3. DESCRIPTION OF COMPONENTS

De-Icers. The De-Icers contain special heater wires or metal foil protected by plies of fabric and rubber, compounded for oil, erosion, and abrasion resistance. One side of each De-Icer has a dull finish (fabric impressioned) to provide good adhesion when bonded to the propeller blade. The other side has a smooth, glossy finish. Dual element De-Icers have three electrical leads; one input for each heating element and a common ground. Single element De-Icers have only two leads (one input — one ground).

De-Icer Wire Harnesses. De-Icer wire harnesses are used with detachable lead strap De-Icers to connect the De-Icer leads to the slip ring leads. The De-Icer wire harnesses replace the integral De-Icer lead strap on specific De-Icers. (See Section 6.)

Slip Rings, Brushes and Brush Blocks or Modular Brush Assemblies. To conduct electric power to the rotating De-Icers, a brush block or modular brush assembly is mounted on the engine or other stationary member of the aircraft. Each brush assembly contains spring loaded brushes which contact the rotating slip rings. Depending on the specific aircraft, there are two general types of slip ring installations:

1. The slip ring is provided as part of a slip ring/starter ring gear assembly which replaces the original starter ring gear on the engine.

2. A slip ring assembly in a metal holder is attached to the aft side of the spinner bulkhead or to the engine crankshaft flange.

Timer. The electric timer distributes power to each of the De-Icer heating elements in a prescribed sequence. The timer will repeat this cycle as long as the control switch is on.

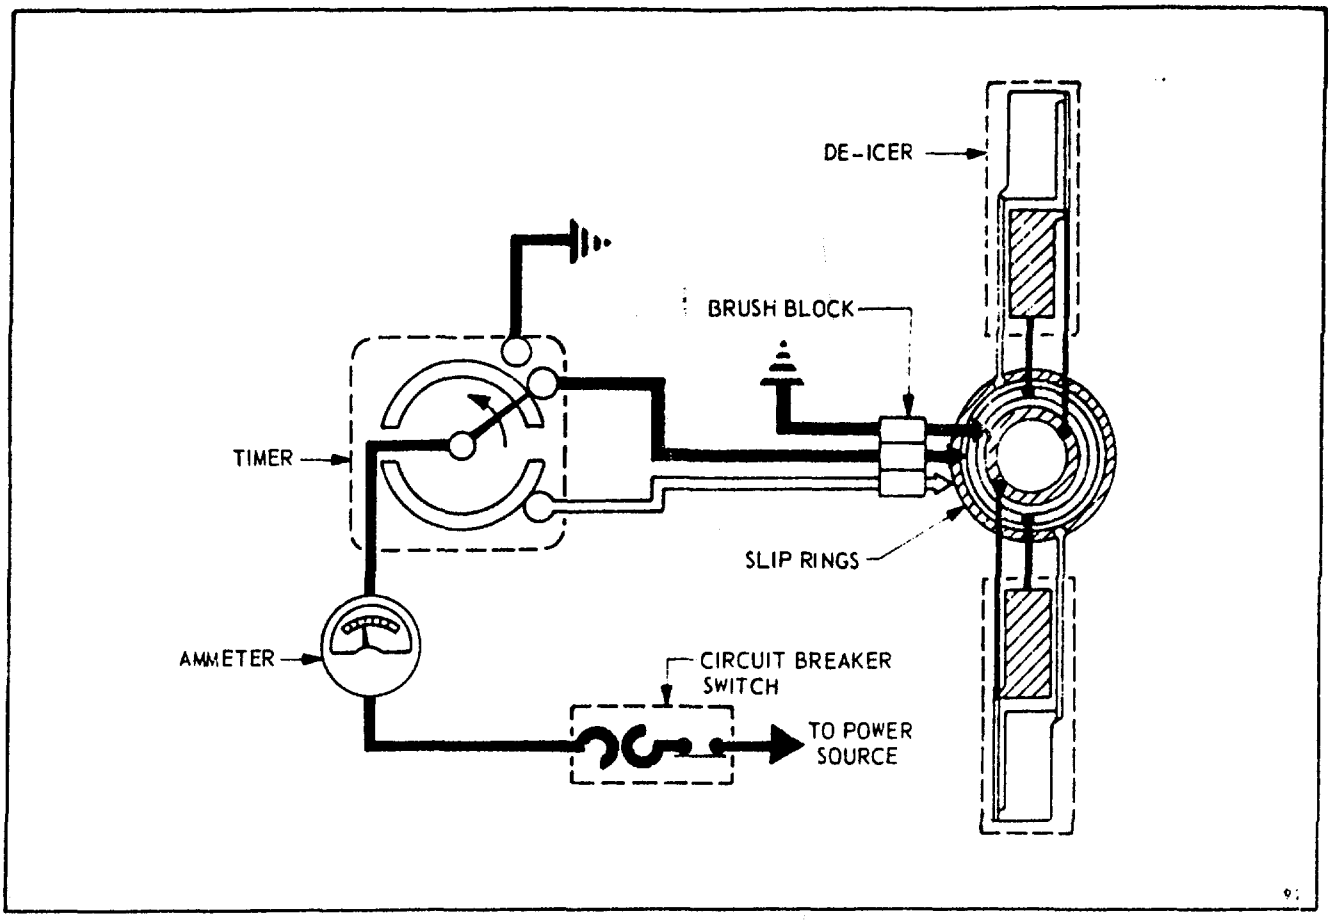

Figure 2-7. Dual Element, Single Engine Cycle Sequence — Phase 2

Ammeter. The ammeter (when used in the system) indicates current flow to the De-Icers. In the event of low aircraft battery voltage (possible in ground checks) the ammeter readings will be below the shaded area on the ammeter scale. Current flow is normal when the ammeter needle points to the shaded range of the scale. Depending on the system, the ammeter may be equipped with an internal or external shunt, and may be either DC or AC. Some ammeters have been adjusted internally to compensate for leadwire resistance for connection of external shunts.

Switch or Circuit Breaker/Switch. The switch may be a combined circuit breaker and switch unit, or it may be a common switch used with a separate circuit breaker. If the system current rises above the circuit breaker limit, it will open to cut power to the De-Icing system. The circuit breaker/switch can be reset by turning it OFF and then ON again. Consult Table 4-1 and the wiring schematics for type used.

Circuit Breaker. Certain aircraft use an additional or separate circuit breaker between the de-icing system and the aircraft power supply. If tripped, the circuit breaker must be reset manually, either in flight or on the ground, depending on the type of aircraft. Consult Table 4-1 and the wiring schematics for components of a specified system.

Other Components. Certain aircraft have additional components such as relays and overload sensing devices for controlling the de-icing system. Although shown in the schematic diagrams, these components may or may not be supplied by the BFGoodrich Company. Information concerning components not supplied by BFGoodrich may be obtained from the aircraft manufacturer or modification station.

CAUTION

Some aircraft manufacturers and modifiers deviate from the methods of installation and wiring propeller de-icing systems recommended by BFGoodrich. Table 4-1 provides BFGoodrich recommended wiring schematics. Where systems are known to have been altered, the wiring schematic must be obtained from the aircraft manufacturer or modifier.

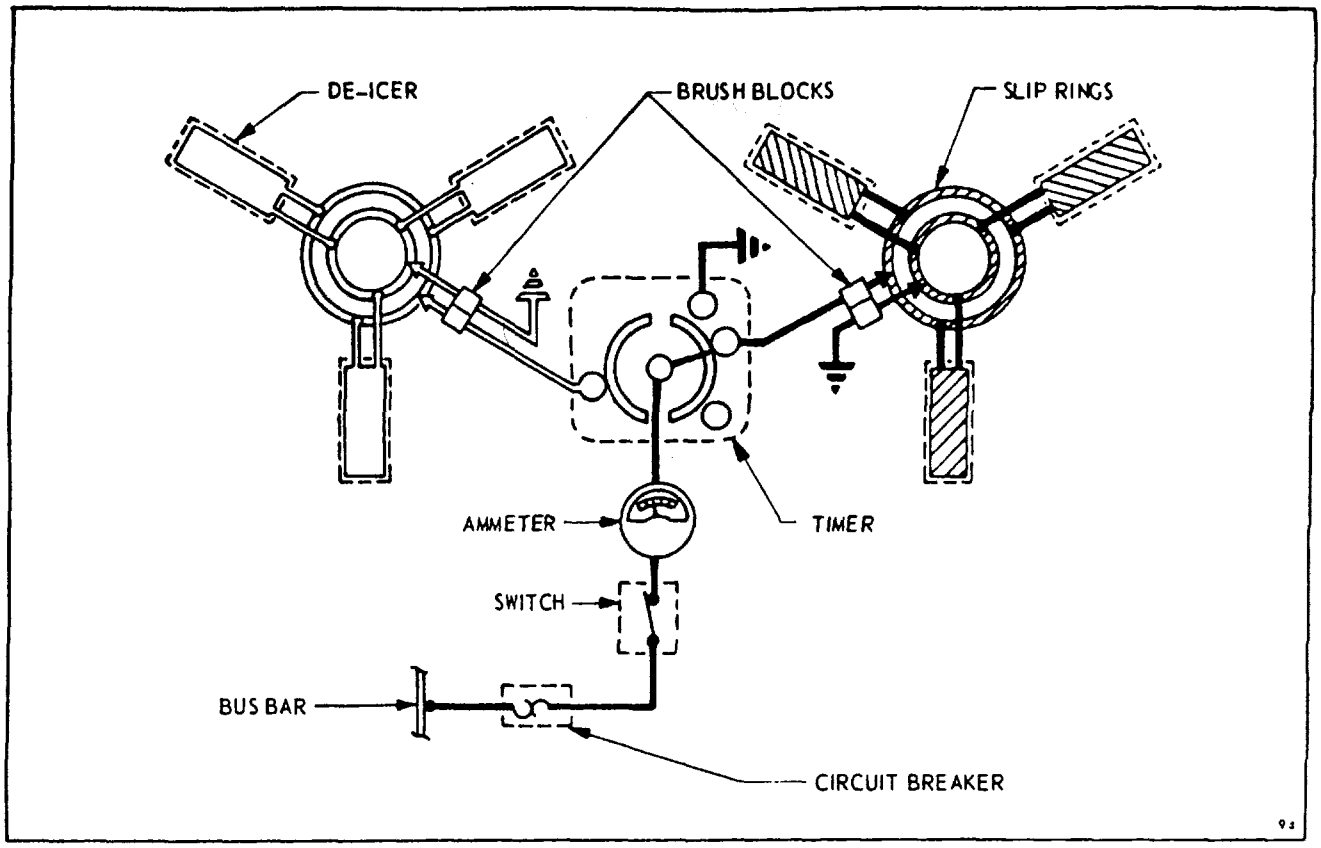

Figure 2-8. Single Element, Twin Engine Cycle Sequence — Phase 1

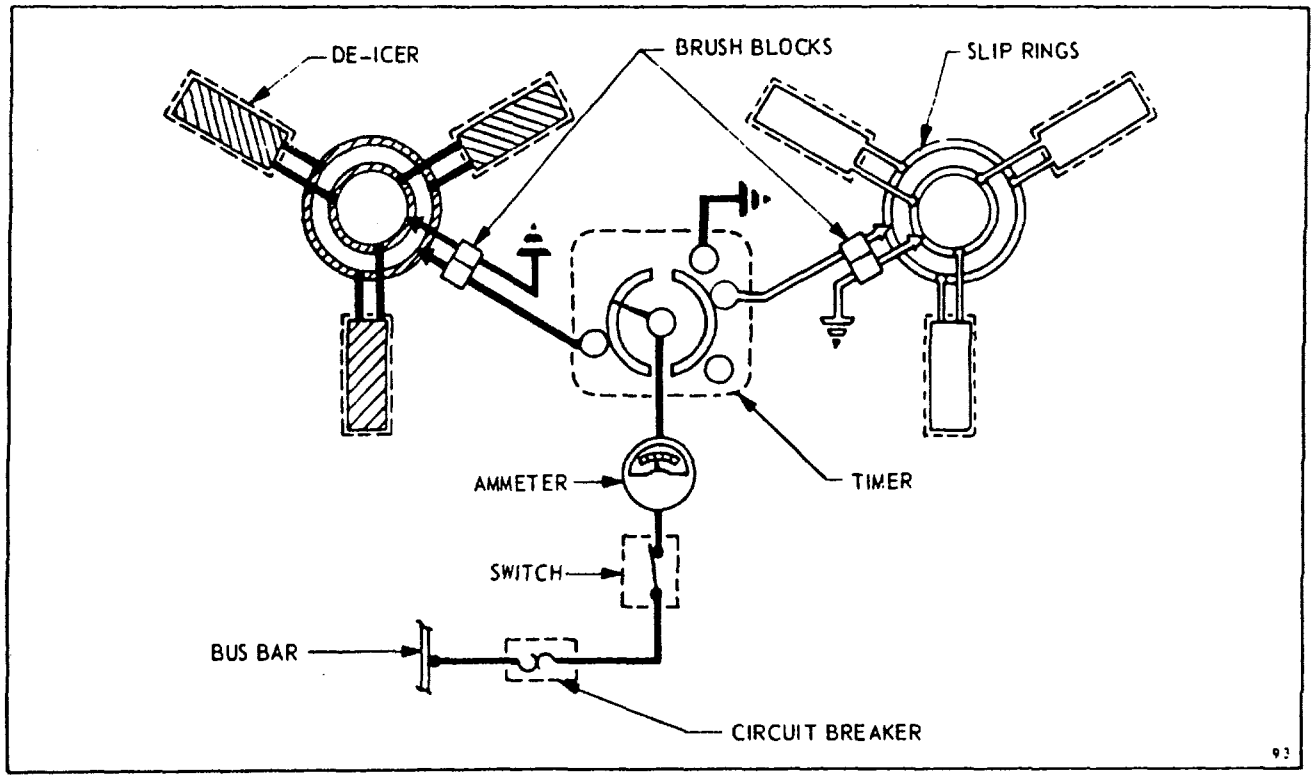

Figure 2-9. Single Element, Twin Engine Cycle Sequence — Phase 2

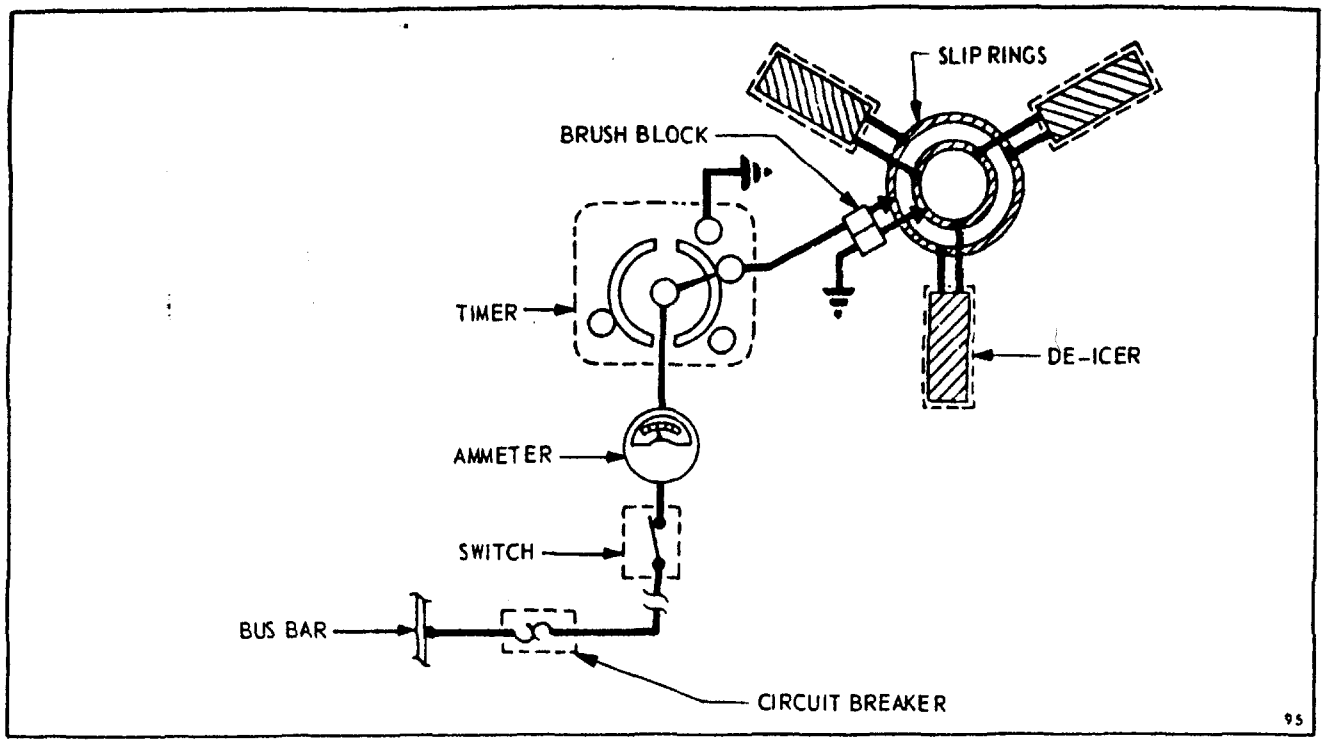

Figure 2-10. Single Element, Single Engine Cycle Sequence — Phase 1

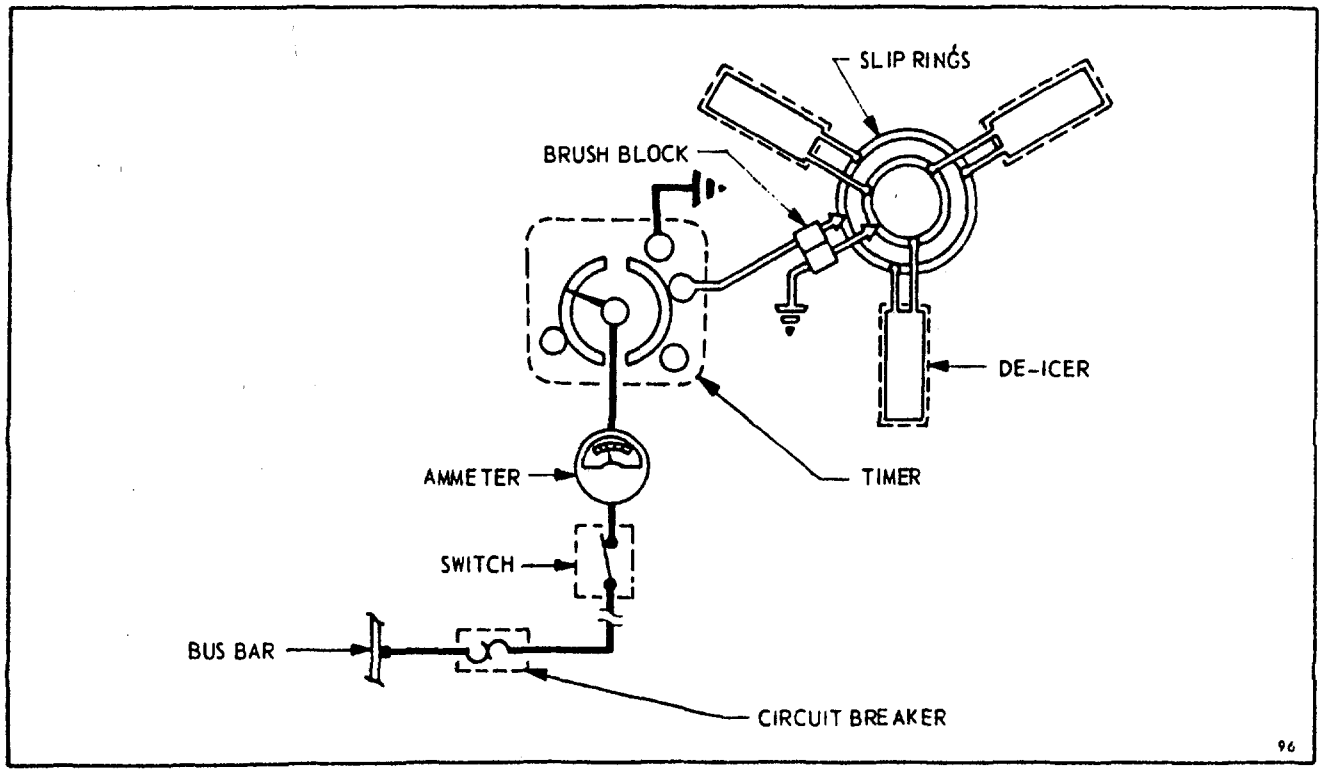

Figure 2-11. Single Element, Single Engine Cycle Sequence — Phase 2

Section 3
Required Inspections

(See, also, FAA Advisory Circular 43 and superseding FAA releases)

To preserve the battery when making ground checkouts, run a minimum number of cycles with the propeller in the static condition. Use of an auxiliary power supply (14 or 28 VDC, as applicable) is suggested. Functional ground checkouts of 115 VAC systems require use of an auxiliary power supply. If not available, make continuity check instead. In any case, the De-Icers should not be operated continuously for more than 5 minutes under high ambient temperature conditions (above 100°F) without allowing them to cool down.

3-1. 50 HOUR INSPECTION

Perform the following checks:

1. Remove spinner dome and open access doors as required to facilitate inspection of wiring.

NOTE

On turbine engines, check for fuel or oil leakage onto the brush blocks and slip rings. This will cause the brushes to wear excessively and to cut into the rings. Stop the leak! ***Clean and refurbish rings and brush block assemblies per maintenance instructions in Section 5-4 and Report No. 68-04-714 respectively.***

With assistant observing De-Icer ammeter* and with De-Icer switch ON, flex all accessible wiring — particularly the De-Icer lead straps, De-Icer wire harnesses, leads from slip ring assembly, and the fire wall electrical connectors, if any, and their wiring. Any movement of the ammeter needle other than the normal flicker from the timer cycling indicates a short or open that must be located and corrected. Check continuity of wiring affected while flexing and prodding the suspected area.

2. With De-Icer switch on, feel De-Icers on propellers for proper sequence of heater operation. The starting point is not important but sequence is vital and must be RIGHT OUTBOARD, RIGHT INBOARD, LEFT OUTBOARD, and LEFT INBOARD heaters, ***in that order.*** **(Single engine systems cycle outboard-inboard and repeat. Single element De-Icers cycle ON-OFF and repeat.) Temperature rise should be noticeable and each heater should warm while energized. Local hot spots indicate surface damage requiring replacement of De-Icer.

*For systems without ammeters, temporarily install an ammeter or amp-probe in the power input line to the timer. Determine proper operating range for system from Table 4-1. Ammeters installed in the propeller de-icing system circuit by some aircraft manufacturers can't be read with sufficient accuracy to provide the correct system amperage values. If ammeter readings are consistently in error, check accuracy per section 3-2.5.

**See appropriate wiring schematic and Table 3-1 for cycling of dual timer systems.

3. Reinstall all previously removed components.

4. Lock brakes and operate engine at near takeoff power. Turn De-Icer system switch ON and observe De-Icer ammeter for at least 2.2 minutes. Ammeter needle must rest within the shaded range on the ammeter. The ammeter may "flicker" when the timer switches. See 3-2.4. NOTE.

3-2. 100 HOUR INSPECTION

To facilitate inspection, insure that propellers are feathered when last shut down. Remove spinner dome and open access doors as necessary. Do not run up engine(s) with spinner dome(s) removed or failure of De-Icer lead straps or De-Icer wire harnesses will occur.

3-2.1. DE-ICERS

1. Closely check De-Icers for wrinkled, loose, or torn areas, particularly around the outboard end and where the strap passes under the lead strap clamp or restrainer. Look for abrasion or cuts, especially along the leading edge and the flat or thrust face.

2. Check that lead strap clamps, terminal clamps, tie straps or restrainers are secured and properly installed. (See figures 5-2 through 5-12, 6-3 through 6-9.) Look for cracks or other damage. Insure that screws are safety-wired.

3. Check that De-Icer lead straps or De-Icer wire harnesses are not placed in tension in the feathered position. If tension exists, insure that no slack has been left between the lead clip and terminal studs or between the lead strap clamp or restrainer and the De-Icer. If none, or if tension still exists after eliminating this slack, check De-Icer location dimension against Table 4-1, and De-Icer and clamp part numbers against parts list. If location exceeds given dimension, and part numbers are correct, then remove the De-Icer and recement it in the proper position. (See BFG report 59-728 for removal and recementing.) If part numbers are incorrect, replace with correct part. All De-Icers must be located the same distance from the hub for rotational balance.

On detachable leadstrap De-Icer installations, check that terminals and terminal studs are not shorting out to each other or the propeller hub. Inspect wire harness for evidence of chafing or shorting. If chafing is found, remove source, if possible, or contact BFGoodrich for corrective action directions. Insure that all clamps and tie straps are properly installed.

4. Insure that lead clips and terminal screw assemblies are tight and in good repair.

5. With De-Icer switch ON and assistant observing ammeter, flex lead straps or De-Icer wire harnesses of De-Icers which are operating and flex slip ring leads; any movement of the ammeter needle other than a normal flicker from the timer cycling indicates a short or open that must be located and corrected. Check continuity of wiring affected while flexing and prodding the suspected area.

6. Perform heat test as in 3-1.2.

3-2.2. SLIP RINGS

1. Visually and by feel, check slip rings for excessive wear, roughened surface, cracks, burned or discolored areas, and deposits of oil, grease and dirt.

2. Clean greasy or contaminated slip rings with CRC 2-26 solvent (from CRC Chemicals, Dresher, Pa.) or with Stoddard solvent. If Stoddard solvent is used, wipe off with a clean cloth dampened with MEK to avoid leaving a film.

3. If uneven wear is found or if wobble is noticed, set up dial indicator and check alignment of slip rings to propeller shaft. (See Section 4-5.)

4. Reface worn or damaged slip rings per Section 5-4.

3-2.3. BRUSH BLOCKS, MODULES AND BRUSHES (For Overhaul, Cleaning, Checkout and Installation Procedures, see Report 68-04-714)

1. Examine mounting brackets, blocks and modules for cracks, deformation, or other physical damage.

2. Check brushes for excessive wear, chipping or breakage.

3. Check brush block or module assembly for accumulation of grease or fuel and for accumulation of carbon on the block or module surface between the brushes. Clean the assembly using MEK and refurbish. Repair source of contaminant leakage.

4. Insure that each brush rides fully on its slip ring throughout 360° rotation. Report 68-04-714 shows the correct alignment; realign as necessary.

5. Check for proper clearance between brush block or module and slip rings and insure that assembly is cocked about 2° with respect to the rings. Loosen mounting screws and move assembly as necessary to comply. Changes in brush position may be made, if necessary, by varying the shim thickness (a laminated metal shim is provided in most instances.).

3-2.4. TIMER TEST

(Necessary in 100 hour inspection only if De-Icer heat test or reading outside normal current range indicates system malfunction.)

The correctness of the timer cycling sequence should be checked in the following manner: (Refer to system schematic; determine from Table 4-1 and appropriate figure for your aircraft.)

NOTE

For bench checkout of DC timers, use power supply with a range of 0-15 amp, 0-32 VDC, 0.75% or less ripple (e.g. Electro Products Labs Model NFB) and use 5 amp min. load on each output. See Table 3-1 for checkout of AC/DC timers.

1. Remove connector plug of wire harness from timer and jump power input socket or sockets of wire harness to timer input pin or pins (see wiring schematic for pin identification).

2. Jump timer ground pin to ground.

3. Turn on De-Icing System.

4. Check timer operation per Table 3-1 using a voltmeter.

NOTE

Some timers require a slight "warm-up" period before they will operate normally. Therefore, the first complete timing cycle may be somewhat longer than normal. This doesn't apply to the 3E1150-12, 3E1899-1, or the 3E1964-1, -2 and -3 timers with the manual step feature.

The 3E1899-1, 3E1964-1, -2 and -3 and 3E1150-7, -10 and -12 timers use electronic stepping circuits. Therefore, an ammeter "flicker" may not be observed when these timers are switching.

5. Check volts to ground in each case. If engines are not operating and auxiliary power is not used, voltage will be battery voltage and cycle time may be slightly longer than indicated.

6. Hold the voltmeter probe on the pin until the voltage drops to 0. Move the probe to the next pin in the sequence shown in the Table. Check voltages at each pin in sequence. When correctness of the cycling sequence is established, turn propeller de-icing switch off.

NOTE

Timers do not home to pin "C" when turned off. Timers of the 3E1150-2, -3, -12; 3E1899-1; 3E1964-1, -2 (S/N 1000 and up); 3E1964-3 and 3E1575 series will "step" power to the next pin in sequence each time they are turned OFF and then ON. Timers 3E1150-7 and -10, 3E1540, 3E1555 series and 3E1964-1, -2 (S/N 1000 and below) require the full cycle time before "stepping".

7. If timer operates correctly remove the jumper wires installed and replace the connector plug in the timer receptacle. If timer is faulty, see Repair Procedures, Section 5.

TABLE 3-1. TIMER OPERATION TEST

Timer P/N	Power Input Pin & Socket	Ground Pin	Output Sequence Time, Voltage	Total Repeat Cycle Time (minutes)
3E1150-2, -3, -10, -12	B(14 or 28 VDC)	A (14 VDC) G (28 VDC)	C, D, E, F -34 sec. each, (14 or 28 VDC)	2.2
3E1150-7	B (28 VDC)	G (28 VDC)	C, D, E, F - 34 sec. each, (28 VDC - 25 Amps, Max.)	2.2
3E1540-1	B (14 VDC)	A (14 VDC)	C, D - 34 sec. each, (14 VDC)	1.1
3E1555-1	B (28 VDC)	G (28 VDC)	C, D - 34 sec. each, (28 VDC)	1.1
3E1575-1	B (28 VDC)* A (115 VAC, 400 Hz)*	G (28 VDC)	C, D - 34 sec. each, (115 VAC, 400 Hz)	1.1
3E1899-1	B (14 or 28 VDC)	A (14 VDC) G (28 VDC)	C - 90 sec. (14 or 28 VDC)	1.5
3E1964-1	B (14 or 28 VDC)	A (14 VDC) G (28 VDC)	C, D - 34 sec. each (14 or 28 VDC)	1.1
3E1964-2	B (14 or 28 VDC)	A (14 VDC) G (28 VDC)	C, D - 20 sec. each (14 or 28 VDC)	.66
3E1964-3	B (14 or 28 VDC)	A (14 VDC) G (28 VDC)	D, F - 90 sec. each (14 or 28 VDC)	3.0
3E1968-1	B (14 VDC)	A (14 VDC)	C, D, E, F - 34 sec. each, (14 VDC - 25 Amps, Max.)	2.2

**The timing mechanism operates on 28 VDC power. It switches 115 VAC 400 Hz power to each of the output pins to operate the De-Icers. If an auxiliary power unit having 115 VAC, 400 Hz power is not available for this test, check the continuity from pins C and D to pin A instead. A closed circuit should be indicated in each, successively, for 34 seconds. For bench checkout, use power supply equivalent to that used for DC timer checkout. (See Note, Section 3-2.4.)*

3-2.5. AMMETER (If Permanent Part of De-Icer System)

At some convenient point between bus bar and ammeter, hook a good volt-ohmmeter with an ammeter scale or a standard ammeter into the circuit and, with the De-Icer switch ON, check the amperage being used by the De-Icer system. The reading of the standard ammeter should closely agree with the reading obtained from the De-Icer ammeter. Turn De-Icer switch OFF and remove volt-ohmmeter or standard ammeter from circuit. If ammeter readings were significantly different and rest of de-icing system checks out satisfactorily, see Ammeter Checkout, Section 4-7.

3-2.6. *CIRCUIT BREAKER AND SWITCH*

If testing required in 3-2.4 and 3-2.5 has been performed satisfactorily, de-icing system circuit breaker and switch are operable. If inoperable, see Repair Procedures, Section 5.

3-2.7. SYSTEM WIRING

With De-Icer system operating, have assistant observe ammeter while visually inspecting and physically flexing wiring from brush block to fire wall, timer, ammeter, switch, circuit breaker, and aircraft power supply. Any movement of the ammeter needle other than a flicker from the timer cycling indicates loose or broken wiring in the area under examination. In such case, check continuity through affected wiring while flexing and prodding area that gave initial indication of trouble.

3-2.8. OTHER

1. Visually and by feel, check all clamps, clips, mountings, electrical connections, and connectors for tightness and electrical soundness. Check for loose, broken or missing safety wire.

2. Replace all previously removed components.

3. Check for radio noise or radio compass interference — operate engine at near take-off power with radio gear ON while turning De-Icer switch ON and OFF. If noise or interference occurs with De-Icer switch ON and disappears when switch is OFF, see trouble-shooting chart, Section 4-3.9.

Section 4
Service Guide

4-1. INTRODUCTION

Whether in flight or during ground testing, the ammeter can be used to determine the general nature of most electrical problems. The Trouble Shooting Chart is based, primarily, on the use of the ammeter* and it is assumed that the user understands all normal operating modes of the system. (See Section 1). Read all of the "Trouble" entries to locate the one matching the conditions of the system being checked. The "Probable Cause" and "Remedy" entries pertinent to each trouble are arranged in the recommended checking sequence.

4-2. HELPFUL TIPS

1. Normal current is shown as a shaded range on the ammeter** for each propeller De-Icer system with engines running. The ammeter reading will be slightly lower when the system is operatec on battery voltage. An auxiliary power supply or engine operation is required when testing for AC voltage.

**If an ammeter is not normally included as a part of the propeller De-Icer system, install one at a convenient point between the bus bar and timer for this checkout.*

***See Table 4-1 for proper operating current range for your de-icing system. Current calculations are based upon nominal voltages of 14 or 28 VDC, or 115 VAC, depending on the system concerned.*

2. Use the "heat test" (Section 3-1.2) and "ammeter test" (Section 3-2.5) to determine which engine's De-Icers are not operating. Use appropriate wiring schematic (find from Table 4-1) to trace circuits.

3. Excess current reading on the ammeter always indicates a power lead is shorted to ground. Thus, when trouble of this nature is found, it is vital that the grounded power lead be located and corrected.

4. Ignore reference to ammeter as probable cause of trouble for systems without permanently installed ammeters.

5. A considerable number of timers have been returned for repair which proved, on test, to be fully operable. Before concluding that the timer is faulty, test it per Section 3-2.4.

6. For insulation resistance tests, use a "Megger" ("Meg" type insulation tester, James G. Biddle Company, Plymouth Meeting, Pa.) or other tester having a 500 VDC, 1000 megohm capacity.

7. Defective wiring in propeller mounted components may be indicated by normal current readings in ground checkouts (propellers not rotating) but low current with propellers rotating at cruise RPM.

4-3. TROUBLE SHOOTING CHART

Trouble	Probable Cause	Remedy
1. Ammeter snows 0 current all phases of the timer cycle.	a. No power from aircraft.	a. If no voltage into circuit breaker, locate and correct open.
	b. Tripped circuit breaker.	b. Locate and correct short before resetting circuit breaker.
	c. Circuit breaker or switch faulty.	c. If no voltage at circuit breaker output with voltage at input and circuit breaker does not reset, replace circuit breaker. If voltage is OK at output, check switch in same manner. If voltage is OK at switch output, go to Step d.
	d. Ammeter faulty.	d. Test ammeter per Section 4-7.
	e. Open ammeter to timer.	e. Disconnect harness at timer and check for appropriate voltage at harness Pin B (also check Pin A for AC voltage on 115 VAC system) to ground. If none, locate and correct open.

4-3. TROUBLESHOOTING CHART (Continued)

Trouble	Probable Cause	Remedy
1. Ammeter shows 0 current all phases of the timer cycle. (Continued)	f. Open timer to both brush blocks.	f. Disconnect wire harness at brush block and check voltage to ground from appropriate pins or leads. (See de-icing system wiring schematic for power and ground lead and pin identification. Find from Table 4-1). If low or no voltage, locate and correct open or high resistance in wire harness. Check continuity from appropriate pin or lead to ground; if high resistance is indicated, check ground wire for breakage and ground connections for correctness and tightness. Correct as required.
	g. Open in De-Icer, De-Icer wire harness or slip ring assembly *leads.*	g. Disconnect De-Icer leads and check resistance per Report *59-728. If not ok, replace faulty* De-Icer. If ok, check for (and fix) open in slip rings leads. See Section 5-4.5. Where detachable lead/strap De-Icers are used, check De-Icer wire harness leads for continuity. Ohmmeter needle must not flicker when leads are stretched or flexed. Replace as required.
2. Ammeter shows normal current part of cycle, zero current rest of cycle.	a. Open in wiring between timer and brush block assembly, one engine.	a. See 1.f. above.
	b. Open in De-Icer or slip ring assembly leads.	b. See 1.g. above.
	c. Timer faulty.	c. Test timer per Section 3-2.4.
3. Ammeter shows normal current part of cycle, low current rest of cycle.	a. Inner and outer De-Icer elements heating same phase (in series).	a. Locate and repair incorrect lead connections. See wiring schematic (Find from Table 4-1).
	b. Open circuit or high resistance in De-Icer or slip ring assembly leads.	b. See 1.g. above.
	c. High resistance in circuit with low current.	*c. Check contact of brushes to* slip rings per Report 68-04-714; correct as indicated: check wiring from timer to De-Icers for loose or corroded connections or partially broken wiring. Correct as required.

4-3. TROUBLESHOOTING CHART (Continued)

Trouble	Probable Cause	Remedy
4. Ammeter shows low current over entire cycle.	a. Aircraft voltage low under normal operating conditions.	a. Check voltage into switch.
	b. Ammeter, switch, or circuit breaker faulty.	b. Check voltage up to and out of ammeter, switch, and circuit breaker. Test ammeter per Section 4-7. If low output and input ok, replace defective component.
	c. High resistance up to timer.	c. Check for partially broken wire, or loose or corroded connection in wiring between aircraft supply and timer input. Correct as required.
	d. High contact resistance in timer.	d. Test timer per Section 3-2.4.
	e. One De-Icer element (or wiring connections to De-Icer) in each cycle out.	e. Perform a heat test on each De-Icer. Turn De-Icer switch ON, and after locating the De-Icer section being heated, follow the heating cycle as shown in Fig. 2-2 to 2-11 as applicable, feeling each section for heating in turn. Replace defective components.
5. Ammeter shows excess current over entire cycle.	a. Power lead shorted to ground.	a. Check power leads from ammeter to timer and then to De-Icers for evidence of damage or arcing. With de-icing system switch OFF and timer harness disconnected, check insulation resistance (use "Megger") to ground from timer harness Pin B (and Pin A on 115 VAC systems). Disconnect harness at brush block(s) and repeat check for applicable brush block harness Pins. (See wiring schematic - find from Table 4-1.) If ground is indicated, locate and correct it.
	b. Ammeter faulty.	b. Test ammeter per Section 4-7.
6. Ammeter shows normal current part of cycle, excess current rest of cycle.	a. Short to ground or short between adjacent circuits, timer to brush block.	a. Disconnect leads at brush block and timer. With "Megger", check insulation resistance from power leads to ground and between adjacent circuits. If ground or short is indicated, locate and correct.

4-3. TROUBLESHOOTING CHART (Continued)

Trouble	Probable Cause	Remedy
6. Ammeter shows normal current part of cycle, excess current rest of cycle. *(Continued)*	b. Short to ground or between adjacent circuits in brush block.	b. Electrically isolate brush block and test per Section 4-6.
	c. Short to propeller or short between two adjacent circuits - slip rings to De-Icers.	c. Isolate brush block. With "Megger", check insulation resistance from one ring of slip ring assembly to bare prop. Reading should be at least .5 megohms after one minute. If not ok, disconnect the slip ring leads one set at a time to trace short. If ok, disconnect slip ring leads and check insulation resistance between slip rings; reading should be at least .5 megohms after one minute. If not ok, clean assembly thoroughly as in 3-2.2 and retest. Replace as required.
	d. Timer faulty.	d. Test timer per Section 3-2.4.
7. Ammeter does not "flick" between cycles. (Timers with electronic stepping circuits may not "flick" noticeably. See 3-2.4 NOTE. To check for proper cycling, test per 3-1.2.)	a. Timer ground open: timer not cycling.	a. Disconnect harness at timer and check ground connection with ohmmeter from appropriate pin (See Table 3-1).
	b. Timer contacts welded together (caused by short in electrical system).	b. Test timer per Section 3-2.4. If timer is faulty, repair or replace it but insure that short causing original failure has been located and corrected.
8. Ammeter flicks between normal cycle periods (confirm by ground test per paragraph 3-2.7).	a. Loose connection between aircraft power supply and timer input.	a. Trace wiring from power source to timer input. Insure that good electrical contacts are made at each connection in the circuit.
	b. Loose or poor connection: timer to De-Icers.	b. If trouble occurs only part of the cycle, determine which De-Icers are affected and check for rough or dirty slip rings causing brush to skip. Also, check circuits for loose or poor connections. (If all De-Icers on one prop are affected, check ground circuit).
	c. Timer cycles erratically.	c. Test timer per Section 3-2.4 and 4-3.7.a. above.

4-3. TROUBLESHOOTING CHART (Continued)

Trouble	Probable Cause	Remedy
9. Radio noise or interference with De-Icers on.	a. Brushes arcing.	a. Check brush alignment per Report 68-04-714. Check for dirty or rough slip rings. If so, clean, machine or replace slip ring assembly. (See Section 5-4.) Check slip ring alignment per Section 4-5.
	b. Loose connection.	b. See 4-3.8.a and b.
	c. Switch or circuit breaker faulty.	c. Place jumper wire across switch or circuit breaker; if radio noise disappears replace switch or circuit breaker.
	d. Wiring too close to radio equipment or associated wiring.	d. Relocate De-Icer wiring at least 8" from radio equipment and wiring.
10. Cycling sequence not correct.	a. Crossed connections between timer and De-Icers.	a. Check system wiring against circuit diagram. (See Table 4-1 for correct circuit diagram.)
11. Rapid brush wear or frequent breakage.	a. Brush block out of alignment.	a. Check brush alignment per Report 68-04-714. Correct as required.
	b. Slip ring wobbles.	b. Check slip ring alignment with dial indicator per Section 4-5 and figure 4-1.
	c. Rough slip rings.	c. Refinish per Section 5-4.

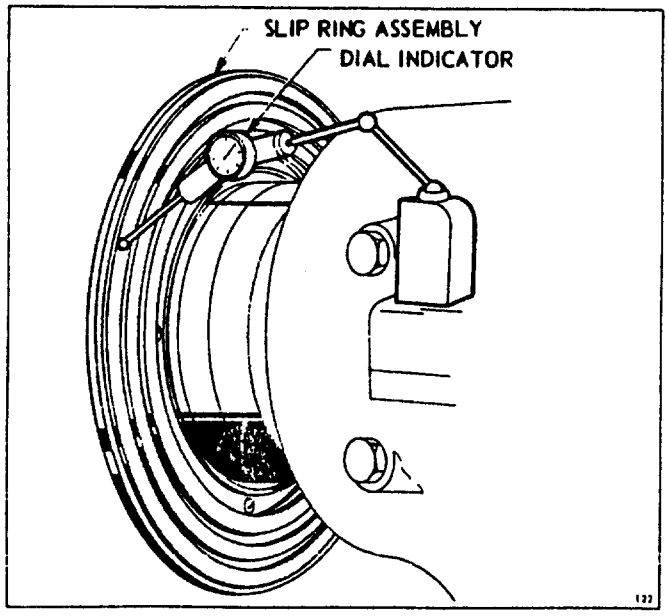

Figure 4-1. Slip Ring Run-Out Test

4-4. DE-ICER RESISTANCE CHECK

To determine incorrect resistance, short or open at the brush-to-slip ring contact, disconnect harness at the brush block and use an accurate low range ohmmeter or Wheatstone bridge to read resistance from each De-Icer circuit lead (Pins A, B or C of brush block. See Table 4-1 for correct wiring schematic) to brush block ground pin. The resistances should be as shown in Report 59-728. If not, disconnect De-Icer lead straps or De-Icer wire harnesses at the spinner bulkhead or starter ring gear and measure heater resistance individually. If first check is off limits but second check is ok, the trouble is probably in the brush-to-slip ring area; if the second check is off limits, the De-Icer or wire harness concerned is damaged and should be replaced.

4-5. SLIP RING RUN-OUT TEST

Severe arcing and brush wear often occur when there is a "wobble" in the starter ring gear or slip ring assembly. The wobble occurs because the slip rings do not run in a plane perpendicular to the center line of rotation of the propeller shaft. This condition, if allowed to exist, will cause rapid deterioration of the slip ring-brush contact surfaces and lead to the eventual failure of the de-icing system.

To alleviate this condition, insure that the slip rings deviate no more than ± .0025" for piston engines (± .004" for turbine engines) from a plane perpendicular to the center line of rotation of the propeller shaft.

PROCEDURE

1. Securely attach a dial indicator gauge, or equivalent, to the engine crankcase such that a reading of the slip ring wobble can be made. (See figure 4-1.)

2. Grasp the propeller blade and rotate it slowly, noting the deviation of the slip rings from a true plane as indicated on the gauge.

NOTE

Due to the loose fit of some propeller thrust bearings, a considerable error may be induced in the readings by pushing the propeller in or out. Care must be taken to exert a uniform push or pull on the propeller so as to hold this error to a minimum.

3. If the deviation measured is within ± .0025" (.005" total deviation) or ± .004" (.008" total deviation) as applicable, and does not exceed .002" in any 4" of slip ring travel, no further action is necessary.

4. If the total deviation exceeds .005" (.008") or .002" within any 4" of slip ring travel, note the amount and location of the deviation.

For starter ring gear mounted slip ring assemblies and slip ring assemblies mounting directly between prop shaft and engine flanges, remove assembly from engine, clean mounting surfaces, reinstall and recheck. If readings are still not within the limits given and refacing per Section 5-4 does not correct this problem, return the assembly to BFGoodrich. For all other types of slip ring assemblies, align per steps 5 through 8.

5. Vary the torque of the attachment bolts over the range of: 65-100 in-lbs. for 1/4-28 bolts, screws or hylock pins, 21-32 in-lbs. for 10-32 screws or bolts, or 100-150 in-lbs. for 5/16-24 bolts. Where belleville washers are used, vary the torque from 40-100 in-lbs.

Do not shim or vary torque of propeller attachment bolts!

6. If the deviation of the slip rings is still excessive, make small (up to .005" max.) washer-shaped shims and place them on the attachment bolts (limit one per bolt) between the slip ring assembly and its mounting surface. Again, vary the torque of the attachment bolts and repeat Step 2.

7. Adjust the shim height and vary the torque until the slip rings run true within the prescribed tolerance. If rings will not adjust within tolerance, check the flatness and structural integrity of the mounting surface. Correct as necessary. If mounting surface is satisfactory, remove slip ring assembly, clean per Section 3-2.2, place on a flat surface and recheck runout. Resurface per Section 5-4, as necessary, reinstall and realign.

8. After properly aligning the slip rings, check the brush block assembly for proper alignment with respect to the slip rings and adjust, if necessary. (See Report 68-04-714).

4-6. BRUSH BLOCK OR BRUSH MODULE RESISTANCE CHECK

To determine when open or short circuit or high resistance is present in brush block or brush module, use low range ohmmeter to measure resistance from face of brush to its receptacle pin. Probe contacting brush should have an area of 1/16 sq. in. min. If over 0.013 ohms, locate and repair cause of excessive resistance or replace brush or module. Check the insulation resistance between the three terminal studs or connector pins, also check from pins to connector housing; it should not be less than .5 megohms after one minute. If it is, check for a short between brush leads. Using instructions for brush replacement in Report 68-04-714, replace insulating tubing as required to correct short.

4-7. AMMETER CHECKOUT

To determine if the De-Icer ammeter is operable, check out as follows:

1. Determine whether ammeter is internally or externally shunted.

a. Examine lower right corner of ammeter face for notation of full scale (FS) deflection.

b. Internally shunted ammeters have the notation "FS = 30 Amps" or "FS = 40 Amps". (Ammeters for AC systems are internally shunted and have the notation FS = 10 Amps.)

c. Externally shunted ammeters have the notation "FS = 50 MV" (millivolts). Scale ranges are 0-30 or 0-50 amps. The external shunts have the notation "30 Amps = 50 MV" (use with 0-30 amp range ammeter) or "50 Amps = 50 MV" (use with 0-50 amp range ammeter). Insure that ammeter and shunt are correctly matched.

2. Check for good electrical connections at terminals of ammeter and shunt (if used). Power lead from bus bar must be connected to the + (Positive) terminal of an internally shunted ammeter. Where external shunt is used, the + terminal of the ammeter must be connected to the same shunt post as the power lead from the bus bar.

3. ELECTRICAL CHECK:

a. For internally shunted meters, connect an equivalent range, calibrated ammeter (accuracy ± 2% F.S. or better) in series with the meter. Turn de-icing system switch ON and check ammeter readings. They should be the same. If not, replace De-Icer ammeter.

b. To check shunt of externally shunted meters, disconnect the meter leads at the shunt and connect a volt-ohmmeter (or equivalent) with a millivolt scale in its place. Turn de-icing system switch ON and check millivolt reading. If De-Icer ammeter scale is 0-50, reading on millivoltmeter will fall within or close to the values for the shaded range (normal operating current range) on the De-Icer ammeter (see also, Table 4-1). If scale is 0-30, reading obtained will be 1⅔ (167%) times the shaded range. For example, if shaded range is 14-18 amps, reading should be about 23.3 to 30 millivolts.

To check meter, use alternative shunt of proper value and check for correct reading with de-icing system switch ON. Meter may be checked without shunt by using a good, adjustable 0-50 millivolt source. If readings from ammeter and shunt do not closely agree, replace defective component.

NOTE

3E1886 ammeter is adjusted to compensate for 0.2 ohm (total) shunt leadwires. When testing use equivalent resistance in series with meter.

Section 5
Repair Procedures
5-1. INTRODUCTION

1. USE OF CORRECT PARTS

The type and number of De-Icers determine the system current drain. The ammeter (where BFG furnished), switch and circuit breaker are designed to operate at that current. Accordingly, only the De-Icers, ammeter, switch and circuit breaker specified for use on an aircraft may be used without affecting system operation. When replacing worn or defective parts, insure that the replacement instructions are followed explicitly. See BFGoodrich Parts List before ordering components. See Tables 4-1 and 4-2 for identification of Parts List for your aircraft.

2. ELECTRICAL

a. For soldering, use Kester "Resin Five" core solder, .062 strand, No. 66 or equivalent. Where flexibility of wire lead is vital, as in brush leads, slip ring leads, etc., guard against applying excess solder which would stiffen the wire or joint. This condition (called "wicking") must be held to ⅛" maximum on these leads.

b. In attaching terminals to wire, use crimping tool which crimps both sides of terminal to avoid loosening insulation. See that terminal is crimped to bare wire, not only on wire's insulation. If wires are too short to repair, replace with same gauge and quality.

c. Bent pins in receptacle may be straightened with long nose pliers, but insure that work hardening does not leave pin brittle and susceptible to breakage. If in doubt, replace the receptacle. Similarly, minor damage to receptacle threads may be repaired; major damage requires replacement. Check insulation resistance between pins to insure insulation has not been damaged. Resistance should be .5 megohm, minimum, after one minute.

d Chafed or worn harness areas indicate the need to redress the wiring. If not too badly damaged, chafed areas may be wrapped well with insulating tape and covered with vinyl tubing. If in doubt, replace the affected wire or harness with same gauge and quality.

3. MECHANICAL

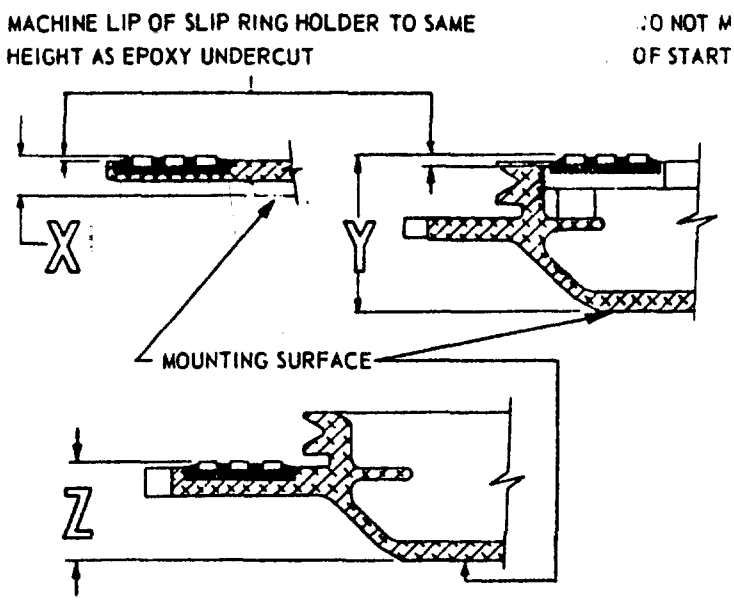
Use safety wire at timer, wire harnesses, brush block assembly, slip ring assembly, lead clip of De-Icers, and wherever provisions are made for its use. Tighten mounting hardware and electrical connections firmly or according to torque values given. Avoid excess force which might strip threads.

5.2. SWITCH, CIRCUIT BREAKER, AMMETER, TIMER, HARNESS

The switch (and shunt), circuit breaker, ammeter, and timer* are not reparable, generally, in the field. If failure should occur, replace with identical parts as listed in the BFGoodrich Parts List. Use the same or equivalent hardware for mounting and making electrical connections as was used originally. Note that aircraft power supply lead ties to positive terminal of ammeter (where used); negative terminal connects to Pin B of connector plug at timer. If ammeter has external shunt, insure that proper connections are made between it and ammeter. If AC ammeter is used, make sure it is connected to correct power source.

*To repair 3E1150-3 timers, use Report 73-14-054; for 3E1150-7 timers use Report 75-23-009; for 3E1968-1 timers use Report 75-23-030.

Repair wire harness as noted in 5-1.2.d or replace with the same gauge and quality wire as originally used. Insure that insulation is equivalent or superior to original and that the same type of color coding shown in the wiring schematic is used.



5-3. BRUSH BLOCK ASSEMBLY

See BFGoodrich Report No. 68-04-714.

5-4. SLIP RINGS (SEE, ALSO, 3-2.2)

1. MACHINING

If structurally sound, slip rings with roughened or damaged surfaces can be machined to restore to serviceability. See Figure 5-1 for machining instructions. See Table 5-1 for absolute minimum dimensions. Check assembly before machining to determine if sufficient ring remains to allow for machining. Do not use assemblies which are worn at or below the minimum dimensions.

PROCEDURE:

1. Thoroughly clean slip ring or starter ring gear assembly with MEK before beginning resurfacing.
2. Check flatness of slip ring or starter ring gear assembly mounting surface. It must be flat within .005" overall.
3. Locate assembly concentrically in lathe so that there is no more than .002" wobble or run-out over 360° rotation.
4. Take a light cut for a smooth finish (29-35 micro-inches). A tool with a 1/64 to 1/32"R edge is recommended. Cut no deeper than required to remove surface damage. Do not machine past dimension given in Table 5-1; dimension is measured from mounting surface.

   CAUTION: IN MACHINING, DO NOT ALLOW TEMPERATURE OF SLIP RINGS TO EXCEED 200°F.

5. Insure that contact surfaces of slip rings are parallel within 0.005" and flat within 0.005" overall — deviation not to exceed 0.002" over a 4" arc.
6. Undercut insulation between and around slip rings .020 to .030", as necessary. Slip ring holder outer edge must be undercut to same dimension as insulation. *Do not machine outer edge of slip ring holders containing synchrophasing targets and do not machine any portion of starter ring gears.*

   CAUTION: WHEN UNDERCUTTING INSULATION, WIDTH OF SLIP RINGS MUST NOT BE REDUCED MORE THAN .005".

7. Deburr slip ring edges.
8. To assure an accurate finish use emery paper.
9. *Check insulation resistance between slip rings and to metal holder with a* "megger" (see section 4-2.6). With 500 VDC applied, resistance must be at least .5 megohms after one minute.

Figure 5-1. Slip Ring Machining

TABLE 5-1. SLIP RING MINIMUM DIMENSIONS

CAUTION

Insure that correct part number is used when finding X, Y or Z dimension.

Slip Ring Assy. No.	X Min. Dim's.	Slip Ring Assy. No.	X Min. Dim's.	Starter Ring Gear/ Slip Ring Assy.	Min. Dim's. Y	Z

2. REPLACEMENT

Slip ring assemblies that are open electrically, cracked or damaged structurally, or which have damaged surfaces beyond the scope of minor repair, should be replaced with new assemblies and aligned per Section 4-5. Install slip rings and ring gears as removed. Where star washers are required in mounting slip ring assemblies, use new star washers. Insure that they are sandwiched between flat washers when used between slip ring assembly and its mounting surface. Insure that belleville washers, where used, are properly oriented. The larger diameter of the washer should be against tne slip ring assembly.

3. SLIP RING STUDS

Some slip ring assemblies use a stud brazed or welded to the slip ring for making the electrical connection. In any work around these studs, avoid side loads on the studs which might lead to breakage of the brazed joint and failure of the slip ring. Generally, broken studs cannot be repaired — the assembly must be replaced. However, parts may be returned to BFGoodrich for inspection and possible repair.

4. ECCENTRIC RUNNING

If brush block cannot be adjusted sufficiently to prevent brushes from riding partially off the edge of the slip rings at any point through 360° of rotation, the spinner bulkhead or slip ring mounting holes or the slip rings are non-concentric. The spinner bulkhead or slip ring must be replaced to permit proper mounting of the slip ring assembly — there is no adjustment for this condition.

5. SLIP RING LEAD WIRES

a. If slip ring lead wires are frayed or broken, they should be repaired or replaced with wire of equivalent length, gauge and quality per standard aircraft practices and Section 5-2.

b. If slip ring lead wire breaks inside the assembly itself, the wire cannot be replaced without probable damage to the assembly; replace the assembly.

c. If slip ring lead wire breaks at a stud, wire should be replaced in following manner:

1. Place assembly on good heat sink; temperature of assembly must not rise above 175°F in any area other than the stud itself.

2. Clean out hole in stud; remove broken wire.

3. Replace wire with equivalent length, gauge and quality, soldering per Section 5-2 and standard aircraft practices.

4. Install equivalent length of standard, thin wall, shrink tubing over stud and lead as was originally used.

5. When finished, check continuity with ohmmeter.

5-5. DE-ICER AND BALANCE WEIGHT INSTALLATION

1. DE-ICER REPLACEMENT

If tests show a De-Icer to have an open circuit, the wrong resistance, or visible damage, replace the De-Icer using removal and installation procedures in BFGoodrich Report 59-728.

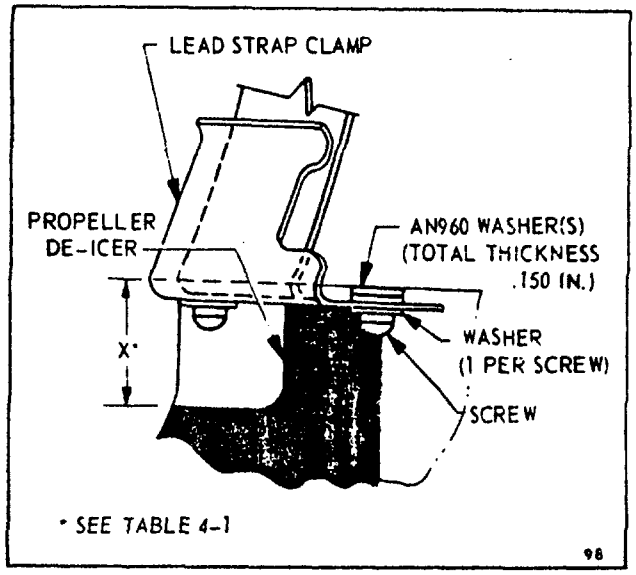
2. BALANCE WEIGHT INSTALLATION

Before removing the old De-Icer and attachment hardware, carefully note and record the exact number, type, and location of all balance weights installed on the hub in the area where the De-Icer lead strap and lead strap clamp are located. Remove the weights and attaching parts and set them aside for reassembly after the De-Icers have been installed. Balance weights must be installed in their original position on the propeller hub or the propeller must be rebalanced as specified by the propeller manufacturer. However, balance weights may be installed above the lead strap clamp. See figure 5-8 for special Beech Model 58 installation. (Some clamps have tapped holes on top for installation of balance weights.)

NOTE

If balance weights are required over or under lead strap clamp use AN960 washers for shims. The number of washers needed depends upon the number of weights used. Clamp must be spaced away from hub so that portion of clamp passing over De-Icer lead strap is about .150" from hub. If washer is required below lead strap clamp, one side of AN960 washer may have to be trimmed to fit.

In some instances, installation of balance weights around or over lead strap clamp will require modification of the weights or replacement with new weights. Add additional modified balance weights to replace weight removed in modification of original weights. Observe propeller manufacturers' recommendations on maximum number of weights used.



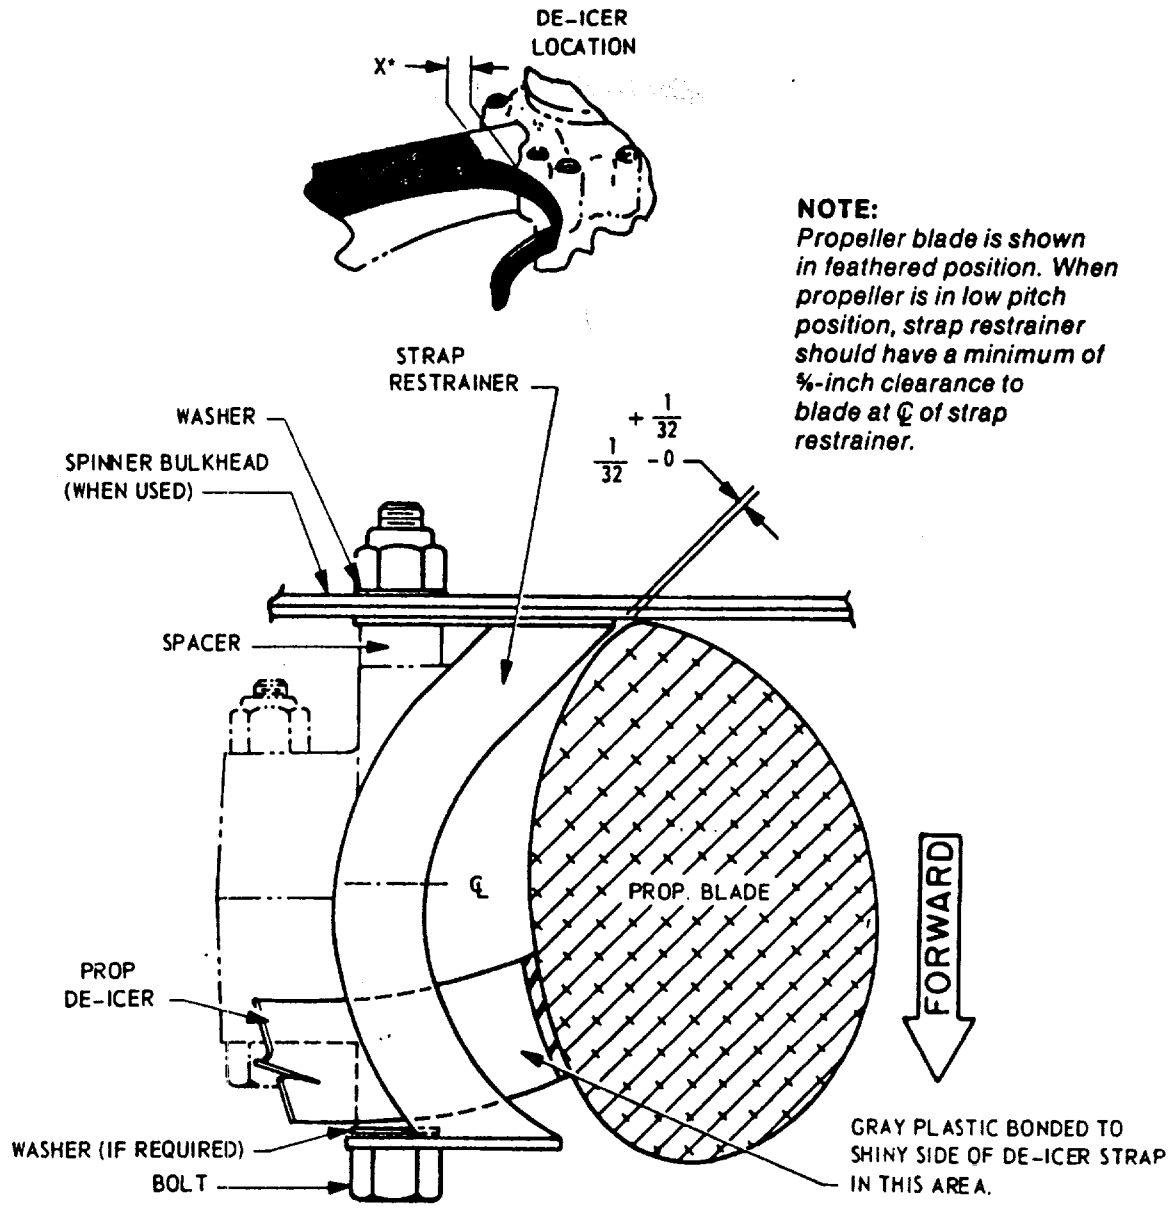


Figure 5-2. Lead Strap Clamp 2E1063-4

R.H. INSTALLATION SHOWN; L.H. OPPOSITE

NOTE:
Propeller blade is shown in feathered position. When propeller is in low pitch position, strap restrainer should have a minimum of 5/8-inch clearance to blade at ℄ of strap restrainer.

INSTALLATION

1. Insert spacer as shown against propeller hub.
2. Position strap restrainer leg against spacer.
3. Check for clearance between other leg of strap restrainer and propeller hub. If any, install washers for snug fit.
4. Install bolt. Do not use washer under bolt head.
5. Install washers as required (minimum one) to prevent nut from bottoming out on bolt.
6. Position strap restrainer to maintain clearance as shown.

NOTE:
Strap restrainers should be installed as shipped — in matched sets by color. Yellow parts are installed on normally rotating (R.H.) propellers. Blue parts are installed on counterrotating (L.H.) propellers.

99

Figure 5-3. Strap Restrainer

NOTE

On new installations, the screws provided for lead strap clamp installation are of sufficient length only for this installation. Where mounting location of balance weight and clamp correspond, new screws may be used. If so, select a screw which has minimum thread engagement per good aircraft practice but is not so long that it bottoms out in the hole (use AN502 or AN503 screws as required).

CAUTION

Insure that screw holding lead strap clamp and/or balance weights will not contact spinner dome in any pitch position.

5-6. LEAD STRAP CLAMP, RESTRAINER STRAP, STRAP RESTRAINER AND TIE STRAP INSTALLATION

A clamp or restrainer is required at the inboard end of the De-Icer to prevent loosening of the De-Icer bond when centrifugal force acts on the lead strap. Various common types of clamps and restrainers are illustrated in Figures 5-2 through 5-12. Attach lead strap clamp or restrainer as shown. Use only existing holes in the hub. Earlier versions of these clamps should be installed in the same manner as those shown.

CAUTION

When a clamp is used, it must not squeeze the lead strap so tightly as to cause damage or to place tension on the strap that could pull the De-Icer bond loose. Some clamps are spaced away from the hub with washers to about .150"; consult figures 5-2 through 5-12 for correct installation. Do not twist the lead straps over 180° during installation. They contain wires which could be broken by excessive twisting.

NOTE

Some old clamps may be modified to the current configuration as follows: 2E1063-1 becomes 2E1063-4 when the sponge is removed; 2E1087-1 and -2 become 2E1087-3 when the sponge is removed from the 2E1087-1 clamp and the clamps are ground off per Figure 5-9; 2E1200 and 2E1200-1 should be replaced with new 2E1200-4's; however, the old part is serviceable if neoprene tubing is in place as shown in Figure 5-10. Clamps 2E1200-2 and 2E1200-3 are OK as they are.

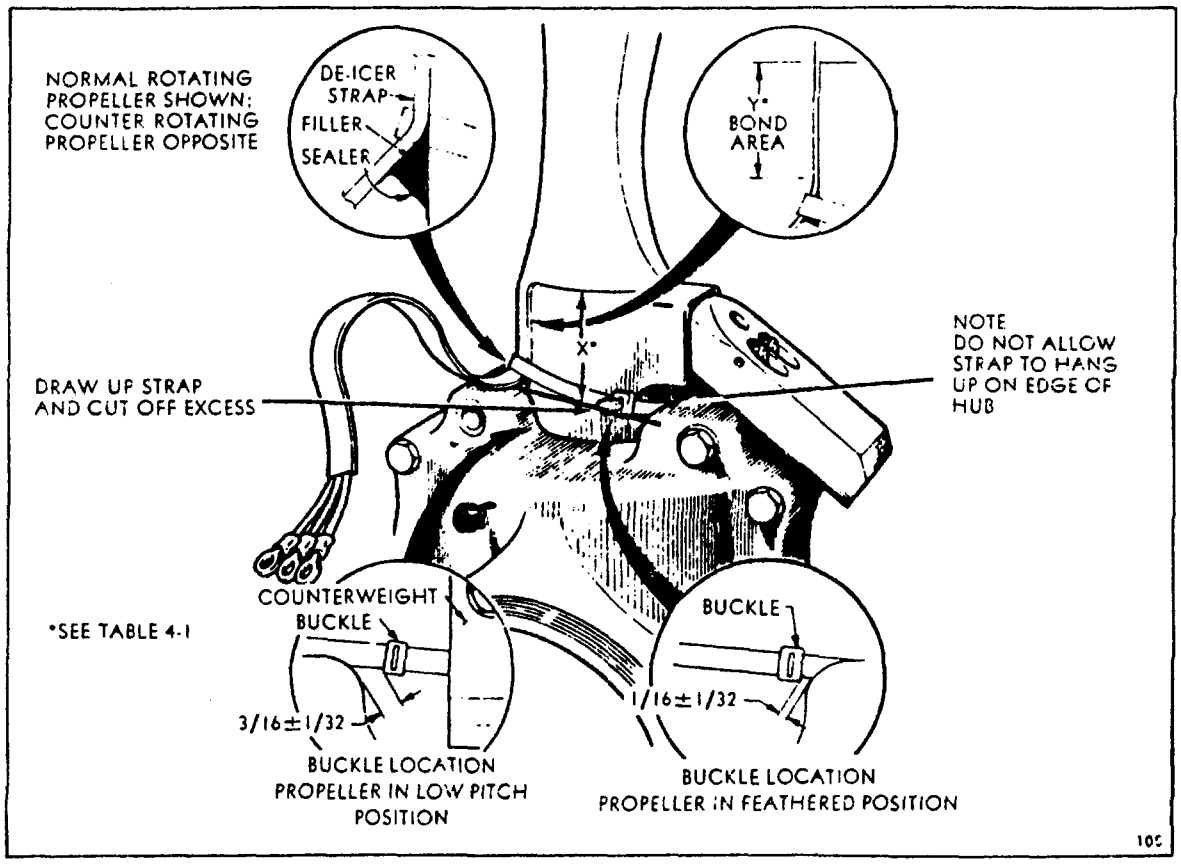

Figure 5-4. Installation of Nylon Tie Strap

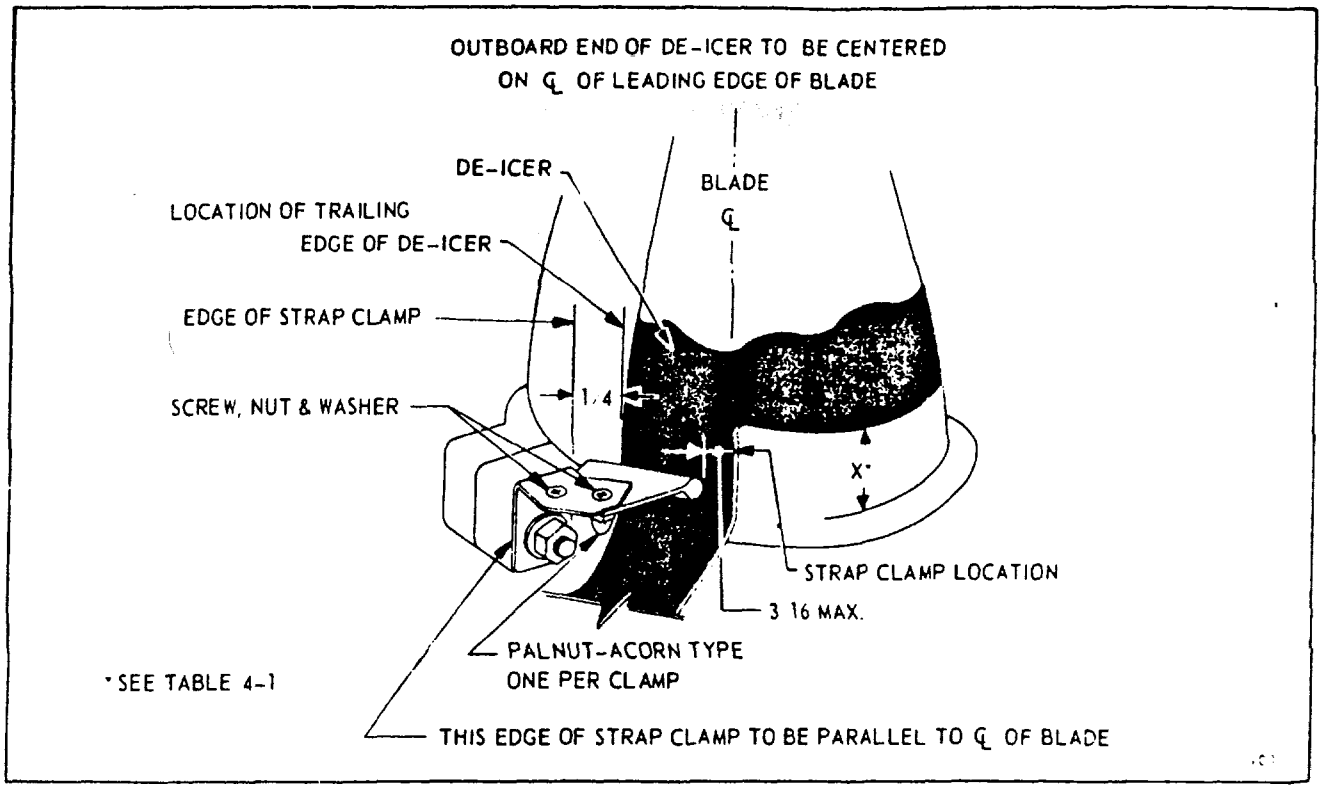

Figure 5-5. Lead Strap Clamp 2E1285-1, -2

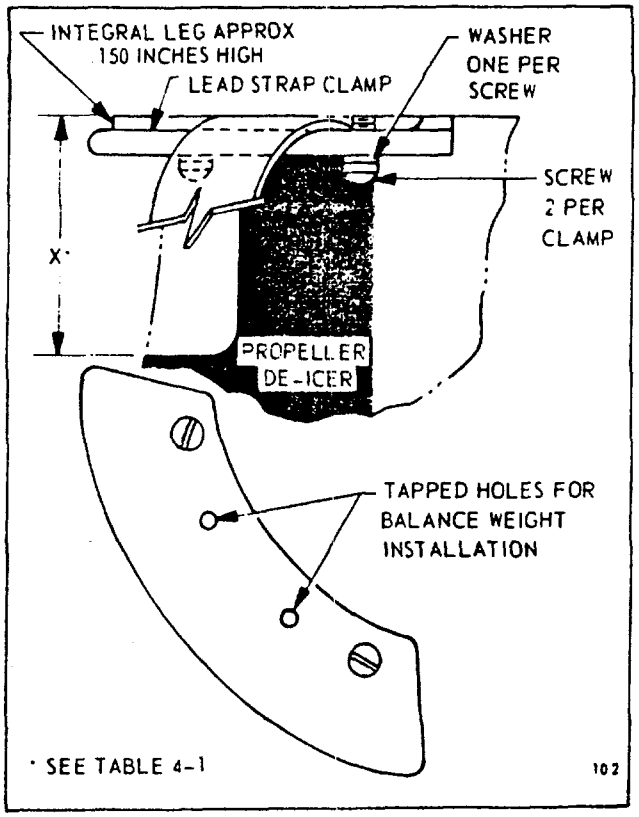

Figure 5-6. Lead Strap Clamp 2E1200-4

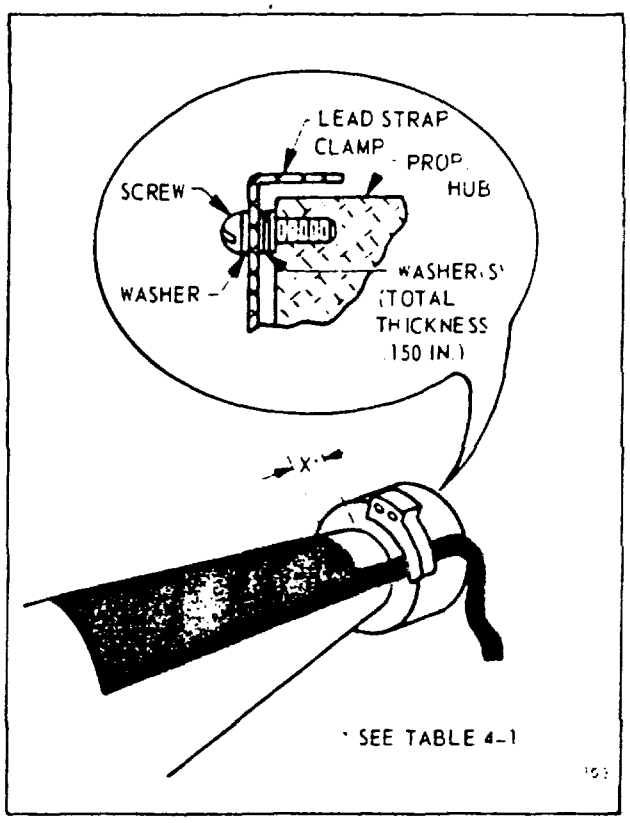

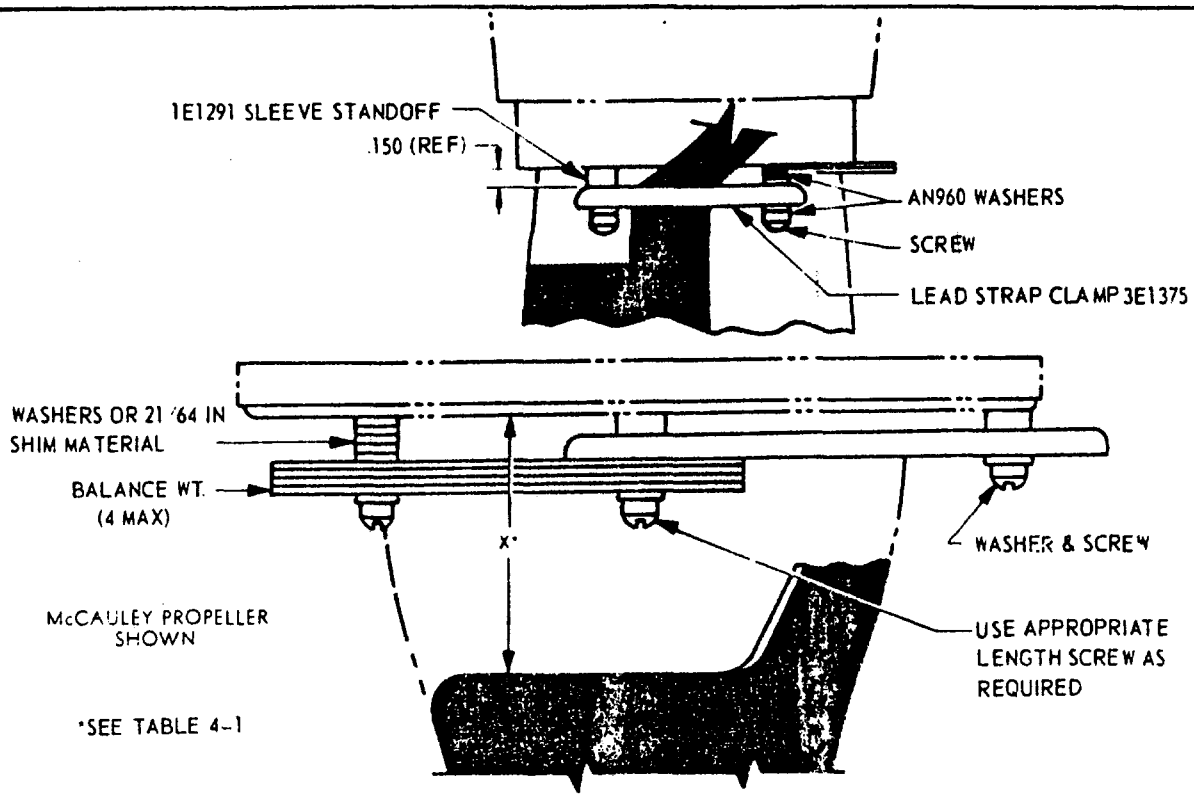

Figure 5-7. Lead Strap Clamp 2E1087-3

NOTE: *If two mounting holes of balance weight coincide with those of lead strap clamp,* modify balance weight to clamp configuration to avoid interference with De-Icer lead strap. Add modified balance weights to replace weight removed in modification.

On Beech Model 58, when balance weights coincide with both lead strap clamp mounting holes, mount weights under clamp. When weights coincide with one clamp mounting hole, install up to 4 weights under clamp and shim to .150" height. Where more than 4 weights are used, install them over the clamp.

Section 6

Detachable Lead Strap De-Icers

6-1. INTRODUCTION

To increase the service life of propeller De-Icers, BFGoodrich isolated the most frequent area of failure — the strap — from the rest of the De-Icer. With this patented design, either the strap or the heating element portion can be replaced upon failure. Basically, conversion to this configuration requires the use of a wire harness to replace the De-Icer lead strap and a terminal clamp or terminal plug and attaching clamp to replace the existing lead strap clamp. In the case of Hartzell compact propellers, a new De-Icer is used, thus permitting discarding of the strap restrainer. See Tables 6-1, 6-2 and 6-3 for applicable aircraft, propellers, and modification kits.

6-2. MODIFICATION OF EXISTING DE-ICERS ON APPLICABLE HARTZELL PROPELLERS

Serviceable existing (installed) De-Icers may be modified to the new configuration per the following procedure:

1. Remove balance weights, if any, noting quantity and position and save for reinstallation.

2. Remove and discard existing lead strap clamps. Disconnect De-Icer leads at terminal strip or studs.

3. Measure De-Icer strap from hub as shown in Figure 6-1 and per Table 6-1 and cut off at appropriate point.

CAUTION

Insure measurements are made correctly or De-Icer will not perform satisfactorily.

4. Slit De-Icer lead strap BETWEEN the wires or braid down to the blade. DO NOT CUT WIRES OR BRAID!

5. Strip ends of wires or braid carefully by hand to dimension shown in Figure 6-1. DO NOT use mechanical wire stripper.

6. Assemble AMP terminal 32442 (or equivalent) to ends of lead wires using standard aircraft practices.

7. Apply BFGoodrich 82-076-1 and -2 sealer (or alternate per BFG Report 59-728F or subsequent) to strap where fabric has been exposed by cuts. Insure that there is insulation over all lead wires.

To permit correct installation of the De-Icer wire harness, it may be necessary to modify the lead clip assembly to permit installation of a clamp to hold the wire harness in place. See Figure 6-2 for lead clip modification and wire harness details.

Correct terminal clamp assembly is shown in Figures 6-3 and 6-4. Install terminal clamp on hub and reinstall balance weights in original position.

6-3. MODIFYING HARTZELL COMPACT PROPELLERS

To convert De-Icing systems on aircraft having Hartzell compact propellers, it is necessary to remove all existing De-Icers, install new De-Icers and modify the propeller counterweights. This work should be accomplished per the following procedure:

1. Remove existing De-Icers, strap restrainers and tie straps. Reinstall prop bolts per manufacturer's instructions.

2. Drill 9/32" diameter hole in counterweight and chamfer per Figure 6-5. File sharp corners as required and cover all modified areas with zinc chromate paint.

3. Install appropriate new De-Icers (See Table 6-1) per BFG Report 59-728F (or subsequent). Locate De-Icers out from hub the appropriate distance per Table 4-1 or 4-2.

4. Slide 5/16" I.D. transflex tubing over De-Icer leads.

5. Insert De-Icer wire harness leads through the counterweight.

6. Connect De-Icer and wire harness leads using window splice terminals (AMP 320559 or equivalent). Connect matching leads (GND-GND, etc.).

7. Form wires as shown in Figure 6-6 and install MS3367-1-9 tie strap in figure 8 configuration. Note position of tie strap buckle (see Figure 6-7 or 6-8). Tighten tie strap and slide tubing over coiled wires as shown.

8. Install MS3367-2-9 tie straps loosely around counterweight and wire harness 1/4" in from ends of tubing. Note position of tie strap buckles in Figures 6-7 or 6-8.

9. Install .263 I.D. transflex tubing over De-Icer wire harness up to counterweight then route under first tie strap. Tighten both tie straps.

10. Install terminals (AMP 32442 or equivalent) on wire harness per standard aircraft practice and connect to existing terminal studs. Insure that correct (OUTB'D-OUTB'D, INB'D-INB'D, GND-GND) connections are made.

11. Install existing clip bar (and cushion material, if applicable) over tubing and wire harness. Attach using spinner attachment hardware; torque per manufacturer's instructions.

TABLE 6-1. AIRCRAFT AND DETACHABLE KIT IDENTIFICATION AND INFORMATION

CAUTION: *This table must be used in conjunction with Table 6-2. After locating Aircraft and Model No. and Kit No., check Table 6-2 for Kit-Propeller Model applicability.*

NOTE: *This table provides retrofit kit information and lists aircraft currently being reworked to this configuration. Aircraft having detachable leadstrap De-Icers installed as original equipment would not require a retrofit kit. Therefore, those aircraft are not listed here. Original equipment kits containing detachable leadstrap De-Icers are shown in Table 4-1 with a + next to the Kit No.*

Aircraft & Model No.	Modification Kit No.	Wire Harness P/N	Clamp P/N	New De-Icer P/N	Mod. De-Icer Strap Length meas. from edge of hub (See Fig. 6-1)	Component Quantity (Sets/Kit)

Report No. 59-728K
February 1, 1983

BFGoodrich

INSTALLATION & REMOVAL PROCEDURES

ELECTRICALLY HEATED PROPELLER DE-ICERS

FOR

ALUMINUM PROPELLERS

GENERAL

The instructions herein apply to initial and replacement installations of BFGoodrich electrically heated propeller De-Icers. Follow instructions exactly to insure maximum adhesion of De-Icers to propeller blades. Hamilton Standard and Dowty Rotol propellers require different cements and procedures which are optional for other types of propellers. (See Section 12). READ ALL INSTRUCTIONS BEFORE BEGINNING WORK!

CAUTION: The condition of the propeller blades and the De-Icer installation must comply with applicable FAA regulations. Inspect prop blades before De-Icer installation. See Section 13.h.

MATERIALS REQUIRED

De-Icers (one for each propeller blade) are supplied in BFGoodrich propeller de-icing system kits. Replacement De-Icers may be ordered from The BFGoodrich Company by specifying the airplane make and model number or De-Icer part number. The following materials and tools are not supplied in the kit. They should be purchased from local suppliers.

Cement 1300L or EC1403 (Minnesota Mining & Manufacturing Company, St. Paul, Minn.); 1 pint is required for six blades.

Filler EC801, (3M Company); 3½ oz. kit for six blades.

Filler 750 (3M Company); 5 oz. is required for six blades.

Sealer 82-076-1, and -2 (BFGoodrich Engineered Products Group, Akron, Ohio); ½ pint is required for six blades.

Sealer F63B12, V66V29 (Sherwin Williams); ½ pint is required for six blades.

Sealer Kit A-2743 (TRW Hartzell Propeller, Piqua, Ohio); 1 qt. kit is provided.

Cleaning Solvent — MEK (Methyl Ethyl Ketone) or Acetone

Tackifying Solvent — Toluol or MEK (see note below)

Cleaning Cloth — any clean, lint-free cloth

1" paint brushes

2" rubber hand roller

¼" metal hand stitcher

Masking tape

NOTE: MEK may be used instead of Toluol to tackify cement, but it provides approximately 10 seconds working time for De-Icer applications, whereas Toluol provides approximately 40 seconds working time. To increase working time of MEK, add up to 5% by volume of cyclohexanone.

1. BLADE PREPARATION

NOTE: If propeller blades extend into the spinner (see Figure A), the inboard end of the De-Icer should be approximately ½" inside the point where the blade emerges from the spinner. If spinner does not cover blade shank, the inboard end of De-Icer should be within ⅛" of the edge of the hub. On non-reverse pitch propellers of Beech Models 65-90, 65-A90, 65-B90, De-Icer should be located 3/16" from hub. ALL DE-ICERS ON A SINGLE PROPELLER MUST BE LOCATED THE SAME DISTANCE FROM THE HUB FOR ROTATIONAL BALANCE.

a. Place center mark at hub end of blade in line with blade's leading edge. Determine location by sighting along leading edge. Starting at hub or at point out from hub indicated in preceding note (or in applicable installation manual) center the De-Icer on this center mark and fit De-Icer strap clamp or restrainer on the hub.* Compare its position with the position of the strap. Adjust position of the De-Icer, as necessary, to make the lead strap agree with the strap clamp unless more specific details are given in the applicable de-icing system installation manual. Hand fit edges, and hold De-Icer in this position while masking off an area approximately ½" from each side of the De-Icer and ½" from the outer end (See Figure B).

*Some BFG De-Icers have scribed centerlines at the inboard and outboard ends. These De-Icers are to be aligned so the scribe lines on the De-Icer align with the centerline of the leading edge.

b. Remove De-Icer. Clean masked off area thoroughly with MEK or Acetone. When rubber restrainer straps are used remove masking tape from the area that accepts the straps. Thoroughly clean around entire blade from hub out about 2". For final cleaning quickly wipe off solvent with a clean, dry, lint-free cloth to avoid leaving a film.

NOTE: Most Hartzell and McCauley propellers have a special protective coating not easily removed by solvents alone. De-Icers should be bonded directly over this protective coating. If bare metal is exposed on Hartzell blades refer to Hartzell's Blade Specification Manual 133 prior to De-Icer installation.

RECOMMENDED CEMENT DRYING TIMES

Propeller Type	Minimum Cement Drying Time*
McCauley or Dowty Rotol	12 hours
Hartzell-Standard blades	12 hours
Hartzell Compact-with long leadstrap De-Icer	24 hours
Hartzell Compact-with De-Icer lead attached to counterweight	12 hours

*Drying times before starting engines applicable to 3M 1300L cement (only). Allow an additional 12 hours cement curing time before energizing the De-Icers.

CAUTION: Cleanliness of metal and rubber parts cannot be over emphasized. Only very clean surfaces will assure maximum adhesion.

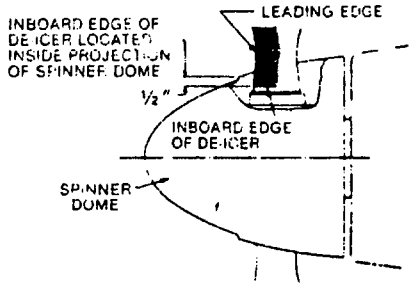

Fig. A — Locating De-Icer on Blade

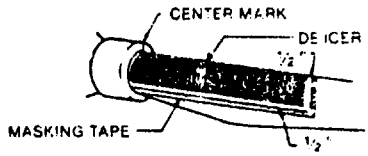

Fig. B — Masking Off De-Icer

2. CEMENT APPLICATION

a. With pencil or pen, mark a center line at the hub of the propeller blade and on the tape at the outboard edge of the masked area.

b. Moisten a clean cloth with MEK or acetone. Clean unglazed (back) surface of the De-Icer and strap. Change the cloth frequently to avoid contamination of the clean area.

c. THOROUGHLY MIX THE CEMENT.

NOTE: To prevent curling of De-Icer edges apply masking tape to the edges on the glazed side before applying cement to the unglazed side. Remove the tape before starting to install the De-Icer.

d. For best results, apply cement and make De-Icer installation at room temperature (65-75°F). Apply one even brush coat of cement to the unglazed back surface of the De-Icer. Apply cement to proper length of De-Icer lead strap so that strap will be cemented to blade up to hub. For propellers using metal strap restrainers, cement De-Icer strap to blade up to projection of centerline of strap restrainer (See Fig. H, View 3). Allow to air dry for a minimum of one hour at 50°F or above, when the relative humidity is less than 75%. If the humidity is 75-90%, allow additional drying time. Do not apply cement if relative humidity is higher than 90%, or if temperature is below

50°F. After cement is dry (not tacky), apply a second even brush coat of cement. Using a silver pencil or a ballpoint pen, mark a center line over the dry cement on the De-Icer before applying the second coat. Where scribe lines are embossed on the De-Icer breeze side, mark centerline on cemented side of De-Icer corresponding to these scribe lines.

NOTE: When cement is applied at temperatures below 65°F, the adhesive bond strength is diminished, regardless of the length of drying time.

e. Apply an even brush coat of cement on the cleaned surface of the propeller blade immediately after the second coat of cement has been applied to the De-Icer. Timing is important because the cement on both surfaces must reach the tacky stage at the same time.

3. DE-ICER INSTALLATION

NOTE: Tacky means slightly sticky to the touch — like adhesive or masking tape.

a. When cement coats are tacky dry on both blade and De-Icer surfaces, position De-Icer on the blade leading edge. Start at the hub end, using center lines as a guide. Make sure that the strap will fall in the previously-marked position. Working outward toward the tip, tack the De-Icer centerline to the leading edge of the propeller blade.

Use the tackifying solvent as necessary. If De-Icer is allowed to get off course, pull up with a quick motion and re-apply De-Icer. If cement is removed from either surface, completely remove De-Icer and re-apply cement as in 2d. Use tackifying solvent as necessary to reinstall De-Icer. When correctly positioned, roll firmly along the center line with a rubber roller (see Figure C).

b. Gradually tilt rubber roller (See Figure D). Carefully work De-Icer over either side of blade contour to avoid trapping air.

c. Roll outwardly from center lines to edges (See Figure E). BE ESPECIALLY CAREFUL TO WORK OUT EXCESS MATERIAL AT OUTBOARD EDGE OF DE-ICER BEFORE OTHER EDGES ARE COMPLETELY ROLLED DOWN. If excess material at edges tends to pucker, work out puckers smoothly and carefully with the fingers (See Figure F).

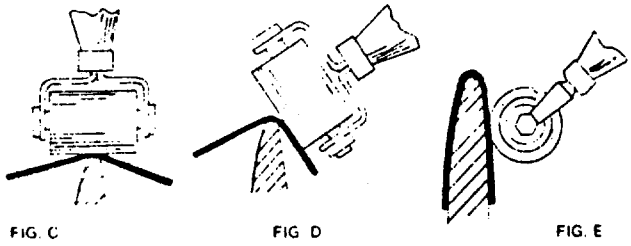

FIG. C FIG. D FIG. E

Fig. C, D, E — Rolling De-Icer onto Blade

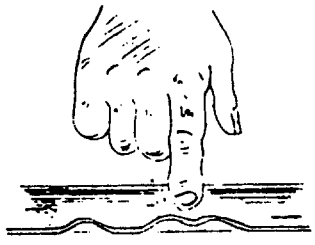

Fig. F — Example of Unacceptable Puckered Edge

d. Roll the tapered edges — especially inboard edge — of the De-Icer with metal stitcher. TO AVOID DAMAGE TO DE-ICER RESISTANCE WIRES OR ELEMENTS, DO NOT USE METAL STITCHER ON BODY OF DE-ICER (See Figure G).

4. APPLICATION OF FILLER AND SEALER

Application of the following sealer is required for **all propeller De-Icer installations.** Application of the following filler and sealer is required for **all De-Icers installed on propellers using Mil-G-23827 grease or equivalent.**

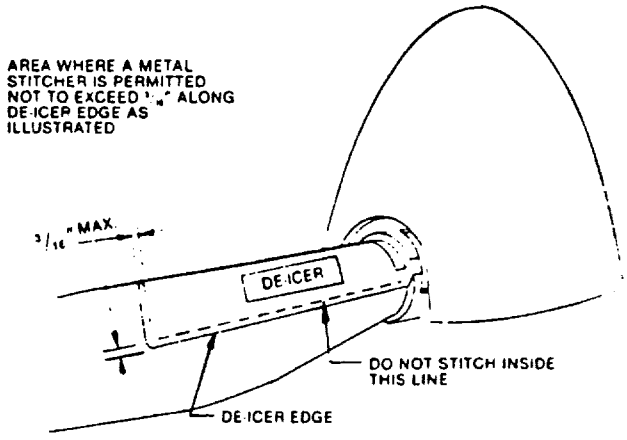

Fig. G — Area for Use of Metal Stitcher

a. MIXING OF MATERIALS — No mixing is required for 3M 750 filler.

CAUTION: 750 filler contains ketone and is extremely flammable.

Material	Manufacturer & No.	Mixing Proportions
Filler	3M EC651 2 Part Sealant	One part accelerator with 10 parts base
Sealer	BFG 82-076-1 & -2 or Sherwin Williams V66V29 & F63B12	Twelve parts -1 with one part -2* One part V66V29 with six parts F63B12

*Recommended ratio. If sealer dries too quickly, use less -2 with -1.

b. APPLICATION OF FILLER — Locate masking tape approximately 1/8" beyond cemented area around De-Icer to permit filler to contact non-cemented portion of blade. Apply one even coat of filler to area around the inboard end, strap, and sides of the De-Icer as shown in Figure H. Filler shall cover 1/8 inch of non-cemented portion of blade, cemented area, and about 1/8 inch of De-Icer as shown in Figure H, Section X-X. Make sure that a fillet of filler covers the area between the lead strap and the blade as shown. Immediately remove masking tape and allow filler to dry for six hours. (24 hours for 3M 750 filler).

NOTE: Filler is not required for short lead strap De-Icers; sealer only may be used.

c. APPLICATION OF SEALER — Apply masking tape about 1/8 inch beyond filler (or 1/4 inch beyond cemented area when no filler is used) to permit sealer to contact non-cemented portion of blade. Apply one even brush coat of either sealer listed to the area around the De-Icer as shown in Figure H. Sealer shall cover 1/8" of non-cemented portion of blade (or 1/4 inch of non-cemented portion of blade where no filler is used) filled area, cemented area, and approximately 1/4 inch of De-Icer as shown in Figure H, Section X-X and Y-Y. Make sure that sealer completely covers filled area (if any) between the lead strap and blade as shown. Immediately remove masking tape before sealer dries. Allow 12 hours cement curing time before starting engine; allow 24 hours cement curing time before operating the De-Icers. (Ref. 1.b. Note)

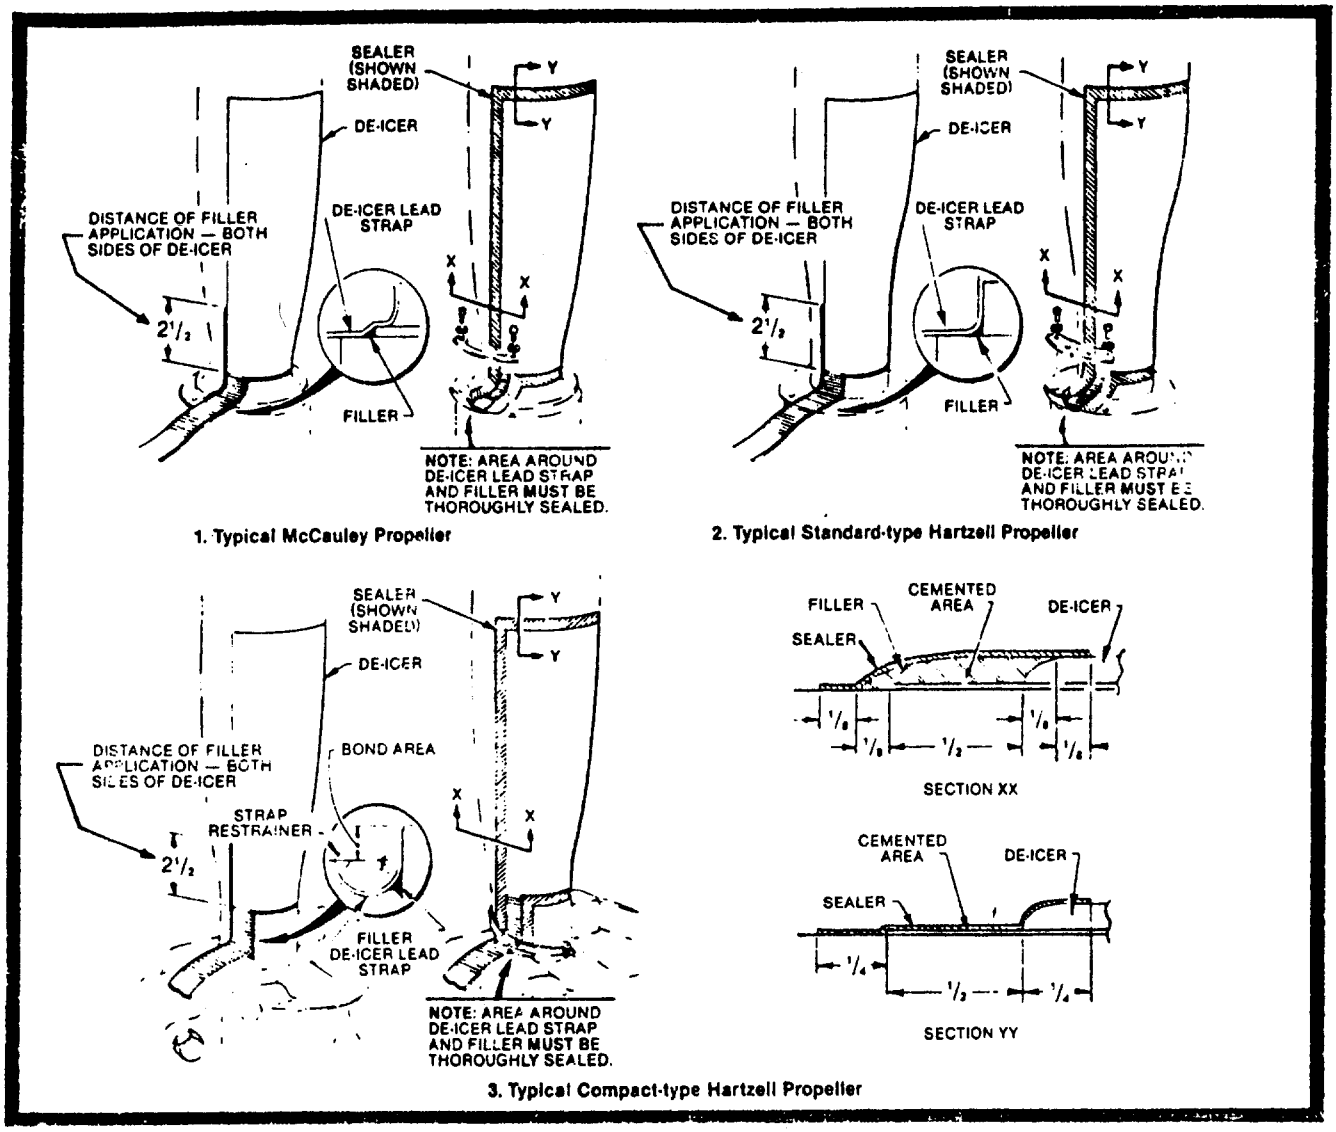

Fig. H — Filler and Sealer Application

5. MARKING HARTZELL PROPELLER BLADES

a. TRW Hartzell Propeller Company has established a method for identifying their propeller blades originally shipped with De-Icers installed. All such blades are marked with a letter "B" or "K" following the basic propeller model number in the blade model designation.

NOTE: The letter "B" represents blades with BFG conventional De-Icers; "K" represents blades with BFG Hot Prop™ De-Icers.

b. Blades which were shipped without De-Icers have a blank space in which the "B" or "K" must be added when the De-Icer is installed. Examples of the blade model designation are shown in Note 2 of the FAA Type Certificate Data Sheets applicable to propellers which are eligible for De-Icers. Examples are:

FAA Data Sheet	Example
P2EA	W 10252 B — 5½
P6EA	V 8433 B — 5½
P892	9349 B — 3
P907	10152 B — 5½
P913	8433 B — 5½

Note the position of the letter "B" in these examples.

c. After the De-Icers have been installed, check blade model designation marked on each blade of the Hartzell propeller.

d. On blades not previously marked, insert a letter "B" or "K" in the blank space following basic model or template number. Refer to the examples in preceding paragraph b, or in Note 2 of FAA Type Certificate Data Sheets.

e. Proceed as follows:

1. Clean off the protective lacquer over the proper space in the blade model designation.
2. Add a letter "B" or "K" in the space provided. Use opaque ink.
3. Apply a protective coating, such as an acrylic clear lacquer.

6. SECURING THE DE-ICER LEAD STRAP

a. Clamps, tie straps, strap restrainers, and restrainer straps are used to prevent loosening of the De-Icer when centrifugal loads are applied to the De-Icer strap. Clamps are used, where possible, to hold the lead strap securely against the hub. Alternately, tie straps, strap restrainers, and restrainer straps are used to limit the movement of the De-Icer strap.

b. For new installations, the proper clamps, restrainers, or straps are provided in the BFGoodrich propeller de-icing system kit. When De-Icers are being replaced, the old clamps or restrainers may be reinstalled. Use MEK or toluol to loosen adhesion of rubber restrainer straps if they are to be reused. Tie straps are not reusable and should be ordered with the De-Icers.

c. Install screws of proper length through clamp into the tapped holes in the propeller hub. Use only existing holes. That portion of the clamp under which the De-Icer

strap passes should be spaced away from hub about .150" with appropriate washers or spacers. Do not safety wire at this time.

d. Install strap restrainers, tie straps, or restrainer straps on the propeller blade or hub per the applicable BFGoodrich propeller De-Icer installation manual for new installations; for replacement installations, install in the same position previously used. Instructions for cementing the restrainer straps are given in Section 7.

7. RESTRAINER STRAP INSTALLATION

(See applicable de-icing system installation manual for other details of a specific installation.)

a. Clean and cement both sides of the restrainer strap. Use materials and procedures outlined for cementing De-Icer, as applicable.

b. When cement is dry, apply a second, even brush coat of cement to both sides of strap.

c. Immediately apply an even brush coat of cement to 2" cleaned area of blade next to hub and over any part of De-Icer and lead strap located in that area.

d. When the cement coats are tacky dry on the blade, De-Icer, and strap, position the strap on the blade and De-Icer as indicated in the applicable de-icing system manual. Roll firmly in place with rubber roller.

e. Apply one even brush coat of sealer (Section 4) over restrainer strap and cemented areas.

f. Allow 24 hours curing time before starting the engine.

8. INSTALLATION OF CLIPS AND TERMINALS

a. The De-Icer strap terminates in narrow leads to which terminals are attached. Attach these terminals to studs or screws on the starter ring gear, the terminal clamp, or the spinner bulkhead, depending upon the airplane being equipped. Secure the strap with a metal clip, as applicable. For Hartzell compact propellers with detachable lead De-Icers, connect the leads to the wire harness and secure to the counterweight.

Details of these types of installations are given in the applicable De-Icing System Installation or Maintenance Manual. For replacement installations, relocate the parts in the same positions from which they were removed.

CAUTION: The De-Icer lead strap must not be twisted more than one turn (180°) in lining up the respective leads.

CAUTION: Never use external tooth star washers (teeth on outer diameter) adjacent to the tongue of the terminals.

b. Be sure there is no slack in the leads between the terminals and the clip.

c. TEST EACH INSTALLED PROP DE-ICING SYSTEM TO INSURE THAT DE-ICERS ARE INSTALLED SO THE BLADES CAN BE MOVED THROUGHOUT THE ENTIRE BLADE PITCH RANGE WITHOUT PLACING THE STRAPS IN TENSION.

9. BALANCE WEIGHTS

a. Reinstall balance weights if previously removed. The original weights or their equivalents must be used. For replacement De-Icer installations, weights should be installed as removed. For new De-Icer installations, see the applicable de-icing system installation manual for details of weight installation. The clamp and weights or restrainer and weights should not contact any part of the propeller or spinner assembly under any condition.

b. Install safety wire on screws as required.

10. FINAL ELECTRICAL CHECK-OUT

a. Be sure terminals are tight, but do not over-torque.

b. Check electrical resistance between terminals or between the slip rings. Compare with the following table for minimum and maximum values in ohms between common ground and either of the other terminals when De-Icer terminals are attached to proper studs.

Part Number	1 De-Icer Ea. Element**		2 De-Icers* Parallel		3 De-Icers Parallel	
	Max.	Min.	Max.	Min.	Max.	Min.
4E1188	5.26	4.58	2.65	2.30	1.78	1.55
4E1214	1.15	0.95	0.58	0.47	0.39	0.32
4E1270	4.12	3.34	2.06	1.67	1.37	1.11
4E1525	3.03	2.63	1.51	1.32	1.01	0.88
4E1601	5.26	4.58	2.65	2.30	1.78	1.55
4E1746	57.40	50.00	28.70	25.00	19.10	16.70
4E1895	1.15	0.95	0.58	0.47	0.39	0.32
4E1956	5.26	4.58	2.65	2.30	1.78	1.55
4E2152	5.26	4.58	2.65	2.30	1.78	1.55
4E2200	4.90	4.74	2.45	2.37	1.64	1.56
4E2271	4.90	4.74	2.45	2.37	1.64	1.58
4E2292	1.12	1.04	0.56	0.52	0.38	0.35
4E2303	1.12	1.04	0.56	0.52	0.38	0.35
4E2336-10	4.24	4.00	2.12	2.00	1.42	1.34
4E2336-12	3.38	3.06	1.69	1.53	1.13	1.02
4E2560	3.60	3.26	1.80	1.63	1.20	1.09
4E2575	3.60	3.26	1.80	1.63	1.20	1.09
4E2595	4.10	3.80	2.05	1.90	1.37	1.27
4E2598	3.84	3.44	1.92	1.72	1.28	1.15

*Four De-Icers in parallel will have half the resistance of two
**Five De-Icers in parallel will have one-fifth the resistance of a single De-Icer element.

If propeller is installed on aircraft, propeller De-Icer circuits must be electrically isolated from the rest of the aircraft wiring when making the above resistance check. Use one of the following methods to isolate:

1. Remove the brush block or module assembly.
2. Retract brushes, and slip a sheet of paper between brushes and slip rings. Do not misalign or damage brushes when inserting the paper shim.
3. Disconnect wiring harness at brush block or module assembly, at a terminal strip, or at a firewall connector plug.

c. Check for intermittent open circuits by tensioning the De-Icer straps slightly while measuring resistance. Also, press lightly on the entire De-Icer heating surface and in the area adjacent to the clamp. Resistance must not fluctuate.

d. Reconnect any circuits that may have been disconnected, or remove paper shim if used. Installation of the electrical propeller De-Icers is now complete.

CAUTION: Observe the 12-hour cement curing time before starting engine. Also, observe the 24-hour curing time before operating the De-Icers. Handle the propeller carefully to prevent damage to the De-Icers. Recheck the position of the De-Icer straps so they are not pinched or snagged by nearby components.

11. ADDITION OF NEOPRENE TO SPINNER DOME FLANGE

(As required; consult applicable de-icing system installation manual.)

While the spinner domes are removed from the airplane, a neoprene strip should be bonded to the spinner dome flange to reduce abrasion in the lead strap area.

a. Thoroughly degrease this area, using MEK or acetone cleaning solvent and wipe clean with a clean, dry, lint-free cloth.

b. Lightly sand to remove all paint in the bond area. See Figure 1.

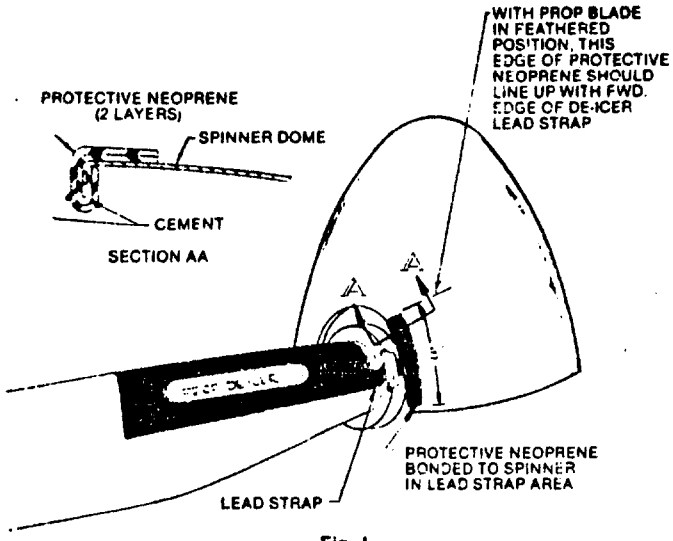

Fig. I
Positioning of Protective Neoprene on Spinner Dome

CAUTION: Cleanliness of bonding areas is vital. Only very clean surfaces will assure maximum adhesion.

c. Reclean with solvent as in paragraph (a) above.

d. Cut the .020 neoprene rubber into two strips each $^5/_8$" x 3".

e. Apply strips of masking tape to the exposed rubber sides of the neoprene to prevent curling during installation. Remove protective paper from neoprene and apply one even coat of 1300L cement to the surfaces and allow to air dry for one hour.

f. Apply one coat of 1300L cement to the spinner dome flange. Allow to air dry one hour so the surface is not tacky.

g. Apply a second coat of cement to one neoprene strip and allow to dry until tacky.

h. Tackify cement on the spinner dome with MEK or toluol, and press the twice-cemented neoprene into position. Extreme care must be used in applying the neoprene to insure a good bond, avoiding looseness or wrinkles. Remove masking tape.

i. After allowing proper drying time, lightly clean the exposed neoprene surface of the installed strip with MEK or acetone. For final cleaning, wipe off the solvent with a clean, dry, lint-free cloth to avoid leaving a film.

j. Apply one coat of 1300L cement to the neoprene rubber strip on the spinner dome flange. Allow to air dry about one hour so surface is not tacky.

k. Apply cement to both neoprene strips, and allow to dry until tacky.

l. Press the second neoprene strip into position. Extreme care must be used in applying the neoprene to insure a good bond, avoiding looseness or wrinkling. Remove masking tape.

m. After allowing proper drying time, lightly clean the exposed neoprene surface of the installed strip with a cloth dampened with MEK or acetone.

12. USE OF ALTERNATE CEMENT

A. HAMILTON STANDARD PROPELLERS

a. The cementing procedure which follows is an approved method for Hamilton Standard propellers, but is optional for other makes. In place of the 1300L or EC1403 cement, the following cements are used:

Cement EC776 (Minnesota Mining & Mfg. Co.); 1 pint is required for 18 blades.

Cement, Bostik 1024 (Part A)* (U.S.M. Chemical Company, Middleton, Mass.); 1 pint is required for 6 blades. Cement, Bostik 1024 (Part B)* Accelerator (U.S.M. Chemical Co.); 1 can is required for 6 blades.

Primer, Bostik 1007 (U.S.M. Chemical Company); 1 pint is required for 18 blades.

*Bostik 1088, parts A and B may be used in place of Bostik 1024; amounts are the same per propeller.

b. Prepare blade as described in Section 1. For best results, install De-Icer at normal room temperature.

c. Thoroughly mix EC776 cement, and brush apply one thin, uniform coat to cleaned metal surface within the masking tape. Allow to dry (at least 30 minutes) before going to next step.

d. Mix primer 1007 thoroughly and apply one even brush coat to the entire previously-coated area. Allow to dry at least 30 minutes.

e. Prepare the 1024 cement by mixing one part of 1024 accelerator (Part B) with 15 parts of 1024 cement (Part A). Prepare only enough for immediate use. The mixture will begin to gel in six to eight hours.

f. Moisten a clean cloth with MEK or acetone and clean the unglazed surface of the De-Icer, changing cloth frequently to avoid contamination.

CAUTION: Cleanliness of metal and rubber parts cannot be too highly stressed. Only very clean surfaces will assure maximum adhesion.

g. Apply two uniform brush coats of 1024 cement to the unglazed, clean, back surface of the De-Icer as in paragraph 2d.

h. Apply an even brush coat of 1024 cement to the primed surface of the propeller blade immediately after the second coat of cement has been applied to the De-Icer. Timing is important because the cement on both surfaces must reach the tacky stage at the same time.

i. When cement coats are tacky dry (usually 10 minutes in direct sunlight to 30 minutes under adverse drying conditions), proceed with installation as described in Section 3.

NOTE: Instead of Bostik primer 1007 and cement 1024, cement EC776 followed by cement 1300L may be used. Apply EC776 as in 12.A.c and 1300L as in 2c through e.

B. DOWTY ROTOL PROPELLERS

a. The cementing procedure which follows is an approved method for Dowty Rotol propellers but is optional for other makes. In place of the 1300L or EC1403 cement and aforementioned sealers, the following cements and sealant are used:

Cement-British Bostick 2402 (Bostik LTD, England)

Primer-British Bostick 9252 (Bostik LTD, England)

Sealer-Ault & Wiborg Base U-1-5-10
Catalyst U-1-4, Dowty Rotol Spec MAT 500

b. Prepare blade as discribed in Section 1. For best results, install De-Icer at room temperature.

c. Apply one coat of 9252 primer to blade and allow to dry for one hour.

d. Thoroughly mix 2402 cement and apply one coat to the De-Icer bonding surface and allow to dry for one hour.

e. Apply a second coat of cement to the De-Icer and immediately apply a coat of cement to the blade surface over the primer coat.

f. When cement coats are tacky dry (usually 10 minutes in direct sunlight to 30 minutes under adverse drying conditions), proceed with installation as described in Section 3.

g. Apply filler per section 4.b.

h. **APPLICATION OF SEALER**—Apply masking tape ¼" beyond De-Icer cement edge to permit sealer to contact base metal and apply one even coat of sealer all over the De-Icer. Prior to the application of sealer, lightly abrade surface of De-Icer with grade 320 silica carbide paper. The thickness of the sealer coat must not exceed .002". **Immediately** remove masking tape before sealer dries.

13. DE-ICER REMOVAL PROCEDURE

NOTE: Cushion the jaws of any pulling tool to prevent damage to the De-Icer, unless it is to be scrapped. If De-Icer has failed under warranty and is to be returned, use extreme care to prevent additional damage to the De-Icer during removal.

a. Remove propeller spinner.

b. Disconnect prop De-Icer terminals from studs on starter ring gear, terminal clamp, or spinner bulkhead (depending upon the airplane). Disconnect leads from wire harness at counterweight for Hartzell compact propellers.

c. Remove the clip which holds strap to starter ring gear or spinner bulkhead, as applicable.

d. Remove clamp or restrainer which holds strap to propeller hub. Note position for reinstallation purposes.

e. Use a liberal amount of MEK or toluol to soften adhesion line between De-Icer and propeller blade. Starting at one corner, loosen enough of the De-Icer to grasp in the jaws of a vise grip plier or similar tool. (See preceding note.) Apply a steady pull to remove De-Icer from the propeller surface slowly and carefully while continuing to use a liberal amount of MEK or toluol to soften adhesion line.

CAUTION: Do not allow solvents to leak into propeller hubs and cause damage to seals.

f. If condition of De-Icer after removal is not important, strip from blade without solvent. De-Icer may tear or come off in pieces.

g. Remove residual cement from blade. Use solvents mentioned above or Turco No. 3 (Turco Products, Inc., Wilmington, California, 1 pint per 6 De-Icers) as necessary.

h. Visually inspect used propeller blades for damage or deterioration prior to De-Icer installation. (Use of 10x magnifying glass is suggested.) Perform other inspection procedures and repair or replace blades per propeller manufacturers' recommendations.

BFGoodrich

REPORT NO. 68-04-714-I
February 1, 1983

OVERHAUL

BRUSH BLOCK ASSEMBLIES

AND MODULAR BRUSH ASSEMBLIES

FOR

ELECTROTHERMAL PROPELLER DE-ICING SYSTEMS

INTRODUCTION

Electrothermal propeller de-icing systems require one brush block assembly or one modular brush assembly per engine. Instructions relating to brush replacement in brush block assemblies are found in Section A of this report. Instructions concerning replacement of brush block assemblies with modular brush assemblies are given in Section B of this report. Replacement of individual brushes or brush modules is described in Section B also.

SECTION A

BRUSH BLOCK ASSEMBLY OVERHAUL

Most brush block assemblies contain a brush retainer assembly which, in turn, contains two or three brushes and springs. To determine if brushes should be replaced, consult the paragraph covering the specific brush block assembly for instructions telling how to measure brush wear. Dimensions are given indicating when brushes MUST be replaced. IF BRUSHES ARE PERMITTED TO WEAR BELOW THE MINIMUM ALLOWED, SYSTEM FAILURE AND SERIOUS SLIP RING DAMAGE MAY OCCUR.

Table 1 lists, in numerical order, all Brush Block Assemblies covered by this publication and may be used as an index to illustrations and pages for specific Brush Block Assemblies instructions. Table 1 also lists the part numbers of the brush block and brush retainer assemblies and their individual brushes and springs. These assemblies or their individual parts (including "B" barrels, braid, tubing, etc. as well as brushes and springs) can be purchased separately from BFGoodrich. However, it is recommended that brushes and their matching springs be purchased and installed in sets. Use only BFG leads and insulation tubing. They have been specifically selected for this application.

To provide a good electrical contact, brush block assemblies using 2E1132 brushes should have a five-hour minimum break-in before the system is operated. This applies to replacements and new installations. This does not prohibit ground checkout of the system with engines "OFF" as specified in the Installation Manual. No break-in time is required for other types of brushes.

TABLE I. ASSEMBLY AND REPAIR PARTS

Brush Block Assembly	Figure No.	Page No.	Brush Retainer Assembly	Brush	Spring
4E1213 4E1283	2	3	3E1176 3E1176	2E1081 2E1081	2E1076 2E1076

1. GENERAL REPLACEMENT INSTRUCTIONS

The following instructions apply, in general, to all brush block assemblies covered in this publication. Additional instructions, where required, are given in the paragraphs treating the specific assembly. Read all general and specific instructions for your brush block before attempting to replace components.

NOTE: Follow established aircraft procedures when soldering, unsoldering, or safety-wiring. When soldering, avoid excessive "wicking" (solder flow) along the lead; wicking must not exceed 3/16 inch. To prevent corrosion use only non-corrosive flux; wipe or flush flux from brush leads and receptacle pins. Clean and degrease all brush block components before reassembling. Use cloth dampened with MEK (methyl-ethyl-ketone) for cleaning. DO NOT SOAK BRUSH BLOCK ASSEMBLY OR BRUSHES IN SOLVENT!

A. BRUSH RETAINER ASSEMBLY REPLACEMENT (See applicable figure and specific instructions)

1. Dismount brush block assembly from aircraft by removing attaching hardware.

2. Remove attaching hardware and separate brush retainer assembly from guide block. Note orientation of terminals with respect to assembly.

3. Discard old brush retainer assembly.

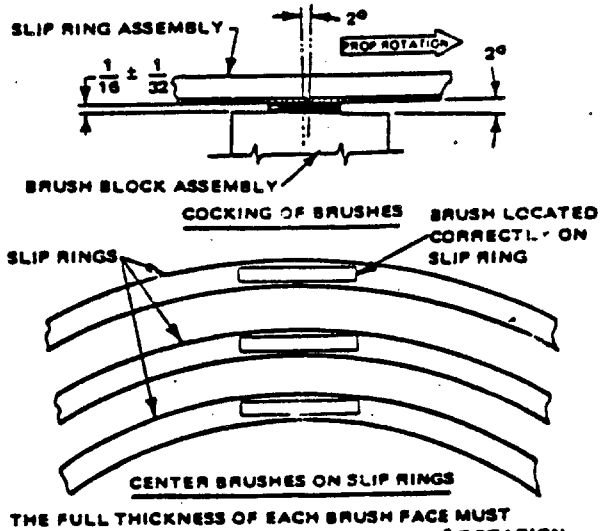

Figure 1. Brush Block Adjustment

4. Assemble new brush retainer assembly; determine correct orientation of brushes to receptacle (see applicable figure) and carefully insert brushes into brush guide block slots or slide guide block over brushes, as applicable. BRUSHES ARE EXTREMELY FRAGILE — AVOID ANY SIDE LOADING. Insure that springs are inserted in alignment slots or holes in retainer and guide blocks.

5. Replace attaching hardware removed in 1.A.2. Insure that new receptacle is oriented according to pin identification shown in applicable figure.

6. Install brush block assembly on aircraft with attaching hardware removed in 1.A.1. Check alignment per figure 1. Safety wire all bolts.

B. BRUSH REPLACEMENT (See applicable figure and specific instructions)

1. Dismount brush block assembly from aircraft by removing attaching hardware.

2. Matchmark receptacle flange and brush retainer block to permit reinstallation in the same position.

3. Remove attaching hardware and separate brush retainer assembly from brush guide block.

4. Unfasten receptacle from brush block and/or brush guide block.

5. Disconnect/unsolder brush leads from studs/receptacle pins.

6. Discard old brushes and springs.

7. Install insulating tubing over brush leads as shown.

8. Connect/solder brush leads to studs/receptacle pins; follow pin identification shown on exploded views.

9. Assemble brushes and springs to brush guide block.

10. Align matchmarks and refasten receptacle to brush retainer block and/or brush guide block.

11. Reassemble brush block assembly using components separated in 1.B.3. above.

12. Check freedom of movement of each brush; with finger at center of brush, press brush into guide block and allow spring to force brush back out slowly. DO NOT ALLOW BRUSH TO SNAP BACK!

13. Check resistance from each brush face to the respective stud/receptacle pin with low range ohmmeter. Resistance must not exceed 0.013 ohms. Probe contacting brush should have an area of 1/16 in² to provide an accurate measurement.

14. Check insulation resistance betwen brushes and from brushes to receptacle housing (when used), with 500VDC, 1000 megohm range "Megger" ("MEG" Type Insulation Tester, James G. Biddle Co., Plymouth Meeting, Pa. or equivalent). Resistance should not be less than 10 megohms for 1 minute.

15. Install assembly on aircraft with attaching hardware removed in 1.B.1. and check alignment per figure 1. Safety wire all bolts.

2. BRUSH BLOCK ASSEMBLIES 4E1213, 4E1283 and 4E1327 (See figure 2.)

A. Brushes should be replaced when "B" barrel is 1/8 inch from spring retainer plate; brushes MUST be replaced when "B" barrel is against spring retainer plate. Brushes should protrude from block 1/16 inch while measurement is made.

B. Follow instructions of paragraph 1.A. and as follows to replace the brush retainer assembly:

1. When removing the attaching hardware (1.A.2.) disconnect brush leads from terminal studs.

2. When assembling brush block (1.A.5.), connect new brush leads to terminal studs noting pin orientation shown in figure 2.

C. Follow instructions of paragraph 1.B. and as follows to replace the brushes:

1. Since a separate receptacle is not used, ignore 1.B.2., 1.B.4., and 1.B.10.

2. After disconnecting the brush leads (1.B.5.):

a. Compress springs so that rods protrude through rear of retainer block.

b. Unsolder "B" barrels and brush leads from brush rods; save barrels and leads for reuse unless new ones are provided.

c. Clean and tin end 1/4 inch of new brush rods; clean inside of "B" barrels and ends of brush leads.

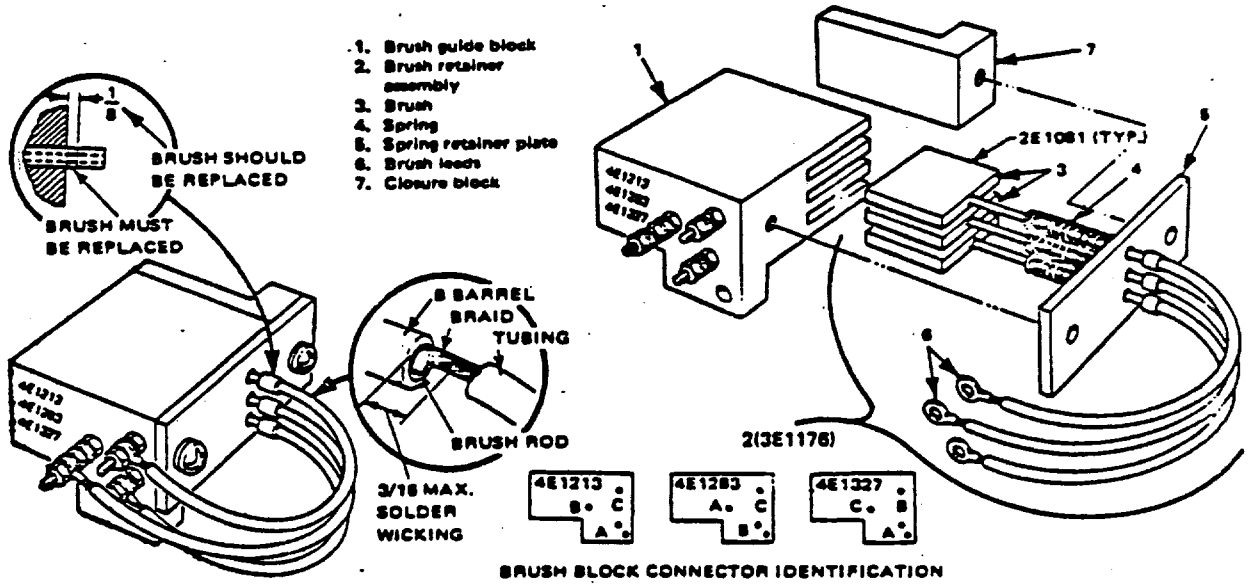

Figure 2. Brush Block Assemblies 4E1213, 4E1283 and 4E1327

BFGoodrich

d. Place new springs over brush rods, insert rods in retainer plate so ends extend through, and hold brushes in position with rubber bands.

e. Install "B" barrels on brush rods so ends of barrels are flush and concentric with ends of rods.

f. Install tubing over brush leads, and insert brush leads between rods and barrels so that flat side of lead is parallel with longer retainer plate surface. Soft solder in place.

NOTE: Longest lead must be installed on center brush rod. Use care to limit wicking of solder on lead to a maximum of 3/16 inch. Do not leave solder on exterior of barrel.

g. Remove rubber bands.

3. BRUSH BLOCK ASSEMBLIES 4E1350-1, -2 and -3 (See figure 3.)

A. Brushes should be replaced when "B" barrel is 3/32 inch or less from the maximum wear position; brushes MUST be replaced when maximum wear position is reached. (See figure 3.) Brushes should protrude from block 1/16 inch while measurement is made.

B. Follow instructions of paragraph 1.A. to replace the brush retainer assembly.

C. Follow instructions of paragraph 1.B. and as follows to replace the brushes.

1. After disconnecting the brush leads (1.B.5.):

a. Compress springs so that rods protrude through rear of retainer block.

b. Unsolder "B" barrels from brush rods: save barrels for reuse.

c. Clean and tin 1/4 inch of end of new brush rods, clean inside of "B" barrels.

d. Place new springs over brush rods, insert rods in retainer block so ends extend through, and hold brushes in position with rubber bands.

e. Install "B" barrels on brush rods so ends of barrels are flush and concentric with ends of rods and soft solder in place. Do not leave solder on exterior of barrel.

f. Remove rubber bands.

2. After installing the insulating tubing (1.B.7.), run brush leads through slots in retainer block.

4. BRUSH BLOCK ASSEMBLIES 4E1311-1, 4E1387-1, -2 and 4E1580-2 (See figure 5.)

A. Measure brush wear as shown in Figure 4. X-dimension (inches) given indicates when brushes MUST be replaced.

B. Follow instructions of paragraph 1.A. and as follows to replace the brush retainer assembly:

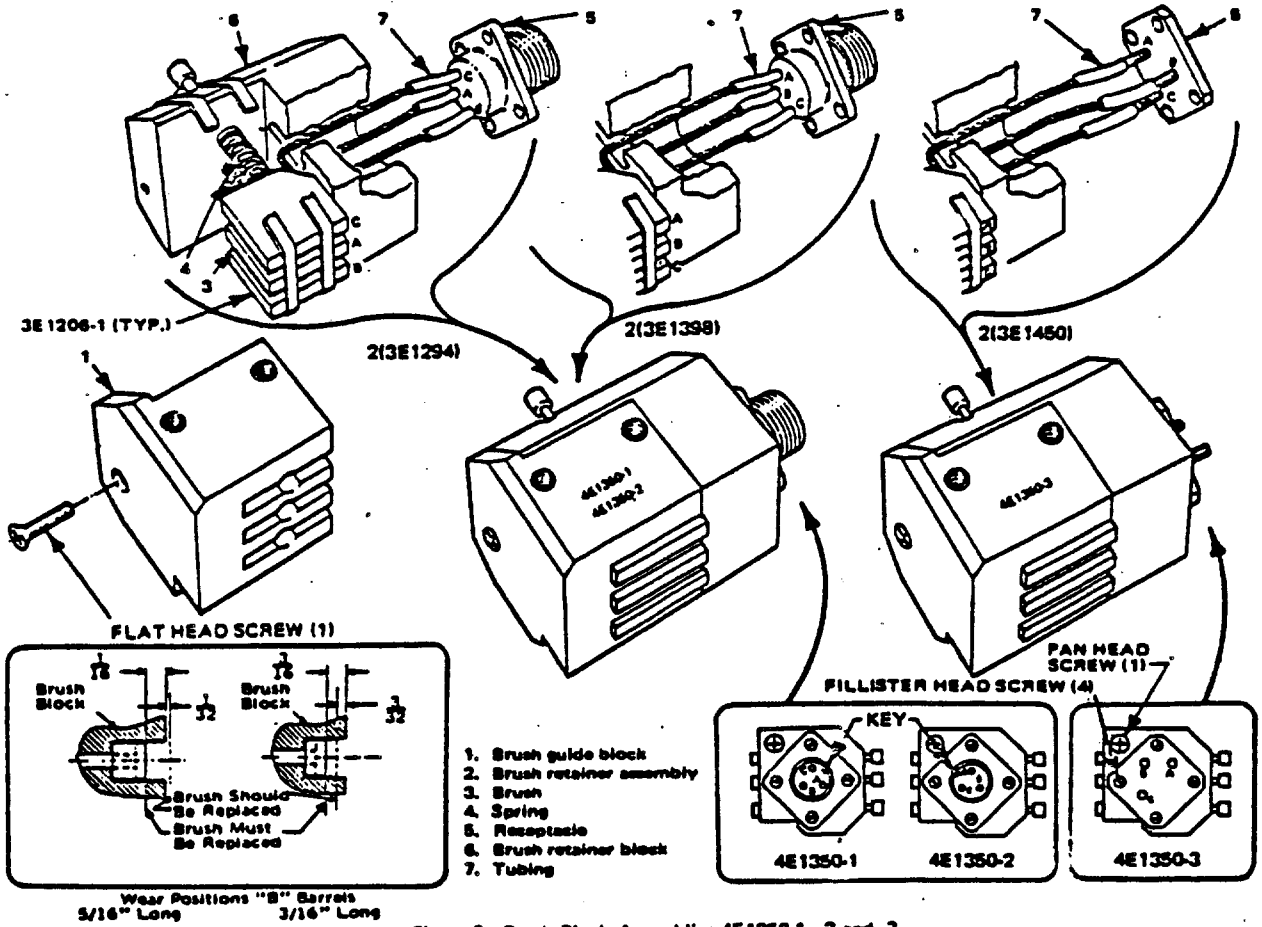

Figure 3. Brush Block Assemblies 4E1350-1, -2 and -3

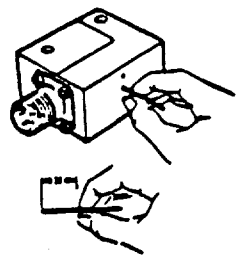
1. When separating (1.A.2.) or reassembling (1.A.4.) brush retainer block, guide block, and brush retainer assembly, move the guide block laterally to disengage or re-engage dowel pins. (Disregard for assemblies without dowel pins.)

2. When reassembling (1.A.4.) the brush retainer assembly, align receptacle as shown in figure 5.

C. Follow instructions of paragraph 1.B. and as follows to replace the brushes:

1. When separating brush retainer block and guide block (1.B.3.), note instructions in 4.B.1. above.



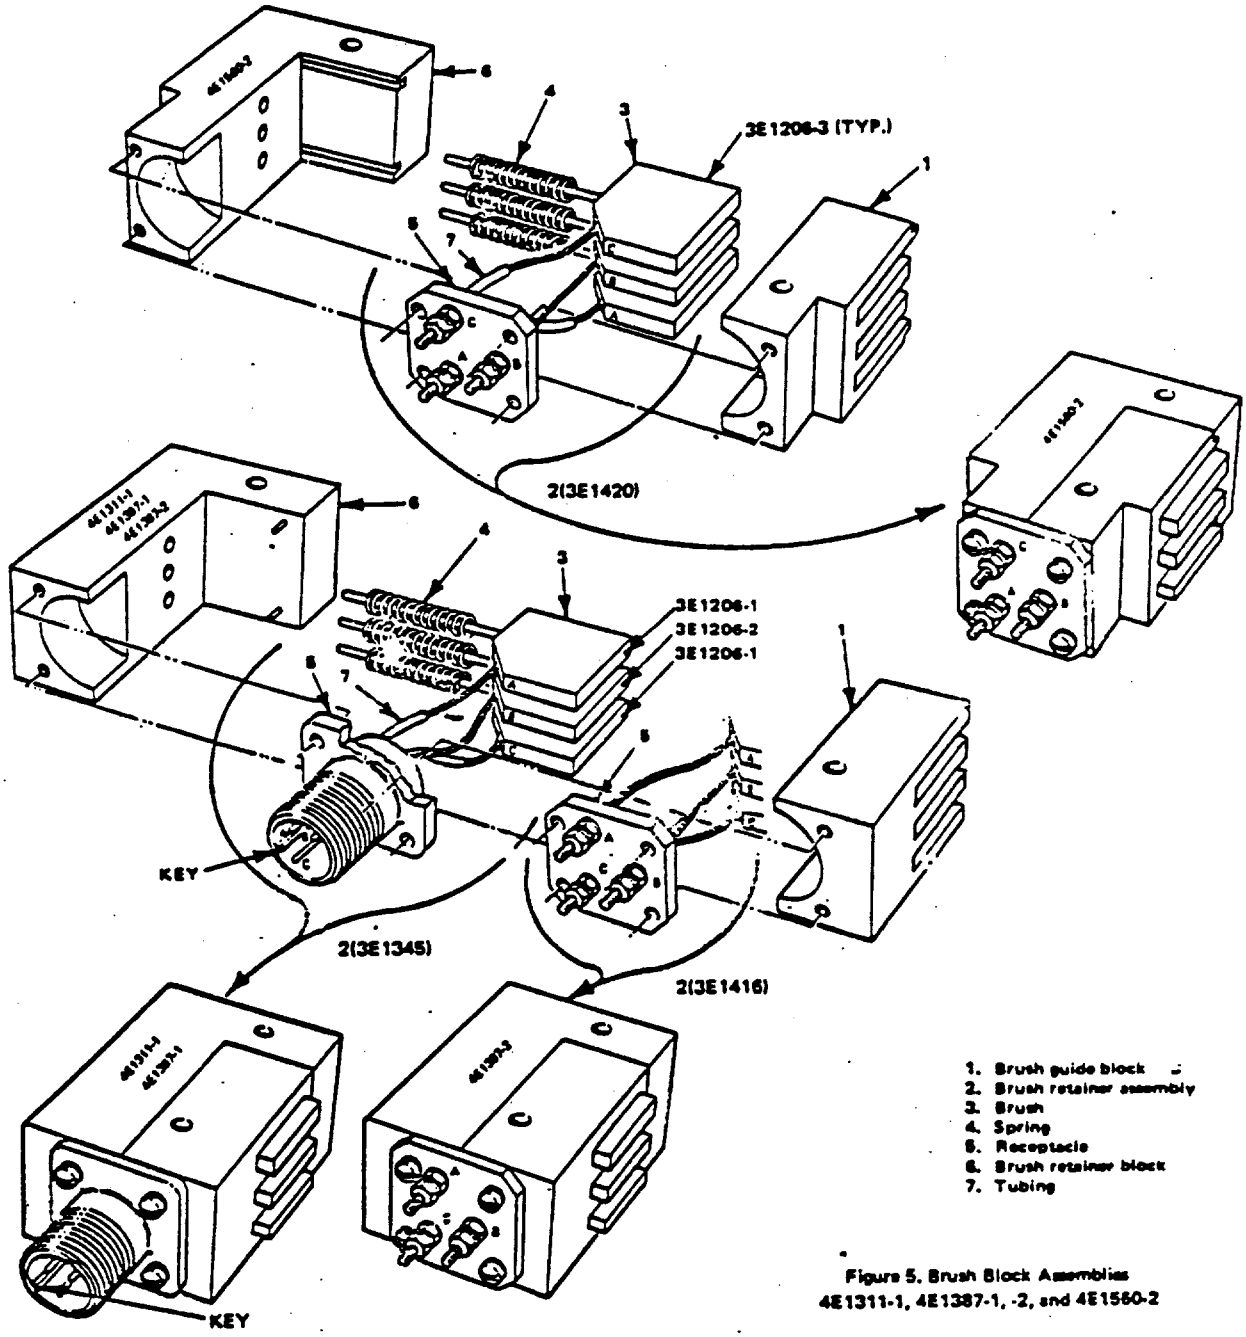


Figure 4. Measuring Brush Wear

Brush Block Assembly	X-Dimension (Inches) MUST Replace
4E1311-1, 4E1387-1-2	17/32
4E1311-2, -3, 4E1387-3, -4, -5, -6, 4E1749-2	1-9/16
4E1350-4, -5, -6	1-1/4
4E1560-2	15/32
4E1639 4E1908-1	1-3/8
Modular Brush Assemblies	
All modules having brushes with rods	23/64
All modules having brushes without rods	1-25/64

During measurement only 1/16 inch of brush should be allowed to protrude from brush block. This is the normal position of the brush when installed on the aircraft.

1. Brush guide block
2. Brush retainer assembly
3. Brush
4. Spring
5. Receptacle
6. Brush retainer block
7. Tubing

Figure 5. Brush Block Assemblies 4E1311-1, 4E1387-1, -2, and 4E1560-2

5. BRUSH BLOCK ASSEMBLY 4E1294 (See figure 6.)

A. Brushes should be replaced when end of "B" barrel is flush with brush guide block; brushes MUST be replaced when end of barrel is 3/32 inch within block counter bore. Brushes should protrude from block 1/16 inch while measurement is made.

NOTE: Either of two types of brushes, 2E1132 or 3E1206-3, may be used. The difference in "B" barrel installation for these brushes is shown in figure 6.

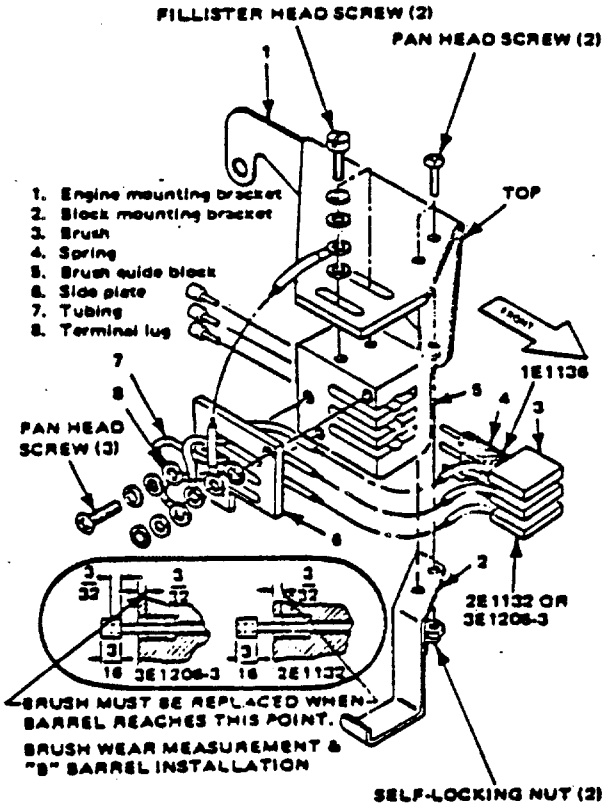

Figure 6. Brush Block Assembly 4E1294

B. A brush retainer assembly is not available as a replacement. The equivalent, as a "bolt-on" assembly, may be procured as "4E1294 WITHOUT MOUNTING BRACKET." Replaces as follows:

1. Dismount assembly from aircraft by removing attaching hardware.
2. Dismount guide block-side plate-brush assembly from mounting bracket by removing connecting screws and nuts.
3. Attach new assembly to mounting bracket with hardware removed in 5.B.2.
4. Install assembly on aircraft with attaching hardware removed in 5.B.1.
5. Check for proper alignment. (See figure 1.)

C. Replace brushes in the following manner.

1. Dismount and disassemble assembly as in 5.B.1. and 5.B.2.
2. Compress springs so that rods protrude through rear of guide block.
3. Unsolder and clean "B" barrels of brushes to be replaced.
4. Remove screws, washers, etc. and separate side plate from guide block.
5. Cut terminal lugs from leads of brushes to be replaced and discard brushes, springs, and lugs.
6. Clean and tin end 1/4 inch of new brush rods.
7. Place new springs over brush rods, insert rods in guide block so ends extend through, and hold brushes in position with rubber bands.
8. Install "B" barrels on brush rods so ends of barrels are concentric and flush with (or 3/32 inch over - see figure 6) ends of rods and soft solder in place. Do not leave solder on exterior of barrel.
9. Install tubing over brush leads and insert leads through the proper slots in the side plate.
10. Install crimp-on terminal lugs on brush leads and reassemble side plate with hardware removed in 5.C.4.
11. Remove rubber band and complete assembly and installation per 5.B.3., 4., and 5.

6. BRUSH BLOCK ASSEMBLIES 4E1311-2, -3, 4E1387-3, -4, -5, -6, 4E1639, 4E1908-1, (See figure 7) **and 4E1749-2** (See figure 8).

A. Measure brush wear as shown in Figure 4. X-dimension (inches) given indicates when brushes MUST be replaced.

B. Follow instructions of paragraph 1.A. and as follows to replace brush retainer assembly:

1. When separating (1.A.2.) or reassembling (1.A.4.) brush retainer block, guide block, and brush retainer assembly, move guide block laterally to disengage or re-engage dowel pins or grooves.
2. When reassembling (1.A.4.) brush retainer assembly, align receptacle as shown in figures 7 and 8.

C. Follow instructions of paragraph 1.B. and as follows to replace brushes:

1. When separating brush retainer block and brush guide block (1.B.3.), note instructions in 6.B.1. above.

7. BRUSH BLOCK ASSEMBLIES 4E1350-4, -5 and -6 (See figure 9).

A. Measure brush wear as shown in Figure 4. X-dimension (inches) given indicates when brushes MUST be replaced.

B. Follow instructions of paragraph 1.A. and the following paragraphs 1. and 2. to replace brush retainer assembly.

1. After separating (1.A.2.) brush retainer assembly from brush guide block, turn brushes sideways. Slip them through hole in brush retainer block to complete removal of brush retainer assembly.
2. To reassemble, turn brushes sideways. Slip them through hole in brush retainer block, and continue assembly per paragraph 1.A.4.

C. Follow instructions of paragraph 1.B. to replace brushes.

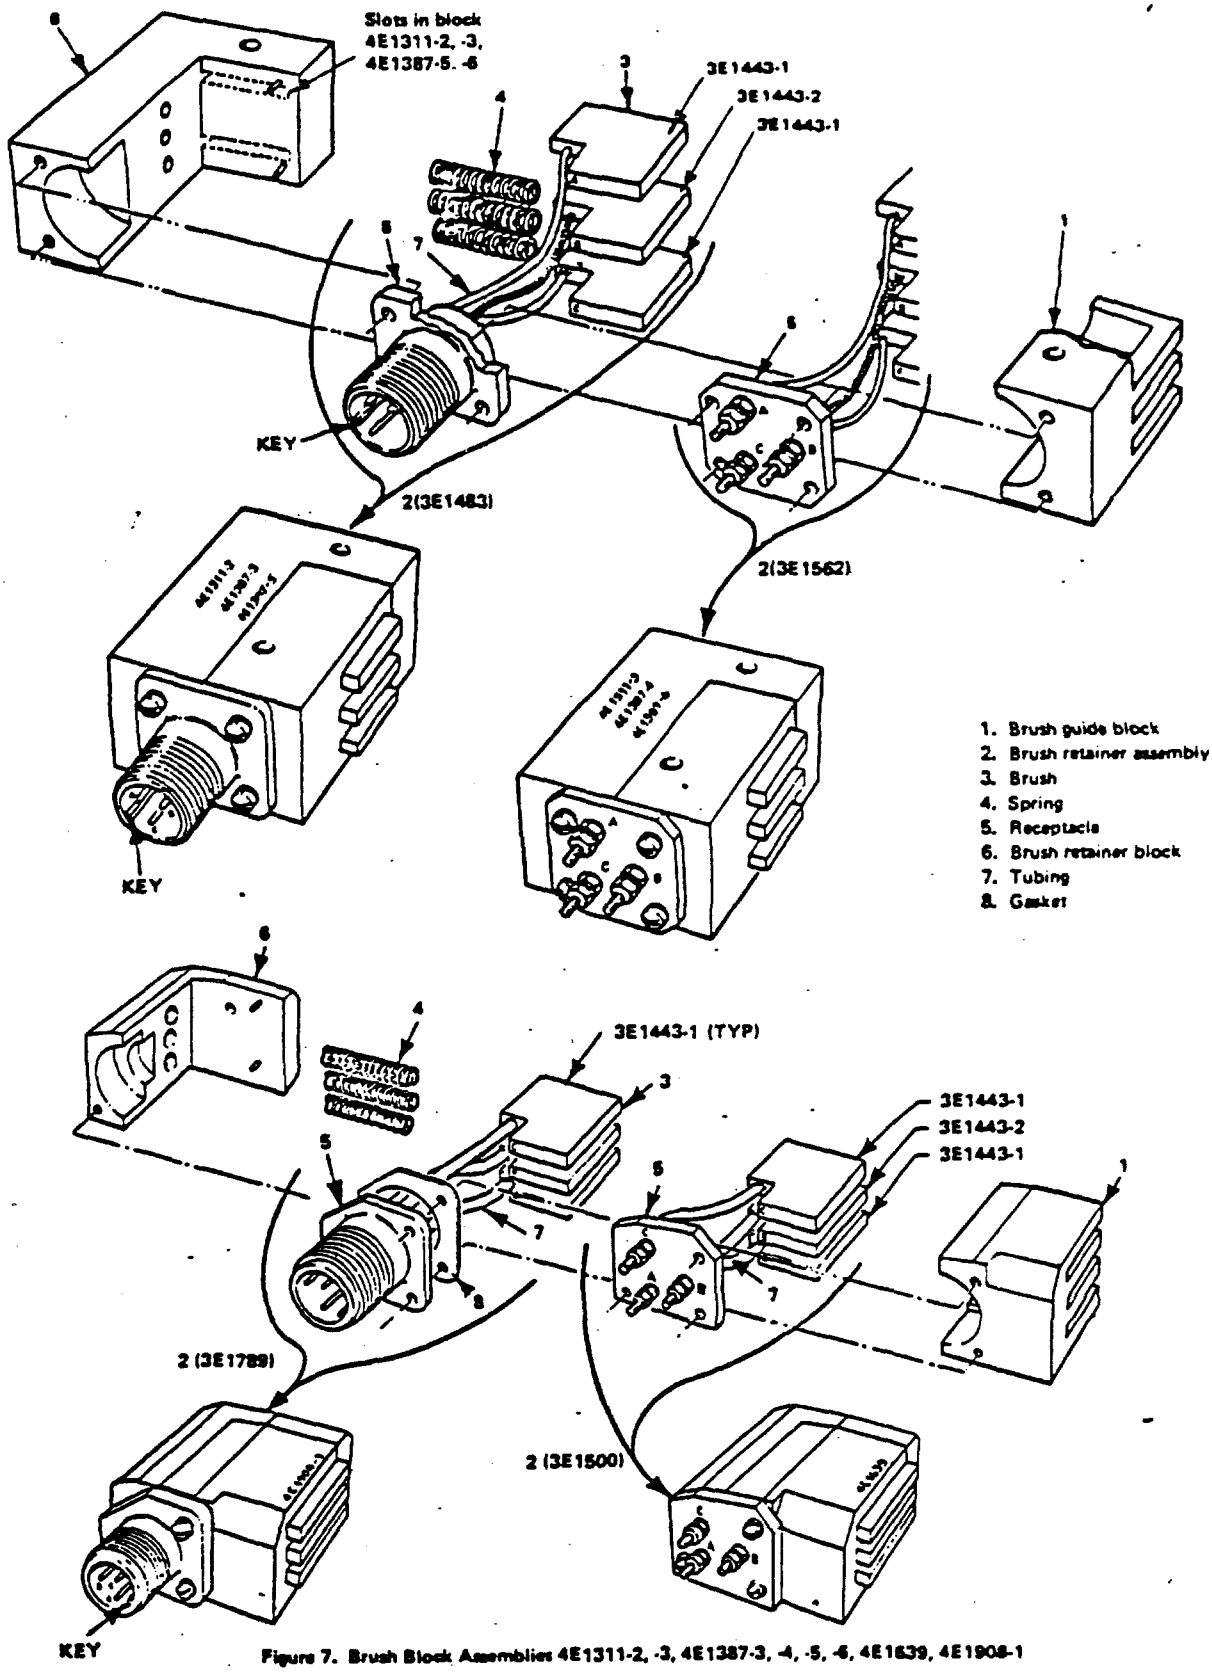

Figure 7. Brush Block Assemblies 4E1311-2, -3, 4E1387-3, -4, -5, -6, 4E1639, 4E1908-1

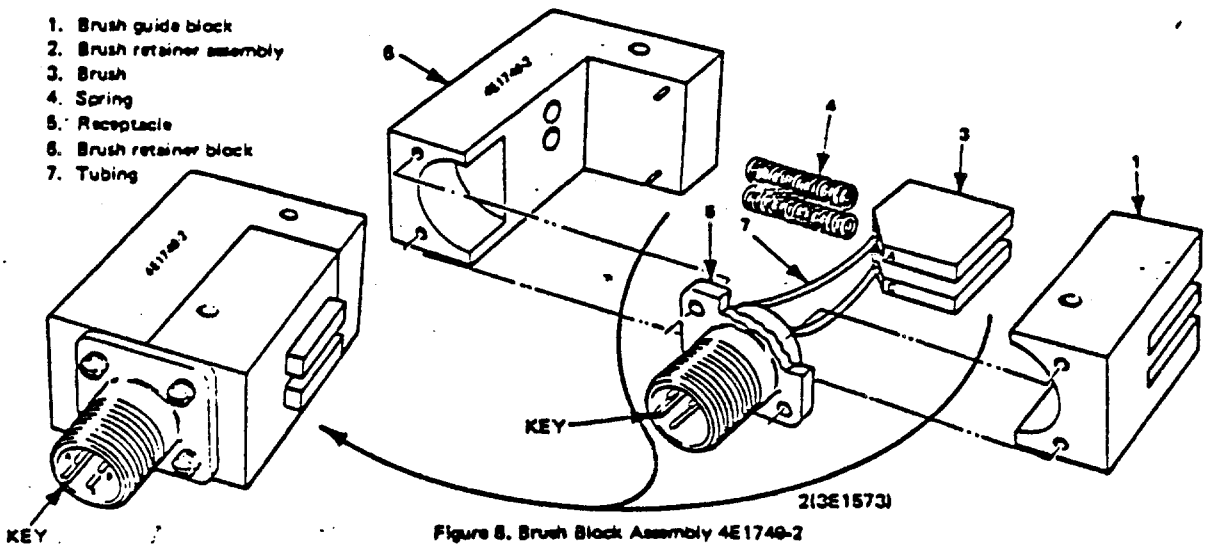

Figure 8. Brush Block Assembly 4E1749-2

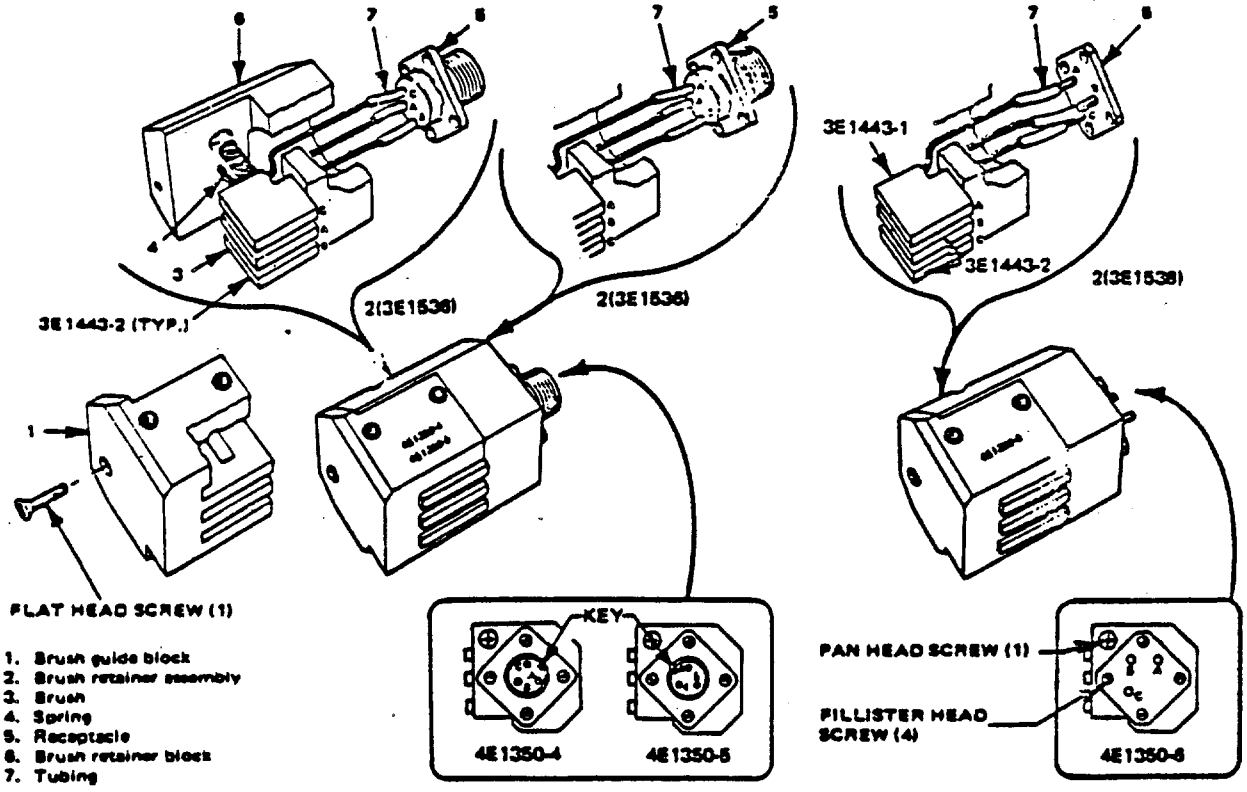

Figure 9. Brush Block Assemblies 4E1350-4, -5 and -6

SECTION B

MODULAR BRUSH ASSEMBLIES

Modular brush assemblies were developed to replace brush block assembly series 4E1311, 4E1350 and 4E1387 as shown in Table 2. Each modular brush assembly is made up of three modules. Each module consists of a plastic housing with an integral brush and spring. Variations of the basic module unit (3E2011) are shown in Figure 10. These modular units are stacked, with appropriate spacers, to produce the 3E2042-1 & -2, 3E2044-1, 3E2044-2, 3E2046-1, 3E2046-2 and 3E2046-3 assemblies. (See figures 11 to 13). Screws are used to hold the modules and spacers together.

All modular brush assemblies are designed for use with ring terminal connectors. Since some brush blocks and wire harnesses have used MS style connectors and receptacles, initial replacement kits are offered which contain the modular brush assembly, wire markers and ring terminals for 14/16 gauge wire and No. 6 studs. When any necessary wire harness modifications have been made, succeeding orders may be placed for single modules or modular assemblies (See Table 2.)

NOTE: When replacing brush blocks on Beech Turboprop (King Air Series) aircraft with modular brush assemblies, contact Beech for replacement details.

1. **Brush Block Replacement Instructions.** (Read all instructions pertaining to your assembly before attempting to replace components).

A. Replacing 4E1311-1 & -2, 4E1350-1, -2, -4 & -5 and 4E1387-1, -3 & -5 Brush Block Assemblies with Modular Brush Assemblies.

1. Remove the brush block assembly to be replaced from the mounting bracket and disconnect the MS connector and mating receptacle.

2. The pins of the mating receptacle are identified as "A", "B" and "C" on the surface of the rubber insert (looking at the face of the connector). Determine the identification of each leadwire going into that receptacle and wrap leadwires with appropriate wire markers.

3. Remove the cable clamp from the wire harness at the receptacle, disassemble the connector, and cut or desolder the wires. (Caution: Before cutting wires check wire lengths to make sure enough wire will be left to make electrical connection with the new assembly.) If sufficient wire is not available after desoldering, splice a suitable length of the same gauge aircraft wire (105°C min. insulation rating) to the harness with insulated butt splice connectors.

4. Cut off previously soldered portions of wire. Strip insulation from the wire 3/32 inch. Crimp the ring terminals provided to the wires. Make sure a good crimp has been obtained.

NOTE: The terminals provided are for wire gauges 16 and 14. If larger wires have been used, install an insulated ring terminal for that size wire and a number six stud.

5. Attach the modular brush assembly to the mounting bracket and align to the slip rings. Follow the instructions on page 2, figure 1, for aligning the brushes to the slip rings.

6. Connect the ring terminals on the wire harness to the terminals on the appropriate brush modules, that is "A" to "A", etc. Make sure the uninsulated portions of the ring terminals on adjacent modules are not touching. If there is interference between adjacent terminals, disassemble modular brush assembly and reassemble per section 2.B. and figure 14.

7. Make sure butt splice connectors and wires of the harness going to the modules do not interfere with any aircraft components.

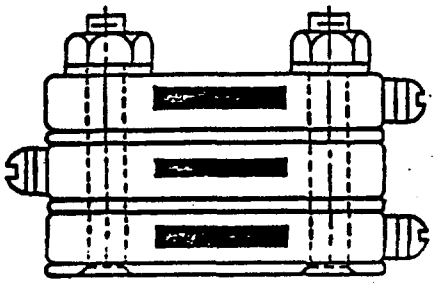

Figure 14. Alternate Module Stacking Arrangement

B. Replacing Brush Block Assemblies 4E1311-3; 4E1350-3 & -6; and 4E1387-2, -4 & -6 with Modular Brush Assemblies.

1. Remove the brush block assembly to be replaced from the mounting bracket but maintain the connection between the wiring harness and that assembly.

2. Each terminal on the surface of the receptacle is identified as "A", "B" and "C". Determine the identification of each leadwire going to this receptacle. Use wire markers to identify the wires or insulated portion of the terminals as "A", "B" and "C".

3. Disconnect the ring terminals of the harness from the receptacle.

4. Attach the modular brush assembly to the mounting bracket and align to the slip rings. Follow the instructions on page 2, figure 1, for aligning the brushes to the slip rings.

5. Connect the ring terminals on the wire harness to the terminals on the appropriate brush module, that is "A" to "A", etc. Make sure the uninsulated portions of the ring terminals of the adjacent modules are not touching. If there is interference between adjacent terminals, disassemble modular brush assembly and reassemble per Section 2.B. and figure 14.

6. Make sure the wires of the harness going to the modules do not interfere with any aircraft components.

2. BRUSH AND MODULE REPLACEMENT (See figures 11, 12, 13, 15, 16 and 17.)

A. Measure brush wear as shown in Figure 4. X-dimension (inches) given indicates when brushes MUST be replaced.

B. Replace Modules; Individual brush replacement is now offered however the entire module unit should be replaced when considerable wear of the housing is apparent.

1. Dismount modular brush assembly from aircraft by removing attaching hardware, and disconnect engine wire harness.

2. Remove assembly screws and separate modules and spacers.

3. The part number of each module is etched into the surface of the plastic housing; replace with the same part number module.

4. Restack modules and spacers as shown in figure 11, 12, 13, 15, 16 or 17. Check A/B/C, C/A/B, A/B, B/C or C/B stacking arrangement and location of spacers. If there is interference between adjacent ring terminals, reorient center module as shown in figure 14.

5. On 3E2042 series, 3E2044 series, 3E2062 series, 3E2071 series and 3E2092 series assemblies, make sure flat washer is positioned between star washer and housing. On 3E2046-1, 3E2046-2 and 3E2046-3 assemblies, use Loctite "C" (or equiv.) on the threads of the assembly screws. Make sure that assembly is square, then tighten screws.

6. Reconnect aircraft wire harness to applicable "A", "B", "C" terminals of modules. Insure that adjacent ring terminals are not touching.

7. Install assembly on aircraft with attaching hardware removed in 2.B.1.

8. Check assembly for proper alignment (see figure 1).

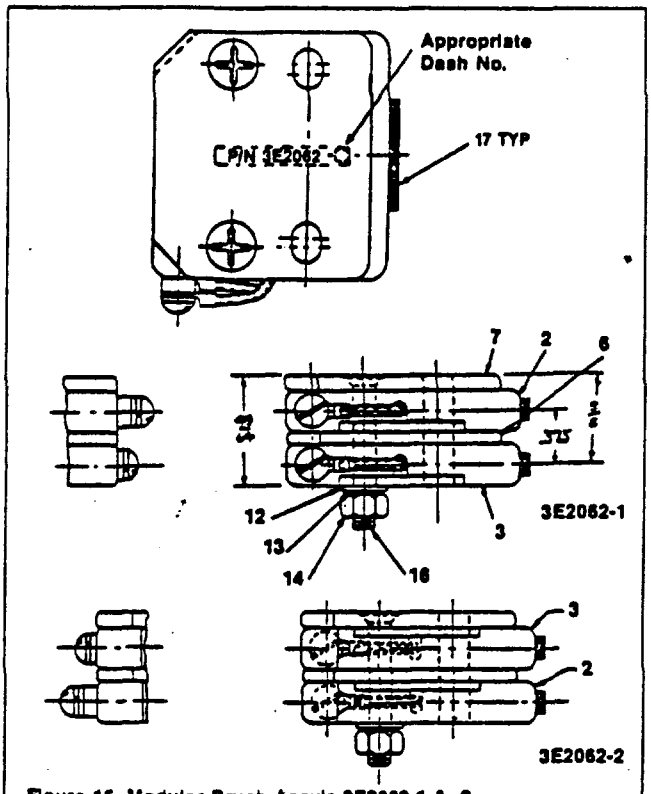

Figure 15. Modular Brush Assy's 3E2062-1 & -2

WARNING

USE ONLY BFGOODRICH BRUSHES. DO NOT SEPARATE UNITS WHEN REPLACING BRUSHES. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN FAILURE OF THE DE-ICER UNIT.

NOTE: IF OIL IS PRESENT ON BRUSH UNIT, BRUSH AND RING SERVICE LIFE MAY BE REDUCED. CHECK ENGINE MANUFACTURERS RECOMMENDATIONS FOR FIXING OIL LEAKS.

C. **Replace Brushes;** If module unit housing is not worn or damaged the individual brush may be replaced as follows:

1. Remove old brush.

a. Remove #6-32 screw securing terminal to housing base. Note brush identification A, B, or C.

b. Remove terminal from brush lead and remove brush through brush opening of unit.

c. Inspect inside of module unit to assure no foreign material is present.

d. Clean outside around brush opening to remove any carbon deposits.

2. Prepare new brush. (See figure 18.)

a. Slide tubing over brush lead so end of tubing almost contacts the brush.

b. Form lead in an arc as shown.

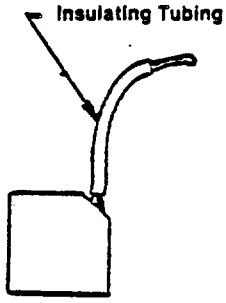

Figure 18. Preparing New Brush

3. Install brush in module. (See figure 19.)

a. Insert lead into brush opening and slide brush into base until lead protrudes through lead exit hole.

b. Compress brush and pull lead to obtain max. available length of lead, external of module base.

c. Secure brush in compressed state using rubber band (Ref. Step 4).

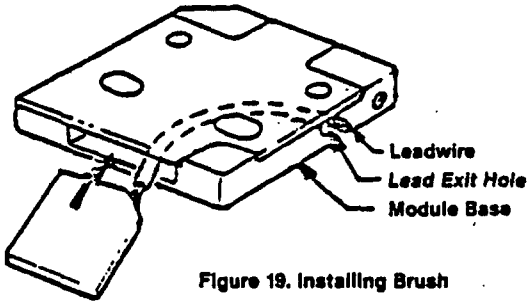

Figure 19. Installing Brush

4. Install terminal. (See figure 20.)

a. With brush compressed, slide tubing to within 3/16 inch of the end of the bare wire as shown.

b. Install ring terminal so the end of the insulating tubing is positioned inside the insulated jacket of the terminal so no bare wire is exposed.

c. Crimp terminal in place with recommended crimping die and tool.

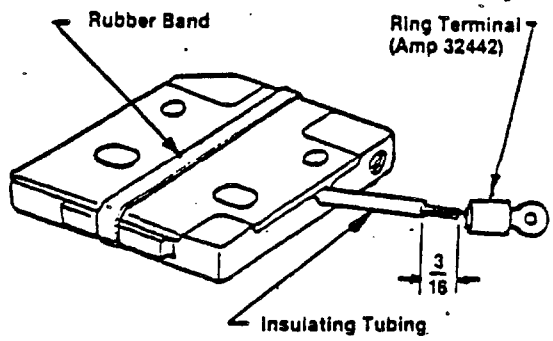

Figure 20. Installing Terminal

5. Attaching brush lead. (See figure 21.)

a. Replace screw and washer (and spacer if required) as shown.

b. Reidentify module unit A, B, or C as required with permanent ink or wire marker.

c. Remove rubber band and carefully pull brush until all slack in lead is incased in module.

d. Compress and release brush to assure it does not bind or hang-up inside module.

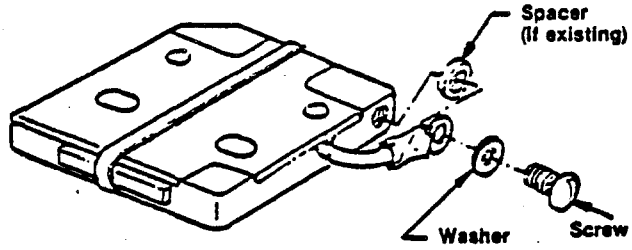

Figure 21. Attaching Brush Lead

NOTE:

FIGURES 18-21 SHOW THE REPLACEMENT OF A BRUSH IN AN INDIVIDUAL MODULE UNIT. IT IS NOT NECESSARY TO REMOVE THE INDIVIDUAL UNITS FROM THE MODULAR BRUSH ASSEMBLY FOR BRUSH REPLACEMENT WHEN THE ABOVE PROCEDURE IS FOLLOWED.

Engineered Products Group
AKRON, OHIO 44318

SERVICE BULLETIN

BFGoodrich

NO. - E79-59
ISSUED - 6-7-79

ENGINEERED SYSTEMS DIVISION

SUBJECT: Replacement of brushes on BFG modular brush and connector bracket assy 4E2360

APPLICABILITY: DeHavilland DHC-6 aircraft equipped with BFG electrical prop de-icing utilizing the subject brush assy.

REFERENCE DOCUMENT: BFG brush block overhaul manual report number 68-04-714H

NOTE: To determine if brushes need replaced refer to the above referenced document for "must replace" dimensions. (Fig. 4, Page 5)

DISCUSSION: The 4E2360 modular brush and connector bracket assy consists of a brush retainer assembly identified as P/N 3E2114-1 and a connector bracket P/N 3E2107, plus associated mounting hardware. The retainer assy is made up of three modular brush units soldered to an MS connector. When brush replacement becomes necessary, the entire brush retainer assy must be replaced. The associated mounting hardware and the 3E2107 bracket can be reused.

PROCEDURE: To replace the retainer assy remove the counter sunk screws securing the modular units to the bracket. Remove the screws securing the connector to the bracket. Before assembling the new retainer assy to the connector bracket note the A, B, C, pin identification of the connector plug with respect to the modular brush units. The "A" brush unit must be positioned against the connector bracket followed by the "B" & "C" units respectively (see Fig. I). The order of brush stacking must be maintained to insure correct electrical wiring when installed on the aircraft.

Install the connector to the bracket using the existing screws, washers and nuts. Carefully remove the cardboard cover protecting the brushes. (Caution should be taken as to not allow the brushes to spring forward when removing the cardboard cover since the brushes are under spring tension). With the brushes stacked in an ABC order install the modular units to the bracket using the counter sunk screws.

Order of installation for the washers and nuts should be: flat washer, star washer and nut. Before tightening these screws be sure the modular units are square to one another. Once squareness is obtained, tighten screws. Check for free brush movement.

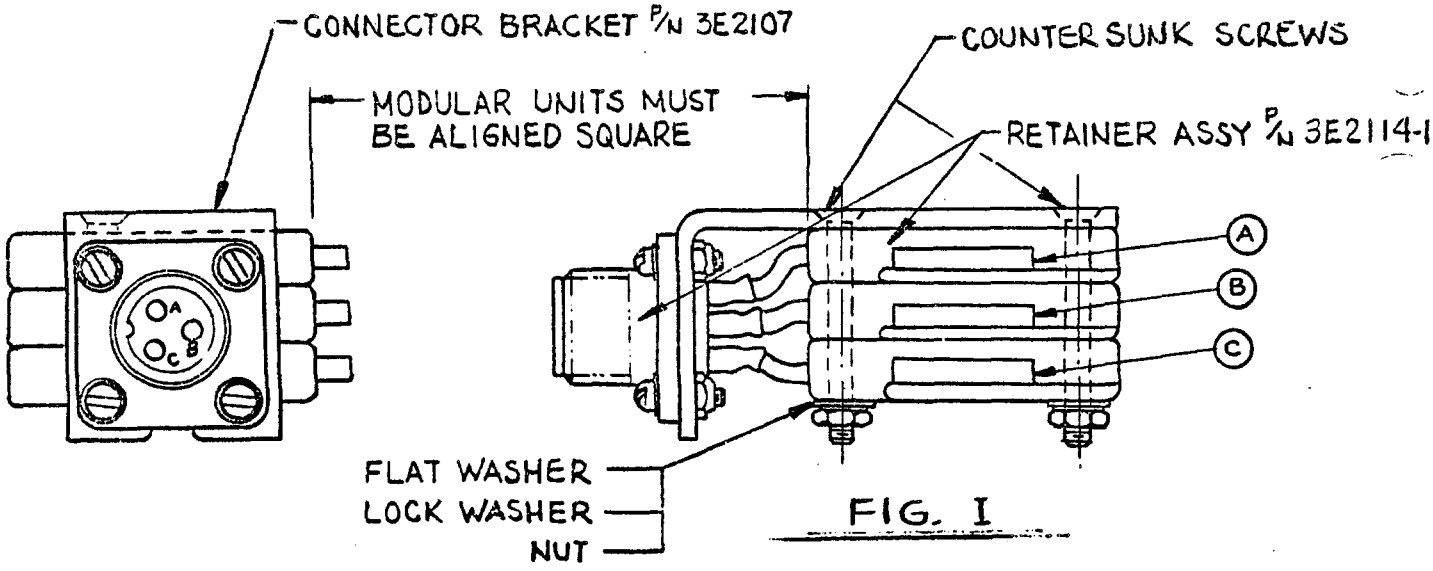

FIG. I

Service Bulletin No. 87

PUB. NO. 39U-4-678A The Bendix Corporation - Utica, New York

SUBJECT: Modification of 1532-3A Deicer Distributor Valve to the 1532-3B configuration.

EQUIPMENT AFFECTED: Bendix, Fluid Power Division, 1532-3A Series Deicer Distributor Valve

REASON FOR CHANGE: To increase valve service life.

ACCOMPLISHMENT: At customer's discretion during overhaul

PUBLICATION REFERENCE: Publication No. 38U-23-668A, Overhaul Instructions with Parts Breakdown.

PARTS REQUIRED:

Quantity	Part Number	Nomenclature
2	2484074	Valve Assembly, Poppet
2	2484073	Seal, Valve

PARTS REMOVED:

Quantity	Part Number	Nomenclature
2	101783	Valve Assembly, Poppet
2	648771	Seal, Valve

SPECIAL TOOLS REQUIRED: No special tools required.

PROCEDURE: Follow disassembly procedure listed in reference publication. Discard Valve Seal and Poppet Valve Assembly, parts removed and replace with parts required.

Reassemble in accordance with procedures in reference publication.

TEST PROCEDURE: Test in accordance with reference publication.

TYPE NUMBER CHANGE: After modification, the type number on the nameplate must be restamped as follows:

From	To
1532-3A	1532-3B

Bendix Fluid Power Division

Service Bulletin No. 91

PUB. NO. 39U-4-692A The Bendix Corporation - Utica, New York

SUBJECT: Modification of 1532-3A and 1532-3B Deicer Distribution Valves

EQUIPMENT AFFECTED:
1532-3A and 1532-3B Deicer Distribution Valves

REASON FOR BULLETIN:
To Incorporate Product Improvement Parts for Increased Service Life

ACCOMPLISHMENT: At Customer's discretion.

PUBLICATION REFERENCE:
Pub. No. 38U-23-668A

KIT AND PARTS REQUIRED:

Quantity	Part Number	Nomenclature
11	SK180	Service Kit Modification consisting of:
2	829489	Control Valve (modified)
2	101764	Plunger & Pin Assembly (modified)
2	834919	Valve Stem (modified)

PARTS REMOVED:

Quantity	Part Number	Nomenclature
2	829489	Control Valve
2	101764	Plunger & Pin Assembly
2	834919	Valve Stem

SPECIAL TOOLS REQUIRED:
None.

DISASSEMBLY: As per Reference Publication

EXPLANATION OF CHANGE:
To extend the life of the Distributor Valve by reducing the corrosive affects of water in the system, the parts in SK180 Kit have the following changes incorporated:

1. Control Valve - Sharp edges on lands which will assist in preventing corrosion build up in the valve land area.

Bendix Fluid Power Division

2.	Plunger & Pin Assembly -	Fused Tin Plate on plunger for added protection against corrosion.
3.	Valve Stem -	Teflon coat (stratified "S" Black) on O.D. of Shaft.

SPECIAL INSTRUCTIONS:

Inspect Valve Housing, P/N 834832, for corrosion (white residues). DO NOT reuse or attempt to clean housings which exhibit any corrosion since the protective coating has been removed in the area of corrosion. It is recommended these housings be replaced.

The rejected valve housings should be returned to Fluid Power Division, The Bendix Corporation, for special cleaning and rework. Due to the complexity of these procedures, the Fluid Power Division wishes to control the cleaning and rework to insure the valve housings are in a like new condition prior to reuse.

NOTE: It is strongly recommended that any valve housing exhibiting corrosion be replaced and the rejected housing be returned to Fluid Power Division.

REASSEMBLY: As per Reference Publication

TEST: As per Reference Publication

TYPE NUMBER CHANGE:

Not affected. However, the letter "M" shall be stamped two (2) spaces adjacent to the "U" in the Serial Number Block.

Service Bulletin No. 97

PUB. NO. 39U-4-704A The Bendix Corporation - Utica, New Yo

SUBJECT: Repair of Valve Housing, Part Numbers 834832, 2487289, 2487512 and 2487221.

EQUIPMENT AFFECTED:

Bendix Fluid Power Division 1532- Series and 38E63 Series Deicer Distributor Valves.

ACCOMPLISHMENT:

Whenever valve housing to control valve fits are more than .0016 per applicable Overhaul Manual

PUBLICATION REFERENCE:

Overhaul Instructions with Parts Breakdown Publication No. 38U-23-668A

Overhaul Instructions with Parts Breakdown Publication No. 38U-2-6911A

PARTS REQUIRED:

Quantity	Part Number	Nomenclature
2	2487527	Control Valves
2	2487888	Plugs

PARTS REMOVED:

Quantity	Part Number	Nomenclature
2	829489	Control Valves
2	834954	Plugs

SPECIAL TOOLS REQUIRED:

Standard Machine Shop Tools

PROCEDURE: Follow disassembly procedure listed in referenced publication.

REWORK:

1. Press out plugs, P/N 834954 and discard (Refer Figure 1).
2. Hone bushing bores to .1920/.1925 inch diameter as shown in Figure 1.
3. Counterbore housing to .4680/.4685 inch diameter, .175 to .180 inch deep. Brush alodine reworked surfaces.

Bendix Fluid Power Division

4. Pressure wash housing.

5. Press in new plugs flush, as noted. Plugs are identified by a .030 to .060 drill point as shown.

NOTE: Housings after rework will be identified by a .020 to .040 diameter drill point on top face of bushing as shown.

6. Reassemble with new valves, P/N 2487527, in accordance with the procedures in referenced publication.

NOTE: Valves, P/N 2487527, are identified by a .030 to .060 diameter drill point on .130/.120 diameter small end of valve

TEST PROCEDURE:

Test in accordance with referenced publication.

TYPE NUMBER CHANGE:

None

Bendix Utica Division
Utica, New York

1. SPECIAL TOOLS. None.

2. DISASSEMBLY. (See figure 4.)
a. Disassemble in the same order as the key index numbers assigned to the exploded view illustration, except as noted below:
b. To remove diaphragm assembly (30), press down with thumb on each valve stem (33) and insert a 6-inch length of 5/64-inch drill rod in hole at bottom end of each valve stem. This will prevent turning of valve stems (33) while removing nuts (26). Remove nuts (31) in this same manner.

CAUTION

Hole in valve stems must not be burred or otherwise damaged.

c. Handle control valves (36) very carefully since they have a critical fit in valve bushings of valve housing (38).

3. CLEANING.
a. Clean all parts with cleaning solvent, Esso Varsol, and dry all parts thoroughly.

CAUTION

Do not use carbon tetrachloride since its use will result in corrosion of parts.

b. Wipe the solenoid coil assemblies thoroughly with a cloth moistened in cleaning solvent. Do not, however, soak the solenoid coil assemblies.
c. Make certain to remove thoroughly all oil from the various housings. See that all housing passages are free of obstructions.

4. INSPECTION.
a. All parts for cracks, breaks, excessive corrosion, and cleanliness.
b. All tapped or threaded parts for stripped and crossed threads.
c. All housings for loose or rough inserts, plugs, and bushings, and for satisfactory valve seats.
d. Solenoid windings and leads for burned, charred, cracked, or frayed insulation.
e. Solenoid coil assemblies for grounds, shorts, open circuits, and resistance. Refer to Table of Leading Particulars.
f. Receptacle for loose, bent, or broken contacts, and for cracked, chipped, or burned bakelite inserts.
g. Contact and lead assembly for broken strands in the lead, and for firm soldering of lead to contact.
h. Control valves for fit in valve bushings of valve housing. Refer to Table of Leading Particulars.
i. All springs for preload force. Refer to Table of Leading Particulars.
j. Valve seals for deeply grooved, fractured, hardened, or cracked seats.

5. REPAIR AND REPLACEMENT.
a. Replace all parts found to be damaged on inspection.
b. Replace all gaskets and the diaphragm at each overhaul.
c. Replace control valves if excessive clearance in valve bushings is due to worn valve surface. If excessive clearance is due to a worn valve bushing, replace the valve housing.

6. LUBRICATION. None.

7. REASSEMBLY. (See figure 4.)
a. Reassembly is the reverse of disassembly, except as noted below:
b. For proper electrical connections, see figure 1. Place the receptacle on the valve head with the "A" contact of the receptacle on the same side of the unit as the "A" boot port.

NOTE

Do not kink the leads while pushing the receptacle into the valve head.

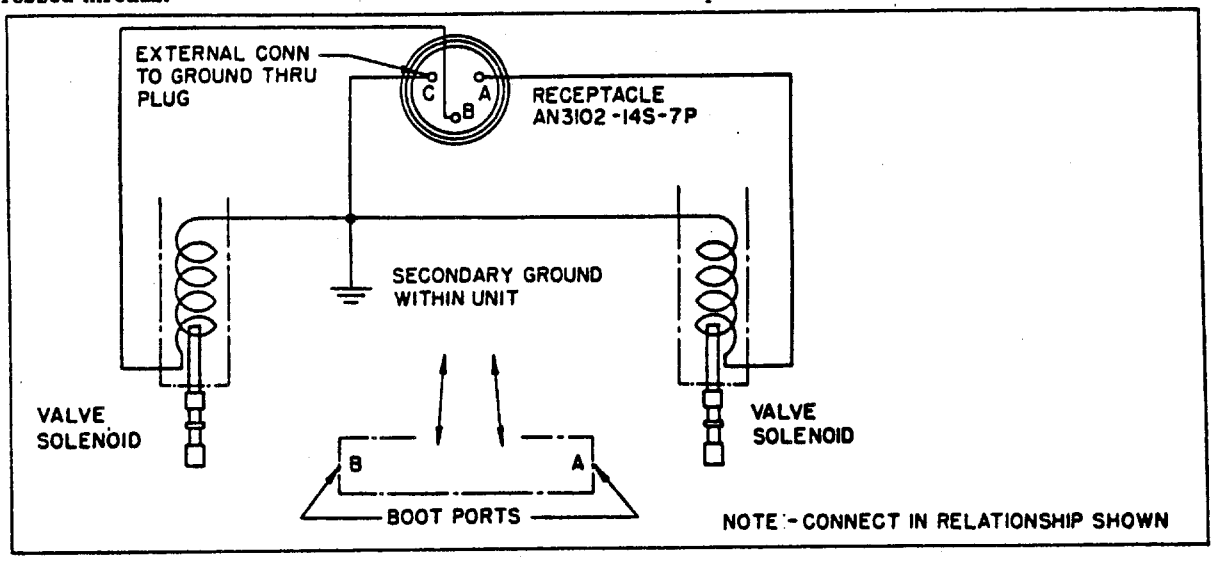

Figure 1. Internal Wiring Diagram - De-Icer Distributing Valve - Bendix Utica Type 1532-3-A

c. Make sure that the marked end of the control valves (36) are assembled next to the control valve springs (37).

d. Apply general purpose joint compound EC 524 manufactured by the Minnesota Manufacturing and Mining Co. around the valve stem pilot as shown in figure 2.

e. Insert a 6-inch length of 5/64-inch drill rod through the holes in the valve stems (33) to prevent turning of stems during assembly of nuts (31 and 26).

8. TEST PROCEDURE. (See figure 3.)

a. Set up complete valve as shown in test stand schematic drawing.

b. With solenoids not energized, set pressure at 16 inches mercury and vacuum at 5 inches suction. Gradually reduce pressure to 1 inch mercury and then restore to 16 inches mercury. Gradually reduce suction to 2 inches mercury and then restore to 4 inches mercury. Valves should remain closed throughout pressure and suction changes and leakage as indicated by flow meter in vacuum line must not exceed 10 cubic feet per hour.

c. Repeat procedure in subparagraph b. above with solenoid "A" energized (24 volts dc) and solenoid "B" not energized. Leakage must not exceed 20 cubic feet per hour.

d. Repeat procedure in subparagraph b. above with solenoid "A" de-energized and solenoid "B" energized (24 volts dc). Leakage must not exceed 20 cubic feet per hour.

e. With 16 inches mercury pressure and 6 inches mercury suction and both solenoids de-energized, the manometers connected to the "A" and "B" ports respectively should read the same value as the vacuum line manometer.

f. With 16 inches mercury pressure and 4 inches mercury suction, energize each solenoid separately several times with 20 volts dc. Valve action must be immediate and complete.

g. Apply 28 volts dc separately to each solenoid. Current consumption must be 1.45 to 1.75 amperes.

1. SPECIAL TOOLS. None.

2. DISASSEMBLY. None. The air ejector is a rolled and welded assembly whose component parts are not procurable or replaceable separately.

3. CLEANING. Use a soft-bristled brush and cleaning solvent, Federal Specification P-S-661, to clean unit internally and externally. Drain solvent thoroughly and dry with compressed air.

4. INSPECTION. Inspect unit for cracks, breaks, leakage, bent or distorted parts, or other damage.

5. REPAIR OR REPLACEMENT. Replace entire unit if damaged or unacceptable due to failure of test procedure (refer to paragraph 8).

6. LUBRICATION. None.

7. REASSEMBLY. None.

8. TEST PROCEDURE.

19E26-1A

a. Perform all tests under standard conditions with the test setup as shown in Figure 1. The temperature of the forcing air must be between 75°F (24°C) and 80°F (26.5°C).

b. Adjust the air pressure regulator valve to give a forcing pressure of 22 psig as indicated on the 0-100 psi gage No. 1. With the suction flow gate valve closed, the vacuum reading indicated on the manometer should be a minimum of 12.2 in. Hg and the forcing flow a maximum of 0.40 lb/min.

c. With a forcing pressure of 22 psig, adjust the suction flow gate valve to give a vacuum reading of 4.0 in. Hg on the manometer. The suction flowrator should indicate a minimum of 0.36 lb/min.

d. Repeat Step b with a forcing pressure of 18 psig. The vacuum reading should be a minimum of 10.0 in. Hg and the forcing flow a maximum of 0.35 lb. min.

e. Repeat Step c with a forcing pressure of 18 psig. The suction flowrator should indicate a minimum of 0.32 lb/min.

19E31-1A

a. Set up ejector in accordance with Figure 1.

b. Adjust air pressure regulator valve to give a forcing pressure of 40 psig. With vacuum flow gate valve closed, vacuum reading should be a minimum of 7.0 inches of Hg and the forcing flow a maximum of 0.25 lbs/min. with 70°F air.

c. With the same forcing pressure as in Step b, open the vacuum flow gate valve to give a vacuum reading of 3 inches of Hg. At this condition the vacuum flow should be a minimum of 0.16 lbs/min.

19E32-1A

a. Set up ejector in accordance with Figure 2.

b. Adjust air pressure regulator valve to give a forcing pressure of 18 psig. With vacuum flow gate valve closed, vacuum reading should be a minimum of 6.3 inches of Hg and the forcing flow a maximum of 0.85 lbs/min.

c. With the same forcing pressure as in Step b, open vacuum flow gate valve to give a vacuum reading of 4 inches of Hg. At this condition the vacuum flow should be a minimum of 0.57 lbs/min.

19E36-2A

a. Set up ejector in accordance with Figure 3.

b. Adjust the air pressure regulator valve to give a forcing pressure of 18 ± 1/2 psig at 70 ± 10°F. At sea level, with the vacuum flow gate valve closed, the forcing flow should be a maximum of 0.85 lbs/min. and the vacuum reading a minimum of 6.4 inches of Hg.

c. With the same forcing pressure as in Step b, open the vacuum flow gate valve to give a vacuum reading of 2.5 inches of Hg. The vacuum flow should be a minimum of 0.80 ± 0.05 lbs/min.

d. With the ejector discharge capped, the gate valve open and a forcing pressure of 3.5 psig, the check valve shall not leak more than 0.5 scfm.

TRANSISTORIZED SEQUENTIAL TIMER, PART NO. 42E13-3A

1. Description and Operation

This manual contains descriptive information, overhaul and test instructions, and an illustrated parts list for Transistorized Sequential Timer, Part No. 42E13-3A. This equipment is manufactured by The Bendix Corporation, Fluid Power Division, Utica, New York.

The transistorized sequential timer (Figure 1) is a component of the Model 26S deicing system used on the DeHavilland Twin-Otter.

The timer provides the energizing voltage to the solenoids in the system distributor valve for deicing specific aircraft boots at a predetermined rate. The timer cycles automatically at a "heavy" or "light" icing rate, as selected by a switch on the aircraft deicing system control panel in the cockpit.

In operation at either heavy or light ice conditions, the timer provides a five second "on" period for two boots and a three second "on" for the other two boots as a function of the rotary circuit selector connecting 28 volts to a connector pin during its cycling period. The total cycle time (including dwell time) is 60 seconds for heavy icing, and 180 seconds for light icing.

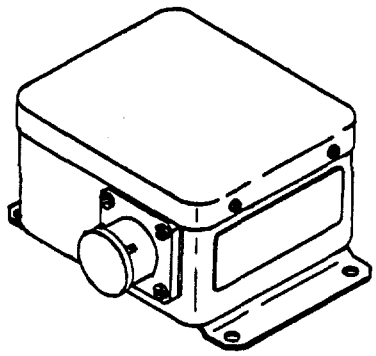

Figure 1

Transistorized Sequential Timer - Three-Quarter View

2. Disassembly (Ref. Figure 4)

A Since the transistorized sequential timer is an electronic assembly, complete disassembly (and subsequent overhaul and reassembly) is impractical and undesirable. Only parts which have been established by testing and inspection as being damaged should be removed.

B. If necessary to remove timer cover (1), remove screws (2). The cover is sealed with silicone rubber, and removal may be difficult.

NOTE: Complete component board (6) has been sealed and treated at the factory with a fungus-resistant varnish. If components on the component board are replaced, that area of the board where the component is replaced must be revarnished with the fungus-resistant varnish.

3. Cleaning

A. If the unit was disassembled, remove all traces of silicone rubber from the top of complete timer box (21, Figure 4), the inside of timer cover (1), and all screws that extend through the box, with acetone or other suitable solvent, and allow to air dry.

B. Clean all other components with clean, dry, compressed air. No further cleaning is required.

4. Inspection/Check

A. Inspect all parts for corrosion, wear, and damage.

B. Inspect all threaded parts for stripped, crossed, or otherwise damaged threads.

C. Inspect terminals and connector pins for damage.

D. Inspect wiring for burns, cracked or peeled insulation, loose connections, and cold solder joints.

5 Repair

If necessary to replace any wiring, see wiring diagram (Figure 2). Solder loose connections and new wiring with rosin core solder composed of 63 percent tin and 37 percent lead

6. Assembly (Ref. Figure 4)

A. Install rotary circuit selector (12) with screw (7), internal tooth lock washer (8), screw (13), and internal tooth lock washer (14), to rotary circuit selector bracket (15). Secure rotary circuit selector bracket to complete timer box (21) with screws (16) and internal lock washers (17)

B Secure complete component board (6) to complete timer box (21) with screw (9), ground terminal (11), and nut (10)

C Apply Locquic Grade N or Q primer or actuator (American Sealants Co., Hartford, Conn.) to the threaded shaft ends of rotary circuit selector (12) and the supplied nuts, and allow to dry thoroughly. When dry, apply one or two drops of Loctite Grade A (American Sealants Co.) to both threaded parts, and assemble through the top holes in rotary curcuit selector bracket (15).

NOTE: If a new rotary circuit selector (12) is used, remove the nuts and discard the supplied washers before installing.

D. Install receptacle connector (3) with mounting flange gasket (5), and secure with screws (4)

E. Make all electrical connections as shown in Figure 2

F Coat the top edge of complete timer box (21, Figure 4), the inside of timer cover (1), and the heads of all screws that extend through the box, with RTV 102 (General Electric Co., Pittsfield, Mass.) silicone rubber Make sure that the coating is thick enough to form a fillet between the

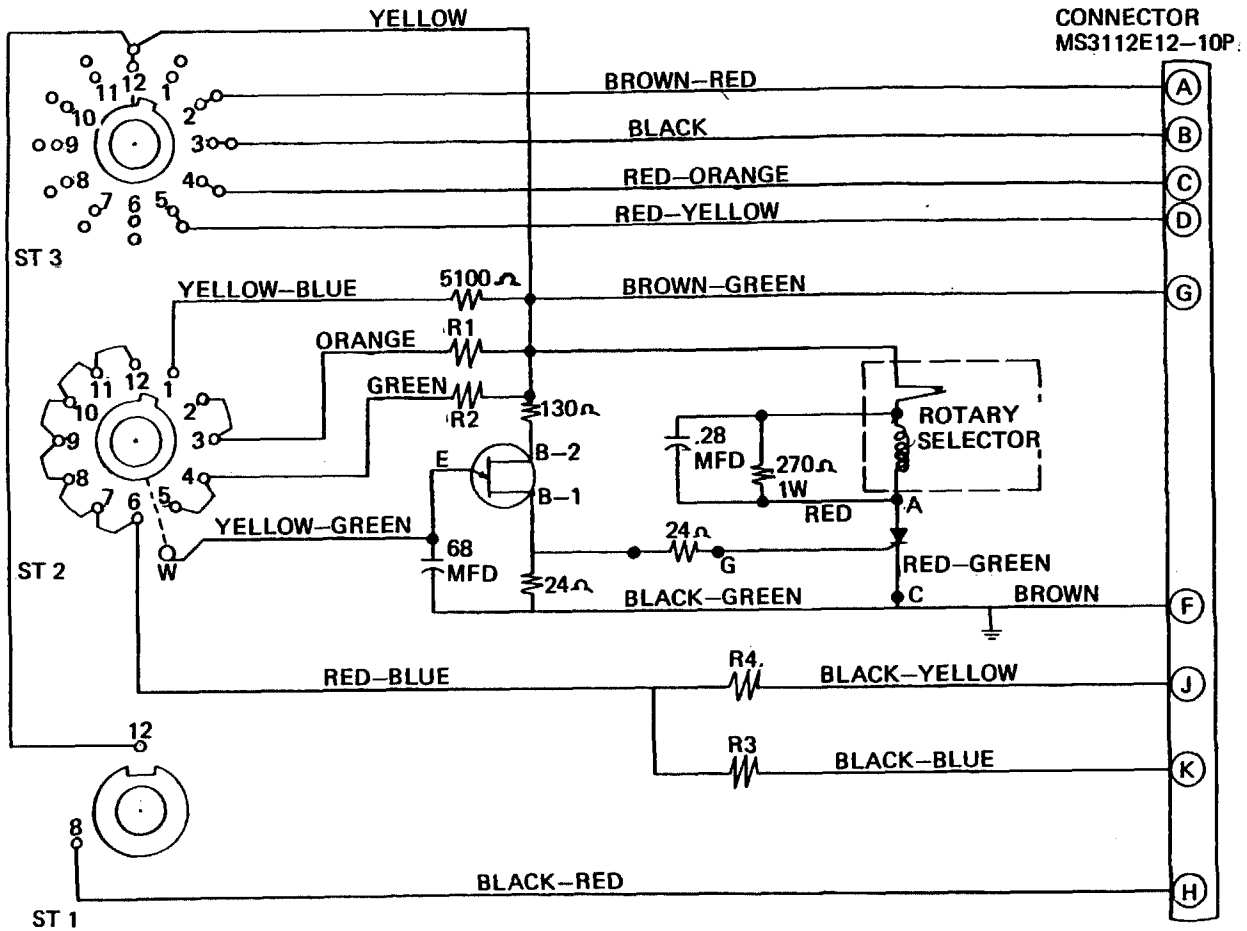

Figure 2

Note: All resistors shown above are .5 watt with a resistance tolerance of + 5%.

cover and the outside of the box. Remove the excess material and allow to cure for two hours at room temperature before handling.

G. Install 4 lengths of 0.020 inch diameter stainless steel lock wire through the drilled heads of screws (2 and 4) (one length for two screws) in accordance with standard aircraft procedures, so that the wire tends to tighten the screws

7. Fits and Clearances

Not applicable.

8. Testing

A. General

(1) Perform all tests at a room temperature of approximately 78°F and at an atmospheric pressure of approximately 29.92 inches of mercury.

(2) If deicer timer test stand 53E42-1A is available, connect adapter cable U755 to the timer and follow the instructions provided with the test stand.

(3) If the deicer timer test stand is not available, connect the timer in a test setup as shown in Figure 3, using suitable test lamps.

B. Icing and Homing Operation

(1) Set the test switch (Figure 3) to the HEAVY ICE position. The timer must begin cycling as indicated by the alternate lighting of the test lamps, and continue cycling until the switch is set to OFF. The timer will continue cycling until the cycle is completed.

(2) Set the test switch to the LIGHT ICE position. The timer must begin cycling as indicated by the alternate lighting of the test lamps, and continue cycling until the switch is set to OFF. The timer will continue cycling until the cycle is completed.

Figure 3

NOTE One complete cycle is the period of time between consecutive lightings of the same lamp This includes the dwell time, during which no lamp will be lit

C Time Intervals

(1) Connect a timer at each test lamp position in turn, so that each time interval may be timed

(2) Set the test switch to each position in order to time the intervals for each lamp The results must be as indicated in Table I

TIME INTERVAL TESTS
TABLE I

Connector Pin Energized	Time Interval (Seconds ± 10 Percent)	
	Heavy Ice Position	Light Ice Position
A	5	5
B	5	5
C	3	3
D	3	3
Dwell Time	44	164
Total Cycle Time	60	180

9 Troubleshooting

If the test values specified in Paragraph 8 cannot be obtained, refer to Table II for remedial procedures

TROUBLESHOOTING CHART
TABLE II

Test Failed	Probable Cause of Failure	Remedy
Paragraph 8 B	Wiring or connector damaged or improperly connected	Check wiring as per Figure 2 Correct or replace as necessary
	Rotary circuit selector damaged	Replace rotary circuit selector
Paragraph 8 C	Components damaged or improperly selected	Replace individual components as necessary. Test per paragraphs 8 A, B, C Revarnish areas where components were replaced

10. Storage Instructions

The transistorized sequential timer may be stored for 24 months (maximum time) provided the following conditions prevail. If these conditions are not observed, shelf life will be considerably shortened.

A. Storage area must be dry.

B. Units must not be subjected to extremely high temperature.

C. Units must be effectively protected from dust. Install cap and plug (20, Figure 4).

D. Units must be handled with care at all times

E. Units should be stored in shipping cartons if possible.

NOTE: Units that remain in storage (or inoperative) beyond the specified time limit must be inspected and tested prior to installation or use.

11. Special Equipment and Materials

The following equipment, or equivalent, is required to perform the overhaul procedures described in this manual.

A. Special

Special test equipment required is listed in Table III.

B. Standard

No standard test equipment is required.

C. Material

Grade 3 Salicyl Anilide - Fungicide

Procurable from: Maas Waldstein Company
2121 McCarter Highway
Newark, New Jersey 07104

SPECIAL TEST EQUIPMENT
TABLE III

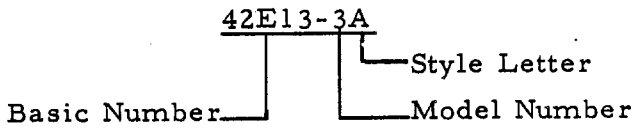
Part No.	Nomenclature	Application
53E42-1A	Deicer Timer Test Stand	Used to test transistorized sequential timer.
U755	Adapter Cable (supplied with 53E42-1A)	Used to adapt timer to test stand.

12. Illustrated Parts List

A. Introduction

(1) Purpose: This parts list is intended for use in requisitioning, storing, and issuing the replaceable parts of Transistorized Sequential Timer, Part No. 42E13-3A.

(2) Usage Code Symbols: Since only one type is covered in this parts list, a usage code is not necessary.



(3) Index Number Sequence: The sequence of the index numbers on the exploded view is the sequence of disassembly.

(4) How to Use this Parts List: When the part number is not known, locate the part on the exploded view and note its index number. Use this index number to locate the part number in the Group Assembly Parts List, Paragraph B.

(5) Bendix Part Numbering System: The part number consists of a basic number and a dash number. The dash number indicates variations of the basic part.

(6) Bendix Type Numbering System: The type numbering system indicates the essential characteristics of the unit.

Example:

SERVICE INSTRUCTIONS

1. DISASSEMBLY

a

a) Disconnect drain line.

b) Backoff bolt (1 figure 1) separator housing (7) with associated parts (8 through 14), will follow as bolt is withdrawn.

c) Remove filter retaining cotter pin (14) from bolt (1).

d) Remove filter retainer (13) and filter element (12) from housing (7).

2. CLEANING

Thoroughly wash all parts with suitable cleaning solvent. Air dry all parts using filtered factory air.

3. INSPECTION

a) Inspect all parts for damage.

b) Inspect all threads for condition and cleanliness.

c) Inspect separator housing for damage and/or burrs.

d) Filter inspection

Inspect filter for a coating of dirt. Long filter life can be expected as most dirt will be entrapped in water droplets and drained over - board. Replace element if condition is questionable.

4. PART REPLACEMENT

a) Replace all damaged parts.

b) Replace filter element as required.

5. LUBRICATION

Lubricate all seals and "O" rings with FS-1265 lubricant obtainable from Dow Corning, Englewood Cliffs, New Jersey.

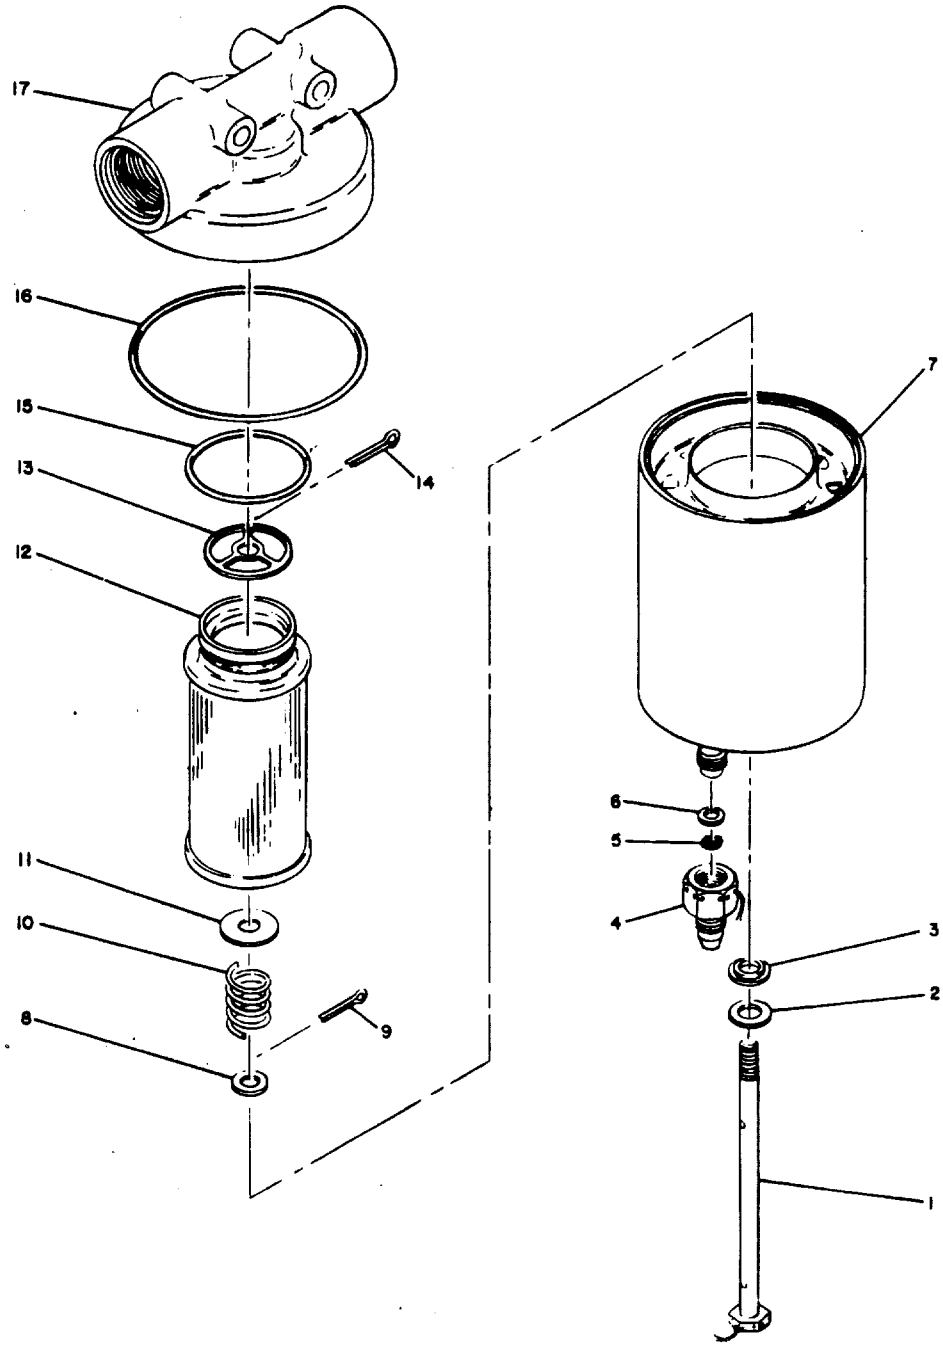

Figure 1 Water Separator and Filter - Exploded View

6. REASSEMBLY

Reassembly is the reverse of Disassembly.

CAUTION

Press the Separator Housing Assembly (7, figure 1) into the Separator Manifold (17). DO NOT FORCE THE BOWL INTO THE HOUSING BY TURNING IN THE RETAINING BOLT (1).

7. TEST PROCEDURE

None required other than a leak check after assembly.

8. OVERHAUL

Disassembly of the unit for Overhaul is the same as for Servicing the unit except the Separator Housing Assembly should be completely disassembled (1 through 9, figure 1). Follow the Service procedures replacing all "O" rings and seals and filter element.

INTRODUCTION

This manual provides off-aircraft maintenance instructions for the Rosemount model 2311M95, 2311M96, and 2311M97 motor for aircraft windshield wiper systems. Aircraft windshield wiper systems using ALCO part numbers are cross referenced as follows:

		Configuration	
ALCO P/N	Rosemount P/N	Drive	Ground
XW-21160-2	02311-0095-0001	Double	Case
XW-21160-1	02311-0095-0002	Single	Case
XW-21160-G1	02311-0096-0001	Single	Bonding Jumper
XW-21160-G2	02311-0096-0002	Double	Bonding Jumper
XW-21160-M1	02311-0097-0001	Single	Bonding Jumper
XW-21160-M2	02311-0097-0002	Double	Bonding Jumper
XW-21160-M2B	02311-0097-0003	Double	Bonding Jumper

This manual contains maintenance procedures normally used by the shop mechanic/technician. For removal of the wiper system from the aircraft, comply with the instructions in the aircraft maintenance manual.

This manual is divided into separate sections:

1. Title Page
2. Record of Revisions
3. List of Effective Pages
4. Table of Contents
5. Introduction
6. Procedures and IPL

Refer to the Table of Contents for the page locations of applicable procedures and the Illustrated Parts List (IPL).

An explanation of the use of the IPL is provided in the introduction to that section.

This manual will be revised as necessary to reflect current information.

DESCRIPTION AND OPERATION

1. DESCRIPTION

The motor assembly (Figure 1), in conjunction with the converter, wiper arm, and wiper blade, is used to clear the pilot's or co-pilot's windshield panels during inclement weather. The motor assembly provides the rotary power for operating the wiper system. An automatic reset thermoprotector, located on each motor, temporarily de-energizes the motor in the event of thermal or amperage overload (see Table 1) and radio noise (EMI) filters are contained in the base of the motor.

The pilot's and co-pilot's motor assemblies are mechanically identical.

2. OPERATION

The motor assembly may be operated at high or low speed, as selected by the wiper system controls located in the cockpit area. Low speed, if applicable, is accomplished through voltage reduction. A gear train, of identical ratio to the converter, is housed in the gear case of the motor. This gear train drives a cam assembly which actuates a parking switch (within the gear case) to automatically stow the wiper blade when the control switch is turned to the PARK position.

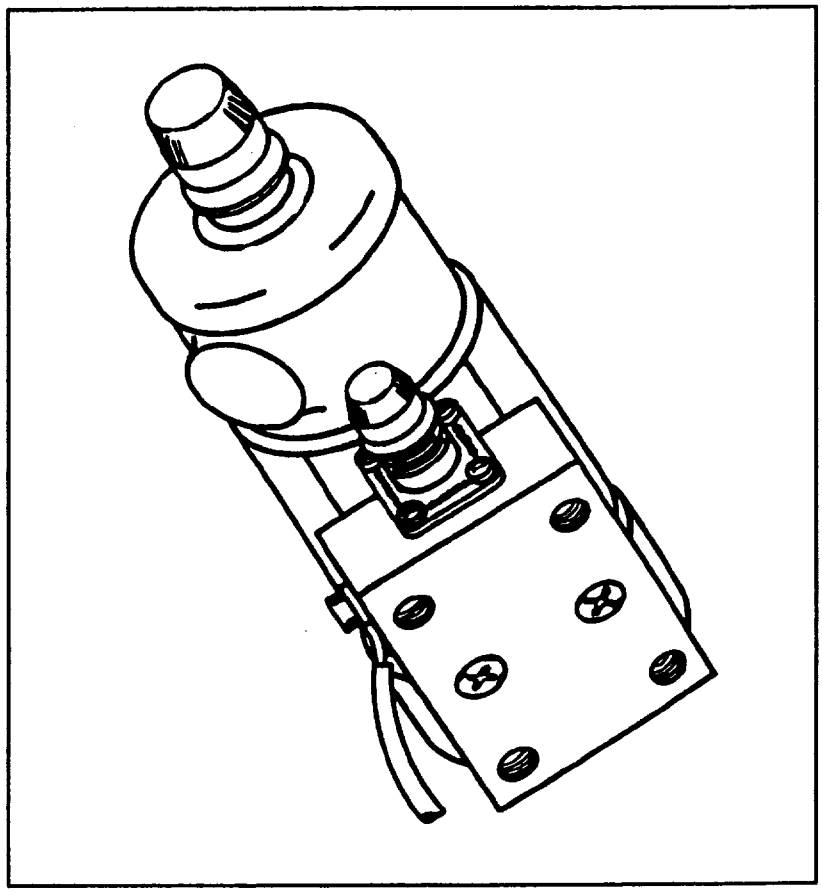

Figure 1. Motor Assembly

Table 1. Leading Particulars

Rated Voltage	28 VDC
Amperage	5.2 Amps
RPM	11,600
HP Rating	1/8 HP

Note: Rated values @ 10.9 in. oz. of torque

TESTING AND TROUBLESHOOTING

1. BENCH TESTING

A. Test Equipment

The following test equipment is needed to perform the test procedures:

- Rotor Lock Bar
- Dynamometer, Magtrol Model HD-400-6 (40 in-oz)
- Readout, Magtrol Model 4636
- Controller, Magtrol Model 4615C
- Power Supply (0-30 Volts, 40 Amps)
- Megohmmeter, Beckman Industrial Model L10A
- Dielectric Strength (Hypot) Meter, Associate Research Model 4450DT

NOTE: Equivalent substitutes may be used.

B. Motor Assembly Test Procedures

(1) Connect the motor assembly as shown in Figure 101.

(2) Apply 10 to 12 VDC across motor pins "A" and "C".

(3) Check for excessive running noise and vibration.

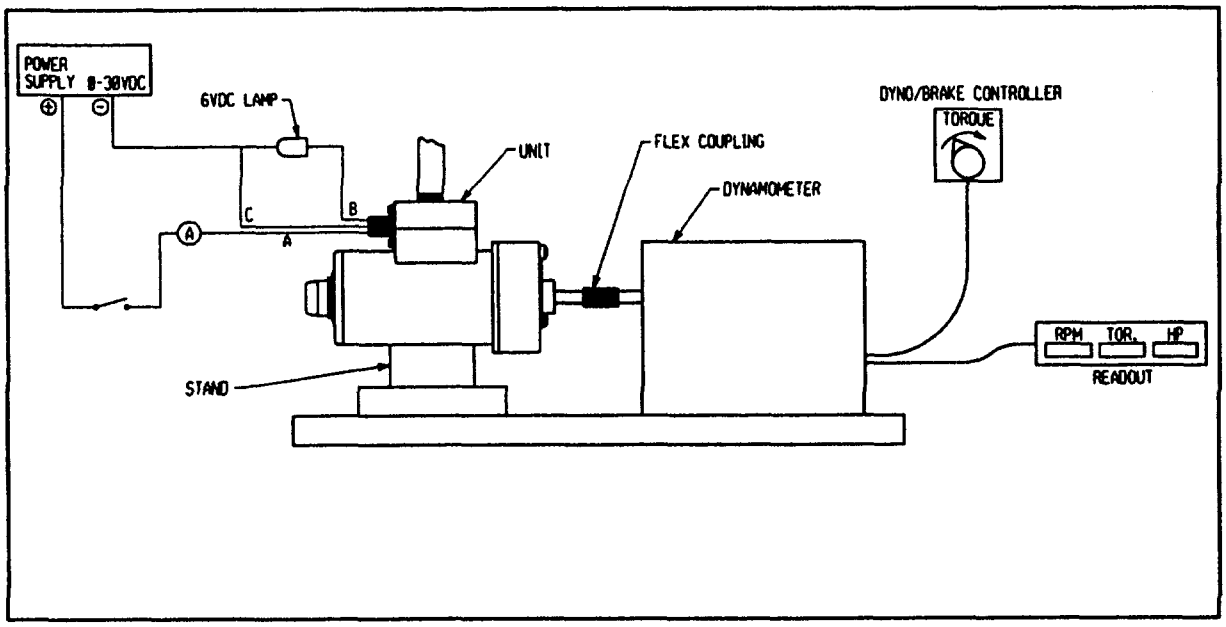
(4) Lock drive shaft of motor in a stationary position and apply 28 VDC across pins "A" and "C". Thermoprotector should de-energize motor circuit in approximately 30 seconds. Allow thermoprotector to complete one on-off cycle.

(5) With 28 VDC applied across pins "A" and "C" and motor operating at its rated torque of 10.9 inch-ounces, check speed and current draw of motor. Speed shall be no less than 10,500 rpm and current draw shall not exceed 6.2 Amperes.

C. Parking Switch Test Procedures

(1) Operate the motor at eight volts applied across motor pins "A" and "C".

(2) Allow motor speed to stabilize and connect a 6-volt lamp across motor pins "B" and "C". The lamp should light in regular pulsation if the parking switch is operating properly.



D. Insulation Resistance Breakdown Tests

CAUTION: THESE TESTS CAN ONLY BE PERFORMED IF THE EMI FILTER CAPACITORS HAVE BEEN REMOVED FROM THE ASSEMBLY. EMI FILTERS WILL BE DESTROYED IF AN INSULATION TEST IS PERFORMED WHILE THEY ARE ATTACHED.

(1) Ensure that no EMI filters are attached to motor and, using a dielectric strength meter, apply 1000 volts AC for 1 minute and check for ground faults between the motor lead wires and the motor barrel. Maximum leakage current is 2mA. Replace motor if ground fault is detected.

(2) Using a megohmeter, test the insulation resistance of the motor between the motor wires and barrel. The resistance should be >20 megohms.

Figure 101. Motor Test Set-up

2. TROUBLESHOOTING

If the motor assembly fails to operate properly, see Table 101 for troubleshooting instructions.

Table 101. Trouble Shooting Chart

PROBLEM	CAUSE	CORRECTION
Motor will not run		
- no current flow	1) Defective power supply or power supply not on.	1) Replace power supply or turn it on.
	2) Open circuit in motor. - open thermoprotector - open field coils - open winding in rotor	2) Check continuity between connector pins A and C and correct opens as necessary.
- current flow through motor	1) Defective or frozen bearings.	1) Replace bearings.
	2) Brushes frozen to commutator.	2) Replace brushes and resurface commutator.
	3) Foreign matter locking rotor.	3) Remove debris.
	4) Incorrect wiring.	4) Correct wiring.
Noisy operation/vibration		
	1) Defective, rough, or worn bearings.	1) Replace bearings.
	2) Defective or worn gears.	2) Check and replace as necessary.
	3) Rotor hitting pole piece or wires.	3) Replace barrel/correct wire placement.
	4) Rotor not balanced correctly/shaft bent (damage).	4) Replace rotor.
	5) Insufficient grease on gears and cam.	5) Apply grease to gears.
Thermoprotector will not cut power to motor		
- current flow through motor	1) Defective thermoprotector.	1) Remove from circuit and check continuity through thermoprotector. Replace as necessary.
- no current flow	1) See above (MOTOR WILL NOT RUN section).	1) See above.
Excessive current draw and/or low speed	1) Direct wiring shorts.	1) Locate and correct.
	2) Low field coil resistance.	2) Measure resistance w/ low resistance measuring ohmmeter. Resistance should be approximately 0.28 ohms.
	3) Dirty or glazed commutator.	3) Resurface commutator and replace brushes.
	4) Worn brushes.	4) Resurface commutator and replace brushes.
	5) Shorted commutator or rotor windings (indicated by a dark, discolored copper bar).	5) Check for burrs between comm bars and remove or replace rotor.
	6) Tight or defective bearings.	6) Replace bearings.
	7) Debris/wires impeding rotor rotation.	7) Remove debris or wires (replace wires if nicked).

Table 101. Trouble Shooting Chart (Continued)

PROBLEM	CAUSE	CORRECTION
Motor will not park or will not park consistently	1) Defective switch. 2) Damaged gear or cam. 3) Incorrect wiring.	1) Remove from circuit and check continuity through switch. Replace as necessary. 2) Replace damaged component. 3) Check for swapped "B" and "A" or "C" wires at connector and correct.

DISASSEMBLY

1. GENERAL

During the following procedures, refer to the item numbers assigned to IPL Figure 1. (Refer to testing and troubleshooting section before disassembling unit; disassemble only parts necessary to facilitate repair). See Testing and Troubleshooting to establish the condition of the unit to determine the extent of disassembly required. Remove only those parts necessary to accomplish the replacement.

2 SPECIAL TOOLS

The following special tools will be needed to perform the disassembly:

- Bearing Puller (Figure 901)

3. DISASSEMBLY PROCEDURES

During the following procedures, refer to item numbers assigned to IPL Figure 1. Refer to testing and troubleshooting section before disassembling unit; disassemble only parts necessary to facilitate repair.

NOTE: IPL Figure 1 presents an exploded view drawing of the motor assembly. The part numbers of all components and sub-assemblies are indicated on the Parts List which accompanies this illustration.

During disassembly procedures, be sure to mark all electrical wire leads that may have to be unsoldered, to ensure that they can be resoldered to their correct terminals during motor assembly.

A. Remove brush cover (220) and insulation (230) by removing lock wire and screws (240).

CAUTION: IF BRUSH COVER INSULATION (230) IS TORN OR OTHERWISE DAMAGED, IT SHOULD BE DISCARDED AND REPLACED.

B. Carefully remove brush and clip assemblies (320) from brush holder assemblies (300) by loosening screws (330).

C. Remove gear case (20, 20A) by removing lock wire and screws (100, 100A). Do not remove insulator (30) unless it is damaged or loose and needs replacement.

D. Remove retaining ring (70), slide cam assembly (40) off rotor shaft, and slide idler gears and washer (50, 60, 80 and 90) off of their posts.

E. Unsolder wire leads from parking switch (110). Remove parking switch by removing screws (120) and lock washers (130).

F. Remove end bell and idler shaft assembly (140) by removing tie bolts (150) and lock washers (160).

CAUTION: IF, FOR ANY REASON, BEARINGS MUST BE REMOVED, THEY SHOULD BE DISCARDED AND REPLACED.

NOTE: Do not disassemble gear or bearings from rotor unless damage of any component is evident (see Inspection/Check). These components are press-fitted and a suitable gear or bearing puller must be used for their removal.

G. Remove rotor assembly (200, 200A), with drive shaft gear (180), and ball bearings (190) as an assembly. Remove spring washer (210).

H. Working through holes in barrel assembly (245), unsolder wire leads from brush holder assembly (300) (See table 301 for wiring information).

J. Remove the brush holder end bell (250) from the barrel assembly (245).

K. Disassemble brush holder ring (270) and end bell assembly (260) by removing screws (280) and lock washers (290).

L. Remove brush holder assemblies (300) from brush holder ring (270) by removing four screws (310).

M. Unsolder wire leads from thermoprotector (340) and remove thermoprotector and snap ring (350).

N. Remove lock wire, four screws (490), two screws (370), and base (361).

P. Remove screw (400) by carefully lifting EMI filter capacitors (440, 440A) and connector (480) aside (as an assembly) to gain access to screw (400). Remove capacitors and connector. If necessary (see Inspection/Check), further disassembly is accomplished by unsoldering wire leads.

Q. Remove sub-base (362) from barrel assembly (245) by removing screw (380).

Table 301. Wiring Information

Model	18 Gauge Wire Color	From	To
-0095	Wht	Connector Pin A	Thermoprotector
	Wht	Connector Pin B	N/C SW (Terminal 1)
	Wht	Connector Pin C	Motor Brush (Near Thermoprotector)
	Wht	Motor Brush	N/C Sw (Terminal 2)
	Lug provides capacitor ground through base		
-0096	Wht	Connector Pin A	Thermoprotector
	Wht	Connector Pin B	N/C SW (Terminal 1)
	Wht	Connector Pin C	Motor Brush (Near Thermoprotector)
	Wht	Motor Brush	N/C Sw (Terminal 2)
-0097	Wht	Connector Pin A	N/O & N/C Sw (Pins 4 & 1)
	Wht	Connector Pin B	N/C SW (Terminal 1)
	Wht	Connector Pin C	Motor Brush (Near Thermoprotector)
	Wht	Motor Brush	N/C Sw (Terminal 2)
	Lug(ground)	Terminal 3	Tie Bolt

CLEANING

1. **MOTOR ASSEMBLY CLEANING** (Refer to IPL Figure 1).

   WARNING: CLEANING AGENTS ARE FLAMMABLE AND TOXIC. USE IN A WELL-VENTILATED AREA AWAY FROM FLAME AND HOT SURFACES. AVOID CONTACT WITH SKIN. DO NOT DIRECT AIR PRESSURE AGAINST SOLVENT IN CONTACT WITH SKIN. BREATHING FUMES MAY CAUSE INJURY.

   A. Wash all metal parts except the rotor assembly (200, 200A), brush and clip assemblies (320), and barrel assembly (245) with cleaning solvent. (Refer to Table 401 for cleaning materials.)

   B. Dry with compressed air or a clean, lint-free cloth.

   C. Rotor assembly (200, 200A), particularly the commutator, should be cleaned with a dry brush and compressed air. Commutator should be wiped clean to remove any film deposit.

Table 401. Cleaning Materials.

Cleaning solvent	Federal Specification P-S-661A
Cloth, lint-free	Commercially Available

NOTE: Equivalent substitutes may be used for above items.

INSPECTION/CHECK

1. INSPECTION

Minimum or maximum measurement limits which determine replacement requirements are provided in Fits and Clearances, Table 801. Perform a visual check of all parts. Pay particular attention to the condition of threads on all bolts and nuts. Check for nicks, burrs, dents and other deformities which may interfere with proper operation of the motor assembly. Visually examine all parts for obvious defects or excessive wear.

2. CHECK

A. Check brush holder ring (270) for cracks or chips and brush holder assemblies for deformities or damaged spring tensioners.

B. Check brushes for cracks, unusual wear pattern and contamination from grease or oil.

C. Check barrel assembly (245) for cracks and deformities, shorted or open field windings or evidence of overheating.

D. Check condition of rotor assembly (200, 200A) shaft and commutator segments, ball bearings (190) and brush holder assemblies (300).

E. Minimum or maximum measurement limits which determine replacement requirements are provided in Fits and Clearances, Table 801.

REPAIR

1. GENERAL

Extensive repair to any components is impractical due to the precise nature of the motor assembly. Repair is limited to replacement of parts determined defective during disassembly, inspection, and testing; resoldering loose wire connections; and reconditioning of motor rotor assembly commutator.

2. EQUIPMENT REQUIRED FOR REPAIR

- Commutator Resurfacer (vendor 30119, part 80-075)

3. RECONDITION MOTOR ROTOR ASSEMBLY COMMUTATOR

CAUTION: DO NOT USE ANY FORM OF EMERY PAPER OR CLOTH OR ANY FORM OF MATERIAL CONTAINING SILICON CARBIDE, ALUMINUM OXIDE, OR ANY OTHER CONDUCTIVE ABRASIVE ON THE COMMUTATOR.

NOTE: The following repair can be performed on the rotor assembly provided that no portion of the commutator diameter measures less than the minimum diameter limits listed in Table 801.

A. Remove glazed surface or recesses created by brushes by machining or refinishing with commutator resurfacer.

B. Wipe loose deposits from commutator using a dry bristle brush or lint-free cloth (See Table 401) and blow off with compressed air.

CAUTION: EXERCISE EXTREME CARE IN PERFORMING STEP C. DO NOT SCRATCH OR OTHERWISE MAR THE SURFACE OF THE COMMUTATOR.

C. Use a mica undercutter to clean out carbon deposits and other foreign particles from the commutator slots. Undercut .51 mm wide by 1.27 mm to 1.52 mm deep.

D. Wipe all dust and particles from the rotor assembly with a dry soft bristle brush or lint-free cloth.

NOTE: Following repair or replacement of parts, the motor should be retested in accordance with the testing and troubleshooting section.

ASSEMBLY

1. GENERAL

Refer to Table 701 for assembly materials.

2. SPECIAL TOOLS AND MATERIALS REQUIRED FOR ASSEMBLY

No special equipment is required to perform the assembly procedures.

3. PROCEDURES

During the following procedures, refer to item numbers assigned to IPL Figure 1. The part numbers of all components or sub-assemblies are indicated on the parts list which accompanies each illustration.

A. General Assembly

NOTE: Base (361) and sub-assembly (362) are matched parts. If either part has to be replaced, see Illustrated Parts List.

(1) Assemble sub-base (362) to barrel assembly (245) using screws (380) and lock washer (390).

(2) Install screw (400) in sub-base barrel assembly and stake screw in two places (180° apart).

(3) Install connector (480) on base using two screws (490).

(4) Assemble brush holder assemblies (300) to brush holder ring (270) using four screws (310) and apply Glyptol (item 7, Table 701) to heads of screws.

(5) Assemble brush holder ring (270) to end bell assembly (260) using two screws (280) and two lock washers (290).

(6) Align small locating pin, on end of barrel assembly (245), with mating hole in end bell assembly (260) and carefully push end bell assembly into barrel assembly until end bell is fully seated.

(7) Solder wire leads to brush holder assemblies (300) as shown in Motor Wiring Diagram Figure 701.

(8) Solder wire "A" and coil wire to Thermoprotector, insert this assembly into mating opening in barrel assembly (245).

(9) Arrange all electrical wiring snugly against inside of barrel assembly (245), allowing maximum clearance for rotor assembly (200, 200A).

(10) Assemble and solder capacitors and wires into sub-base assembly and connector as shown in figures 701 and 702.

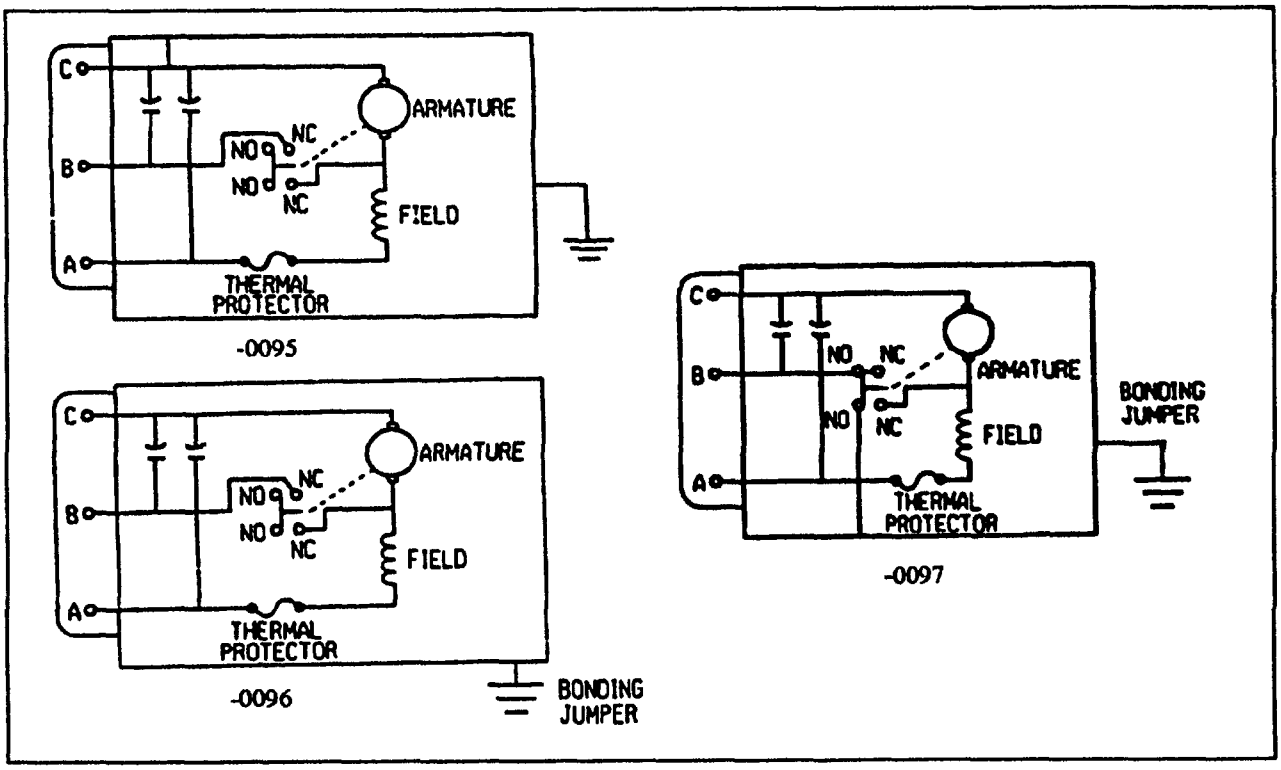


Figure 701. Motor Wiring Diagram

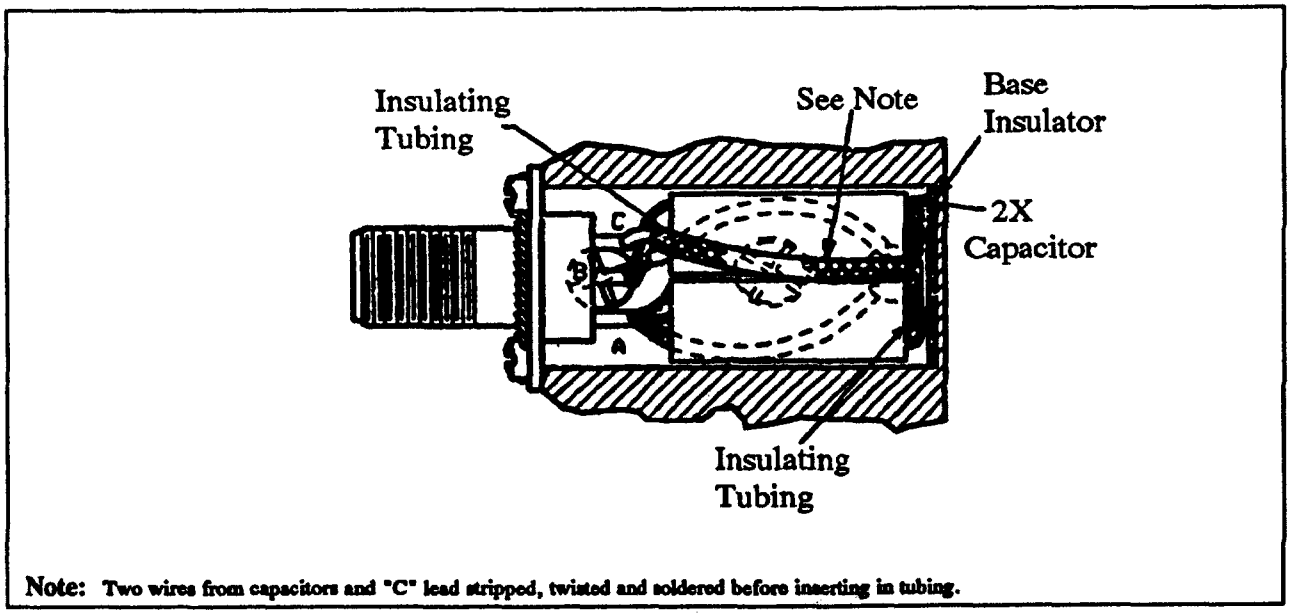

Figure 702. Connector Wiring Diagram

Table 701. Assembly Materials

ITEM	NOMENCLATURE	IDENTIFICATION	SOURCE
1	Solvent, Cleaning	Trichlorethane	34897
2	Solder, 60/40	QQ-S-571	70279
3	Paint, Flat Black	590-B-027	72225
4	Thinner, Lacquer	MIL-T-19544	72225
5	Glyptol	1201	59319
6	Wipe, Lint Free	05313	78112
7	Grease	MIL-G-81322D	54527
8	Sealant, Permatex	1372	62337
9	Tape, Protective	Masking	61139

(11) Insert paper insulator (430) between capacitors and back of the sub-base assembly, assemble base (361) using screws (370), stake screws into position(two places for each, 180° apart), and install two additional connector screws (490).

(12) If bearings (190) or drive shaft gear (180) were removed, press-fit bearings and drive shaft gear on rotor assembly (200, 200A) drive shaft using bearing installation tool (Figure 902).

(13) Position spring washer (210) (raised tangs facing rotor assembly) inside end bell assembly (250).

(14) Insert rotor assembly (200, 200A), with bearings and drive shaft gear, into barrel assembly (245) until its leading bearing is fully inserted into brush end bell assembly (250) and is seated on spring washer (210).

(15) Align small locating pin located on end of barrel assembly (245) with mating hole in back side of end bell idler shaft assembly (140), put electrical wiring (for parking switch) through holes in end bell and push end bell into barrel assembly (245).

(16) Secure idler shaft assembly (140) and brush end bell assembly (250) to barrel assembly using bolts (150) and lock washers (160).

(17) Assemble brush wire clip (320) on brush holder screw, tighten brush holder screw, lift the spring arm and install the brush clip (brush curvature must match curvature of rotor).

(18) Operate the motor at normal speed (27-30 VDC), holding the brushes tightly against commutator for about 15-20 seconds. Remove the brushes and check the brushes for chipping and minimum surface contact (shininess) of 90%.

(19) Run-in motor for approximately 1 hour at 10-12 VDC across pins "A" and "C".

(20) Assemble parking switch (110) to end bell idler shaft assembly (140) using screws (120) and lock washers (130).

(21) Solder wire leads, if applicable, to parking switch (110) as shown in Figure 701.

(22) Slide washer (90) over the idler shaft closest to the rotor.

(23) Lubricate idler shafts and rotor shaft with grease (item 7, Table 701), install idler gear (80) over first shaft, and install gear (60) over the second shaft.

(24) Install cam (40) on rotor shaft, lift cam slightly, and install gear (50).

(25) With all gears seated on the shafts and meshed properly with each other and rotor gear, install retaining ring (70) on first shaft.

(26) If insulator (30) was removed because of damage, install new insulator inside gear case assembly (20, 20A).

(27) Secure gear case (20, 20A) to idler shaft assembly (140) using bolts (100, 100A) and lockwire.

(28) Install brush cover insulation (230) on barrel assembly (245), working it carefully around thermoprotector (340), and install snap ring (350) around thermoprotector.

(29) Install brush cover (220) and secure using two screws (240) and lockwire.

3. PAINTING

A. Use masking tape (item 9, Table 701) to mask rotor shaft ends, electrical connector and nameplate if installed.

B. Using a clean, lint free cloth (see Table 401) wipe all unmasked surfaces with lacquer thinner.

C. Paint with flat black paint (item 3, Table 701) and allow to air dry.

4. STORAGE

Store in a dry dust-free area, preferably in original shipping container designed for shipment of spare assemblies. Shelf life is for indefinite period.

FITS AND CLEARANCES

1. General

Refer to the motor assembly table of limits (Table 801) to determine maximum and minimum inspection limits for fits and clearances.

Table 801. Motor Assembly Table of Limits

ITEM	INSPECTION	MAX.	MIN.	REMEDY
(Item numbers refer to IPL Figure 1 of Illustrated Parts List)				
Bearing Housing	Measure bearing housing.	0.8669"	0.8661"	Replace if housing measures more than indicated.
Shaft Diameter	Measure for minimum shaft diameter.	—	0.2754"	Replace if diameter measures less than indicated.
Bearings (190)	Bearings should be free running.	—	—	Replace if there is any doubt of condition.
Commutator	Make sure surfaces are smooth and clean (Rough commutator surface will cause excessive brush wear). Then, measure commutator diameter.	—	0.850"	Replace if diameter measures less than indicated.
Rotor and Stator	Check windings for broken leads and frayed insulation.	—	—	Repair if practical.
Brushes (320)	Measure brush length across back of brush.	—	5/32"	Replace both brushes if either brush is worn beyond dimension indicated.
Brush Springs (300)	Measure compression pressure of springs at new brush length.	0.650 lbs. at contact point	0.350	Replace if spring pressure is incorrect.

SPECIAL TOOLS, FIXTURES, AND EQUIPMENT

Table 901. Equipment List

Item	Description	Mfg.	Model	Range
1	Ammeter	Simpson	1227	0 - 5 Amps
2	Stopwatch	Minerva	140L	0 - 5 min.

ILLUSTRATED PARTS LIST

1. INTRODUCTION

A. Purpose

Replacement parts and complete assemblies for additional installation may be ordered by means of the replacement parts list and exploded view drawings of the complete assembly and component parts.

B. How to Use

(1) Assembly Order Indenture System

The indenture system used in the parts list shows the relationship of one part to another. For a given item, the number of indentures depicts the relationship of the item to the associated next higher assembly as follows:

1 2 3
Assembly
• Detail Parts for Assembly
• Subassembly
• • Detail Parts for Subassembly
• • Subassembly

NOTE: The manufacture of aircraft wiper systems and components performed by ALCO Controls Division of St. Louis, MO (vendor code 70255) has been transferred to Rosemount Inc., Burnsville, MN. ALCO Controls Division part numbers are shown in parenthesis ( ) to cross reference existing units/parts when ordering replacement parts/units.

(2) Quantity Per Assembly

The UNITS PER ASSY column shows the total number of units required per assembly, per subassembly, etc., as applicable. The letters RF indicate the item is listed for reference purposes.

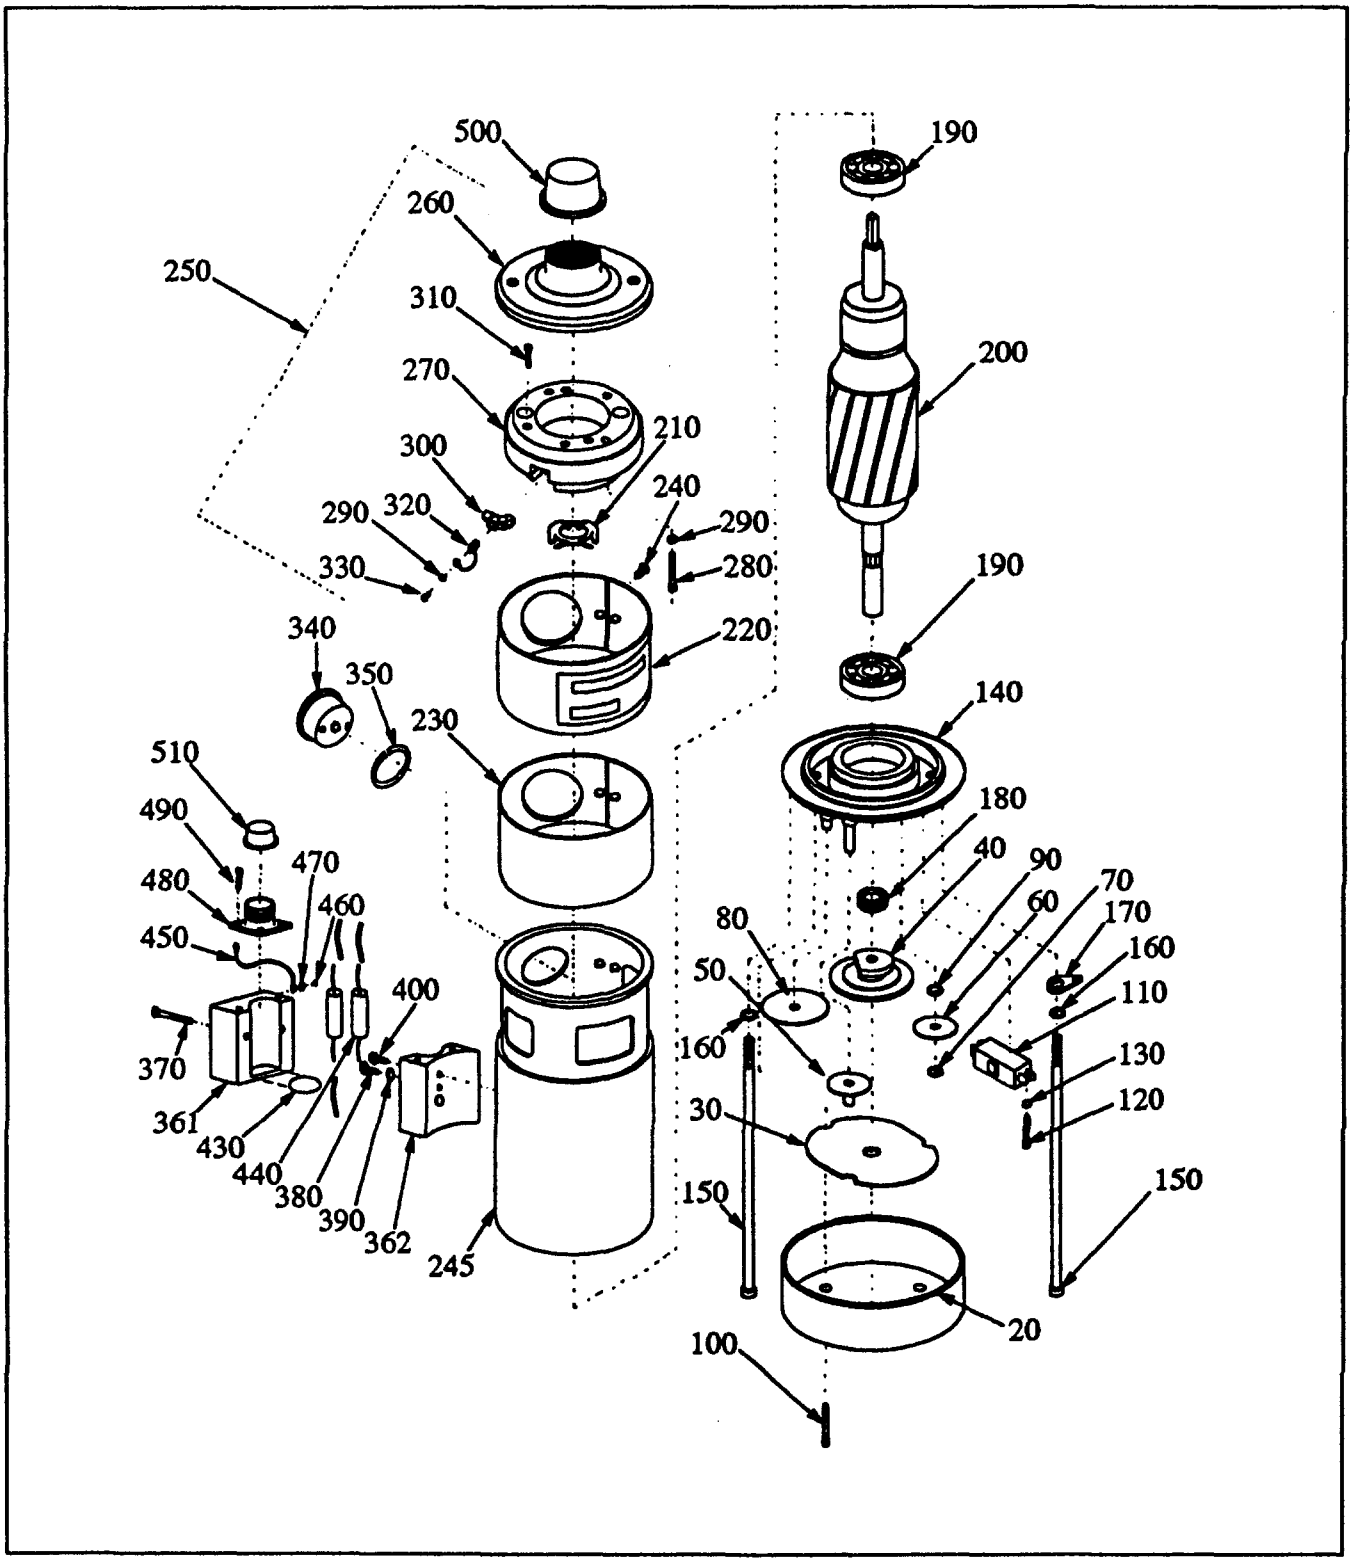
(3) Effectivity Code

The EFF CODE column designates which parts are contained in each of the various motor assembly models. All parts in a figure with the same effectivity code must be used together to ensure part compatibility.

(4) Vendor Numbers

V21452	Highland Electric P Los Angles, CA	V3U476	Honeywell Inc. Microswitch Division 1 Hickory Drive P.O. Box 460 Mars Hill, NC 28754
V21452	Highland Electric Los Angles, CA	V77535	Associated Spring 226 South Center Street Corry, PA 16407
V31335	Torrington Co. Fafnir Bearing Division 59 Field Street Torrington, CT 06790	V79963	Zierick Mfg. Co. Radio Cir. Mount Krisco, NY 10549
V34669	Alliance Plastics Inc 3123 Station Road Erie, PA 16510-3045	V82647	Texas Instruments Inc. Control Products Div. 34 Forest Street Attleboro, MA 02703-2454

C. Procurement



All parts, including vendor parts, can be procured from:

V59885	Rosemount Inc. Aerospace Division 14300 Judicial Road Burnsville, MN 55306-4898

Publication No. 1532U-23-865B
Revision I
October 1993

1.0 DESCRIPTION AND OPERATION

This manual contains descriptive information, overhaul and test instructions, and an illustrated parts list for Deicer Distributing Valve, P/N's 1532-2A, 1532-3A, 1532-3B, 1532-3C, 1532-6A and 1532-6C manufactured by Lucas Western Inc., Power Transmission (LWIPT), Utica, New York 13503.

The deicer distributing valve (Figure 1) is a component of the aircraft deicer system.

The deicer distributing valve contains a pressure inlet port, a vacuum port, two ports (A and B) which connect to the associated deicer boots, and an exhaust port which is piped overboard to a low pressure area.

The pressure inlet port is integral with the aircraft manifold pressure line, thereby making pressure available at all times. Ports A and B are connected, through lines, to the deicer boots which provide the suction and pressure connections to operate the deicer boots. The exhaust port which is piped overboard to a low pressure area, serves to discharge the pressurized air in the deicer boots.

The deicer distributing valve normally has vacuum applied to it at all times. This suction within the deicer distributing valve holds down the deicer boots when the deicer system is not energized.

2.0 DISASSEMBLY

A. Remove tie wire, screws (6, Figure 7), and terminal lug (7), and carefully lift out receptacle connector (5). Unsolder wires.

B. Remove screws (9), solenoid retainer (8), and head gasket (10). Discard gasket (10).

C. Carefully pull wires from connector cavity down and through opening in valve head (14) for the solenoid and contact and lead assembly.

D. Remove tie wire. Remove screws (2 and 4), washers (3), and valve head assembly (1).

E. Remove plunger and pin assemblies (12) and solenoid coil assemblies (13) from valve head (14).

F. Carefully remove control valves (32) and control valve springs (33) from valve housing (38 or 39).

G. Remove tie wire. Remove screws (16), washers (17), and exhaust valve cover assembly (15).

H. Remove flapper valve cover gasket (18), poppet valve assemblies (20), and valve springs (19) from exhaust valve housing (21). Remove exhaust valve housing (21) and exhaust port housing gasket (22) from valve housing (38 or 39). Discard gaskets (18 and 22) and poppet valve assemblies (20).

I. To remove diaphragm assembly (26), remove self-locking nuts (27) on top side of diaphragm assembly (26).

J. Remove diaphragm washers (29), diaphragm (30), and diaphragm springs (31).

K. Invert valve housing (38 or 39) and remove self-locking nuts (23), valve washers (24), valve seals (25), and remaining valve washers (24) from valve stems (28). Record number of valve washers (24) removed. Remove valve stems (28) from valve housing (38 or 39). Discard valve seals (25), diaphragm (30), and self-locking nuts (23 and 27).

L. Remove tie wire, screws (35), washers (36), identification plate (34), and gasket (37). Discard gasket (37).

3.0 CLEANING

WARNING

USE CLEANING SOLVENT ONLY IN A WELL-VENTILATED AREA

Clean all arts, except solenoid coil assemblies (13, figure 7), with Esso Varsol (manufactured by the Humble Oil and Refining Co., Pelham, New York), or equivalent. Solenoid coil assemblies should be wiped with a clean cloth dampened with cleaning solvent. Dry parts using dry filtered air at a pressure of 25 to 30 psig.

4.0 INSPECTION/CHECK

A. Inspect and discard all parts that are cracked, broken, and have non-cleanable corrosion.

B. Inspect threaded parts for stripped and crossed threads.

C. Inspect valve housing (38 or 39, figure 7) for loose plugs. Check condition of valve seats.

D. Inspect leads of solenoid coil assemblies (13) for burned, charred, cracked, or frayed insulation.

E. Using ohmmeter, check resistance between lead and outer case of each solenoid coil assembly. The resistance should be 17.6 ohms ± 5%.

F. Inspect receptacle connector (5) for loose, bent, or broken pins, and for cracked, chipped, or burned inserts.

G. Inspect contact and lead assembly (11) for broken strands of wire and poor solder connection between lead and contact.

H. Inspect valve washers (24) for being grooved.

I. Check spring lengths and compression requirements as shown in Table 1.

J. Inspect control valves (32) for being scored and replace if scored.

5.0 REPAIR AND REPLACEMENT

A. Standard overhaul replacement parts kit for each model are as follows:

Unit	Kit
1532-2A	SK262
1532-3A	SK263
1532-3B	SK264
1532-3C	SK261
1532-6A	SK261
1532-6C	SK261

B. Replace any damaged parts in addition to the standard replacement parts as required.

C. Replace control valves (32, Figure 7) if excessive clearance in valve bushings is due to worn valve surface. If excessive clearance is due to worn valve bushings, replace valve housing (38 or 39). Permissible worn clearance is 0.0010 inch maximum.

6.0 ASSEMBLY

A. Apply EC1357 cement on both sides of diaphragm (30, figure 7) in small area around stem holes. (See Figure 2).

Publication No. 1532U-23-865B
Revision I
October 1993

TABLE 1. SPRING DATA

Spring	Compressed length	Compression load
Valve spring (19, Figure 7)	0.308 inch	14 to 16 ounces
Diaphragm spring (31, Figure 7)	0.406 inch	10 to 14 ounces
Control valve spring (33, Figure 7)	0.500 inch	5.5 to 6.5 ounces

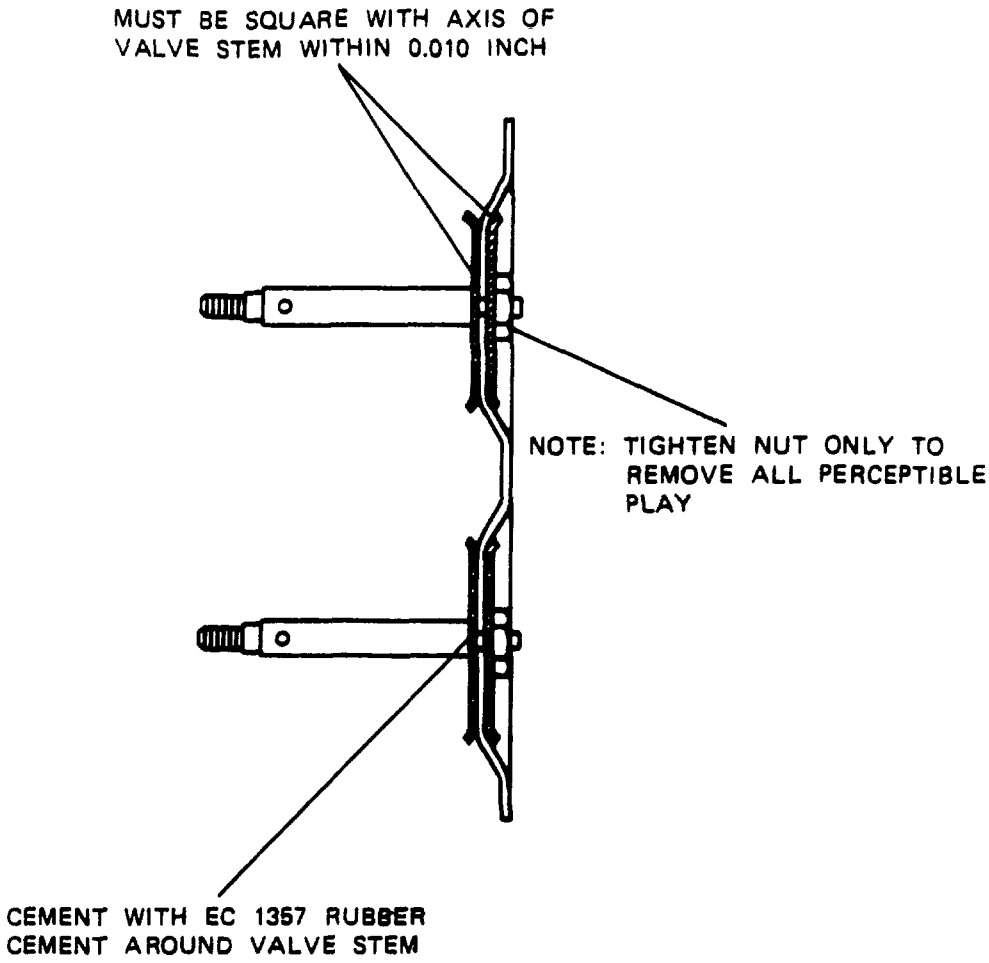

Figure 2. Diaphragm Assembly

B. Position diaphragm washers (29, figure 7) and valve stem (28) onto diaphragm (30) and loosely assemble new self-locking nuts (27). (See Figure 2).

C. Position diaphragm assembly (26, Figure 7) in fixture U6926, making sure it fits smoothly.

D. Assemble fixture cover U6925 in position on diaphragm assembly (26) and tighten with slave screws (2).

E. Locate a 1/16-inch drill rod 6 inches long into stem holes through fixtures tighten self-locking nuts (27).

NOTE:

DO NOT OVERTIGHTEN SELF-LOCKING NUTS TO AVOID CAUSING DISTORTION IN DIAPHRAGM.

F. Remove slave screws (2) and remove diaphragm assembly (26) from holding fixtures.

G. Install solenoid coil assemblies (13) and contact and lead assembly (11) into valve head (14). Carefully thread wires through opening in valve head (14) into cavity of receptacle connector (5). Place plunger and pin assemblies (12) into solenoid coil assemblies (13).

H. Place diaphragm springs (31) on protruding end of valve stems (28) and position diaphragm assembly (26) on valve housing (38 or 39).

NOTE:

WHEN ASSEMBLIED INTO VALVE HOUSING (38 OR 39), DIAPHRAGM ASSEMBLY (26) MUST OPERATE FREELY.

I. Install control valve springs (33) and control valves (32) in valve housing (38 or 39). Ensure small land ends of control valves (32) are assembled next to control valve springs (33).

J. Secure new head gasket (10) and solenoid retainer (8) using five screws (9). Torque screws (9) between 8 and 10 pound-inches.

K. Solder leads from solenoid coil assemblies (13) and contact and lead assembly (11) to receptacle connector (5) with Eclipsaloy No. 9, Grade 5 or 15 solder. (See Figure 3).

NOTE:

DO NOT KINK LEADS WHILE PUSHING RECEPTACLE CONNECTOR (5, FIGURE 7) INTO VALVE HEAD (14).

L. Secure receptacle connector (5) and terminal lug (7) to valve head (14) with screws (6). Torque screws (6) between 4 and 5 pound-inches. Install tie wire.

Publication No. 1532U-23-865B
Revision I
October 1993

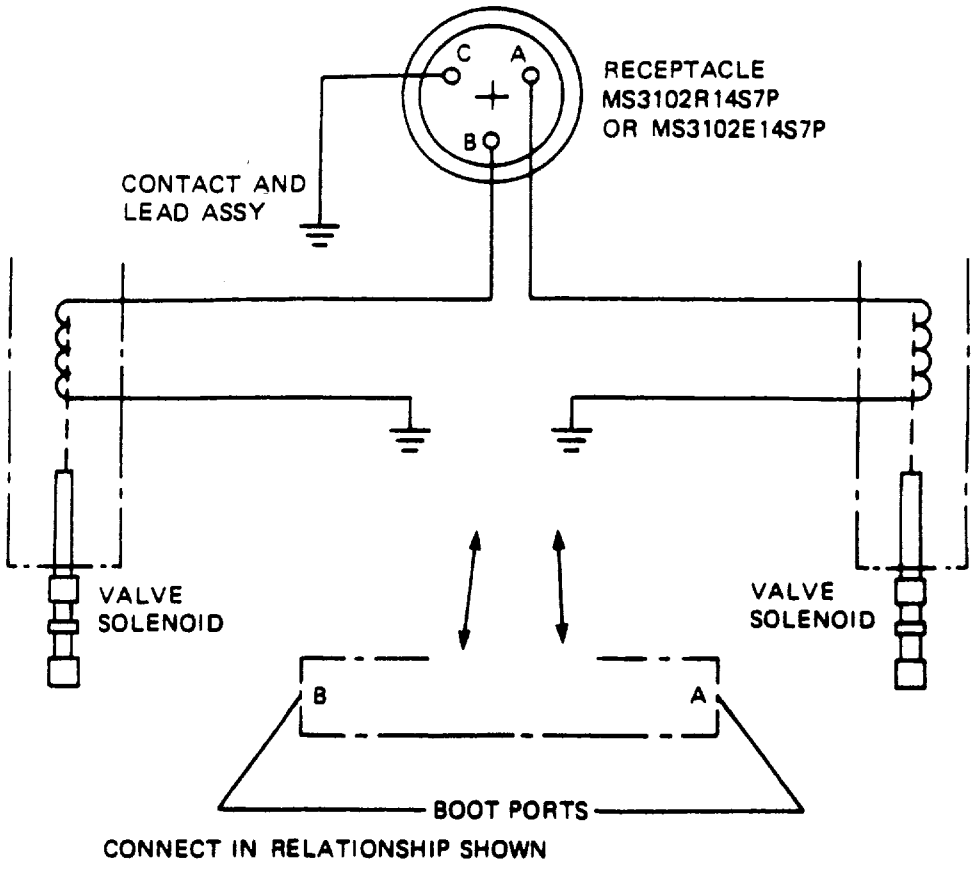

Figure 3. Wiring Diagram

M. Install valve washer (24), new valve seal (25), valve washer (24), and new self-locking nut (23) on each valve stem (28). Tighten self-locking nuts (23) to secure valve seals (25) onto seats of valve housing (38 or 39).

NOTE:

INSTALL SAME NUMBER OF INNER VALVE WASHERS (24) AS NOTED AT DISASSEMBLY.

N. Before continuing with assembly of the deicer distributing valve, it is necessary to adjust self-locking nuts (23) as follows:

1. Plug boot ports A and B.
2. Apply 2 psig air pressure to pressure port and energize each solenoid several times. (See Figure 4).
3. Adjust self-locking nuts (23, Figure 7) to obtain minimum air leakage past valves.

NOTE:

CARE MUST BE USED WHEN TIGHTENING NUTS SINCE OVERTIGHTENING OR UNDERTIGHTENING WILL CAUSE LEAKAGE PAST VALVES.

4. Re-energize both valves several more times and recheck leakage for proper sealing of valves with an air flowmeter for total leakage.
5. Leakage, as determined by flowmeter located in pressure supply line, represents total of internal as well as external leakage, and must not exceed 3 cubic feet per hour.
6. Repeat steps (2) through (5) with 8 psig air pressure applied.

O. Install new exhaust port housing gasket (22) and exhaust valve housing (21) on valve housing (38 or 39). Install new poppet valve assemblies (20) and valve springs (19) in exhaust valve cover assembly (15). Install flapper valve cover gasket (18) and exhaust valve cover assembly (15) on exhaust valve housing (21) and secure with washers (17) and screws (16). Torque screws (16) between 13 and 15 pound-inches. Install tie wire.

P. Secure valve head assembly (1) to valve housing (38 or 39) with screws (2), washers (3), and screw (4). Torque screws (2 and 4) between 13 and 15 pound-inches. Install tie wire.

Q. Secure name plate gasket (37) and identification plate (34) to valve housing (38 or 39) with washers (36) and screws (35). Torque screws (35) between 4 and 5 pound-inches. Install tie wire.

7.0 FITS AND CLEARANCES

Fit and clearance information appears in the applicable portion of paragraph 6.

8.0 TESTING

If performance test stand 53E19-35A is not available, test the deicer distributing valve as follows:

A. Operational Tests

1. Connect deicer distributing valve to test setup shown in Figure 5.

2. Apply vacuum to 4 inches of mercury to suction port, leaving pressure port open. Leakage rate, as indicated by the flowmeter, must not exceed 3 cubic feet per hours.

3. Connect pressure port and set pressure at 8 psig and vacuum at 6 inches of mercury.

4. Leakage, as indicated by flowmeter in vacuum line, must not exceed 5 cubic feet per hour. (Compound gages connected to A and B ports should read same as vacuum line manometer).

5. Repeat steps 3 and 4 with solenoid A energized with 20 Vdc and solenoid B deenergized. Leakage must not exceed 20 cubic feet per hour. (A port compound gage should read inlet pressure and B port compound gage should read vacuum inlet pressure).

6. Repeat step 5 (inflate condition) with solenoid A deenergized and solenoid B energized with 20 Vdc.

7. Readings on A and B port compound gages should be reversed from those in step 5.

8. Leakage must not exceed 20 cubic feet per hour.

9. With 8 psig pressure and 4 inches vacuum applied, energize each solenoid separately several times with 20 Vdc.

10. Valve action must be immediate and complete.

1 - FLOWMETER 0-15 CFH
2 - GLOBE VALVE - 1/4 PIPE
3 - PRESS. REDUCING VALVE - 1/4 PIPE 0 TO 15 PSIG
4 - ACCUMULATOR TANK - 1 TO 3 GAL. (PRESSURE)

16 · VOLTMETER 0-30 VDC
17 · COMPOUND GAGE 0-30 PSIG PRESS 0-30" HG.

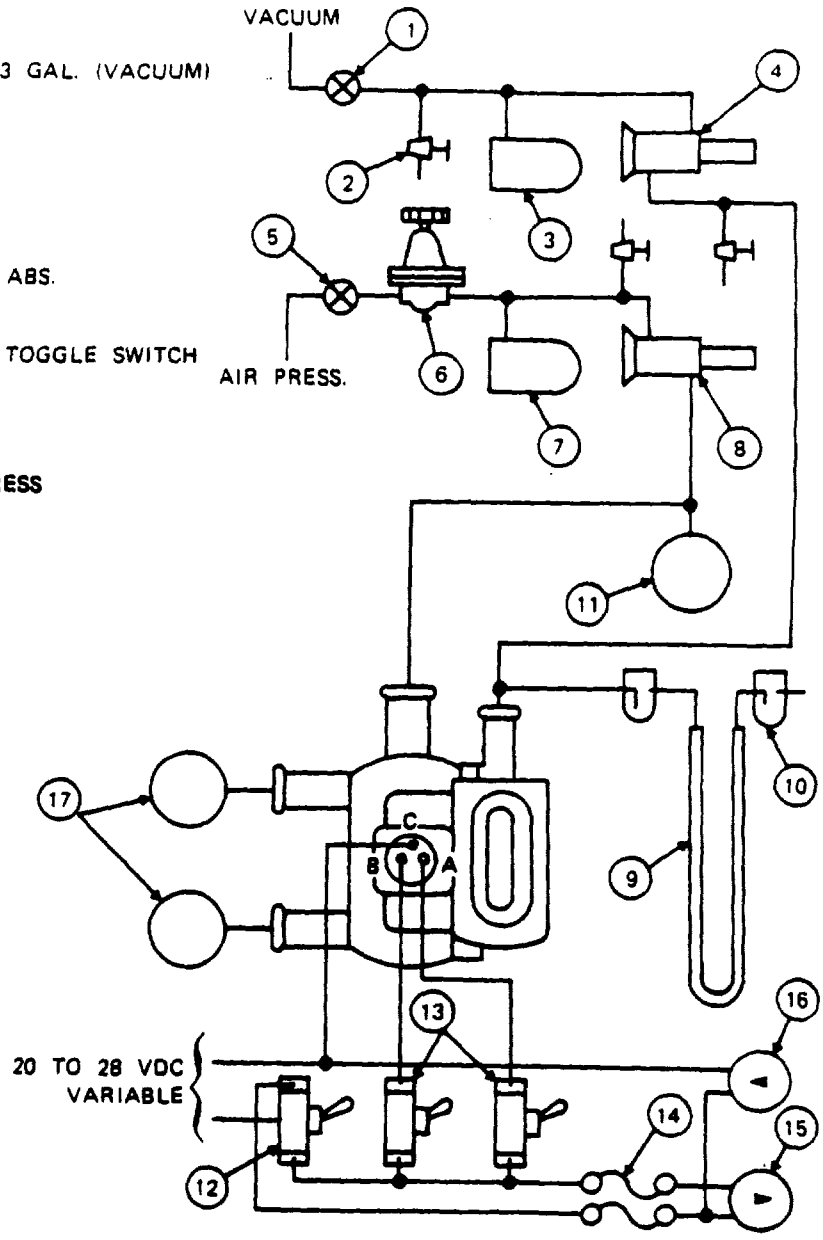

Figure 5. Test Setup

B. **Solenoid Current Consumption**

1. Energize each solenoid separately with 28 Vdc.
2. Current consumption should be between 1.45 and 1.75 amperes.

C. **Secondary Ground**

1. Using calibrated ohmmeter, check resistance from pin A to secondary ground lug on receptacle.
2. Repeat step 1 from pin B to secondary ground lug.
3. Resistance must not be more than 25 ohms.
4. Check resistance from pin C to secondary ground.
5. Resistance must not be more than 5 ohms.
6. Check rejected parts for cold solder joints or dirt at ground clip contact joints.

9.0 STORAGE INSTRUCTIONS

The deicer distributing valve may be stored for 60 months (maximum time) provided the following conditions prevail. If these conditions are not observed, shelf life will be considerably shortened.

A. Storage area must be dry.

B. Units must not be subjected to temperatures higher than 250°F.

C. Units must be effectively protected from dust.

D. Units must be handled with care at all times.

E. Units should be stored in shipping cartons if possible.

F. Units should be tested prior to installation.

NOTE:

UNITS THAT REMAIN IN STORAGE (OR INOPERATIVE) BEYOND THE SPECIFIED TIME LIMIT MUST BE INSPECTED AND TESTED PRIOR TO INSTALLATION OR USE.

10.0 SPECIAL TOOLS, FIGURES AND EQUIPMENT

The following equipment, or equivalent, is required to perform the overhaul procedures in this manual.

A. **Special**

Performance test stand 53E19-35A should be used, if available, to test the deicer distributing valve. Assembly fixture U6926 and fixture cover U6925 are used when assembling the valve. (See Figure 6).

B. **Standard**

Standard test equipment is listed in Table 2.

11.0 TROUBLESHOOTING

If the test values specified in Paragraph 8 cannot be obtained, refer to Figure 9 for item identification and Table 6 for remedial procedures.

TABLE 2 TROUBLESHOOTING

Test Failed	Probable Cause	Remedy
Paragraph 6N Excessive Leakage	Seal (25) loose or too tight	Readjust nut (23) to obtain minimum minimum leakage per Paragraph 6N, Step 5
	Defective seat on valve housing (38)	Inspect valve housing for chipped or uneven seats
	Quantity of shims (24) inadequate	Add or subtract shims as required to obtain minimum leakage: Paragraph 6N
	Defective nut (23) allowing for uneven seating of seal (25)	Inspect nut and seal for squareness. Replace nut if necessary.
	Internal valve housing leakage (38)	If the preceeding guides still allow leakage, internal housing leakage may exist. Replace housing
Paragraph 8A Step 2 Excessive Leakage	Defective diaphragm assembly (26)	Inspect diaphragm assembly for torn diaphragm (30) or leakage around valve stem (28) and washers (29). Replace if necessary

Test Failed	Probable Cause	Remedy
	Contamination of diaphragm assembly (26)	Inspect mating surfaces of diaphragm (30) and housing (38) for foreign matter. Insure clean surfaces of each
	Defective gasket (26)	Inspect condition of gasket. Replace if worn or cracked
	Defective sealing surface of valve poppet assembly (20)	Inspect condition of poppet assembly. Replace if seal is uneven
	Defective seat on exhaust valve housing (21)	Inspect condition of housing. Replace if chipped or uneven seats exist
	Defective control valve (32) and/or bushing	Inspect condition of control valves for burrs or scratches. Replace control valve if worn or scratched. Check clearance per Paragraph 5C.
	Spring (19) not seated properly on poppet valve assembly (20)	Cycle solenoids A and B several times to position spring. Insure that the large spring end rides on poppet valve assembly
	Loose screws (2), (4) (16)	Inspect for loose screws and tighten per Paragraph 6
	Loose hose connections	Inspect hose connections for leakage and tighten
	Head valve assembly (1) not installed properly	Inspect installation per Paragraph 6, Step P
Paragraph 8 Step 4 Excessive Leakage	Refer to Paragraph 8A, Step 2 - Troubleshooting	
Paragraph 8 Steps 5 & 6 Excessive Leakage	Refer to Paragraph 8A, Step 2 - Troubleshooting	
Boot Ports do not pressure	Control valve (32) stuck in control valve bushing	Inspect parts for contamination, burrs or scratches. Clean areas per Paragraph 3. Replace control valve if defective. Check clearance per Paragraph 5C. If bushing is defective, replace housing (38)

Test Failed	Probable Cause	Remedy
	Defective control spring (33)	Check spring requirements per Table 1. Replace if defective
	Control valve (32) installed incorrectly	Check control valve installation. Insure small land end of control valve rides on control valve spring
	Gasket (22) installed incorrectly	Check gasket installation. Insure that gasket is installed per Figure 7
	Movement of solenoid plunger (12) restricted	Inspect surrounding area of plunger for contamination. Clean area per Paragraph 3
	Defective solenoid coil assembly (13)	Check coil resistance. Replace solenoid if resistance does not meet Paragraph 4E
	Defective ground connection	Check continuity per Paragraph 8C, Steps 4 & 5
	Defective connector pins (5)	Inspect for bent or broken pins. Replace connector if defective
Paragraph 8A Step 9, 10 Excessive Leakage	Refer to Paragraph 8A, Steps 5 & 6 - Troubleshooting	
Paragraph 8B Step 2 Solenoid Current consumption not within specification	Defective solenoid coil assembly (17)	Check coil resistance. Replace solenoid if resistance does not meet Paragraph 4E criteria
	Defective ground connection	Check continuity per Paragraph 8C, Steps 4 & 5
	Defective solenoid wires	Check continuity per Paragraph 8C, Steps 1-3. Inspect condition of wires for frayed insulation
Paragraph 8C Steps 1-6 Resistance readings not within spec.	Defective solder connection	Check connections for cold solder joints, dirt, non-contact areas, and damaged wires

12.0 ILLUSTRATED PARTS LIST

A. Introduction

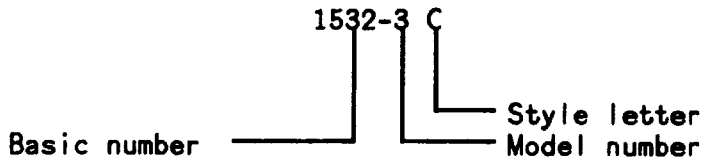
1. Purpose

This parts list is intended for use in requisitioning, storing, and issuing replaceable parts of Deicer Distributing Valve, Part No's 1532-2A, 1532-3A, 1532-3B, 1532-3C, 1532-6A AND 1532-6C.

2. Usage Code Symbols

A = 1532-3A
B = 1532-3B
C = 1532-3C
D = 1532-6A
E = 1532-6C
F = 1532-2A

3. How To Use This Parts List



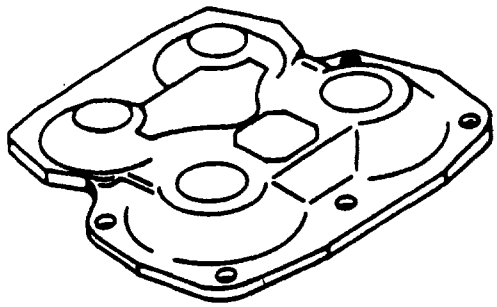
When the part number is not known, locate the part on the exploded view and note its index number. Use this index number to locate the part number in the Group Assembly Parts List, Paragraph B.

4. LWIPT Part Numbering System

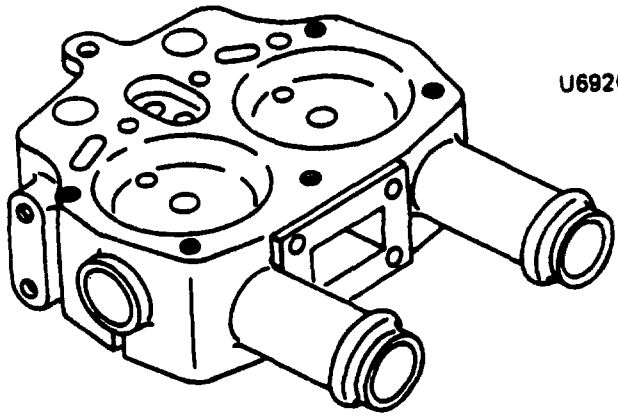
The part number consists of a basic number and a dash number. The dash number indicates variations of the basic part.

5. LWIPT Type Numbering System

The type numbering system indicates the essential characteristics of the unit.



6. Vendor's Code



Parts obtainable from vendors other than LWIPT are listed (by the vendor's part number) in the part number column. The vendor's code number is listed in the description column preceded by the letter "V", and the LWIPT part number is listed for reference purposes following the vendor's code.

Vendor's Code	Name and Address

Standard Test Equipment

Type or Model no.	Nomenclature	Application
C-2400, C-P	Mercury trap (8 req'd) Meriam Instrument Co., Cleveland, OH	Prevents mercury loss in manometers.
301	Ammeter Weston Instruments Division of Daystrom Inc., Newark, NJ	Used to measure solenoid coil current
301	Voltmeter Weston Instruments Division of Daystrom Inc., Newark, NJ	Used to measure variable DC power supply output
5300	Resistance bridge Leeds and Northrop Co., Philadelphia, PA	Used to measure solenoid coil resistance.
10AA25FF	Manometer (4 req'd) Meriam Instrument Co.	Provides load and indicates pressure.
10A2735	Flowmeter (2 req'd) Fischer and Porter Co., Warminster, PA	Used to measure pressure loss in vacuum and pressure lines.
------	Accumulator tank, 1 to 3 gallon capacity (2 req'd)	Used to eliminate pulsations in vacuum and pressure lines.
------	Fuse, 2.5-ampere (2 req'd)	Used to protect solenoid coils.
------	Globe Valve, 1/4 inch pipe (2 req'd)	Used to regulate air pressure and vacuum.
------	Needle valve, 1/4 inch pipe (3 req'd)	Used to regulate air pressure and vacuum.
------	Pressure reducing valve, 1/4 inch pipe, 0 to 15 psi	Used to regulate air pressure.
------	Pressure gage, 0 to 100 psi	Used to measure air pressure.
------	Toggle switch, spst	Used to switch ammeter in solenoid coil circuit.
------	Toggle switch, spst (2 req'd)	Used to energize solenoids A and B.

October 1990

1.0 DESCRIPTION AND OPERATION

This manual contains descriptive information, overhaul and test instructions, and an illustrated parts list for Deicer Distributing Valve, P/N's 1532-8A, 1532-8C, 1532-10A and 1532-10C manufactured by Lucas Aerospace Power Transmission Corporation (LAPTC), Utica, New York 13503.

The deicer distributing valve (Figure 1) is a component of the aircraft deicer system.

The deicer distributing valve contains a pressure inlet port, a vacuum port, two ports (A and B) which connect to the associated deicer boots, and an exhaust port which is piped overboard to a low pressure area.

The pressure inlet port is integral with the aircraft manifold pressure line, thereby making pressure available at all times. Ports A and B are connected, through lines, to the deicer boots which provide the suction and pressure connections to operate the deicer boots. The exhaust port which is piped overboard to a low pressure area, serves to discharge the pressurized air in the deicer boots.

The deicer distributing valve normally has vacuum applied to it at all times. This suction within the deicer distributing valve holds down the deicer boots when the deicer system is not energized.

2.0 DISASSEMBLY

A. Remove screws (6, Figure 7), and terminal lug (7), and carefully lift out receptacle connector (5). Unsolder wires. Discard screws (6).

B. Remove screws (9), solenoid retainer (8), and head gasket (10)and grounding jumper (15). Discard gasket (10) and screws (9).

C. Carefully pull wires from connector cavity down and through opening in valve head (14) for the solenoid and contact and lead assembly.

D. Remove screws (2 and 4), washers (3), and valve head assembly (1). Discard screws (2) and (4).

E. Remove plunger and pin assemblies (12) and solenoid coil assemblies (13) from valve head (14).

F. Carefully remove control valves (33) and control valve springs (34) from valve housing (40 or 41).

G. Remove screws (17), washers (18), and exhaust valve cover assembly (16). Discard screws (17).

H. Remove flapper valve cover gasket (19), poppet valve assemblies (21), and valve springs (20) from exhaust valve housing (22). Remove exhaust valve housing (22) and exhaust port housing gasket (23) from valve housing (40 or 41). Discard gaskets (19 and 23) and poppet valve assemblies (21).

I. To remove diaphragm assembly (27), remove self-locking nuts (28) on top side of diaphragm assembly (27).

J. Remove diaphragm washers (30), diaphragm (31), and diaphragm springs (32).

K. Invert valve housing (40 or 41) and remove self-locking nuts (24), valve washers (25), valve seals (26), and remaining valve washers (25) from valve stems (29). Record number of valve washers (24) removed. Remove valve stems (29) from valve housing (40 or 41). Discard valve seals (26), diaphragm (31), and self-locking nuts (24 and 28).

L. Remove screws (36), washers (37), identification plate (35), and gasket (38). Discard gasket (38) and screws (36).

M. Remove pipe plugs (39) from housing (40) on model 1532-8A and 1532-8C.

3.0 CLEANING

WARNING

USE CLEANING SOLVENT ONLY IN A WELL-VENTILATED AREA

Clean all arts, except solenoid coil assemblies (13, figure 7), with Esso Varsol (manufactured by the Humble Oil and Refining Co., Pelham, New York), or equivalent. Solenoid coil assemblies should be wiped with a clean cloth dampened with cleaning solvent. Dry parts using dry filtered air at a pressure of 25 to 30 psig.

4.0 INSPECTION/CHECK

A. Inspect and discard all parts that are cracked, broken, and have non-cleanable corrosion.

B. Inspect threaded parts for stripped and crossed threads.

C. Inspect valve housing (40 or 41, figure 7) for loose inserts and plugs. Check condition of valve seats.

D. Inspect leads of solenoid coil assemblies (13) for burned, charred, cracked, or frayed insulation.

E. Using ohmmeter, check resistance between lead and outer case of each solenoid coil assembly. The resistance should be 17.6 ohms ± 5%.

F. Inspect receptacle connector (5) for loose, bent, or broken pins, and for cracked, chipped, or burned inserts.

G. Inspect contact and lead assembly (11) for broken strands of wire and poor solder connection between lead and contact.

H. Inspect valve washers (25) for being grooved.

I. Check spring lengths and compression requirements as shown in Table 1.

J. Inspect control valves (33) for being scored and replace if scored.

5.0 REPAIR AND REPLACEMENT

A. A standard overhaul replacement parts kit SK 271 is available from LAPTC for routine overhauls which covers all four models.

B. Replace any damaged parts in addition to the standard replacement parts as required.

C. Replace control valves (33, Figure 7) if excessive clearance in valve bushings is due to worn valve surface. If excessive clearance is due to worn valve bushings, replace valve housing (40 or 41). Permissible worn clearance is 0.0010 inch maximum.

6.0 ASSEMBLY

A. Apply EC1357 cement on both sides of diaphragm (31, figure 7) in small area around stem holes. (See Figure 2).

Publication No. 1532U-23-865G
Revised
October 1990

TABLE 1. SPRING DATA

Spring	Compressed length	Compression load
Valve spring (20, Figure 7)	0.308 inch	14 to 16 ounces
Diaphragm spring (32, Figure 7)	0.406 inch	10 to 14 ounces
Control valve spring (34, Figure 7)	0.500 inch	5.5 to 6.5 ounces

Publication No. 1532U-23-865G
Revised
October 1990

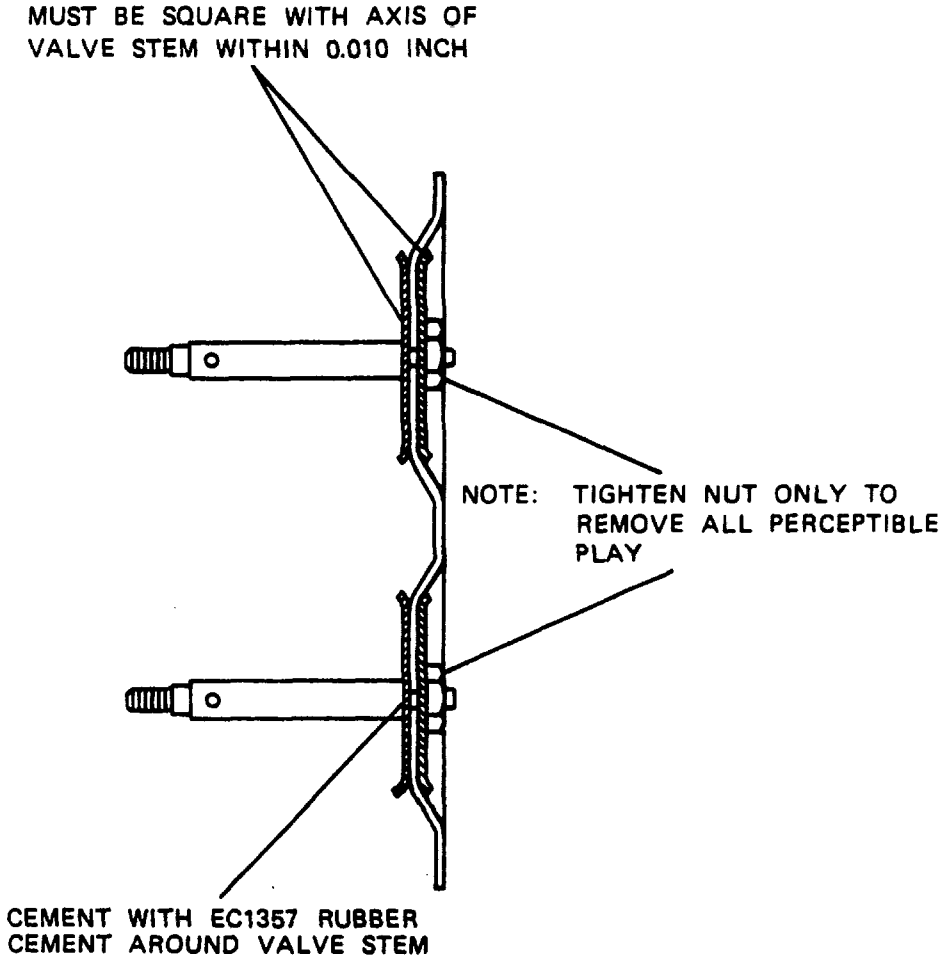

Figure 2. Diaphragm Assembly

B. Position diaphragm washers (30, figure 7) and valve stem (29) onto diaphragm (31) and loosely assemble new self-locking nuts (28). (See Figure 2).

C. Position diaphragm assembly (27, Figure 7) in fixture U6926, making sure it fits smoothly.

D. Assemble fixture cover U6925 in position on diaphragm assembly (27) and tighten with slave screws (2).

E. Locate a 1/16-inch drill rod 6 inches long into stem holes through fixtures tighten self-locking nuts (28).

NOTE:

DO NOT OVERTIGHTEN SELF-LOCKING NUTS TO AVOID CAUSING DISTORTION IN DIAPHRAGM.

F. Remove slave screws (2) and remove diaphragm assembly (27) from holding fixtures.

G. Install solenoid coil assemblies (13) and contact and lead assembly (11) into valve head (14). Carefully thread wires through opening in valve head (14) into cavity of receptacle connector (5). Place plunger and pin assemblies (12) into solenoid coil assemblies (13).

H. Place diaphragm springs (32) on protruding end of valve stems (29) and position diaphragm assembly (27) on valve housing (40 or 41).

NOTE:

WHEN ASSEMBLIED INTO VALVE HOUSING (40 OR 41), DIAPHRAGM ASSEMBLY (27) MUST OPERATE FREELY.

I. Install control valve springs (34) and control valves (33) in valve housing (40 or 41). Ensure small land ends of control valves (33) are assembled next to control valve springs (34).

J. Secure new head gasket (10) and solenoid retainer (8) and jumper assembly (15)using five screws (9). Torque screws (9) between 8 and 10 pound-inches.

K. Solder leads from solenoid coil assemblies (13) and contact and lead assembly (11) to receptacle connector (5) with Eclipsaloy No. 9, Grade 5 or 15 solder. (See Figure 3).

NOTE:

DO NOT KINK LEADS WHILE PUSHING RECEPTACLE CONNECTOR (5, FIGURE 7) INTO VALVE HEAD (14).

L. Secure receptacle connector (5) and terminal lug (7) to valve head (14) with screws (6). Torque screws (6) between 4 and 6 pound-inches.

Publication No. 1532U-23-865G
Revised
October 1990

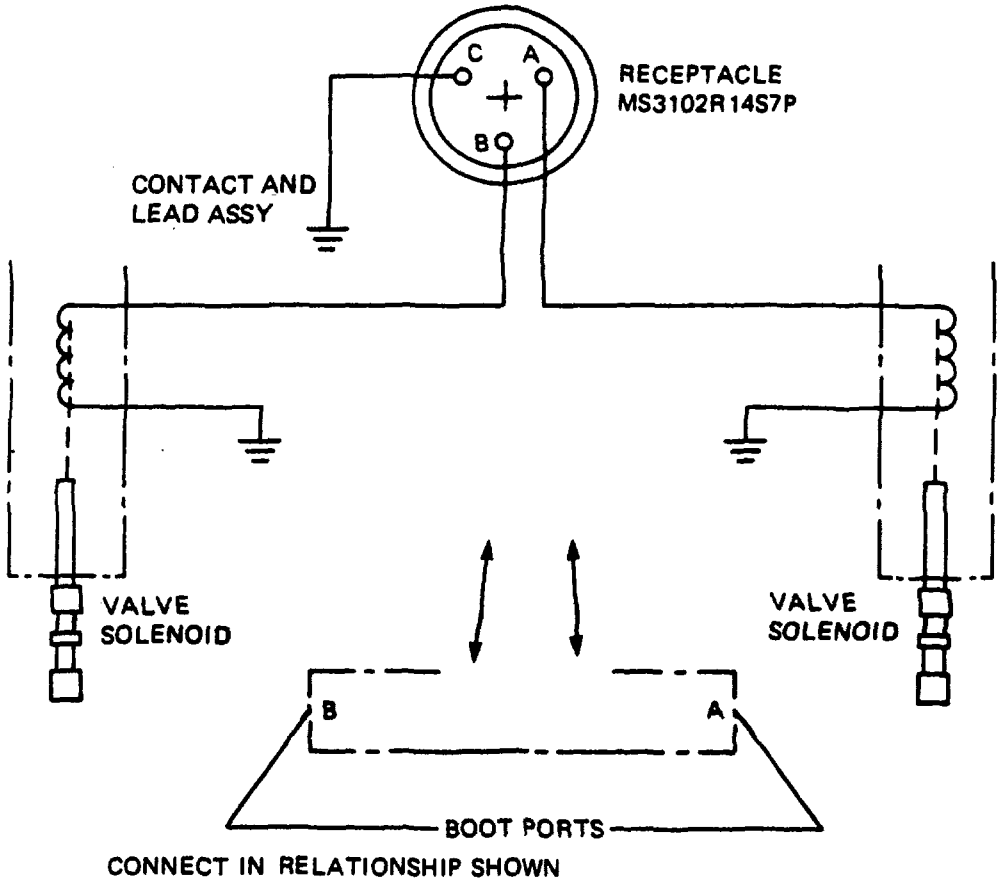

Figure 3. Wiring Diagram

M. Install valve washer (25), new valve seal (26), valve washer (25), and new self-locking nut (24) on each valve stem (29). Tighten self-locking nuts (24) to secure valve seals (26) onto seats of valve housing (40 or 41).

NOTE:

INSTALL SAME NUMBER OF INNER VALVE WASHERS (25) AS NOTED AT DISASSEMBLY.

N. Secure valve head assembly (1) to valve housing (40 or 41) with screws (2), washers (3), and screw (4). Torque screws (2 and 4) between 13 and 15 pound-inches.

O. Secure name plate gasket (38) and identification plate (35) to valve housing (40 or 41) with washers (37) and screws (36). Torque screws (36) between 4 and 6 pound-inches.

P. Apply loctite No. 592 pipe sealant with teflow to pipe plugs (40) for model numbers 1532-8A and 1532-8C and install in housing (39) torque to 10 to 12 inch pounds.

Q. Before continuing with assembly of the deicer distributing valve, it is necessary to adjust self-locking nuts (24) as follows:

1. Plug boot ports A and B.
2. Apply 2 psig air pressure to pressure port and energize each solenoid several times. (See Figure 4).
3. Adjust self-locking nuts (24, Figure 7) to obtain minimum air leakage past valves.

NOTE:

CARE MUST BE USED WHEN TIGHTENING NUTS SINCE OVERTIGHTENING OR UNDERTIGHTENING WILL CAUSE LEAKAGE PAST VALVES.

4. Re-energize both valves several more times and recheck leakage for proper sealing of valves with an air flowmeter for total leakage.

5. Leakage, as determined by flowmeter located in pressure supply line, represents total of internal as well as external leakage, and must not exceed 3 cubic feet per hour.

6. Repeat steps (2) through (5) with 8 psig air pressure applied.

R. Install new exhaust port housing gasket (23) and exhaust valve housing (22) on valve housing (40 or 41). Install new poppet valve assemblies (21) and valve springs (20) in exhaust valve cover assembly (16). Install flapper valve cover gasket (19) and exhaust valve cover assembly (16) on exhaust valve housing (22) and secure with washers (18) and screws (17). Torque screws (17) between 20 and 25 pound-inches.

7.0 FITS AND CLEARANCES

Fit and clearance information appears in the applicable portion of paragraph 6.

8.0 TESTING

If performance test stand 53E19-35A is not available, test the deicer distributing valve as follows:

A. Operational Tests

1. Connect deicer distributing valve to test setup shown in Figure 5.

2. Apply vacuum to 4 inches of mercury to suction port, leaving pressure port open. Leakage rate, as indicated by the flowmeter, must not exceed 3 cubic feet per hours.

3. Connect pressure port and set pressure at 8 psig and vacuum at 6 inches of mercury.

4. Leakage, as indicated by flowmeter in vacuum line, must not exceed 5 cubic feet per hour. (Compound gages connected to A and B ports should read same as vacuum line manometer).

5. Repeat steps 3 and 4 with solenoid A energized with 20 Vdc and solenoid B deenergized. Leakage must not exceed 20 cubic feet per hour. (A port compound gage should read inlet pressure and B port compound gage should read vacuum inlet pressure).

6. Repeat step 5 (inflate condition) with solenoid A deenergized and solenoid B energized with 20 Vdc.

7. Readings on A and B port compound gages should be reversed from those in step 5.

8. Leakage must not exceed 20 cubic feet per hour.

9. With 8 psig pressure and 4 inches vacuum applied, energize each solenoid separately several times with 20 Vdc.

10. Valve action must be immediate and complete.

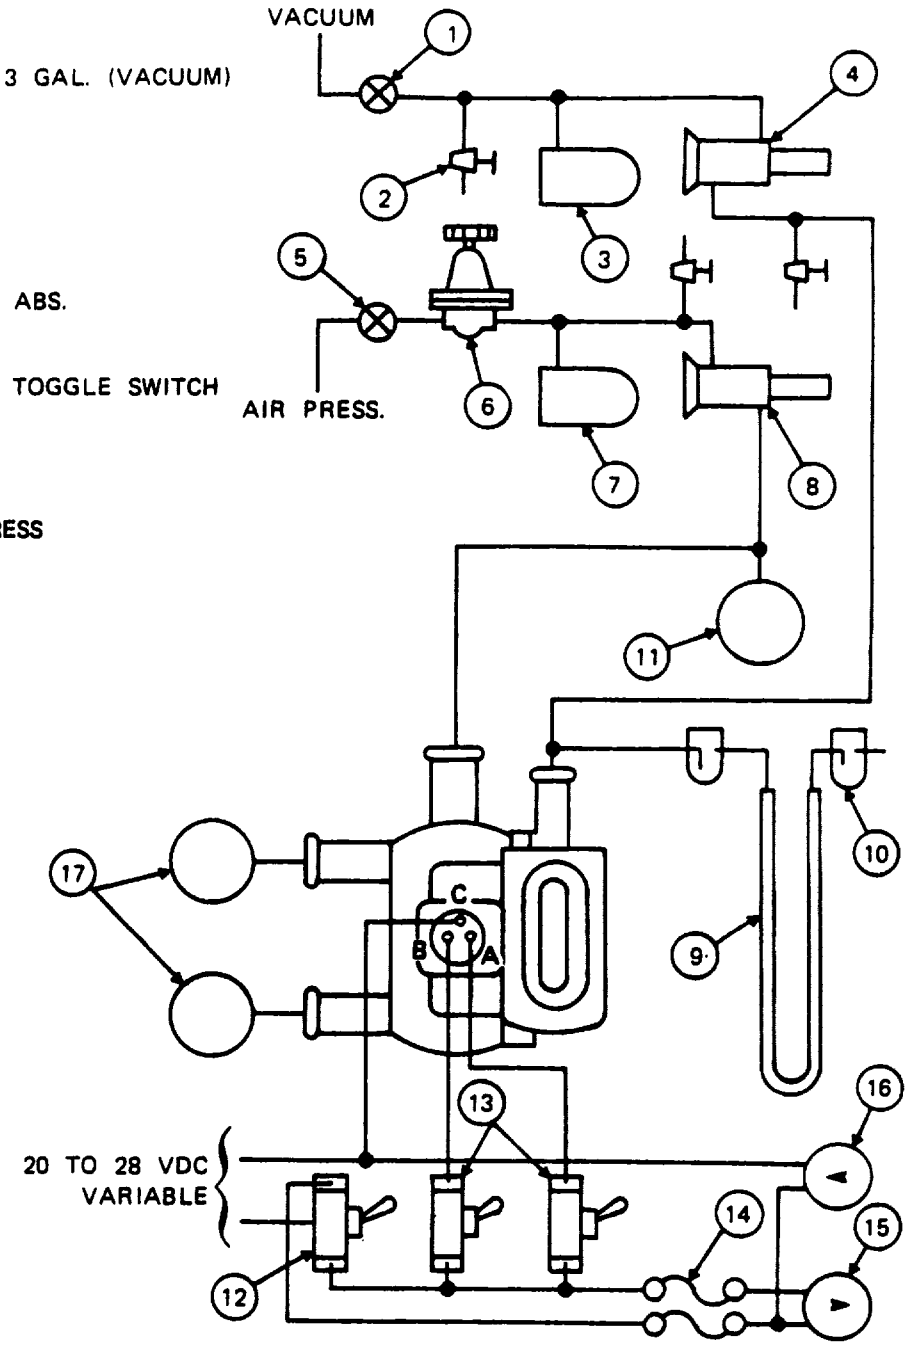

Figure 5. Test Setup

B. **Solenoid Current Consumption**

1. Energize each solenoid separately with 28 Vdc.
2. Current consumption should be between 1.45 and 1.75 amperes.

C. **Secondary Ground**

1. Using calibrated ohmmeter, check resistance from pin A to secondary ground lug on receptacle.
2. Repeat step 1 from pin B to secondary ground lug.
3. Resistance must not be more than 25 ohms.
4. Check resistance from pin C to secondary ground.
5. Resistance must not be more than 5 ohms.
6. Check rejected parts for cold solder joints or dirt at ground clip contact joints.

9.0 STORAGE INSTRUCTIONS

The deicer distributing valve may be stored for 60 months (maximum time) provided the following conditions prevail. If these conditions are not observed, shelf life will be considerably shortened.

A. Storage area must be dry.

B. Units must not be subjected to temperatures higher than 250°F.

C. Units must be effectively protected from dust.

D. Units must be handled with care at all times.

E. Units should be stored in shipping cartons if possible.

F. Units should be tested prior to installation.

NOTE:

UNITS THAT REMAIN IN STORAGE (OR INOPERATIVE) BEYOND THE SPECIFIED TIME LIMIT MUST BE INSPECTED AND TESTED PRIOR TO INSTALLATION OR USE.

Publication No. 1532U-23-865G
Revised
October 1990

10.0 SPECIAL TOOLS, FIGURES AND EQUIPMENT

The following equipment, or equivalent, is required to perform the overhaul procedures in this manual.

A. **Special**

Performance test stand 53E19-35A should be used, if available, to test the deicer distributing valve. Assembly fixture U6926 and fixture cover U6925 are used when assembling the valve. (See Figure 6).

B. **Standard**

Standard test equipment is listed in Table 3.

11.0 TROUBLESHOOTING

If the test values specified in Paragraph 8 cannot be obtained, refer to Figure 9 for item identification and Table 6 for remedial procedures.

TABLE 2 TROUBLESHOOTING

Test Failed	Probable Cause	Remedy
Paragraph 6N Excessive Leakage	Seal (26) loose or too tight	Readjust nut (24) to obtain minimum minimum leakage per Paragraph 6N, Step 5
	Defective seat on valve housing (40 or 41)	Inspect valve housing for chipped or uneven seats
	Quantity of shims (25) inadequate	Add or subtract shims as required to obtain minimum leakage; Paragraph 6N
	Defective nut (24) allowing for uneven seating of seal (26)	Inspect nut and seal for squareness. Replace nut if necessary.
	Internal valve housing leakage (40 or 41)	If the preceeding guides still allow leakage, internal housing leakage may exist. Replace housing
Paragraph 8A Step 2 Excessive Leakage	Defective diaphragm assembly (27)	Inspect diaphragm assembly for torn diaphragm (31) or leakage around valve stem (29) and washers (30). Replace if necessary

Test Failed	Probable Cause	Remedy
	Contamination of diaphragm assembly (27)	Inspect mating surfaces of diaphragm (31) and housing (40 or 41) for foreign matter. Insure clean surfaces of each
	Defective gasket (27)	Inspect condition of gasket. Replace if worn or cracked
	Defective sealing surface of valve poppet assembly (21)	Inspect condition of poppet assembly. Replace if seal is uneven
	Defective seat on exhaust valve housing (22)	Inspect condition of housing. Replace if chipped or uneven seats exist
	Defective control valve (33) and/or bushing	Inspect condition of control valves for burrs or scratches. Replace control valve if worn or scratched. Check clearance per Paragraph 5C.
	Spring (20) not seated properly on poppet valve assembly (21)	Cycle solenoids A and B several times to position spring. Insure that the large spring end rides on poppet valve assembly
	Loose screws (2), (4) (17)	Inspect for loose screws and tighten per Paragraph 6
	Loose hose connections	Inspect hose connections for leakage and tighten
	Head valve assembly (1) not installed properly	Inspect installation per Paragraph 6, Step P
Paragraph 8 Step 4 Excessive Leakage	Refer to Paragraph 8A, Step 2 - Troubleshooting	
Paragraph 8 Steps 5 & 6 Excessive Leakage	Refer to Paragraph 8A, Step 2 - Troubleshooting	
Boot Ports do not pressure	Control valve (33) stuck in control valve bushing	Inspect parts for contamination, burrs or scratches. Clean areas per Paragraph 3. Replace control valve if defective. Check clearance per Paragraph 5C. If bushing is defective, replace housing (40 or 41).

Test Failed	Probable Cause	Remedy
	Defective control spring (34)	Check spring requirements per Table 1. Replace if defective
	Control valve (33) installed incorrectly	Check control valve installation. Insure small land end of control valve rides on control valve spring
	Gasket (23) installed incorrectly	Check gasket installation. Insure that gasket is installed per Figure 7
	Movement of solenoid plunger (12) restricted	Inspect surrounding area of plunger for contamination. Clean area per Paragraph 3
	Defective solenoid coil assembly (13)	Check coil resistance. Replace solenoid if resistance does not meet Paragraph 4E
	Defective ground connection	Check continuity per Paragraph 8C, Steps 4 & 5
	Defective connector pins (5)	Inspect for bent or broken pins. Replace connector if defective
Paragraph 8A Step 9, 10 Excessive Leakage	Refer to Paragraph 8A, Steps 5 & 6 - Troubleshooting	
Paragraph 8B Step 2 Solenoid Current consumption not within specification	Defective solenoid coil assembly (13)	Check coil resistance. Replace solenoid if resistance does not meet Paragraph 4E criteria
	Defective ground connection	Check continuity per Paragraph 8C, Steps 4 & 5
	Defective solenoid wires	Check continuity per Paragraph 8C, Steps 1-3. Inspect condition of wires for frayed insulation
Paragraph 8C Steps 1-6 Resistance readings not within spec.	Defective solder connection	Check connections for cold solder joints, dirt, non-contact areas, and damaged wires

12.0 ILLUSTRATED PARTS LIST

A. Introduction

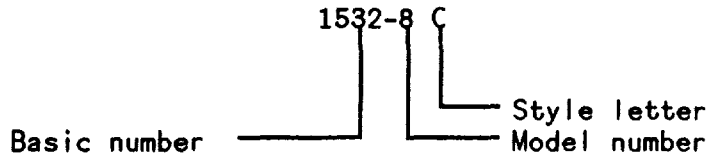
1. Purpose

This parts list is intended for use in requisitioning, storing, and issuing replaceable parts of Deicer Distributing Valve, Part No's 1532-8A, 1532-8C, 1532-10A and 1532-10C.

2. Usage Code Symbols

A = 1532-8A
B = 1532-8C
C = 1532-10A
D = 1532-10C

3. How To Use This Parts List



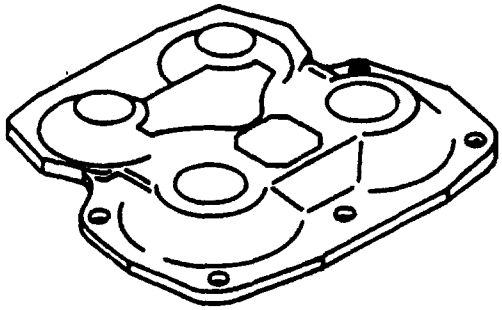
When the part number is not known, locate the part on the exploded view and note its index number. Use this index number to locate the part number in the Group Assembly Parts List, Paragraph B.

4. LAPTC Part Numbering System

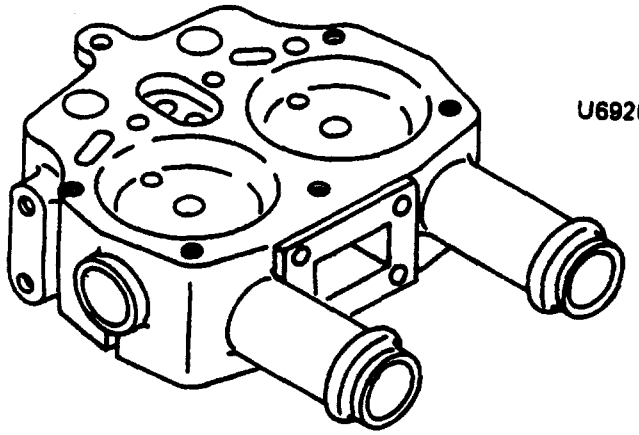
The part number consists of a basic number and a dash number. The dash number indicates variations of the basic part.

5. LAPTC Type Numbering System

The type numbering system indicates the essential characteristics of the unit.



6. Vendor's Code



Parts obtainable from vendors other than LAPTC are listed (by the vendor's part number) in the part number column. The vendor's code number is listed in the description column preceded by the letter "V", and the LAPTC part number is listed for reference purposes following the vendor's code.

Standard Test Equipment

Type or Model no.	Nomenclature	Application
C-2400, C-P	Mercury trap (8 req'd) Meriam Instrument Co., Cleveland, OH	Prevents mercury loss in manometers.
301	Ammeter Weston Instruments Division of Daystrom Inc., Newark, NJ	Used to measure solenoid coil current
301	Voltmeter Weston Instruments Division of Daystrom Inc., Newark, NJ	Used to measure variable DC power supply output
5300	Resistance bridge Leeds and Northrop Co., Philadelphia, PA	Used to measure solenoid coil resistance.
10AA25FF	Manometer (4 req'd) Meriam Instrument Co.	Provides load and indicates pressure.
10A2735	Flowmeter (2 req'd) Fischer and Porter Co., Warminster, PA	Used to measure pressure loss in vacuum and pressure lines.
------	Accumulator tank, 1 to 3 gallon capacity (2 req'd)	Used to eliminate pulsations in vacuum and pressure lines.
------	Fuse, 2.5-ampere (2 req'd)	Used to protect solenoid coils.
------	Globe Valve, 1/4 inch pipe (2 req'd)	Used to regulate air pressure and vacuum.
------	Needle valve, 1/4 inch pipe (3 req'd)	Used to regulate air pressure and vacuum.
------	Pressure reducing valve, 1/4 inch pipe, 0 to 15 psi	Used to regulate air pressure.
------	Pressure gage, 0 to 100 psi	Used to measure air pressure.
------	Toggle switch, spst	Used to switch ammeter in solenoid coil circuit.
------	Toggle switch, spst (2 req'd)	Used to energize solenoids A and B.

DESCRIPTION

The Lucas Aerospace Power Transmission 38E96 Regulating and Relief Valve regulates high-pressure, engine compressor bleed air to a lower pressure that is used to operate various pneumatic aircraft accessories such as:

1) Pneumatic deicer systems
2) Ejector-operated vacuum systems.

In addition to the ability to regulate air, the valve has a built-in safety feature.

If the regulation section of the valve should fail, the safety feature takes over to regulate the system pressure 1.5 - 5.0 psi higher than maximum regulated pressure. This gives the valve a dual regulating feature and eliminates the need for installing separate safety valves in the system.

TABLE OF LEADING PARTICULARS

SPECIAL TOOLS AND TEST EQUIPMENT

Table 2 lists the special tools and equipment suggested for maintenance of the regulating and relief valve.

TABLE 2

SPECIAL TOOLS AND TEST EQUIPMENT

P/N	DESCRIPTION	APPLICATION
U-7958	Holding Fixture (Soft jaw vise may be used instead of holding fixture)	Used to hold housing (27) and (19) when assembling or disassembling items (14) thru (18).
U-7957	Assembly Fixture	Used to hold valve assembly when assembling or disassembling items (5) and (9) thru (13).
U-7957	Holding Fixture	Used to hold valve assembly when assembling or disassembling items (1) thru (4).
U-7960	Holding Fixture	Used to hold adjusting screw (7) while assembling nut (8).
U-7961	Guide (Bullet Nose)	Used to install sealing ring (20) on actuating rod (19).
53E19-35C	Performance Test Stand	Used for testing of Regulating and Relief Valve.

1. DISASSEMBLY

WARNING

DO NOT REMOVE ALL FOUR SCREWS FROM VALVE COVER (5) AS SPRINGS (10) AND (12) ARE UNDER COMPRESSION.

a) Remove two screws (1) and two washers (2) from regulator valve cover (3). Remove two screws (6) and two washers (2) from relief valve cover (5). Remove the two screws from each housing which will allow the valve assembly to be installed over the pins of the assembly fixture U7957 (or equivalent).

b) Install valve assembly in assembly fixture U7957 and clamp down. Remove the two remaining screws (6) and flat washer (2). Grasp relief valve cover (5) firmly, unclamp fixture and remove relief valve cover (5) slowly.

c) Remove items (7) through (13). Remove valve from assembly fixture and remove items (1) thru (4), (22) thru (25).

CAUTION

ASSEMBLY (9), (10) and (11) MAY BE WEDGED TOGETHER. HANDLING MAY PRODUCE SUDDEN MOVEMENT/RELEASE OF COMPONENTS.

d) Install valve housing assembly (27) on holding fixture U7958 or equivalent. Insure flat surfaces on head of actuating rod (19) line up with flat surfaces on holding fixture. Remove items (14) thru (18).

e) Remove valve housing (27) from holding fixture U7958 and remove rod (19). Remove sealing ring (20) from rod (19) and sealing ring (21) from valve housing (27).

2. CLEANING

Thoroughly wash all parts with a suitable cleaning solvent. Air dry all parts using clean, filtered, factory air.

3. INSPECTION

a) Inspect all parts for damage.

Note: If "O" rings are dried and brittle, expect to find wear on items 3, 19, 23 and 27 (in bore of regulating valve piston cavity).

b) Inspect all threads for condition and cleanliness.

c) Inspect valve housing (27) .161 - .163 inch diameter hole, Figure 2. If diameter exceeds .165 or is scored or out-of-round, repair per Paragraph 5.

d) Inspect actuating rod (19) for scoring or galling. Replace if either is evident.

e) Inspect cover (3) ID for scoring or galling. Replace if either is evident.

f) Inspect ID of housing (11) for wear from spring (12). Replace if wear is noted.

g) Inspect valve seat (15) and spring retainer (13) for wear or rounding on seating edge. Either condition is cause for replacement.

h) Inspect spring guide (9) and housing (11) for scoring or galling. Replace if either is evident.

i) Inspect for sharp edge of orifice. Replace if necessary. (See Figure 2).

4. PARTS REPLACEMENT

a) Standard overhaul replacement parts kit for each model are as follows:

UNIT	SERVICE KIT NUMBER
38E96-2C,2D,4A	SK276
38E96-3A	SK277
38E96-2E,5A,6A	SK278

b) In addition to standard replacement parts replace any worn or damaged parts as required.

5. REPAIR

Repair valve housing (27) as follows: (Refer to Figure 2.) Normal, standard machine shop tools are required.

a) Use a suitable fixture to support valve housing. Drill and tap one wall for .125 inch pipe thread plug.

b) Install plug MS20913-1D to depth shown, 0 - .030 inch. Use Loctite retaining compound RC620 on threads. Stake plug in place.

c) Machine plug head flush to .010 inch above surface "A".

d) Machine .161 - .163 inch must be held concentric with "A" within .001 inch. Do not exceed 32 micro finish.

WARNING

KEEP ALODINE 1200 AWAY FROM ACIDS. DO NOT LET ORGANIC MATERIALS, LIKE SAWDUST, RAGS, ETC., GET SATURATED WITH IT BECAUSE THEY CAN EASILY IGNITE WHEN DRY. IF IT GETS ON YOUR SKIN, WASH THOROUGHLY. IF IT GETS IN YOUR EYES, FLUSH WITH WATER FOR 15 MINUTES AND SEEK PROMPT MEDICAL ATTENTION.

f) Brush Alodine 1200 on remachined surfaces.

6. LUBRICATION

Lubricate all sealing rings and "O" rings with FS1265 lubricant or DC4 compound obtainable from Dow Corning, Englewood Cliffs, NJ.

7. REASSEMBLY (Refer to Figure 1)

a) Install "O" ring gasket (21) into housing (27). Using guide U7961, install sealing ring (20) onto rod (19). Install rod (19) into housing (27). Place housing assembly onto holding fixture U7958. Assemble items (15) through (18) over shaft (19). Insure item (18) is assembled chamfer side up.

Line up kidney slots of items (15) and (18), position a full kidney slot over the housing (27) opening. Place two screws (6) through assembly (15) - (18) into housing (27) to align diaphragm. Install nut (19) on shaft, make sure nut (14) is on seat valve (15), torque nut to 4.5 in-lbs above drag torque.

b) Assemble seal (4) onto cover (3). Install quad ring seal (24) onto piston (23). (Do not twist quad ring seal. Lubricate piston ID lightly.) Install gasket (25), piston (23), and spring (22) onto cover (3). Install cover assembly into valve housing (27). Install screws and washers (1) and (2), and torque screws (1) to 36 in-lbs.

c) Place valve over pins of assembly fixture U7957. Assemble items (9) through (13) onto valve housing (27).

d) Lube threads of screw (7) with Bostik never seize thread lube and assemble nut (8) using holding fixture U7960.

e) Install screw and nut assembly (7) and (8) into valve cover (5).

f) Place cover assembly (5), (7) and (8) over guide pins of fixture. Align guide (11) over seat (13), press down on cover to compress springs (10) and (12), and slide clamp of fixture over cover.

g) Install two screws (6) and two washers (2) through cover (5) into housing (27). Torque screws to 22 in-lbs.

h) Unclamp and remove assembly from fixture. Install the two remaining screws (6) with washers (2) through cover (5) into housing (27). Torque screws to 22 in-lbs.

8. TEST PROCEDURE 38E96

Install valve assembly in Test Stand 53E19-35C or test set up as shown by Figure 4.

a) Crack and Resetting Pressure Test

1) Gradually increase the pressure until leakage through the relief valve cap (5) reaches 5 scfh. At this point, the relief valve pressures should be as follows:

Relief Pressure PSIG	Style Number
20.5 to 22.0	2 A,B,C,D
22.5 to 24.0	3
20.5 to 22.0	4
24.5 to 17.0	5
23.0 to 26.0	6, 2E

Record this cracking pressure (refer to Figure 6 Data Sheet).

2) Increase relieving flow to above 12 scfh then decrease to the pressure per style number in the table below. The leakage flow allowed is 5 scfh maximum.

Relief Pressure PSIG	Style Number
19.5	2 A,B,C,D
21.5	3
19.5	4
23.5	5
22.5	6, 2E

Add shims item 11A, Figure 1, to maintain correct relief pressure levels (.090" maximum). Disassemble and correct part if unit fails this test.

b) Remove from leak fixture and increase pressure until relief valve is in full relief. Record this pressure.

c) Pressure Piston Test

If Test Stand 53E19-35C is not available, install valve in test set up as shown in Figure 3.

1) Set inlet pressure conditions to 85 psig min. and flow to 35 scfm. Reduce inlet pressure to 10 psig.

2) Slowly increase inlet pressure to 85 psig min. Observe that there is a sudden dip in regulated pressure or flow (pressure piston, item (23), Figure 1, has closed). Record the inlet pressure at which the regulated pressure dips momentarily.

3) Decrease the inlet pressure from 85 psig min. Observe that there is a sudden change in regulated pressure and flow (pressure piston has opened). Record the inlet pressure at which the regulated pressure raises momentarily.

4) The recorded inlet pressures of paragraphs c(2) and c(3) must be between 45 and 85 psig inlet pressure.

d) Calibration

The valve setting in paragraph 8(e) is for guidance only in making the initial setting. Readjustment may be necessary to meet the requirement of minimum flow of paragraphs e, f and g.

e) Setting

Adjust the power spring adjusting screw to maintain the regulating pressure per valve style shown in regulating pressure table. The inlet pressure is 85 psig min ± 1 psig (-2E 30 ± 1 psig) and flow 25 ± 1/2 scfm.

Regulating Pressure PSIG	Style Number
17.0 to 19.0	2 A,B,C,D,E
16.5 to 19.5	3
17.0 to 19.0	4
20.5 to 22.5	5
19.0 to 21.0	6

f) Test Acceptance Points

1) With inlet pressure of 85 psig min. ± 1 psig (-2E, 30 ± 1 psig) and flow of 25 ± 1/2 scfm, the regulated pressure should be within the limits of Table of paragraph e. Record the regulated pressure.

2) For the -2E Model only with 20 psig inlet pressure, record regulated pressure at flows of 5 and 20 scfm.

Proceed to paragraph g maintaining inlet pressure at 85 psig min.

g) Stability Test

1) Operate unit at 85 psig min. ± 1 psig inlet pressure and the following flows:

Style Number	Flow Scfm
2,3,4,5,6	25 ± 1/2

Record regulated pressure.

Perform following for all styles.

2) Introduce a rapid change in flow from 25 to 35 scfm (-2E only with 50 psig inlet pressure at flows of 5 to 20 scfm) and return to 25 scfm. Cycle three times. Valve must be stable with no chattering or relieving.

3) With inlet pressures of 30 ± 1 psig and flow of 30 ± 1/2 scfm, (-2E only 20 ± 1/2 scfm) the regulated pressure should be within the limits of paragraph 8e. Record the regulated pressure.

h) After setting the adjusting screw (7), torque nut (8) to 18 in-lbs above drag torque, apply Hysol epoxy 1C (white) on nut (8) and screw (7) and allow to cure.

i) Tie wire screws (6) no more than two screws each wrapping. Tie wire screws (1) in same manner. Use wire MS20995C20-6.

9. TROUBLESHOOTING

If the test values specified in paragraph 8 cannot be obtained, refer to Figure 1 for item identification and Table 3 for remedial procedures.

TABLE 3 TROUBLESHOOTING

Test Failed	Probable Cause	Remedy
Para 8.a) 1 cracking pressure too high	High Spring Tension	Remove Shim (11a). If no shim in unit, place valve in full relief and recheck. Replace spring (12)
Cracking pressure too low	Low spring tension	Add shim (11a). Check valve seat (15). Replace spring (12).
Para 8.a) 2 Cracking pressure good, valve leaks	Seating surfaces dirty, scratched	Inspect seating surfaces. Clean, polish or replace component
	Seating surface on seat valve (15) too wide	Replace seat valve.
	Nut (14) on actuating rod (19) not positioned correctly	Follow instructions in Para. 7
		Adding a shim (11a) may solve leak problem but may elevate cracking pressure beyond spec.
Para 8.b Valve fails to go into full relief		Adjust stand to read 1 lb over crack test pressure. Cover top of unit with hand to apply back pressure. Should put unit into relief. Check center hole in housing (27) for proper size or burrs, excess Everlube.

Test Failed	Probable Cause	Remedy
Para 8.c	Binding in lower portion of valve	Check cover (3), piston (23) and ring for wear or signs of binding/lack of lubrication. Repair/replace components
	Spring (22) too stiff	Replace spring (22)
	Actuation Rod (19) binding	Check for burr in housing (27) hole
Para 8.g Unstable valve chatter or shifting dip exaggerated	Check entire unit especially actuation rod (19)	
Air exhaust from vent under discharge port.	Damaged or missing "O" rings	Check "O" rings. Replace questionable items.

1.0 DESCRIPTION

The 44E15 Water Separator and Filter Assembly removes water and contamination from the engine bleed system before it can collect and freeze in the bleed air components.

This separator provides a centrifugal component to the air, so that liquid water collects on the walls of the separator bowl. The collected water gravitates to the bottom of the bowl, where it is removed through a drain opening. There also is a bypass relief valve that will allow air flow through the separator in case the filter element becomes clogged.

Maximum Pressure	75 Psig
Flow	20 SCFM
Maximum Temperature	250° F
Filtration -1 models	0.3 Micron
Filtration -2 models	2.0 Micron

2.0 DISASSEMBLY

A. Back out housing retaining bolt (1, fig. 1) and remove housing (7) from manifold (10).

B. Remove O-ring (9) from manifold (10).

C. Remove cotter pin (19) and separate items 2, 3, 4, 5, 6, 7, 8 and 18.

D. Remove screws (17) and separate items 11 through 16.

3.0 CLEANING

Thoroughly wash all parts with suitable cleaning solvent. Air dry all parts using filtered air. The filter element (18) is not cleanable.

4.0 INSPECTION

A. Inspect all parts for damage.

B. Inspect all threads for condition and cleanliness.

C. Inspect separator housing and manifold for burrs.

5.0 PART REPLACEMENT

A. Standard overhaul replacement part kits for each model are as follows:

Unit No.	Kit No.
44E15-1A	SK 255
44E15-1B	SK 251
44E15-2A	SK 256
44E15-2B	SK 252

B. Replace any damaged parts in addition to the standard replacement kit as required.

Pub. No. 44U-23-8511A
Revised
March 1992

6.0 LUBRICATION

Lubricate all O-rings with DC-4 lubricant obtainable from Dow Corning, Midland, Michigan 48640 prior to assembly.

7.0 ASSEEMBLY

A. Assembly in reverse order of disassembly.

B. Torque bolt (1) to 9-11 inch pounds above running torque.

CAUTION

PRESS THE FILTER ELEMENT HOUSING ASSEMBLY (7) INTO THE SEPARATOR MANIFOLD (10). DO NOT FORCE THE ASSEMBLY INTO THE HOUSING BY TURNING IN THE RETAINING BOLT. (1).

8.0 TEST PROCEDURE

A. A unit leakage check is performed by plugging the drain fitting and discharge port of the unit with suitable fittings.

B. Connect the inlet port to a filtered source of air pressure.

C. Apply 125 PSIG air pressure to the inlet port and immerse the assembly in water. No leakage is permitted and no unit damage should be apparent.

CAUTION

TAKE ADEQUATE SAFETY PRECAUTIONS BEFORE APPLYING AIR PRESSURE.

E. Relieve air pressure, dry unit and install shipping caps.

9.0 STORAGE

The Water Separator may be stored for 60 months (maximum time) provided the following conditions prevail. If these conditions are not observed, shelf life will be considerably shortened.

A. Storage area must be dry.

B. Units must not be subjected to temperatures higher than 250° F.

C. Units must be effectively protected from dust.

D. Units should be stored in shipping cartons if possible

E. The unit should be tested per paragraph 7 prior to installation

TECHNICAL MANUAL

OVERHAUL INSTRUCTIONS WITH PARTS BREAKDOWN

AIRCRAFT CLOCK

TYPE A13A

WAKMANN MODEL W-33-7540-4

(WAKMANN)

PUBLISHED UNDER AUTHORITY OF THE SECRETARY OF THE AIR FORCE AND THE CHIEF OF THE BUREAU OF AERONAUTICS

31 JANUARY 1962

TABLE OF LEADING PARTICULARS

Actuation	Manually set and manually wound
Indicator Hands	Hour, minute, second, minutes elapsed
Movement	17 jewel, 8 day
Overall Dimensions	2.375 inches square X 1.42 inches deep
Face Dimensions	1 7/8 inches diameter, 12 hour black face with fluorescent-luminescent hands and numerals
Weight	8.32 ounces
Rate	Variable, using the regulator lever

1. SPECIAL TOOLS. None.

2. DISASSEMBLY. (See figures 1 and 2.)

a. Disassemble in the same order as the key index numbers assigned to the exploded view illustrations. Disassemble only as far as necessary to replace defective parts.

3. CLEANING.

a. Cleaning should be accomplished by experienced and skilled watchmakers under shop conditions.

4. INSPECTION.

a. Check that winding and setting knob is properly secured and under spring tension.

b. Check clock regulator lever if clock is running too fast or too slow.

c. Check freedom of the minute and hour hands by pulling the winding and setting knob outward and rotating in both directions.

d. Check clock dial face for scratches and scoring.

e. Check clock case and plastic seal for evidence of scratches and scoring.

5. REPAIR AND REPLACEMENT.

Note

The following repair and replacement procedures may be performed by authorized field personnel. All practices not listed must be performed by skilled watchmakers under shop conditions.

a. To replace a damaged case or crystal, unscrew the lock ring (5, figure 1) and then remove crystal (6) and plastic seal (7). After unscrewing the back (15), remove the two small screws (20) from the case back. Tip case forward and the movement will drop out.

b. To replace a rear mounted clock installation, remove the two 6-32 bolts (43) from the front of the instrument panel. Remove the two Tinnerman nuts (42) from the instrument panel rear. See figure 3 for installation requirements of a rear mounted clock.

c. To replace a front mounted clock installation, remove the two 6-32 self-tapping screws (43, figure 1) from the front of the clock case. See figure 3 for installation requirements of a front mounted clock.

d. After repair or replacement, it may be necessary to regulate the clock. Remove clock from instrument panel. (Refer to step b. or c.) Remove the case back. (Refer to step a.) Move the regulator lever (5, figure 2) toward + or – as required.

Note

Regulator is graduated from + to –. If clock runs fast, move regulator toward –. If clock runs slow, move regulator toward +. One division on regulator dial will alter clock rate + one minute per day.

6. LUBRICATION.

a. Clock lubrication should be performed by skilled watchmakers under shop conditions. Use lubricating oil, Military Specification MIL-L-3918.

7. REASSEMBLY.

a. Reassembly is the reverse of disassembly.

8. TEST PROCEDURE.

a. Fully wind clock. Over a period of four days, determine the following factors. On the first day, determine the starting error. On the second day, run the minutes elapsed hand for six hours. On the third day, run the hour and minute hands for six hours. On the fourth day, run the minute and hour hands and minutes elapsed hand for six hours.

Note

Do not rewind the clock during or after the four day test period.

b. The average daily error rate should not exceed 30 seconds per day. The variation of any daily error rate from the average daily rate shall not exceed 15 seconds per day.

c. Allow clock to operate until it stops. The clock must run for a minimum of eight days (192 hours).

d. Check the rate during the eight days. The clock shall not gain or lose more than 15 seconds after eight days.

NOTE

THIS PAGE LEFT BLANK INTENTIONALLY.....

LANDING GEAR

VIKING – Temporary Revision

PSM NO.: 1–6–6A **AIRCRAFT:** DHC-6 **SERIES:** ALL

PUBLICATION: COMPONENT MAINTENANCE MANUAL **TEMPORARY REVISION NO.:** 32–21

Insert in Chapter 32 – CONTENTS, before page 1

CHAPTER 32 – LANDING GEAR

REASON FOR ISSUE:
This Temporary Revision supersedes TR 32-20 and replaces pages 1 & 2 of the Table of Contents.

ACTION:

In Chapter 32, remove existing TR 32-20 and replace with this Temporary Revision 32-21.

— Continued overleaf —

RECORDING INSTRUCTIONS:
Record this Temporary Revision No. and the relevant information in the appropriate columns of the TEMPORARY REVISION INDEX provided at the front of the manual.

ABSC
AIRCRAFT BRAKING SYSTEMS CORPORATION

SERVICE LETTER

1204 Massillon Road
Akron, OH 44306–4186

Ph: (330) 796–4400
Fax: (330) 796–9805

SUBJECT: PAINT WHICH COMPLIES WITH EPA EMISSION STANDARDS

EFFECTIVITY: This General Service Letter is applicable to all Aircraft Braking Systems Corporation (ABSC) wheels and brakes in active service.

REFERENCE: All ABSC wheel and brake Component Maintenance Manuals and Overhaul Manuals for all wheel and brake assemblies (housings) on Commercial, General Utility and Military aircraft.

PROBLEM: High volatile organic compound (VOC) paints such as lacquer, enamel and polyurethane will not meet EPA emission standards for VOC's per liter (420 g/l) which become effective September 1998. A change to high solids (low VOC) paint is required to comply with future environmental regulations.

These regulations, which apply to ABSC, may not apply to the operator or overhauler because of differences in local requirements.

SOLUTION: Aircraft Braking Systems Corporation is converting its new production and overhauled products to environmentally compatible paint consisting of high solids polyurethane and primer. This conversion is planned to be completed by September 1998. Some product is already converted.

Although operators may choose from many other paint systems, the paint, described in this General Service Letter, is identified as providing good performance and processibility at reasonable cost.

1. **High Solids Polyurethane Topcoat per Specification MIL–C–85285:**

   A. *Recommended applications*: Use this paint when durability, appearance and cost similar to the former solvent based (high VOC) polyurethane is desired. This is a high performance paint and is relatively difficult to strip similar to the solvent based polyurethane paints.

   B. *Performance:* This high solids (low VOC) polyurethane has a service performance that is comparable to the former solvent based polyurethane, MIL–C–83286, with the possible exception of Skydrol compatibility. If a high level of Skydrol compatibility is desired, a MIL–C–85285 paint can be purchased that is qualified to the Douglas paint specification, DMS 2115, Composition C.

      Drying time is four (4) hours to touch compared to two (2) hours for solvent based polyurethane. This can be improved with an accelerator.

   C. *Supplier:* Suggested source for this paint:
      Courtaulds Aerospace Inc.
      Sealants, Adhesives and Coatings Division
      1608 Fourth Street
      Berkeley, CA 94710
      Ph: (510) 526–1525

      This suppler is listed in DMS QPL 2115.

   D. *Equipment:* A high volume, low pressure spray gun used with a pressure pot will provide a uniform high gloss coverage.

(RELEASED: 10/16/97)

© ABSC 1997 ALL RIGHTS RESERVED

SERVICE INFORMATION LETTER (Continued)

For stripping, bead blasting with plastic media works well.

E. *Environmentally safe cleaning:* Use acetone to remove uncured paint from equipment.

A paint removal system called *Peel Away 5 or 7* can be used to remove cured paint:
Dumond Chemicals, Inc.
1501 Broadway
NY, NY 10036
Ph: (212) 869–6350

2. **High Solids Epoxy Polyamide Primer per Specification MIL–P–23377, Type I:**

A. *Recommended applications:* Use this primer with the high solids polyurethane paint of paragraph 1. above.

B. *Performance:* This primer is glossier than others but is very compatible with the topcoat. Masking tape does not adhere as well and may require roughing the surface if the tape is formed over a relatively sharp contour.

Drying time is longer than solvent primers. The application of heat will reduce cure time to one hour.

If maximum Skydrol resistance is required, this primer should be purchased to the Douglas specification, DMS 2104, Composition C.

C. *Supplier:* Suggested source for this primer:
Dexter Aerospace
Materials Division
1 East Water Street
Waukegan, IL 60085
Ph: (847) 623–4200

This supplier is listed in DMS QPL 2104.

D. *Equipment:* Same as for the topcoat. See Paragraph 1.D. above.

CORRECTIVE ACTION: At the next revision of each ABSC publication (Component Maintenance or Overhaul Manuals), the paint procedure will be reviewed and if appropriate, revised to include the paint in this General Service Letter.

RECOMMENDATION: The paint identified above is recommended for good performance and processing. Operators and overhaulers may choose other paint systems depending on their local clean air standards, paint availability and operating environment. Operators are reminded of the need to protect their wheels and brake housings from corrosion in order to maintain their warranty coverage.

SERVICE LETTER

1204 Massillon Road
Akron, OH 44306–4186

Ph: (330) 796–4400
Fax: (330) 796–9805

SUBJECT: RETURN MATERIAL AUTHORIZATION (RMA) PROCEDURE

1. EFFECTIVITY: This Service Letter is applicable to all customers of Aircraft Braking Systems Corporation.

2. REASON: The previous method for returning materials to ABSC did not provide adequate tracking of returns and did not lend itself to a timely returns process.

3. DESCRIPTION: A new Return Material Authorization (RMA) procedure has been developed to expedite material return and provide a method for tracking customer returns. This Service Letter describes the new procedure which will enhance ABSC's ability to process customer returns.

RETURN MATERIAL AUTHORIZATION (RMA) PROCEDURE

NOTE: All customers having a need to return materials to ABSC for any reason must contact their ABSC representative prior to returning the material to obtain Return Material Authorization (RMA).

Material received by ABSC without an RMA will be returned to the customer at their expense.

1. General:

   A. Customers of Aircraft Braking Systems Corporation will, on occasion, need to return materials to ABSC for:

      (1) Repair and/or overhaul work,

      (2) Engineering evaluation,

      (3) Quality analysis,

      (4) Inventory return, or

      (5) Shipping error

   B. The new RMA procedure provides a process for properly documenting the reason for the material return and assigns a unique tracking number to the returned material.

2. Advantages of the RMA Procedure:

   A. Customer returns will be handled more efficiently and timely.

   B. Quicker response to a customer's concerns.

   C. The same return process will be used for all types of material returns.

   D. The status of any return will be readily available by referencing the assigned RMA number.

(RELEASED: 3/11/98)

© ABSC 1998 ALL RIGHTS RESERVED

3. The RMA Procedure:

A. When a customer has a need to return material to ABSC the following steps are taken:

(1) The customer contacts their usual ABSC representative.

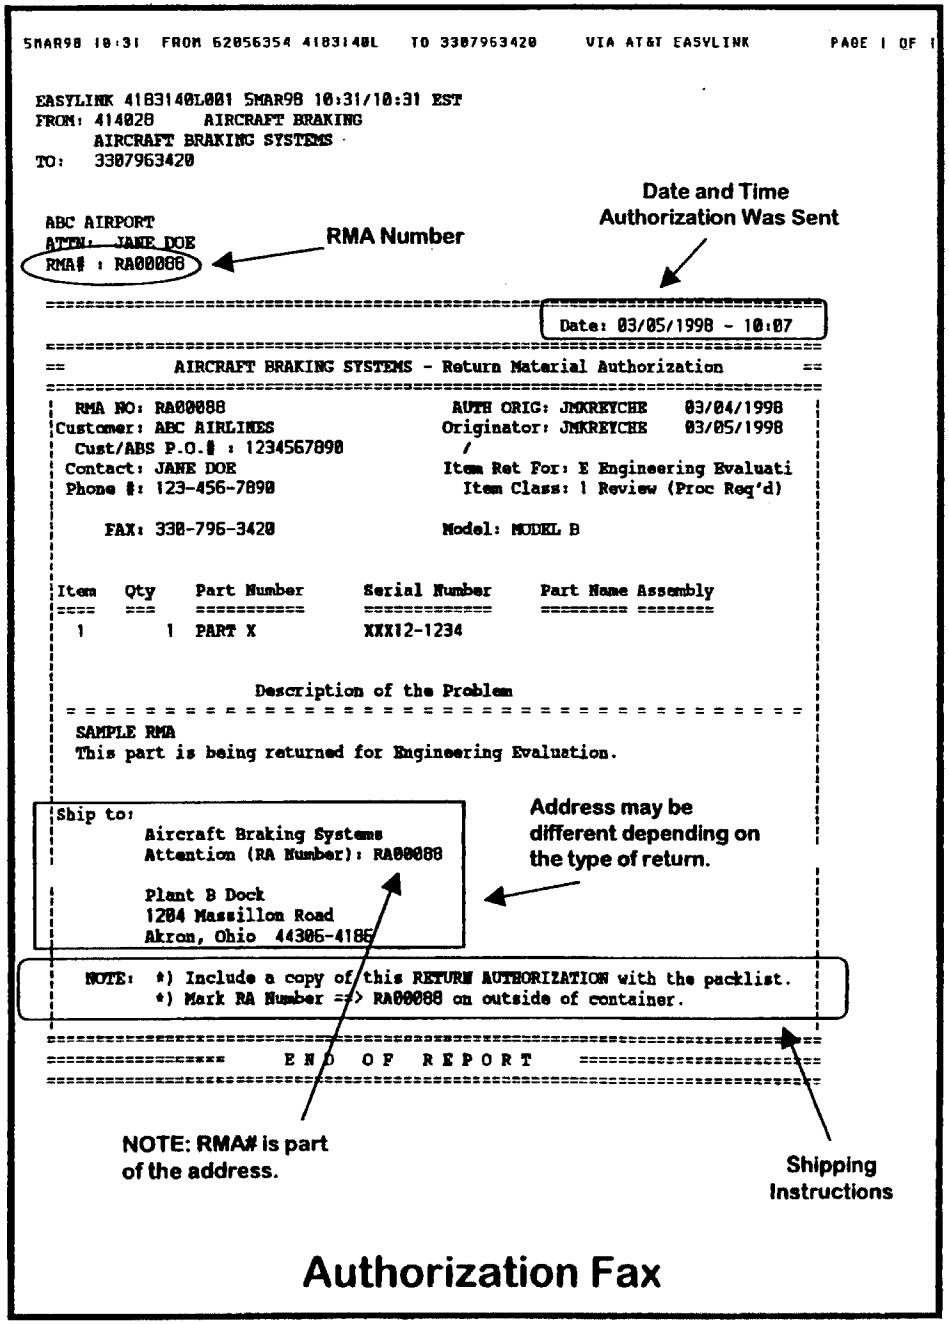
(2) The ABSC representative collects all of the necessary information about the return from the customer.

NOTE: The information necessary to process returns is listed on the "Customer Request for Return Material Authorization" form attached to this Service Letter. This form may be completed by the customer and faxed to the ABSC representative to facilitate communications between ABSC and the customer.

A separate RMA will be issued for each type of return.

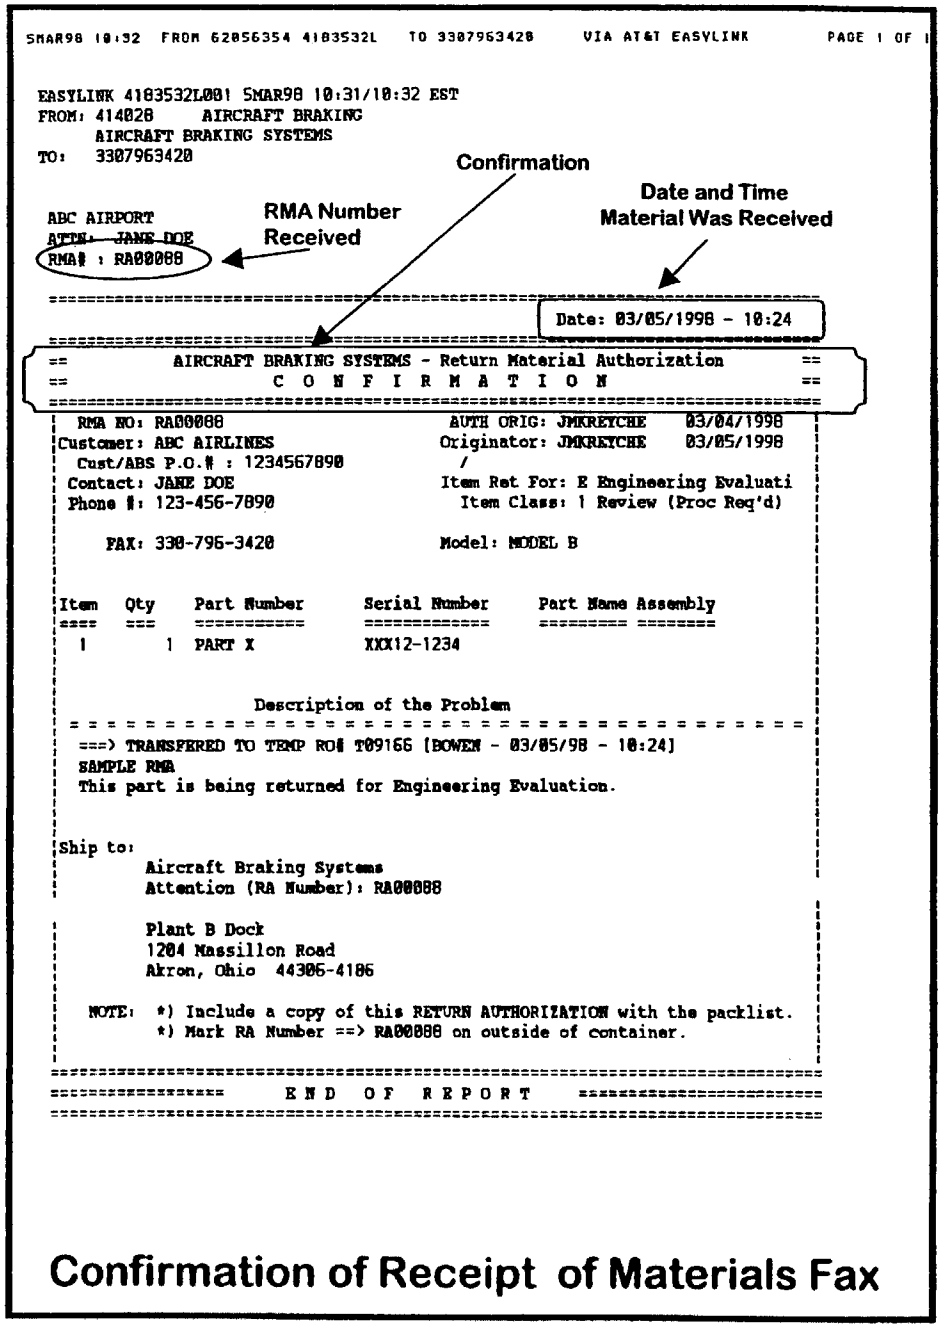
(3) An RMA number is assigned to the return.

(4) An RMA Fax with shipping instructions is sent to the customer. An example of the Authorization Fax is attached to this Service Letter.



(5) The customer clearly marks the RMA number on the attention line of the address label on the container to be returned.

(6) The customer includes a copy of the RMA Fax with the packing list.



(7) The material is shipped by the customer to the address shown on the RMA Authorization.

NOTE: The RMA return address will be different for various return types. Each RMA type (refer to paragraph 1.A. of the Return Material Authorization Procedure) must be packaged separately.

(8) Upon receipt of the material at ABSC, a confirmation of receipt fax is sent to the customer, and the return is processed at ABSC. An example of the Confimation of Receipt of Materials Fax is attached to this Service Letter.

Fax: (330) 796–9805

SUBJECT: EXTENSION OF SHELF LIFE OF BUNA–N BASED BEARING SEALS AND GREASE RETAINER BAFFLES

1. EFFECTIVITY: This General Service Letter is applicable to all Aircraft Braking Systems Corporation (ABSC) bearing seals and grease retainer baffles. ABSC designs use Buna–N (nitrile) based elastomers. These are all packaged with labels identifying a 12 quarter (3 year) shelf life from cure date. This General Service Letter is applicable to all ABSC bearing seals and grease retainer baffles that have a 12 quarter (3 year) shelf life.

2. REASON: This General Service Letter is issued to relax the life restrictions on ABSC bearing seals and grease retainer baffles using Buna–N (nitrile) based elastomer.

   Perfectly good bearing seals manufactured with BUNA–N material are being scrapped because of a military age restriction (per MIL–STD–1523) for shelf life of 12 quarters (or 3 years) that took effect 01 February 1985. MIL–STD–1523A, issued 01 February 1984, extended the shelf life to 40 quarters (or 10 years) but was cancelled 30 January 1995. This was because of the realization that storage mode had a greater effect on elastomeric physical properties than age.

3. DESCRIPTION: Based on its use of chipboard box for resistance to ultraviolet light, and with the expectation that the box will be stored flat, at temperatures 5° to 35°C (41° to 95° F), and away from any room that generates ozone, ABSC extends the life of its BUNA–N bearing seals listed in SUBJECT given above to 40 quarters (or 10 years) from the cure date.

4. CORRECTIVE ACTION: For unused parts, the shelf life label may be altered as follows: The Expiration Date (E/D) identifier is to be lined out but remain legible. A new Expiration Date identification 40 quarters or 10 years after the Cure Date (C/D) identifier is to be added followed by "(GS–SL–48)". Example: WAS–"C/D 2Q97: E/D 2Q2000" becomes "C/D 2Q97: ~~E/D 2Q2000~~ E/D 2Q2007 (GS–SL–48)". The new characters need not immediately follow the original characters. They may be added near the original characters.

SUBJECT: AIRCRAFT BRAKING SYSTEMS CORPORATION'S INTERNET WEB SITE: www.aircraftbraking.com

Aircraft Braking Systems Corporation (ABSC) is pleased to introduce ABSC's World Wide Web site to provide information and access for customers and users of ABSC equipment.

Welcome to the **ABSC Online** web site.

ABSC's web site provides access to online personnel, document indexes and current Service Bulletins leading toward **immediate response** to your product support requirements. In addition, we provide online registration for Technical Support training and for ABSC Airline Conferences. In the near future, we will be expanding our web site to provide direct access to more of the latest technical documents, a wide range of corporate information and additional ABSC departments.

ABSC wants to support your aircraft braking systems with the best response time and quality in the industry. We will continue to serve you better with the latest in communication technology. We're using the World Wide web to provide secured and interactive access to the people and information you want and need, when you need them.

The ABSC web site features the following major topics:

- **Customer Support**

  Identifies ABSC representatives who are the first line of contact for ABSC equipment users.

- **Technical Support**

  Supplies engineering information services directly by contacting the appropriate support engineer. Presents an organizational directory identifying program assignments with *e–mail* hot–links.

(RELEASED: 12/30/98)
© ABSC 1998 ALL RIGHTS RESERVED

- **Repair and Overhaul**

  Provides direct communication with ABSC Repair and Overhaul facilities in Akron, Ohio or Slough, England.

- **Distributors**

  Provides the list of worldwide distributors of ABSC authorized parts and supplies.

- **Training**

  Announces periodic general and specialized maintenance training seminars customized to meet operator's requirements. The ABSC video tape library of supporting information can be ordered Online.

- **Technical Publications**

  Contains a directory of all ABSC publications. New documents will be available for direct downloading from the site, while older documents are identified for reference only in the directory.

- **Corporate Information**

  Presents corporate and product information, press releases and promotional materials.

- **Employment Opportunities**

  Provides job requirements of open salary positions for engineering personnel and the aircraft programs they would support.

- **What's New?**

  Provides a summary of what is happening within ABSC and upcoming events for operators.

- **Upcoming Airline Conferences**

  Provides all the details of upcoming Airline Conferences and special events: **who, what, when, where and why and how!**

This is your service. Tell us what you want. Drop us a line to tell us what you like and what you don't like... about the website, about our service, or even about us. Go ahead and check us out...and be sure to tell us what you think. Thanks.

If you have comments or suggestions, *e–mail* ABSC at webmaster@aircraftbraking.com.

SERVICE BULLETIN

TO: HOLDERS OF SERVICE BULLETIN ARAVA–202–32–2 BRAKE ASSEMBLY IMPROVED LINING REPLACEMENT.

Attached to this transmittal letter is Revision No. 2 of Service Bulletin ARAVA–202–32–2 (basic issue dated Apr 23/87).

HIGHLIGHTS OF REVISION NO. 2 DATED 7 JUNE 1990

REVISION NO. 2 CONTAINS ALL PAGES OF THIS SERVICE BULLETIN. Pages which have been received are outlined below, together with the Highlights of the revision.

1. SUBJECT, Page 1 of 2:

   A. Changed applicability of conversion from Brake Assembly 5001571–2 to 5001571–5 to Brake Assemblies 5001571–2 and 5001572–5 to 5001571–7.

2. SECTION I, Page 1 of 2:

   A. Paragraph A. Updated effectivity to reflect latest manual revision and lining change.

   B. Paragraphs B. and C. Changed conversion instructions for asbestos and asbestos–free linings to new, improved asbestos–free linings.

   C. Paragraph F. Changed Reference to latest manual revision identification.

3. SECTION II, Page 1 of 2:

   A. Revised paragraphs A., B. and C. for new, improved asbestos–free lining conversion and re-identification instructions for Brake Assembly 5001571–7.

4. SECTION III, Page 2 of 2:

   A. Clarified parts required for conversion to Brake Assembly 5001571–7.

5. Replace Service Bulletin ARAVA–202–32–2, pages 1 and 2, Revision No. 1 dated April 21/89 with Service Bulletin ARAVA–102–32–2, ARAVA–201–32–2 and ARAVA–202–32–2, pages 1 and 2, Revision No. 2, revised Jun 7/90.

SERVICE BULLETIN

SUBJECT: LINING REPLACEMENT/REWORK BRAKE ASSEMBLIES 5001571–2 AND 5001571–5 TO 5001571–7

SECTION I – PLANNING INFORMATION

A. EFFECTIVITY: This Service Bulletin is applicable to Brake Assemblies 5001571–2 and 5001571–5.

B. REASON: This Service Bullletin is issued to replace asbestos and asbestos–free linings with new, improved asbestos–free linings and to advise operators of the availability of new, improved asbestos–free linings.

C. DESCRIPTION: This Service Bulletin provides instructions for replacing asbestos and asbestos–free linings with new improved asbestos–free linings and the reidentification of brake assemblies. The new, improved asbestos–free lining will be readily identified by white paint and part number stamped on the back side.

D. APPROVAL: Compliance with this Service Bulletin does not alter FAA TSO conformance.

E. WEIGHT AND BALANCE: None.

F. REFERENCE: AP–560 (32–43–12) Component Maintenance Manual with Illustrated Parts List (basic issue dated 1 June 1972) for Brake Assemblies 5001571–1, 5001571–2, 5001571–3, 5001571–4, 5001571–5 and 5001571–6.

SECTION II – ACCOMPLISHMENT INSTRUCTIONS

A. At the next brake overhaul or next lining replacement, replace Linings 5004562 or 5004562–1 with Linings 5010396.

(1) Operators are advised that old asbestos linings may be used until stock depletion. The new, improved asbestos–free linings are to be used as a set. They are not to be mixed with old linings in any one assembly.

B. Reidentify Brake Assembly 5001571–2 or 5001571–5 by grinding off "–2" or "–5" and metal stamping a "–7" after brake assembly number in 0.12 inch (3,05 mm) characters to read "5001571–7".

NOTE: Where necessary, the part should be suitably supported for stamping.

C. Metal stamp repair number 5R87–060–1 in 0.09 inch (2,3 mm) characters adjacent to the assembly number. Brakes which already have repair number 5R87–060 adjacent to assembly number should have a "–1" metal stamped in 0.09 inch (2,3 mm) characters following 5R87–060 to then read "5R87–060–1".

NOTE: Where necessary, the part should be suitably supported for stamping.

D. Re–treat and repaint any displaced metal in accordance with Referenced Component Maintenance Manual, REPAIR section.

SECTION III – MATERIAL INFORMATION

A. The following parts are required to rework Brake Assembly 5001571–2 to 5001571–7.

New Part Number	Units Per Assembly	Nomenclature	Old Part Number	Disposition
5010396	8	LINING, Brake	5004562	Discard

B. The following parts are required to rework Brake Assembly 5001571–5 to 50015071–7.

New Part Number	Units Per Assembly	Nomenclature	Old Part Number	Disposition
5010396	8	LINING, Brake	5004562–1	Discard

page 102	Revised paragraph 2.C. adding nuts for clarification.
page 302	Revised paragraph 2.F.(1)(a) and 2.F.(2).
pages 401 thru 405/406	Revised Cleaning Materials list and added paragraph 2.A.(1). Revised paint stripping procedures adding Method 1 and Figure 401. Relocated text.

Chapter/Section and Page No.	Description of Change
page 502	Added paragraph 3.C.
page 602	Added paragraph 3.B.
page 609	Added tool number 1-71409 to paragraph 5.B.(5).
page 612	Added paragraph 5.D.(6) for clarification and renumbered remaining paragraphs.
page 613	Clarified Figure 605, adding tool number 1-71409.
Repair No. 5 pages 601 and 602	Added Repair No. 5 - Repair of Fairing Retaining Screw Threads, Outboard Wheel Subassembly, including Repair Figures 601 and 602.
page 705	Editorial change.
page 707	Corrected 15 ounce-inches to 1.5 ounce-inches in paragraph 4.C.
page 1004	Added figure items 222 and 222A.

TO: HOLDERS OF AP-559 (32-40-12) OVERHAUL MANUAL WITH ILLUSTRATED PARTS LIST FOR MAIN WHEEL ASSEMBLIES 5000444, 5000444-1, 5000444-2, AND 5006586 USED ON DEHAVILLAND DHC-6, IAI ARAVA-101, 202, AND CASA C-212-200 AIRCRAFT.

Attached to this transmittal letter is Revision No. 6 of AP-559 (basic issue dated 1 March 1972).

REVISION NO. 6 DATED 15 SEPTEMBER 1988

REVISION NO. 6 CONTAINS ALL PAGES OF THE MANUAL. Pages which have been added or revised are outlined below, together with the Highlights of the revision.

Please retain all previous HIGHLIGHTS pages, inserting them in this manual for future reference.

HIGHLIGHTS

Chapter/Section and Page No.	Description of Change
All pages	This manual has been prepared with automated word processing equipment. Shifting of text may have occurred. Marking of the shifted text has been eliminated. Marking of text pages reflect only actual changes.
	This manual has been changed from Overhaul to Component Maintenance Manual. Sections have been relocated and pages renumbered accordingly. Changed the masthead to Component Maintenance Manual Loral Aircraft Braking Systems, and deleted 5006586 assembly. Added metric equivalents throughout text. The technical information has not changed unless specified in the following highlights.
	Deleted Main Wheel Assembly 5006586 and 5000444-2 throughout text. Wheel Assembly 5006586 is now in AP-678 (32-40-90).
Cover	Revised to latest format. Deleted Main Wheel Assemblies 5000444-2 and 5006586.
Title Page	Added Main Wheel Assembly 5000444-3 used on DHC-6 and deleted Main Wheel Assembly 5000444-2 and 5006586 used on CASA C-212-200.
Record of Revisions, page 1/2	Added Revision No. 5 and 6

Chapter/Section and Page No.	Description of Change
Service Bulletin List, page 1/2	Added Service Bulletin DH-32-3, ARAVA-101-32-1 and ARAVA-202-32-1. Deleted CASA 212-200-32-1 (date inserted Dec 31/81) and CASA 212-200-32-2.
List of Effective Pages, pages 1 and 2	Revised to reflect current revision.
Table of Contents pages 1 and 2	Expanded table to subjects in text for clarification.
Introduction pages 1 thru 4	Revised to latest format.
32-40-12	
page 1	Changed paragraph 1. to General. Renumbered paragraph 1. to 2. Description and Operation. Renumbered paragraph 1.B. to 2.A. Changed paragraph 1.D. to 2.C., adding clarification for steel disk drive ring. Changed paragraph 1.E. to 2.D. deleting paragraph 1.F. Changed paragraph 2. to 3. Paragraph 3.B., deleted "Do not use impact or power wrenches to remove or tighten any threaded part."
pages 2 thru 4	Changed Figure 1 to Sheet 1 of 3 and relocated Key to Figure. Added Figure 1 (Sheet 2 of 3) and (Sheet 3 of 3).
page 5	Revised Key to Figure 1 and Figure 1 (Sheet 1 of 2) to agree with IPL, adding zero to figure reference and as follows: Item 1 - Changed Not Used to RF. Items 10 & 20A - Added. Item 90 - Change wheel bolt to internal wrenching bolt. Item 100 - Was 11. Item 110 - Was 12. Item 120 - Was 13. Item 130 - Was 14. Item 140 - Was 15. Item 150 - Was 16. Item 160 - Was 17. Item 170 - Was 18, rubber grommet. Item 180 - Was 19.

Chapter/Section and Page No.	Description of Change
page 5 (continued)	Item 190 - Was 20, plain washer. Item 200 - Was 21. Item 210 - Was 22, tire change counter. Item 220 - Was 23. Item 230 - Was 11. Item 240A - Added. Item 255 - Added. Item 300A - Added. Changed paragraph 3. to 4. and clarified weights. Deleted paragraph 4. Metric Equivalents, adding dimensions to text.
page 6	Added paragraph 5., Wheel Differences.
page 101 thru 106	Added TESTING AND FAULT ISOLATION section. Added Hardness Test paragraph 5.
page 301 thru 303/304	Relocated data from pages 101 and 102. Adjusted figure item reference to agree with IPL changes.
page 301	Paragraph 1., added NOTE and CAUTION. Relocated existing WARNING and CAUTION to paragraph 2. Added paragraphs B., C. and D. Paragraph 2.A. changed Schrader No. 4722 to 4277 in error.
page 302	Added WARNING for paragraph E. Clarified WARNING for paragraph F. and deleted CAUTION "Do not use impact or power wrenches."
pages 302 and 303/304	Added paragraph F.(1) and (2) and CAUTION. Changed paragraph F. to F.(3) and added NOTE. Clarified paragraphs G. and H. Added paragraph J. and changed I. to K. and clarified. Added paragraph L.
page 401 thru 403/404	Relocated data from page 201 thru 204.
page 401	Added 1,1,1 Trichloroethane, brushes, and grease to Cleaning Materials paragraph 1., and CAUTION to paragraph 2.
page 402	Added NOTE to paragraph 2.B. and 2.C. Paragraph 3., changed to Paint Removal Procedures. Added NOTE for paragraph 3.A.

Chapter/Section and Page No.	Description of Change
pages 501 thru 506	Relocated data from page 301 thru 304. Clarified figure item references to agree with IPL changes.
page 501	Changed title of paragraph 1. to Check Materials from Approved Penetrant Inspection Materials. Added paragraphs 2.B. and 2.C.
page 502	Changed and relocated paragraphs 3.E.(1) and 3.F.(1) to 3., Wheel Subassembly and clarified.
page 503	Changed and relocated paragraphs 3.E.(5), 3.F.(3) and 3.D. to paragraph 4. Changed paragraph 3.E.(2) and 3.E.(4) to paragraph 5. adding steel drive ring (300A). Changed Figure 301 to 501. Changed paragraph 3.B. to paragraph 9. and added NOTE.
page 504	Changed paragraph 3.E.(3) to paragraph 6. Changed paragraph 3.F.(2) to paragraph 7. and clarified. Changed paragraph 3.A. to paragraph 8. adding Figure 502 reference.
page 505	Added Figure 502.
page 506	Combined paragraphs 3.G. and 3.H. to paragraph 10. Added self-locking nut 180 and minimum torque value. Added paragraphs 11. and 12.
page 601 thru 617/618	Relocated data from pages 401 thru 414 and clarified figure item references to agree with IPL changes.
page 601	Revised Repair Materials, clarified chemical film solutions. Added Loctite RC/620, MIBK, and Aeroprite paint.
page 602	Changed wheel halves to wheel subassembly. Deleted existing NOTE on corrosion and added NOTE to paragraph 3.A.
page 603	Changed Figure 401 to 601.
pages 602 and 604	Relocated and clarified paragraphs 3.A. thru 3.H. Added Key to Figure 601. Added General to Key.
pages 605 and 606	Added paragraphs 4.B. and renumbered 4.B. to 4.C. Added paragraph 4.C.(1) and renumbered sub-paragraphs (1) thru (6) to (2) thru (7). Clarified step (7) and added Figure 602. Changed 0.0015 to 0.002 maximum clearance.

Chapter/Section and Page No.	Description of Change
page 607	Relocated paragraph 5., Repairing Worn Bearing Bores to Repair No. 1 and Repair No. 2. Changed paragraph 6. to 5. Changed figure reference 403 to 603.
page 608	Changed Figure 403 to 603.
pages 609 thru 612	Added paragraph 5.C. and 5.D. adding steel drive ring data.
page 611	Added Figure 604.
pages 612 thru 617/618	Changed paragraph 7. to 6. Re-Treating and Repainting adding Aeroprite Method 1 and Figure 605, and Figure 606. Relocated paragraph 8. Drive Flange Rivet Hole Repair to Repair No. 3. Relocated paragraph 9. Drive Flange Tee Bar Plunger Hole Repair to Repair No. 4. Deleted paragraph 10., Wheel Assembly 5000444-2 Reidentification to Wheel Assembly 5006586.
Repair No. 1 pages 601 and 602	Added. Relocated text and format.
Repair No. 2 pages 601 and 602	Added. Relocated text and format.
Repair No. 3 pages 601 and 602	Added. Relocated text and format.
Repair No. 4 pages 601 and 602	Added. Relocated text and format.
pages 701 thru 709/710	Relocated data from pages 501 thru 506 and clarified figure item references to agree with IPL changes. Clarified data by subject.
page 701	Added paragraph 2.B., 2.C. and 2.D.
pages 702 and 703	Added paragraph 3.B. Renumbered paragraph 3.B. to 3.C. Changed paragraph C.(1) to paragraph D.
page 703	Changed paragraph C. to E. and clarified.
pages 704 and 705	Changed paragraph D. to F. and clarified. Added paragraph G., relocated data adding WARNING and CAUTION. Deleted CAUTION "Do not use impact or power wrenches."

Chapter/Section and Page No.	Description of Change
pages 705 and 706	Changed paragraph F. to H. and clarified. Changed *paragraph G. to I. and H. to J. Combined paragraphs* I., J., and K. to paragraph K. adding CAUTIONS.
pages 707 and 708	Added paragraph 3.L. Added paragraph 4., Wheel Balancing, and Figure 701.
page 709/710	Relocated Storage Instructions from page 901/902.
page 801/802	*Relocated data from 601 and 602 deleting metric* equivalent Figures 604, 605 and 607. Changed Figure 601 to 801, 602 to 802, and 603 to 803. Added bolt 255, self-locking nut 180 and disk drive ring 300A.
page 901/902	Added Special Tools section.
page 1001 thru 1006	Relocated data from page 1101 thru 1106.
page 1001	Revised Introduction to latest format.
page 1002	Revised IPL Figure 1 adding Main Wheel Assembly 5000444-3 and deleted P/Ns 5000444-2 and 5006586. Changed figure item references to agree with revised parts list.
pages 1003 thru 1005	Revised parts list as follows: Item 1.B. - Deleted. Item 1.C. - Added. Deleted Main Wheel Assembly 5006586. Item 10 - Added. Item 20 - Was 2. Added effect code AC. Item 20A - Was 2A. Item 20B - Was 2B, deleted. Item 30 - Was 3. Added (Order class 2 or 4 only). Item 40 - Was 4. Item 40 - Was 5. Item 60 - Was 6. Added (Order class 2 or 4 only). Item 70 - Was 7. Item 80 - Was 8. Item 90 - Was 9. Item 100 - Was 11. Item 110 - Was 12. Item 120 - Was 13. Item 130 - Was 14. Item 140 - Was 15.

Chapter/Section and Page No.	Description of Change
pages 1003 thru 1005	Item 150 - Was 16. Item 160 - Was 17. Item 170 - Was 18. Changed grommet to preformed packing. Item 180 - Was 19, P/N MS20364-1032. Item 190 - Was 20. Item 200 - Was 21. Item 210 - Was 22. Item 220 - Was 23. added (Order class 2 or 4 only). Item 221 - Was 23A. Item 230 - Was 10 (not in disassembly order). Item 240 - Was 24. Added effect code AB. Item 240A - Added. Item 250 - Was 25. Added effect code AB. Item 255 - Added. Item 260 - Was 26. Item 270 - Was 27. Item 271 - Was 27A. Added effect code AB. Item 280 - Was 28. Item 281 - Was 28A. Item 290 - Was 29. Added effect code AB. Item 300 - Was 30. Added effect code AB. Item 300A - Added. Item 310 - Was 31. Item 311 - Was 31A. Item 320 thru 350B - Added.
page 1006	Added vendor code 56878.

OVERHAUL MANUAL WITH IPL
MAIN WHEEL ASSEMBLIES
5000444 AND 5006586

TO: HOLDERS OF AP-559 (32-40-12) OVERHAUL MANUAL WITH ILLUSTRATED PARTS LIST FOR MAIN WHEEL ASSEMBLIES 5000444, 5000444-1, 5000444-2, AND 5006586 USED ON DEHAVILLAND DHC-6, IAI ARAVA-101, 202, AND CASA C-212-200 AIRCRAFT.

Attached to this transmittal letter is Revision No. 5 of AP-559 (basic issue dated 1 March 1972).

REVISION NO. 5 DATED 16 APRIL 1984

HIGHLIGHTS

Pages which have been added or revised are listed below, together with the Highlights of the revision. Please delete the affected pages and insert Revision No. 5 pages dated April 16, 1984. Enter Revision No. 5 dated April 16, 1984 and add insertion date on the Record of Revisions sheet.

Please retain all previous HIGHLIGHTS pages in this manual for future reference.

Chapter/Section and Page No.	Description of Change
Service Bulletin List, page 1/2	Added Service Bulletins Casa 212-200-32-2, DH-32-1, and DH-32-2.
List of Effective Pages, page 1/2	Revised to reflect current revision.
Introduction, pages 1 thru 5/6	Revised Introduction to add manual verification and updated the field office address list.
32-40-12	
page 301	Added NOTE and added supplier addresses to paragraph 1. Numbered paragraph 2.A. Deleted NOTE from paragraph 2. Relocated text.
page 302	Deleted Figure 301. Added last sentence to paragraphs E.(2) and E.(3). Renumbered Figure 302 reference to 301 in paragraph E.(4) NOTE. Relocated text.
page 303/304	Renumbered Figure 302 to 301. Relocated text.
page 408	Added paragraph 6.A.(5).
page 411	Clarified paragraph 8. Drive Flange Rivet Hole Repair by adding steps 8.A.(2), (3), (4), (5), and (7). Renumbered step (4) to (6). Added new paragraph 9. Drive Flange Tee Bar Plunger Hole Repair. Relocated text.

Chapter/Section and Page No.	Description of Change
page 412	Clarified detail for bushing installation in Figure 404 and changed title to "Drive Flange Rivet Hole Repair". Relocated text.
page 413/414	Added page for revised Figure 405. Renumbered paragraph 9. to 10.
pages 1103 and 1104	Revised Parts List as follows: Item 23A - Added figure item to repair parts. Item 27A - Added. Item 31A - Added figure item to repair parts. Relocated text.
page 1105/1106	Added page for relocated text.

OVERHAUL MANUAL WITH IPL
MAIN WHEEL ASSEMBLY 5000444 AND 5006586

TO: HOLDERS OF AP-559 (32-40-12) OVERHAUL MANUAL WITH ILLUSTRATED PARTS LIST FOR MAIN WHEEL ASSEMBLIES 5000444, 5000444-1, 5000444-2, AND 5006586 USED ON DEHAVILLAND DHC-6, IAI ARAVA-101, 202, AND CASA C-212-200 AIRCRAFT.

Attached to this transmittal letter is Revision No. 4 of AP-559 (basic issue dated 1 March 1972).

REVISION NO. 4 DATED 31 DECEMBER 1981

REVISION NO. 4 CONTAINS ALL PAGES OF THE MANUAL. Pages which have been added or revised are outlined below, together with the Highlights of the revision.

Please retain all previous HIGHLIGHTS pages, inserting them in this manual for future reference.

HIGHLIGHTS

Chapter/Section and Page No.	Description of Change
Rev. 3 Highlights Page	Corrected nomenclature in first paragraph which incorporated Temporary Revision No. 1, page 2.
All pages	Added 5006586 to Masthead.
Record of Revisions, page 1/2	Added Revision No. 4.
Record of Temporary Revisions, page 1/2	Added incorporation date of Temporary Revision 32-1.
Service Bulletin List, page 1/2	Added Service Bulletin Casa 212-200-32-1.
List of Effective Pages, page 1/2	Corrected Masthead which incorporates TR32-1. Revised effective page dates to agree with current revision.
Table of Contents, page 1/2	Corrected issue date which incorporated Temporary Revision 32-1, page 4.
Introduction, pages 1-4	Corrected ATA No. on page 1, which incorporated Temporary Revision 32-1, page 5. Also updated pages 1-4.

Chapter/Section and Page No.	Description of Change
32-40-12	
page 1	Revised paragraphs 1A and 1F to include 5006585 assembly.
page 2	Added 5006586 assembly to Figure 1.
page 201	Changed Specification MIL-C-25107A to MIL-C-19853, Type II, in 1. Cleaning Materials.
page 202	Changed specification MIL-C-25107A to MIL-C-19853, Type II, in paragraph 3C.
page 301	Added figure item reference 2A and 2B to paragraph 3A.
page 411	Added paragraph 8 - Drive Flange Rivet Hole Repair. Added Figure 404.
page 412	Added Figure 405. Added paragraph 9 Assembly Re-identification 5000444-2 to 5006585.
page 505	Clarified paragraph K.
page 1102	Added figure item reference 2A and 2B and Main Wheel Assembly 5006586 to Figure 1.
page 1103	Added figure item 1C and effect Code D. Added figure item 28A.

OVERHAUL MANUAL WITH IPL
MAIN WHEEL ASSEMBLY 5000444

TO: HOLDERS OF XAP-559 (32-40-12) OVERHAUL MANUAL WITH ILLUSTRATED PARTS LIST FOR MAIN WHEEL ASSEMBLIES 5000444, USED ON DEHAVILL AND DHC-6, MAIN WHEEL ASSEMBLY 5000444-1 USED ON IAI ARAVA-101 AND 102, AND MAIN WHEEL ASSEMBLY 5000444-2 USED ON CASA C.212 AIRCRAFT.

Attached to this transmittal letter is Revision No. 3 of XAP-559 (basic issue dated 1 March 1972).

REVISION NO. 3 DATED 15 JUN 1979

REVISION NO. 3 CONTAINS ALL PAGES OF THE MANUAL. Pages which have been revised are outlined below, together with the Highlights of the revision.

Please remove and retain all previous Highlights pages in the manual for future reference.

No revision bars were used. All sections of the manual were revised to the latest format of ATA-100 and Goodyear technical information.

Manual number was changed from XAP-559 to AP-559.

TO: HOLDERS OF XAP-559 OVERHAUL MANUAL WITH ILLUSTRATED PARTS LIST FOR MAIN WHEEL ASSEMBLIES 5000444 AND 5000444-1 (32-40-12) USED ON DEHAVILLAND DHC-6.

Attached to this transmittal letter is Revision No. 2 of XAP-559 (basic issue dated 1 March 1972).

REVISION NO. 2 DATED 15 FEBRUARY 1978

REVSION NO. 2 CONTAINS ALL PAGES OF THE MANUAL. Pages which have been revised are outlined below, together with the Highlights of the revision. Retain Highlights pages in manual for future reference.

HIGHLIGHTS

Chapter/Section/Page No.	Description of Change
Cover	Revised to the latest format and added P/N 5000444-2.
Title Page	Clarified aircraft references. Added P/N 5000444-2 and revision date.
All pages	Revised masthead from Aviation Products to Goodyear Aerospace.
List of Effective Pages, page 1/2	Revised to reflect current revision.
Record of Revision, page 1/2	Revised to reflect current revision.
Introduction, pages 1 thru 4	Added Goodyear field offices and included "TSO NOTICE" from the Table of Contents.
Table of Contents, page 1/2	Removed Chapter/Section number and TSO Notice.
32-40-12, page 2	Added 5000444-2 to figure title.
32-40-12, page 3/4	Added paragraph 5. - Wheel Differences.

Chapter/Section/Page No.	Description of Change
32-40-12, page 201	In paragraph 1.C., changed the word inspect to check.
32-40-12, page 301	Changed title from Inspection/Check to Check.
32-40-12, pages 301, 302, 303/304	Revised section changing the word "inspect" to "check".
32-40-12, page 401	In paragraphs 1. and 2., replaced "retired from service" with "replaced".
32-40-12, page 501	In paragraphs 2.C.(2) and 2.C.(3), changed "alcohol" to "isopropyl alcohol".
32-40-12, page 502	In paragraph 2.D.(1), changed "alcohol" to "isopropyl alcohol".
32-40-12, page 901	Revised to latest Storage Instructions.
32-40-12, page 1101	Revised to latest format. Moved Vendor Codes to page 1104.
32-40-12, page 1102	Added Wheel Assembly 5000444-2 to Figure 1 title.
32-40-12, page 1103	Added Effect Codes to Wheel Assembly 5000444-2 and associated parts.
32-40-12, page 1104	Relocated Vendor Codes from page 1101.

COMPONENT MAINTENANCE MANUAL
MAIN WHEEL ASSEMBLY 5000444

INTRODUCTION

This manual is published in accordance with Air Transport Association Specification No. 100 for the guidance of personnel responsible for the overhaul and/or maintenance of the assembly(ies) covered in this publication. The procedures described in this manual may be altered if better and/or more economical equivalent methods can be employed by the individual facilities. However, the alternate procedures must not lessen the performance or efficiency of operation of the assembly, and all torque and specific limits or values contained herein must be strictly observed.

All dimensions and other values are expressed in U.S. units followed, where applicable, by the appropriate SI (International System) metric units in parentheses. All illustration dimensions are in inches with millimeter conversions in parentheses unless otherwise specified. Dimensions of standard tools or parts such as drills, taps, bolts, nuts, etc. where there are no equivalent metric tools or parts for the application, appear in U.S. units. Illustrations are for reference only and are not drawn to scale. Attempt is made to illustrate relationship to adjoining parts in proper proportion.

The following precautions apply to all procedures in this manual:

NOTICE

Any alteration to or substitution of any part contained in any wheel and/or brake affecting those assemblies could result in unit malfunction, or other adverse effects.

If alteration to or substitution of any part contained in any Aircraft Braking Systems' wheel and/or brake affecting those assemblies is necessary, obtain prior written Aircraft Braking Systems' authorization and instruction before performing such alteration or substitution.

AIRCRAFT BRAKING SYSTEMS ASSUMES NO LIABILITY WHATSOEVER, WHETHER CONTRACTURAL, WARRANTY, TORT OR OTHERWISE, FOR ANY UNAUTHORIZED SUBSTITUTION OF OR ALTERATION TO ANY PART CONTAINED IN ANY WHEEL AND/OR BRAKE OR FOR ANY ALTERATION NOT PERFORMED IN ACCORDANCE WITH AIRCRAFT BRAKING SYSTEMS APPROVED PROCEDURES.

While Aircraft Braking Systems represents the information contained in this manual was current at the time of publication of this issue, and verified by comparison to engineering documentation, the user is cautioned that he must inquire of the nearest authorized distributor or dealer of Aircraft Braking Systems' wheels and brakes as to whether a more recent publication is in existence before proceeding with overhaul or maintenance operations. If you cannot locate a dealer or distributor, make your inquiry directly to our Customer Support Department, Aircraft Braking Systems, 1204 Massillon Road, Akron, Ohio 44306-4186.

Users outside the United States and Canada should contact the nearest Aircraft Braking Systems International Field office as listed in this manual or the closest Aircraft Braking Systems' distributor.

The aircraft maintenance manual shall take precedence for the component's interface connections with the functional features as used in the aircraft. This manual may also describe functional features that may or may not be used when installed as a component of a system in the aircraft.

TSO NOTICE

This assembly for commercial transport usage carries a "TSO" marking which identifies it as having been fully laboratory tested and qualified to the applicable Federal Aviation Administration (FAA) regulations. As a commercial transport category assembly, it is also tested and qualified to the specification requirements of the applicable airframe manufacturer and, finally, is certified on the applicable aircraft.

After final certification, any substitution of or alteration to any part and/or any change of process or material is not permitted without complete requalification of this assembly and resubmittal of the test data to the FAA for approval.

The FAA regulations subject Aircraft Braking Systems, the airframe manufacturer and the operator to constant surveillance to assure that proper Quality Assurance material and processing controls are maintained in order to provide replacement parts that are the same quality as the parts originally certified in this assembly.

SAFETY SUMMARY

Adhere to all manufacturer's Warnings and Cautions for all materials specified in this manual. Wear protective clothing (gloves, apron, etc.) approved for the materials and tools being used.

ON-CONDITION MAINTENANCE

Individual operators shall determine the frequency of maintenance. Since each operator has a different set of operating conditions, overhaul frequency will vary. Aircraft Braking Systems recommends that on-condition maintenance be performed.

World Airlines Technical Operations Glossary (WATOG) defines on-condition maintenance as follows:

A primary maintenance process having repetitive inspections or tests to determine the condition of units, systems or portions of structure with regard to continued serviceability (corrective action is taken when required by item condition).

DATA RIGHTS

The unit charge for this manual covers reproduction and handling costs only and does not constitute purchase of the data or design contained herein, nor does it convey to the purchaser any rights, patent or otherwise, to reproduce or manufacture from said data.

DESCRIPTION AND OPERATION

1. General (Ref. Fig. 1)

   A. The main wheel assembly is designed for use with 11.00-12 tube-type or tubeless tires. The wheel subassembly is manufactured from forged aluminum alloy.

2. Description and Operation

   A. The main wheel is the divided type to facilitate tire installation and removal. The inboard and outboard subassemblies are held together by bolts, washers and self-locking nuts. When tubeless tires are mounted, a preformed packing is installed on the outboard wheel subassembly to provide an air seal at the juncture of the two wheel subassemblies. A separate valve subassembly is installed in the outboard wheel subassembly to inflate and deflate the tubeless tire. When tube-type types are installed, neither the preformed packing nor the valve subassembly is installed.

   B. The wheel rotates on two tapered roller bearings. The bearing cups are shrink-fitted into the hubs of each wheel subassembly. The bearings are protected against dirt and moisture contamination and loss of lubricant by a steel-reinforced rubber bearing seal installed on each wheel subassembly. The outboard bearing cone and seal are held in place by the axle nut. The inboard bearing cone and seal are held in place by a wire retaining ring.

   C. The disk drive ring is shrink-fitted into the flange of the inboard wheel subassembly, and is secured to the wheel flange. The disk drive ring engages the brake disk when the wheel and brake are installed on the aircraft. Three steel disk springs are secured to the wheel flange and disk drive ring. The springs secure three tee bar plungers, which align the brake disk in the drive ring and eliminate noise.

      (1) For Main Wheel Assembly 5000444 and 5000444-1, an aluminum alloy disk drive ring is secured with rivets and washers.

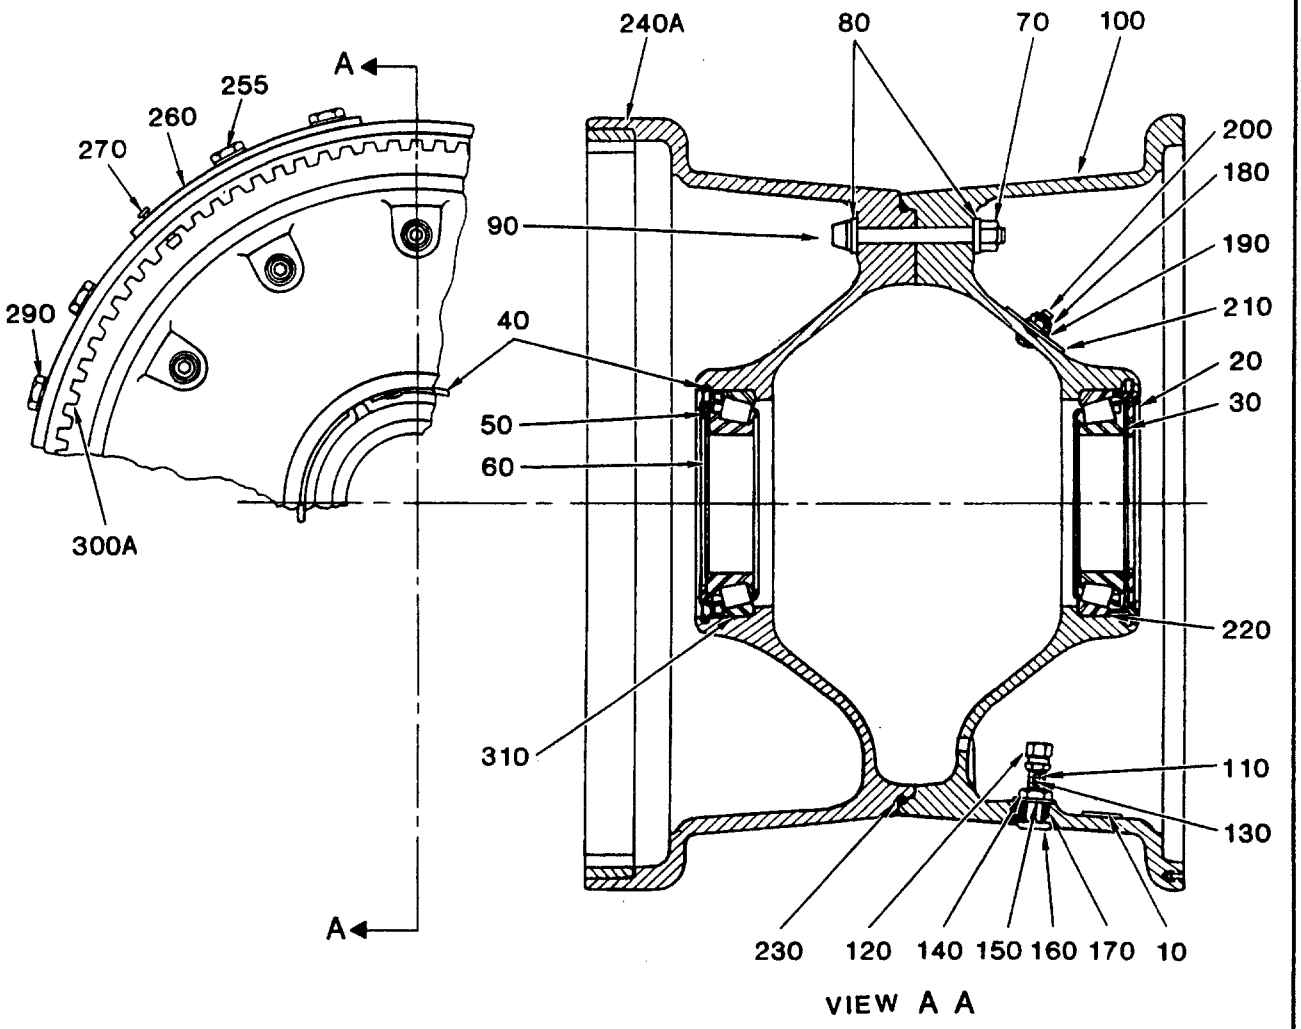
      (2) For Main Wheel Assembly 5000444-3, a steel disk drive ring is secured with hex head bolts and washers.

   D. Each wheel subassembly is individually balanced at the time of manufacture. This permits one wheel subassembly to be assembled in any position relative to the other subassembly and allows interchanging of wheel subassembly without rebalancing the assembly.

3. Handling Procedures

   A. Careful handling of the wheel components will assure long service life and trouble-free operation.

   B. Strictly observe the deflation and inflation procedures and the torque values specified in this manual. Do not overtighten any bolt or nut.



ASSEMBLY 5000444

150A.	Spacer	310.	Bearing Cup

- Item not illustrated.

C. Handle the wheel bearing cones with extreme care. Dropping or mishandling the cones during maintenance may cause bearing failures. Do not drive bearing cones onto the aircraft axle. Never overtighten the axle nut.

D. The wheel should be properly maintained to protect the paint and surface finishes, as exposed surfaces are susceptible to corrosion. Nicks, scratches and other damage caused by improper handling of the wheel during maintenance invite corrosion, which if unattended will eventually lead to fatigue cracks and premature removal from service.

4. Leading Particulars

Wheel Size and Type	11.00-12, Tube or Tubeless
Weight (Approximate) 5000444	28.3 pounds (12,8 kg)
5000444-1	28.7 pounds (13,0 kg)
5000444-3	32.6 pounds (14,8 kg)
Material	Forged Aluminum Alloy
Wheel Bolt Nut Torque	150 pound-inches (16,9 N-m) (Lubtork)
Lubrication:	
Wheel Preformed Packing	Grease, Specification MIL-G-81322
Bearings	Grease, Specification MIL-G-81322
Bearing Seal Lips	Grease, Specification MIL-G-81322

5. Wheel Differences

A. Main Wheel Assembly 5000444 differs from Main Wheel Assembly 5000444-1 only in the outboard bearing seal and inflation valve.

B. Main Wheel Assembly 5000444 differs from Wheel Assembly 5000444-3 only in the inboard wheel subassembly.

(1) The 5000444-3 Wheel Assembly has a steel disk drive ring, secured with hex head bolts and washers.

TESTING AND FAULT ISOLATION

1. Test Equipment and Materials

NOTE: Equivalent substitutes may be used for items listed below.

Tire Pressure Gage - Capable of measuring up to 225 psi (15,51 bars). Scale may be greater than 1 psi (0,068 bars) increments but scale should be readable to 1 psi.	Commercially available
Inflation Cage	Commercially available
Tire Deflator Schrader 4277 or equivalent	Schrader Automotive, Incorporated Division of Arvin Industries 566 Mainstream Drive P.O. Box 675 Nashville, TN 37202-0675
Grease Specification MIL-G-81322	Commercially available
Antiseize Compound Specification MIL-T-5544	W J Ruscoe & Company 483 Kenmore Boulevard Akron, OH 44301
Soap Solution 30 percent soap solution	Commercially available
Soft Bristle Brush	Commercially available
Cellulose Sponge	Commercially available

2. General

WARNING: TO PREVENT POSSIBLE INJURY TO PERSONNEL, EXERCISE ALL SAFETY PRECAUTIONS BEFORE CONDUCTING TESTS.

A. The purpose of this test section is to provide guidance of maintenance personnel responsible for overhaul and/or maintenance as follows:

(1) To determine the extent of disassembly required.

(2) To provide operational test (leak test) after maintenance action to verify proper wheel/tire assembly.

B. Serviceability of aircraft wheels subjected to rolling with a flat or disintegrated tire and damage to overloaded mating wheel, where applicable, should be checked in accordance with CHECK section.

C. Check for missing or broken wheel bolts and nuts.

(1) If a single bolt or nut is broken or missing, replace it and the two (one on each side) adjacent bolts and nuts in accordance with DISASSEMBLY.

(a) If a bolt or nut is cracked, replace cracked bolt or nut only.

(2) Magnetic-particle check (or equivalent) all other bolts after thorough cleaning in accordance with CLEANING and CHECK.

(3) If more than one bolt is broken or missing, all bolts are nonserviceable.

3. Test Setup

A. None required.

4. Operational Test and Fault Isolation Procedures (Ref. IPL Fig. 1)

WARNING: TO PREVENT POSSIBLE INJURY TO PERSONNEL, EXERCISE ALL SAFETY PRECAUTIONS BEFORE CONDUCTING TESTS.

NOTE: Steps A. and B. should be performed to determine the exact condition or malfunction of the main wheel assembly. All variations from the established leakage rates should be noted for future reference during testing.

A. Perform the following to determine the extent of disassembly required.

CAUTION: BEARING SEALS AND CONES MAY BE LOOSE. CARE SHOULD BE TAKEN TO PREVENT DROPPING AND DAMAGING THESE PARTS.

(1) Remove bearing seals and bearing cones in accordance with DISASSEMBLY.

(2) Clean bearing cups (220 and 310) in accordance with CLEANING and check roller contacting surface of cups for damage in accordance with CHECK.

(3) Clean bearing cones (30 and 60) in accordance with CLEANING and check roller surfaces in accordance with CHECK.

(4) Check bearing seals (20 or 20A and 50) in accordance with CHECK.

(5) Cover hub openings of wheel assembly to prevent contamination of bearing lubricant.

(6) Check tightness of disk drive ring (300 or 300A). If disk drive ring is loose, replace in accordance with REPAIR.

(7) Check disk drive ring (300 or 300A) gear teeth for wear in accordance with CHECK.

B. Operational Test (Leak Test)

WARNING: TIRE AND/OR WHEEL FAILURE MAY OCCUR CAUSING INJURY TO PERSONNEL OR DAMAGE TO EQUIPMENT IF TIRE IS OVER-INFLATED FROM ANY HIGH PRESSURE SOURCE. TIRE AND WHEEL ASSEMBLY MUST BE SERVICED WITH INFLATION EQUIPMENT WHICH HAS BEEN SPECIFICALLY DESIGNED FOR THIS OPERATION.

(1) Place wheel/tire assembly in an inflation cage and inflate to recommended operating pressure.

NOTE: Verify and check operating pressure before handling wheel/tire assembly. Reference Aircraft Tire Manual and Data Book for specific tire data and checks.

(2) Coat juncture around inflation valve subassembly (110 or 110A) and tire beads with soap solution. Check carefully for air leaks in the form of soap bubbles.

NOTE: If air leaks are present, proceed to step (5).

(3) If no leaks occur, remove all traces of soap solution from wheel/tire assembly with water and a cellulose sponge or soft bristle brush. Dry wheel thoroughly with clean, compressed air.

(4) Check pressure after 24 hours.

(a) If reduction in pressure exceeds five percent of inflation pressure, completely deflate tire. Disassemble and check wheel preformed packing (230) and seal groove for damage. Replace wheel preformed packing (230), or if seal groove is damaged, repair and re-treat in accordance with REPAIR. Assemble in accordance with ASSEMBLY AND STORAGE and retest wheel/tire assembly.

(b) If reduction of pressure is less than five percent, reduce tire pressure to recommended storage pressure and remove wheel/tire assembly from inflation cage.

(5) If air leaks are present, proceed with the following steps:

(a) Completely deflate tire and remove assembly from inflation cage and remove all traces of soap solution from wheel/tire assembly with water and a cellulose sponge or soft bristle brush. Dry wheel assembly thoroughly with clean, compressed air.

(b) If leakage occurred around valve subassembly (110 or 110A), check torque on leaking part. Torque hex nut (140 or 140A). Retest the wheel/tire assembly.

(c) If leakage occurred around valve subassembly (110 or 110A) and persists after torque check, remove valve subassembly per DISASSEMBLY. Check interface surfaces and replace preformed packing (170). Reassemble in accordance with ASSEMBLY AND STORAGE and retest.

(d) If leakage occurred around tire bead seat, remove tire from wheel per DISASSEMBLY, check wheel bead seat and tire bead for damage. If tire bead is cut or defective, install a new tire. If wheel bead seat is scratched, nicked, or pitted, repair in accordance with REPAIR. Retreat and repaint areas per REPAIR. Reassemble tire in accordance with ASSEMBLY AND STORAGE and retest the wheel/tire assembly.

5. Hardness Test (Heat Damage Test)

A. Components of the wheel assembly that are suspected of having heat damage shall be checked for hardness as follows:

(1) Remove tire from wheel in accordance with DISASSEMBLY.

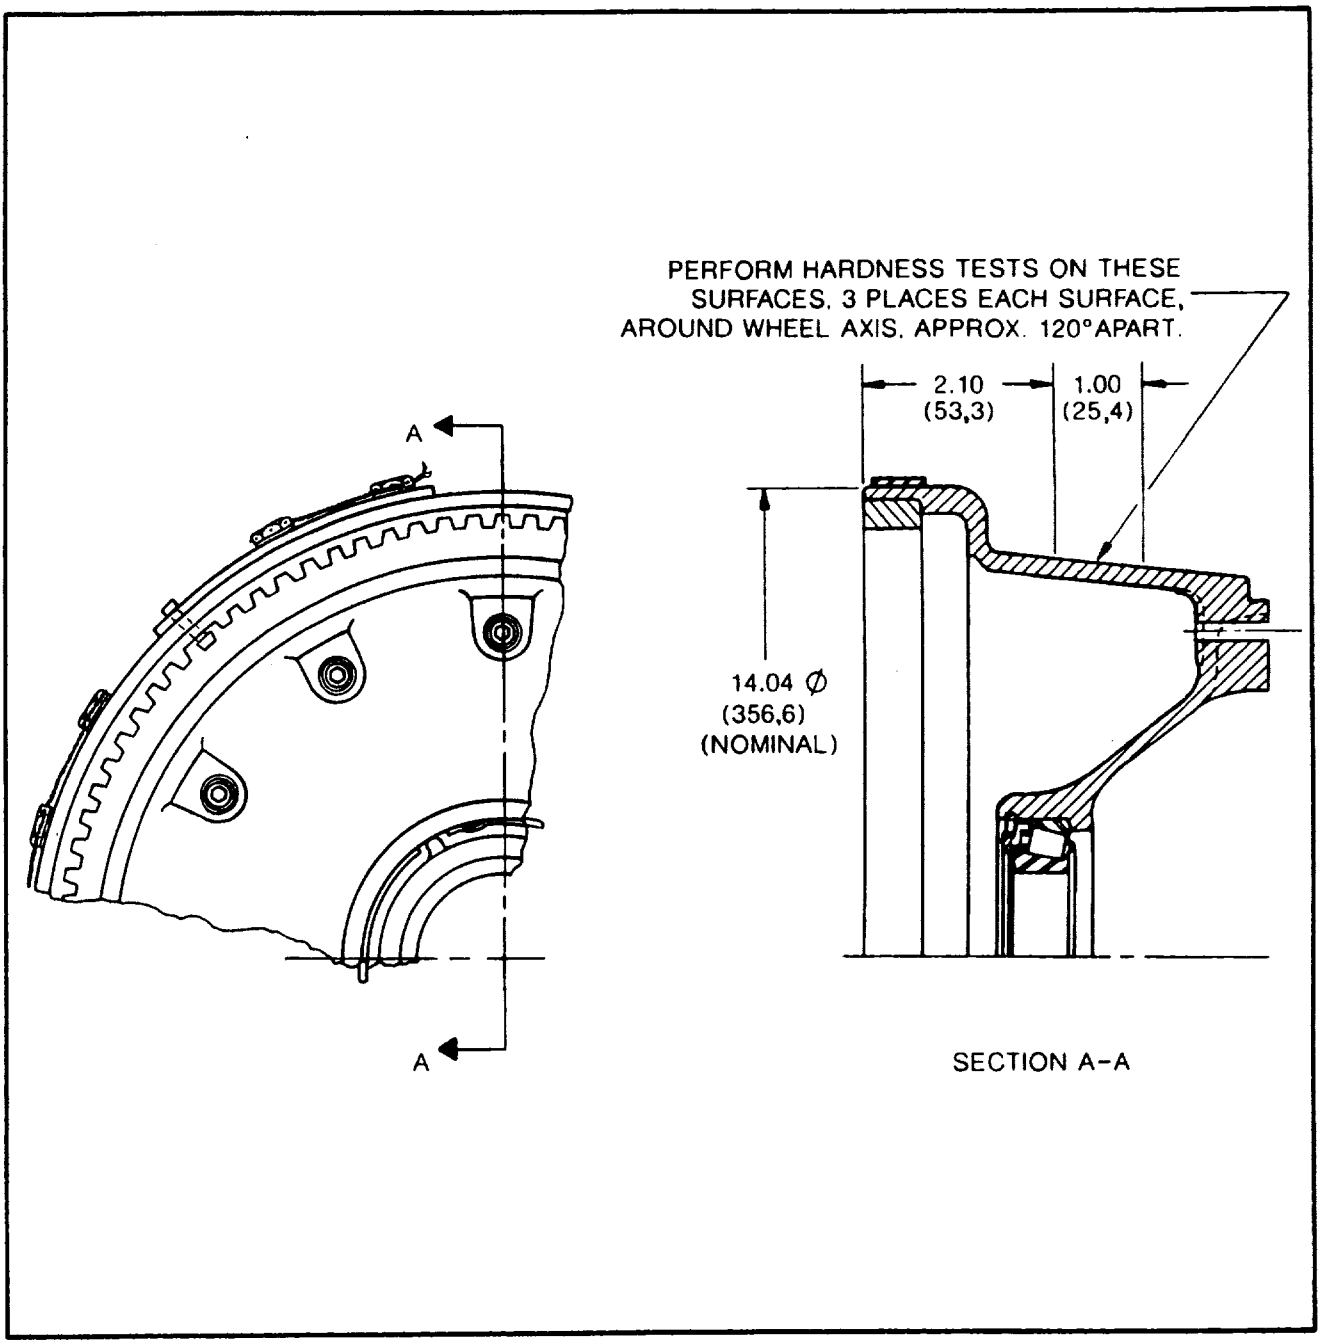
(2) Visually check wheel assembly for discoloration, scorched paint, or other evidence of overheated condition.

B. Hardness Test as follows:

(1) Rockwell or Brinell Test

(a) Perform a hardness test on the wheel at three places, 120° apart, as shown in Figure 101. Remove paint from surfaces to be checked and obtain hardness readings on three areas. Check hardness readings in accordance with Figure 102.

NOTE: Do not make tests over balance weight mounting holes.



(b) If a reading of less than B71 (112 BHN) and greater than B63 (99 BHN) is obtained, perform a second test in tubewell area. The wheel subassembly shall be impression-stamped with the hardness value and letters "OV" (overheated). This stamping should be placed on the outside of any of the fusible plug bosses for future reference, and the wheel may be continued in service. If an average value of less than B63 is obtained, or if values obtained vary more than the specified range permitted in Figure 102, replace the wheel subassembly.

NOTE: A second hardness test reading is recommended if there is any question as to the accuracy due to an inconsistant reading or excessive point spread. The second check shall be performed in close proximity to the first hardness test reading.

(c) The Brinell test may be substituted, using data in Figure 102, if Rockwell test cannot be performed.

(d) The outboard wheel subassembly should be checked in the same manner if the inboard wheel subassembly has been excessively overheated.

(e) Refinish wheel areas where paint has been removed in accordance with REPAIR.

Heat Damage Test - Inboard Wheel Subassembly
Figure 101

Item	Brinell Test	Rockwell Test B Scale
Ball Diameter	10 mm	1/16 inch
Test Load	500 kg	100 kg
Number of Readings Equally Spaced	3	3
Acceptable Minimum Average Hardness	99 BHN	B63
Maximum Total Range of Three Readings	4 points*	2 points*

NOTE: Test area must be free of paint.

* Applicable to marginal hardness wheel only. Marginal hardness wheels are wheels with ANY ONE hardness reading of less than B64 (101 BHN).

Hardness Test Readings
Figure 102

DISASSEMBLY

1. General (Ref. IPL Fig. 1)

NOTE: See TESTING AND FAULT ISOLATION for operational test and fault isolation procedures to establish condition of unit and determine extent of disassembly required.

A. Disassemble the main wheel assembly in accordance with the following instructions and Disassembly Procedures.

CAUTION: BEARING SEALS AND BEARING CONES WILL BE RELEASED WHEN WHEEL ASSEMBLY IS REMOVED FROM AIRCRAFT AXLE. CARE SHOULD BE TAKEN TO PREVENT DROPPING AND DAMAGING THESE PARTS.

B. Any wheel subjected to rolling with a flat or disintegrated tire and the corresponding overloaded mating wheel where applicable, shall be subjected to checking or replacement as detailed in General Check Procedures (See CHECK).

C. The use of power wrenches for wheel disassembly is governed by the following:

(1) Do not use power wrenches for disassembly of any threaded parts made of nonferrous material or parts (aluminum, brass, etc) threaded into nonferrous tapped holes.

(2) The use of power wrenches for disassembly of any ferrous parts or parts threaded directly into ferrous tapped holes, such as wheel fasteners, is acceptable.

D. It is recommended new preformed packings be installed at each overhaul. If necessary to reuse preformed packing, mark installation position of packing with respect to wheel subassembly so the packing may be reinstalled in the original position. Carefully place packing on a clean, flat surface to avoid damage or stretching.

2. Disassembly Procedures

WARNING: DO NOT ATTEMPT TO DISASSEMBLE WHEEL UNTIL TIRE HAS BEEN COMPLETELY DEFLATED, OTHERWISE, SERIOUS INJURY TO PERSONNEL OR DAMAGE TO EQUIPMENT CAN RESULT.

CAUTION: DISASSEMBLE THE WHEEL ON A TIRE CHANGER OR A CLEAN, FLAT SURFACE, BEING CAREFUL NOT TO NICK, SCRATCH OR DAMAGE THE WHEEL SUBASSEMBLIES.

A. Remove valve cap (120) and apply a tire deflator (Schrader 4277 or equivalent) to release tire pressure completely.

WARNING: DO NOT ATTEMPT TO REMOVE VALVE CORE UNTIL TIRE HAS BEEN COMPLETELY DEFLATED. VALVE CORES WILL BE EJECTED AT HIGH VELOCITY IF UNSCREWED BEFORE AIR PRESSURE HAS BEEN RELEASED.

B. Remove valve core (130) from valve stem (160 or 160A).

CAUTION: HANDLE BEARING CONES WITH EXTREME CARE. MANY AIRCRAFT BEARING FAILURES OCCUR AS A RESULT OF MISHANDLING DURING SERVICING.

C. Remove outboard bearing seal (20 or 20A) and outboard bearing cone (30).

D. Remove retaining ring (40), inboard bearing seal (50) and inboard bearing cone (60).

WARNING: NEVER BREAK TIRE BEADS LOOSE UNTIL TIRE HAS BEEN COMPLETELY DEFLATED, OTHERWISE, EXPLOSIVE SEPARATION OF WHEEL COMPONENTS WILL RESULT.

CAUTION: DO NOT PRY BETWEEN WHEEL FLANGE AND TIRE BEADS AS THIS COULD DAMAGE THE WHEEL AND TIRE.

E. Break tire beads free of both wheel flanges by applying pressure in even increments around entire sidewall as close to tire beads as possible.

WARNING: NEVER ATTEMPT TO REMOVE WHEEL BOLTS OR NUTS UNTIL TIRE HAS BEEN COMPLETELY DEFLATED, OTHERWISE, EXPLOSIVE SEPARATION OF WHEEL COMPONENTS WILL RESULT.

F. Remove wheel fasteners as follows:

(1) Check for missing or broken wheel bolts or nuts. If a single broken or missing bolt or nut is found, replace it and the two (one on either side) adjacent bolts and nuts.

NOTE: Magnetic-particle check (or equivalent) all other bolts after thorough cleaning in accordance with CLEANING and CHECK.

(a) If a bolt or nut is cracked, replace cracked bolt or nut only.

(2) If more than one bolt is broken or missing, all bolts are nonserviceable.

CAUTION: IF ANY WHEEL BOLT OR NUT IS ACCIDENTALLY TIGHTENED, INSTEAD OF LOOSENED, TO MORE THAN 120 PERCENT OF RECOMMENDED FINAL TORQUE VALUE, REPLACE BOTH NUT AND BOLT.

(3) Remove self-locking nuts (70), double-recessed washers (80) and internal wrenching bolts (90) to release wheel subassemblies (100 and 240 or 240A).

NOTE: The use of power wrenches for disassembly of fasteners can reduce the service life of bolts and nuts.

G. Separate the wheel subassemblies and remove tubeless tire or tire and tube.

H. Carefully remove wheel preformed packing (230) from inboard wheel subassembly (240 or 240A), if tubeless tire was installed.

NOTE: It is recommended that new preformed packings be installed at each overhaul. If necessary to reuse preformed packing (230), mark installation position on wheel so it may be reinstalled in the original position. Carefully place packing on a flat, clean surface to avoid damage or stretching.

I. If installed, remove valve subassembly (110 or 110A) from outboard wheel subassembly (100) by removing hex nut (140 or 140A), washer (150) or spacer (150A), valve stem (160 or 160A) and preformed packing (170).

NOTE: It is not necessary to remove the valve subassembly at each tire change. It is recommended the valve subassembly be removed for inspection at each overhaul and whenever it is necessary to remove the bearing cup.

J. Remove self-locking nut (180), plain washer (190), and screw (200) releasing tire/time change counter (210).

K. The bearing cups (220 and 310), disk springs (260), tee bar plungers (270) and disk drive ring (300 or 300A) should not be removed unless replacement is necessary, if paint is to be stripped, or if a thorough check of wheel subassemblies is required. Instructions for removal and installation of these parts are given in REPAIR.

L. Instruction plate (10) should not be removed unless damaged or if paint is to be stripped or thorough check of wheel subassembly is required.

CLEANING

1. Cleaning Materials

NOTE: Equivalent substitutes may be used for items listed below.

Dry-Cleaning Solution Type I, Stoddard Solvent Type II, 140°F Solvent Specification P-D-680	Commercially available
Methyl Isobutyl Ketone (MIBK) Specification TT-M-268	Commercially available
Isopropyl Alcohol Specification TT-I-735	Commercially available
Vapor Degrease Solution 1,1,1-Trichloroethane Specification MIL-T-81533	Commercially available
Polyplus Plastic Media Screen Size 20/40 (Primary)	Inventive Machine Corporation (I.M.C.) P.O. Box 369 Bolivar, OH 44612
Plastic Reclaimable Abrasive Machine (PRAM)	See SPECIAL TOOLS, FIXTURES AND EQUIPMENT section
Plastic Media (Dry Stripping Abrasive)	U.S. Technology Corporation A Subsidiary of U.S. Plastic and Chemical Corporation 328 Kennedy Drive Putnam, CT 06260
Paint Removing Solvent (Alternate) Specification MIL-C-19853, Type II	Turco Products Division of Purex Corporation 24600 South Main Street Carson, CA 90749
Soft Wire Brush	Commercially available
Soft Bristle Brush	Commercially available
Grease Specification MIL-G-81322	Commercially available

2. Cleaning Procedures (Ref. IPL Fig. 1)

WARNING: CLEANING SOLVENTS ARE TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS. AVOID PHYSICAL CONTACT WITH SOLVENT AND DO NOT INHALE VAPORS.

CAUTION: A THOROUGH CLEANING OR IMMERSION OF WHEELS MAY CAUSE ENTRAPMENT OF SOLVENT IN PASSAGE HOLES. ENSURE REMOVAL OF INFLATION VALVE PRIOR TO CLEANING.

CAUTION: CLEAN BEARING CONES CAREFULLY IN A SEPARATE CONTAINER OF CLEAN SOLVENT TO AVOID CONTAMINATION.

A. Clean all metal parts with dry-cleaning solution conforming to Specification P-D-680. Use a soft bristle brush to remove hardened grease, dust and dirt. Vapor degrease the wheel bolts and remove any scale with a soft, wire brush.

(1) If drive ring has been removed and carbon remover has not removed all of the sealant, use MIBK with light rubbing with a clean cloth.

CAUTION: DO NOT SPIN BEARING CONES WITH COMPRESSED AIR.

B. Dry all metal parts thoroughly after cleaning, using filtered and dried compressed air.

NOTE: Ensure foreign materials and solvents have been removed from all cavities, threaded holes, pockets and other areas where entrapment might occur.

C. Check in accordance with CHECK section and repack bearing cones and coat bearing cups with grease, Specification MIL-G-81322, immediately after drying.

NOTE: New bearing cones and bearing cups packaged in preservative need not be degreased prior to use as the preservative is compatible with the recommended grease.

Lubrication of bearings by mechanical or other pressure methods is recommended because it is more efficient, reduces the possibility of contamination, and assures a more even distribution of grease within the bearing.

D. Clean all rubber and nonmetallic parts in isopropyl alcohol, Specification TT-I-735 and dry with a clean, soft cloth.

3. Paint Removal Procedures

A. Strip wheel subassembly as follows - Method I (Dry Stripping)

WARNING: THE DRY STRIPPING PROCESS IS OPERATOR-SENSITIVE AND ONLY AN EXPERIENCED, TRAINED OPERATOR SHOULD BE PERMITTED TO PERFORM THE PAINT REMOVAL OPERATION IN ACCORDANCE WITH EQUIPMENT MANUFACTURER'S RECOMMENDATIONS.

NOTE: This procedure covers general information on the dry stripping process of pneumatic blast removal of paint utilizing ground plastic particles. The procedure provides suggested control parameters to safely and effectively remove paint from component parts using the dry stripping process.

Paint should be stripped from parts before inspecting by Zyglo, dye pentrant or eddy-current methods; otherwise, inaccurate readings will result.

(1) Completely disassemble the part to be stripped. Remove all parts from wheel subassemblies, including valve, instruction and data plates and balance weights.

NOTE: Bearing cups need not be removed during dry paint stripping.

(2) Clean part to be stripped in accordance with CLEANING section.

(3) Plug or seal off openings, threaded holes, bearing cups and inserts as required.

(4) Remove paint using the dry stripping procedure in accordance with Figure 401 and as follows:

(a) The media (dry stripping abrasives) is effective only when used with the appropriate equipment. Depending on operator requirements, check with these (or other suitable) manufacturers for advice and application information concerning their particular equipment.

(b) Refer to Cleaning Materials for recommended dry stripping abrasives and equipment.

CAUTION: FLUSH MEDIA FROM CAVITIES, THREADED HOLES, POCKETS AND OTHER AREAS WHERE ENTRAPMENT MIGHT OCCUR.

(5) Remove part and rinse thoroughly with water heated to a temperature of 160° to 180°F (71° to 82°C).

(6) Dry part thoroughly with filtered and dried compressed air. Apply grease, Specification MIL-G-81322, to bearing cups if installed.

NOTE: After paint stripping, the part must be re-treated and repainted in accordance with instruction in REPAIR.

NOZZLE TYPE/SIZE	NOZZLE PRESSURE	NOZZLE DISTANCE	MEDIA TYPE	ANGLE OF APPROACH
1 BMLV-8 1/2 inch (12,7 mm) 4	45 - 55 PSI (3,10-3,79 bars) 3	36 - 48 inch (914-1219 mm)	POLYPLUS 20/40	45 - 75°
2 VENTURI 5/16 inch (7,94 mm) 4	UNDER 30 PSI (2,07 bars) 3	6 - 8 inch (152,4-203,2 mm)	POLYPLUS 20/40	45 - 75°

PHYSICAL REQUIREMENTS OF MEDIA

	POLYEXTRA	POLYPLUS
HARDNESS (MOH SCALE)	3.0 ± .25	3.5 ± .25
SPECIFIC GRAVITY (GMS/CC)	1.15 ± 10%	1.50 ± 10%

NOTES:

1. STAND-OFF, OPEN BLASTING.
2. CLOSED-CYCLE BLASTING (PERFORMED IN PRESSURE BLAST EQUIPMENT CHAMBER).
3. PRESSURE READINGS MUST BE TAKEN AT THE NOZZLE RATHER THAN ESTIMATED FROM REGULATOR GAGE READINGS. RECHECK PRESSURE EVERY FOUR HOURS AND EACH TIME PRESSURE IS CHANGED AT REGULATOR.
4. PROCESS VARIABLES INCLUDE PRESSURE, DISTANCE FROM NOZZLE TO WORK PIECE, ANGLE OF ATTACK AND NOZZLE SIZE. PARAMETERS SELECTED WILL VARY WITH PAINT COATING AGE, TYPE AND NUMBER OF COATINGS, BUT THE FOLLOWING PARAMETERS HAVE SUCCESSFULLY REMOVED VARIOUS COATING TYPES WITH NO EFFECT ON SUBSTRATE.
5. RECOMMENDED PLASTIC MEDIA TYPE AND SIZE IS POLYPLUS 20/40. POLYEXTRA 12/20 OR 20/30 PRODUCES A SMOOTHER FINISH BUT PAINT REMOVAL RATE IS LOWER. TYPE III PLASTIC MEDIA TYPE IS NOT TO BE USED ON THE SUBJECT AIRCRAFT COMPONENTS.

Recommended Dry Stripping Variables
Figure 401

B. Strip wheel subassembly as follows - Method II (Wet Stripping)

WARNING: PAINT REMOVAL SOLVENTS ARE CAUSTIC, TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS IN ACCORDANCE WITH MANUFACTURER'S DIRECTIONS. OBSERVE ALL SAFETY PRECAUTIONS. AVOID PHYSICAL CONTACT WITH SOLUTION AND DO NOT INHALE VAPORS.

NOTE: Paint should be stripped from wheel subassemblies before inspecting by Zyglo, dye penetrant or eddy-current methods; otherwise, inaccurate readings will result.

(1) Completely disassemble the part to be stripped to prevent solvent from being entrapped between mating surfaces. Remove all parts from wheel subassemblies, including valve, bearing cup, disk drive ring and balance weights.

NOTE: Bearing cups need not be removed during paint stripping if a suitable mask (or other method) is used to assure contamination does not occur behind the bearing cup by stripping fluids.

(2) Clean the part to be stripped in accordance with Cleaning Procedures.

(3) Plug and seal off threaded holes and threaded inserts.

CAUTION: PARTS MUST BE COMPLETELY IMMERSED IN SOLVENT. CONTACT WITH WATER BLANKET DURING IMMERSION WILL CAUSE SEVERE CORROSION OF THE PART.

(4) Immerse part in a paint removing solvent conforming to Specification MIL-C-19853 for a period of 30 minutes to two hours. Immersion time depends on condition of paint. Carefully follow the manufacturer's instructions for the particular solvent being used.

CAUTION: FLUSH SOLVENT FROM CAVITIES, THREADED HOLES, POCKETS AND OTHER AREAS WHERE ENTRAPMENT MIGHT OCCUR.

(5) Remove part from solvent and rinse thoroughly with water heated to a temperature of 160° to 180°F (71° to 82°C).

(6) Dry part thoroughly with filtered and dried compressed air. Apply grease, Specification MIL-G-81322, to bearing cups if installed.

NOTE: After paint stripping, the part must be re-treated and repainted in accordance with REPAIR.

CHECK

1. Check Materials

NOTE: Equivalent substitutes may be used for items listed below.

Type	Penetrant	Developer	Supplier
Fluorescent	Zyglo ZL-16	Zyglo ZP-13 (wet) optional	Magnaflux Corporation 7310 West Lawrence Street Chicago, IL 60656
	Penetrex ZL-2A with emulsifier ZE-4	Penetrex ZP-4 (dry) or ZP-13 (wet) optional	
Red Dye	Spot Check	Spot Check	
	Dy-Chek	Dy-Chek	Turco Products Division of Purex Corporation P.O. Box 6200 Carson, CA 90749
	Met-L-Chek	Met-L-Chek	Met-L-Chek 1639 Euclid Street Santa Monica, CA 90404

2. General (Ref. IPL Fig. 1)

A. Check all components of the main wheel assembly for cracks, nicks, corrosion, and other damage. Replace any cracked, severely corroded, or badly damaged parts.

B. Perform the specific checks listed, referring to REPAIR for the appropriate repair procedures.

C. Serviceability of aircraft wheels subjected to rolling with a flat or disintegrated tire and damage to overloaded mating wheel, where applicable, should be checked as follows:

(1) Wheel Rolled with a Flat Tire

(a) Check carefully for deformation in the flange area and for tire brinelling and/or chafing damage on the flange outside diameter. Check wheel for an out-of-round condition by measuring the diameter of the flange at three places, equally spaced, around the outside diameter. The difference between the largest and smallest diameter readings shall not exceed 0.030 inch (0,76 mm). Replace any wheel with damage or deformation in excess of limits.

(2) Wheel Rolled with Disintegrated Tire

(a) Any wheel where the flanges have made direct contact with the runway due to rolling or sliding should be replaced. The high stress levels imposed on the wheel flange and bead seat area will invariably render the wheel nonserviceable even with minimal damage.

(3) Mating Wheel

(a) In the event of a wheel rolled with a flat or disintegrated tire on any aircraft fitted with dual, tandem or dual tandem wheels, the corresponding mating overloaded wheel must also be considered. The mating wheel should be removed from service if the distance rolled was sufficient to cause any damage to the overloaded tire. Rolling in the overloaded condition will impose additional stress on the bolts and nuts fastening the wheel subassemblies and may require early replacement. In all cases of overloaded rolling, the bolts and nuts should be replaced or checked for fatique damage at each tire change.

3. Wheel Subassembly (100 and 240 or 240A)

A. Check wheel subassembly for cracks and structural damage. Pay particular attention to the bead seat, bolt boss, valve hole, drive ring interface and tubewell radius. Check the underside of the tubewell area paying particular attention to the area from the tire bead seat radius to the end of the toe of the tire. Replace cracked wheel subassembly.

NOTE: Strip paint from wheel subassembly and check wheel bead seat, using ultrasonic or eddy-current methods. Check all other areas of the wheel subassembly by Zyglo or dye penetrant methods. Replace cracked wheel subassembly.

B. Check wheel subassembly for corrosion, nicks, scratches, tool marks, and other damage. Remove any corrosion and surface damage up to the limits given in REPAIR. Wheel subassembly damaged beyond these limits should be replaced.

C. Check the threaded steel inserts in the outboard wheel subassembly hub flange for damage. If stripped or damaged, replace insert according to instructions in REPAIR.

CAUTION: HANDLE BEARING CONES WITH EXTREME CARE. MANY AIRCRAFT BEARING FAILURES OCCUR AS A RESULT OF MISHANDLING DURING SERVICING.

4. *Bearing Cup (220 and 310) and Bearing Cone (30 and 60)*

A. Wipe bearing cups free of grease and visually check roller contacting surface of cups for looseness, scratches, pitting, brinelling, spalling, heat discoloration, rust, corrosion, and excessive wear. Replace bearing cups having any defects in accordance with instructions in REPAIR.

B. Check bearing cones (30 and 60) and roller surfaces for nicks, scratches, rust, corrosion, spalling, flat spots, pitting, roller end scoring, heat discoloration, and wear. Check bearing cage rib faces for scoring and bearing cage for nicks, dents, distortion, and wear in the roller pockets. Replace bearing cones having any defects.

5. Disk Drive Ring (300 or 300A)

A. Check disk drive ring (300), rivets (280), and plain washers (290) for tightness. If rivets are loose or rivet holes are enlarged, see REPAIR.

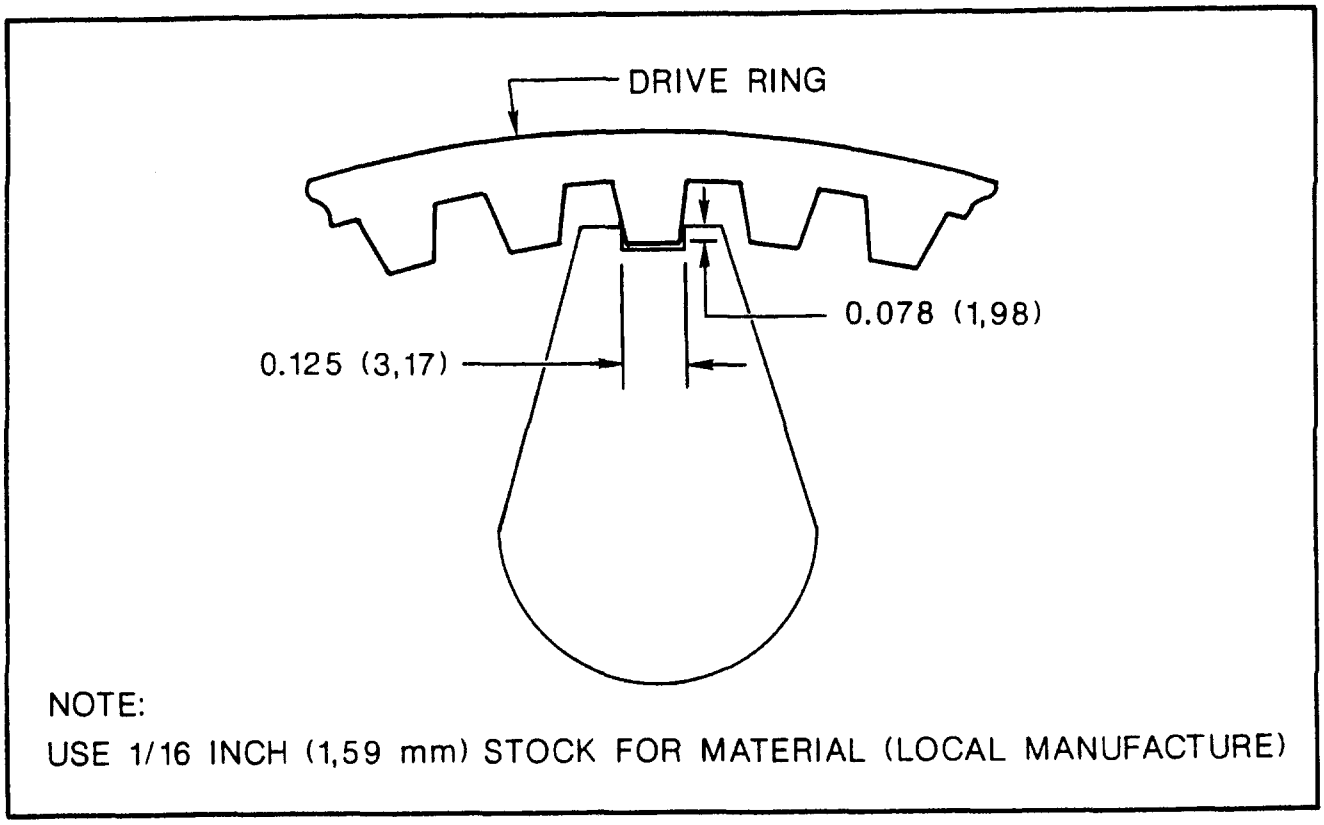
B. Check disk drive ring (300A), hex head bolts (255) and plain washers (290) for tightness. If bolts are loose or threads are stripped see REPAIR.

C. Check disk drive ring gear teeth for wear. Replace ring if three or more teeth are worn to a thickness of 0.125 inch (3,17 mm) or less at a point 0.078 inch (1,98 mm) from top of tooth.

NOTE: Check worn condition of gear teeth with the disk drive ring wear template shown in Figure 501.

6. Disk Spring (260) and Tee Bar Plunger (270)

A. Check disk springs (260) and tee bar plungers (270) for security, wear or damage. If tee bar plunger is loose due to enlarged or damaged holes see REPAIR.



7. Valve Subassembly (110 or 110A)

A. Check valve stem (160 or 160A) and hex nuts (140 or 140A) for stripped or crossed threads and other damage. Replace valve stem if bent or damaged.

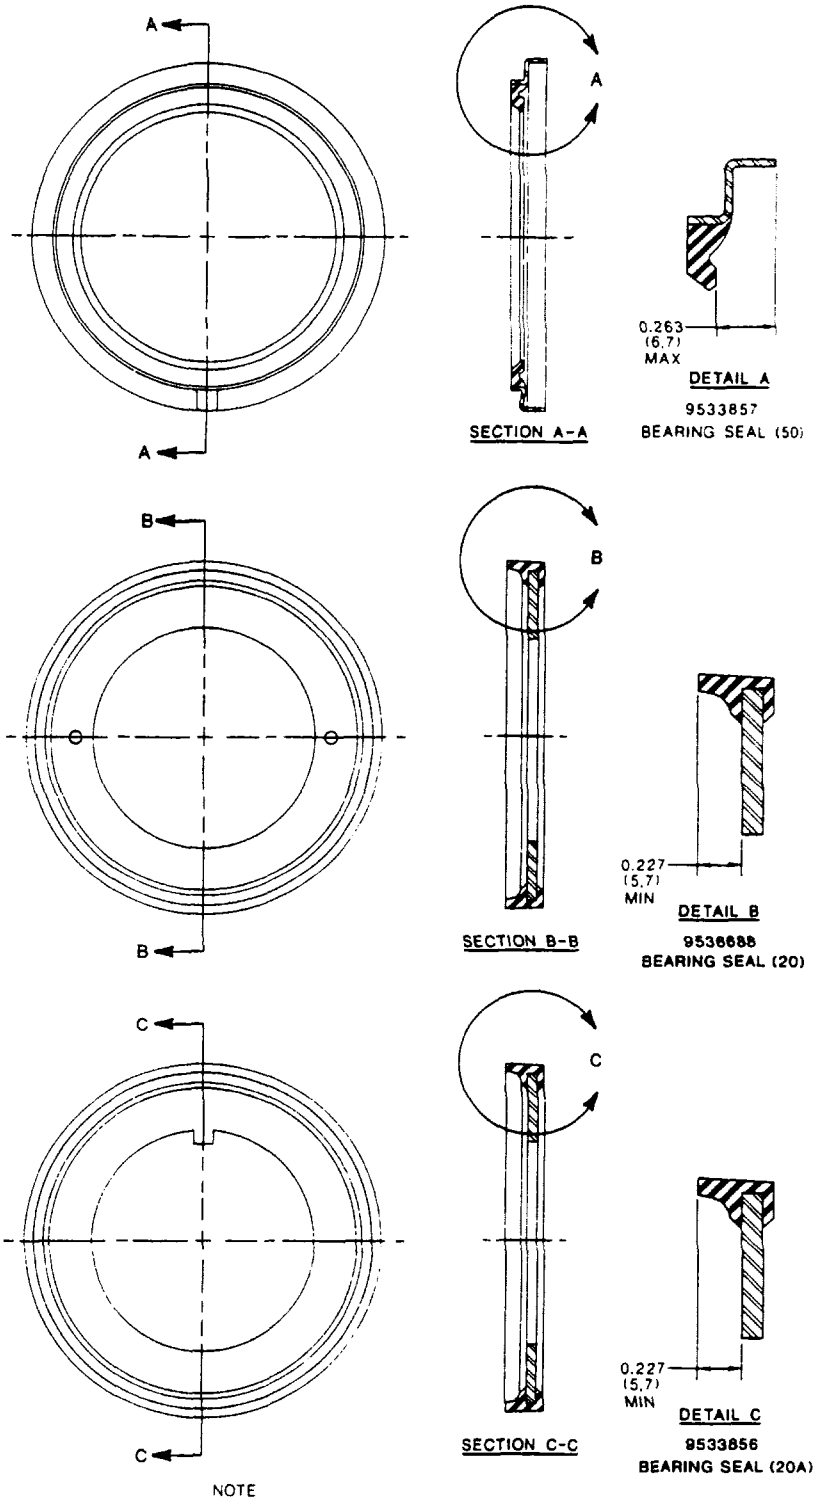
B. Replace valve cap (120) or valve core (130) if these parts are unserviceable.

8. Bearing Seal (20 or 20A and 50)

A. Check bearing seals for cuts, nicks, distortion, and other damage. Check for permanent set or distortion of seal lips, security of the rubber-to-metal bond and for damage and distortion to the metal base. Replace defective seals.

Disk Drive Ring Wear Template
Figure 501

B. Check bearing seals for wear as follows:



(1) Check seals for wear by measuring the lip-to-face distance as shown in Figure 502. Replace seals not meeting dimension given.

(2) Check bearing seal for grooves or damage. Replace seals if damaged.

9. Preformed Packing (170 and 230)

A. It is recommended new preformed packings be installed at each overhaul. If necessary to reuse these parts, check for cuts, permanent set, and other damage. Replace packings that are cut or damaged, or that have a permanent set.

NOTE: Cuts on packings often indicate the presence of burrs or other damage on adjoining wheel parts. Check adjoining parts and remove burrs or other damage that may cause packing damage to reccur, see REPAIR.

NOTE
SHORE "A" HARDNESS READING OF 60 TO 80 REQUIRED

Bearing Seal Wear Limit
Figure 502

10. Self-Locking Nut (70 and 180) and Internal Wrenching Bolt (90)

A. Check self-locking nuts for worn, stripped, and crossed threads. Replace if damaged. Nuts should be replaced after 10 applications. If unable to determine the number of applications, degrease the nut and bolt and check the torque required to turn nut on a nonlubricated bolt past the nut's locking section. Replace any self-locking nut requiring less than the minimum torque value as follows:

(1) Replace self-locking nut (70) when minimum torque value is less than 15 pound-inches (1,69 N-m).

(2) Replace self-locking nut (180) when minimum torque value is less than 2 pound-inches (0,23 N-m).

B. Degrease and magnetic-particle check all bolts for cracks, paying particular attention to radius under the bolt head and to the threads adjacent to the bolt shank. Replace any cracked bolts and those having stripped, crossed, or damaged threads. No reworking of the bolts is permissible.

11. Tire/Time Change Counter (210)

A. Check tire/time change counters for damage. Replace if illegible or damaged.

12. Retaining Ring (40)

A. Check retaining ring for deformation, corrosion and damage. Replace if damaged.

13. Instruction Data Plate (10)

A. Check instruction plate for looseness and legibility. Replace if loose or illegible.

REPAIR

1. Repair Materials

NOTE: Equivalent substitutes may be used for items listed below.

Aluminum Oxide Cloth (320 to 360 grit, wet-or-dry)	Commercially available
Grease Specification MIL-G-81322	Commercially available
Chemical Film Solutions Specification MIL-C-5541	
Alodine 1200	Amchem Products, Incorporated 300 Brookside Avenue Ambler, PA 19002
Turco 4178	Turco Products Division of Purex Corporation 24600 South Main Street Carson, CA 90749
Iridite 14-2	Allied-Kelite Products Division Richardson Chemical Company 2400 East Devon Avenue Des Plaines, IL 60016
Loctite RC/620	Loctite Company 705 North Mountain Road Newington, CT 06111
3M776 Adhesive Sealant	Minnesota Mining & Manufacturing Company Adhesive Coating and Sealer Division 3M Center St. Paul, MN
Aluminum Lacquer Specification TT-L-32	Commercially available
Zinc Chromate Primer Specification TT-P-1757	Commercially available
Methyl Isobutyl Ketone (MIBK) Specification TT-M-268	Commercially available
Aluminum Topcoat/Primer Combination (FA-10242) Aeroprite	Contact your local distributor of aviation products and supplies.
Aeroprite Reducer TH-89	Contact your local distributor of aviation products and supplies.

2. General (Ref. IPL Fig. 1)

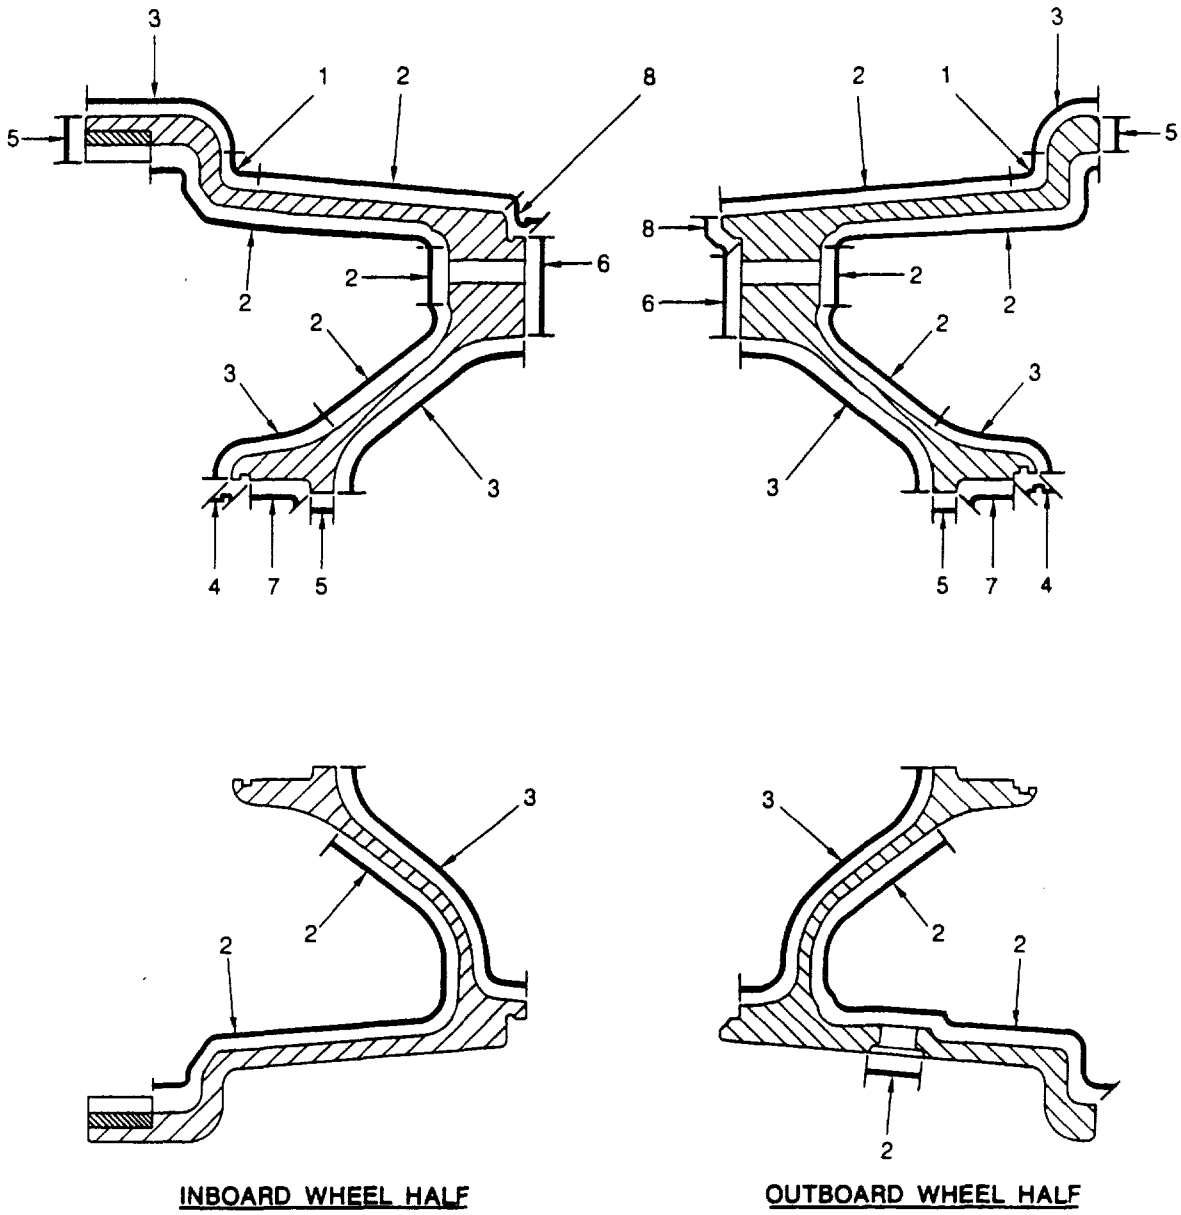
A. Repairs to the main wheel are limited to the replacement of parts and repairs specified in this section. No attempt should be made to repair cracked, severely corroded or badly damaged parts. Components that cannot be repaired within the limits defined in this section should be replaced.

3. Repair of Wheel Subassembly (100 and 240 or 240A)

CAUTION: REMOVAL OF CORROSION AND SURFACE DAMAGE WILL PREVENT STRESS CONCENTRATIONS AND PREMATURE WHEEL FAILURE. HOWEVER, ANY REMOVAL OF MATERIAL WILL SHORTEN THE ROLL LIFE OF THE WHEEL. THEREFORE, IT IS RECOMMENDED THAT REMOVAL OF MATERIAL BY BLENDING BE LIMITED TO THE MINIMUM REQUIRED FOR REMOVING CORROSION OR SURFACE DAMAGE.

A. Remove all corrosion and surface damage from wheel subassemblies according to limits defined in Figure 601. Wheel subassemblies corroded or damaged beyond these limits should be replaced. Imperfections should be blended out. Use fine, aluminum oxide cloth for polishing. Unless otherwise specified, surface finish of repaired surfaces should not exceed a roughness of 150 microinches RHR. All reworked surfaces shall be cleaned thoroughly, then re-treated and repainted in accordance with Re-Treating and Repainting.

NOTE: All scratches, nicks, tool marks and other surface damage should be blended out to a minimum 1/4 inch (6,35 mm) radius and then highly polished. Use fine aluminum oxide cloth for polishing. This will prevent stress concentrations and premature wheel failure. In repairing wheels, any removal of material will shorten the roll life of the wheel; therefore, it is recommended material removed by blending be kept to a minimum.



B. If threaded holes or inserts are damaged in the outboard wheel subassembly, replace inserts or repair in accordance with Repair No. 5 - Repair of Fairing Retaining Screw Threads, Outboard Wheel Subassembly.

4. Replacing Bearing Cup (220 and 310)

A. Remove bearing cups from wheel subassemblies as follows:

CAUTION: DO NOT OVERHEAT WHEEL SUBASSEMBLY OR PROLONG THE HEATING PERIOD. OVERHEATING WILL ADVERSELY AFFECT THE WHEEL'S SERVICE LIFE. REMOVE VALVE SUBASSEMBLY (IF INSTALLED) BEFORE HEATING WHEEL SUBASSEMBLY.

(1) Heat wheel subassembly in an oven not exceeding 250°F (121°C) for 30 minutes.

NOTE:
NUMBERS INDICATE REPAIR AREAS (SEE KEY TO FIGURE)

Wheel Subassembly Repair Limits
Figure 601

Key to Figure 601

General:	Internal and external tubewell, hub and web repairs shall not be located directly opposite surfaces previously blended. When damaged depth is less than 0.015 inch (0,38 mm) deep, all blended type repairs shall be blended with a depth to width ratio of 1 to 100 in surface width. Where not possible, use as generous a width to depth ratio as practical with the area being repaired. Repairs are limited in each marked area to the following limits:
Area 1:	Blend out and polish imperfections up to 0.010 inch (0,25 mm) deep and 0.050 inch (1,27 mm) long. Maintain surface finish of 20 microinches RHR.
Area 2:	Blend out and polish imperfections up to 0.015 inch (0,38 mm) deep and 1.00 inch (25,4 mm) long. Blemish area must not exceed 1.00 square inch (6,45 sq cm). Do not blend opposite surfaces. Remove corrosion, nicks and other imperfections from valve hole.
Area 3:	Blend out and polish nicks and other imperfections up to 0.031 inch (0,787 mm) deep and 1.00 inch (25,4 mm) long. Do not blend opposite surfaces.
Area 4:	Blend out and polish nicks and other imperfections as long as retention and seating of bearing seal is not impaired.
Area 5:	Blend out and polish nicks and other imperfections up to 0.060 inch (1,52 mm) deep and 1.00 inch (25,4 mm) long.
Area 6:	Blend out and polish imperfections up to 0.010 inch (0,25 mm) deep and 1.00 inch (25,4 mm) long. Reworked area must not exceed 0.50 square inch (3,225 sq cm). Radius sharp bolt hole edges up to 0.03 inch (0,78 mm).
Area 7:	Blend out and polish imperfections as long as bearing cup retention is not impaired. Maintain surface finish of 100 microinches RHR.
Area 8:	Blend out and polish imperfections as long as sealing qualities are not impaired. Maintain surface of 63 microinches RHR.

CAUTION: WHEN REMOVING CUP, EXERCISE EXTREME CARE TO AVOID RAISING BURRS IN THE BEARING BORE. ALWAYS SUPPORT THE WHEEL SUBASSEMBLY ON THE HUB, NOT ON THE FLANGE.

(2) Remove wheel subassembly from heat source and immediately remove cup from bearing bore by tapping it out evenly with a fiber or phenolic punch.

(3) Carefully remove primer residue and any foreign matter from bearing bore. Make sure that bearing bore and shoulder are clean and free of burrs.

B. Allow wheel subassembly to cool to room temperature and check maximum bearing bore dimension.

(1) If the bore surface is damaged, refer to Repair No. 1 - Inboard Wheel Bearing Cup Bore Repair or Repair No. 2 - Outboard Wheel Bearing Cup Bore Repair.

(2) Check the wheel subassemblies for maximum bore dimension. The maximum dimension to be an average of three readings taken 120 degrees apart.

(a) Maximum diameter of the outboard wheel subassembly (100) hub bore shall not exceed 4.1187 inches (104,6 mm).

(b) Maximum diameter of the inboard wheel subassembly (240 or 240A) hub bore shall not exceed 4.1187 inches (104,6 mm).

(3) If maximum dimension is exceeded, repair in accordance with Repair No. 1 - Inboard Wheel Bearing Cup Bore Repair or Repair No. 2 - Outboard Wheel Bearing Cup Bore Repair.

C. Install bearing cups as follows:

(1) Make sure bearing bore and shoulder in wheel hub are clean and free from burrs or any other imperfections which might prevent proper seating of bearing cup.

(2) Chill new bearing cup with dry ice.

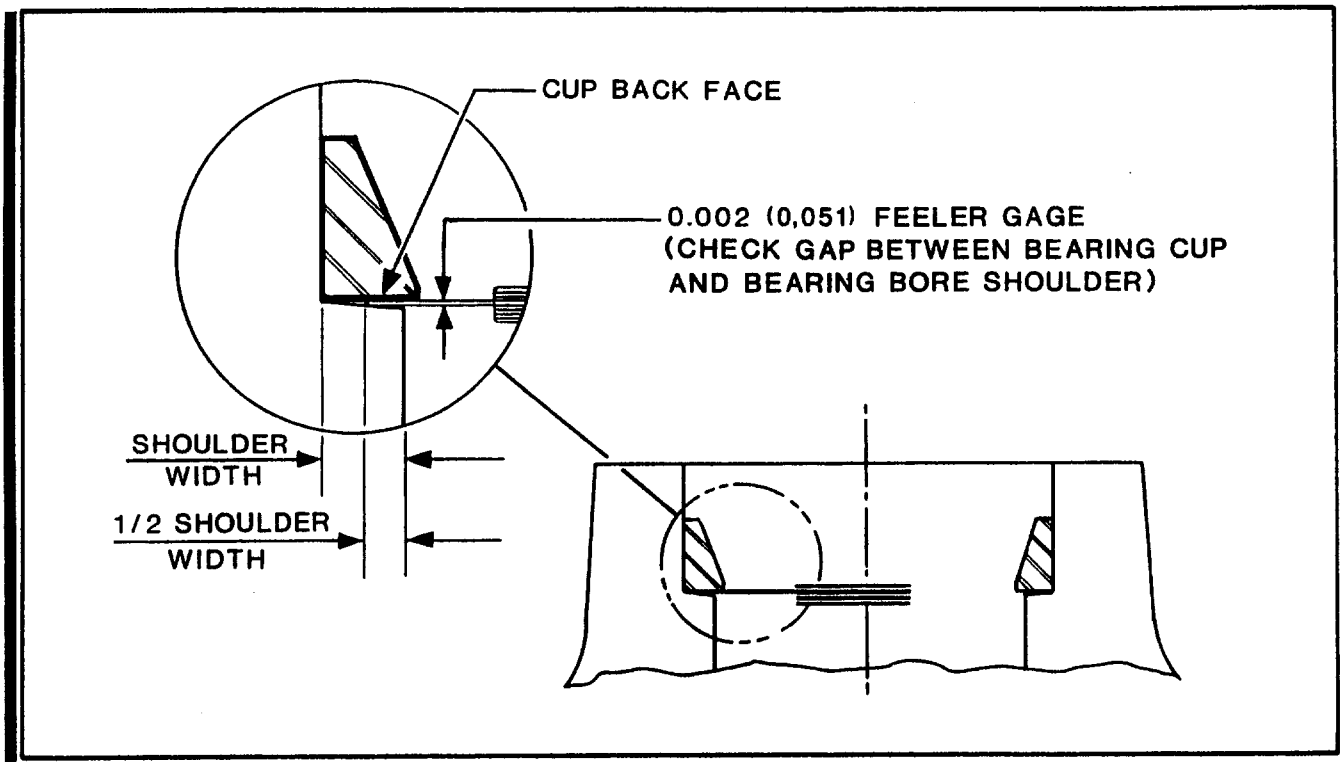
CAUTION: DO NOT OVERHEAT WHEEL SUBASSEMBLY OR PROLONG THE HEATING PERIOD. OVERHEATING WILL ADVERSELY AFFECT THE WHEEL'S SERVICE LIFE.

(3) Heat wheel subassembly in an oven not exceeding 250°F (121°C) for 30 minutes.

(4) Remove wheel subassembly from heat source and remove bearing cup from dry ice. Dry hub bore and cup thoroughly.

(5) Coat wheel contact surfaces of bearing cup with zinc chromate primer or paste, Specification TT-P-1757 and immediately install cup into bearing bore while primer or paste is still wet.

NOTE: When installing Bushing Cup Subassembly 5R4-140, align slot in bushing with hole in wheel subassembly.



CAUTION: WHEN INSTALLING THE BEARING CUP, SUPPORT THE WHEEL SUBASSEMBLY ON THE HUB, NOT ON THE FLANGE.

(6) Using a fiber or phenolic punch, tap cup into bore and up tightly against shoulder. Avoid cocking the cup during installation.

(7) Cup seating should be checked after the wheel hub has cooled enough to hold the cup. To ensure the cup is adequately seated, check for any clearance (gap) between the cup back face and the shoulder (register) in the wheel hub with a 0.002 inch (0,05 mm) feeler gage. A 0.002 inch (0,05 mm) maximum clearance between cup and shoulder is permissible, provided the feeler gage cannot be inserted more than one-half the width of the shoulder at any location around back face of cup as shown in Figure 602.

NOTE: Above limits do not apply to areas of wheel hub shoulder cleaned up in accordance with Repair of Wheel Subassemblies.

(8) Allow wheel to cool to room temperature. Apply a light coat of grease, Specification MIL-G-81322, to bearing cup to prevent corrosion.

Typical Bearing Cup Register Check
Figure 602

5. Replacing Disk Drive Ring (300 or 300A)

CAUTION: WHEN HEATING WHEEL SUBASSEMBLY FOR DRIVE RING REMOVAL AND INSTALLATION, ENSURE THAT CUP SEATING HAS NOT BEEN IMPAIRED.

NOTE: Remove disk drive ring only if it requires replacement or if a thorough check of the wheel subassembly is necessary. If removed for checking, mark the location of the disk drive ring to ensure reassembly in the original position.

A. Remove disk drive ring (300) from inboard wheel subassembly (240) as follows:

(1) Cover bearing cup with cardboard or fiber disk to prevent contamination or damage.

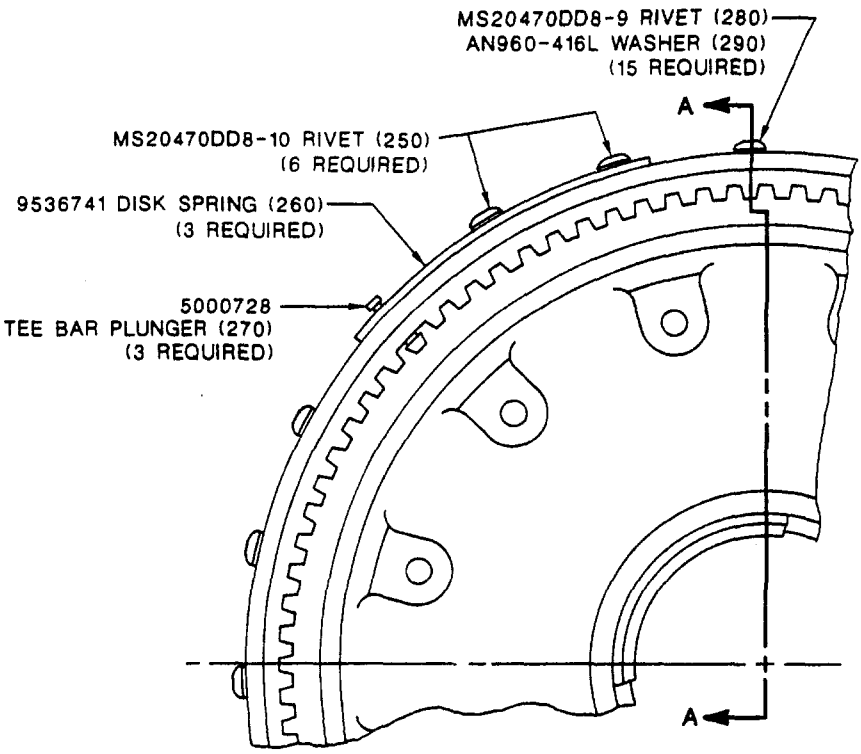
CAUTION: WHEN REMOVING RIVETS, BE CAREFUL NOT TO ENLARGE RIVET HOLES IN WHEEL FLANGE.

(2) Remove the two rivets (250) holding each disk spring (260) to the wheel flange; then disengage disk spring from the tee bar plunger (270) and remove plunger from inside of wheel.

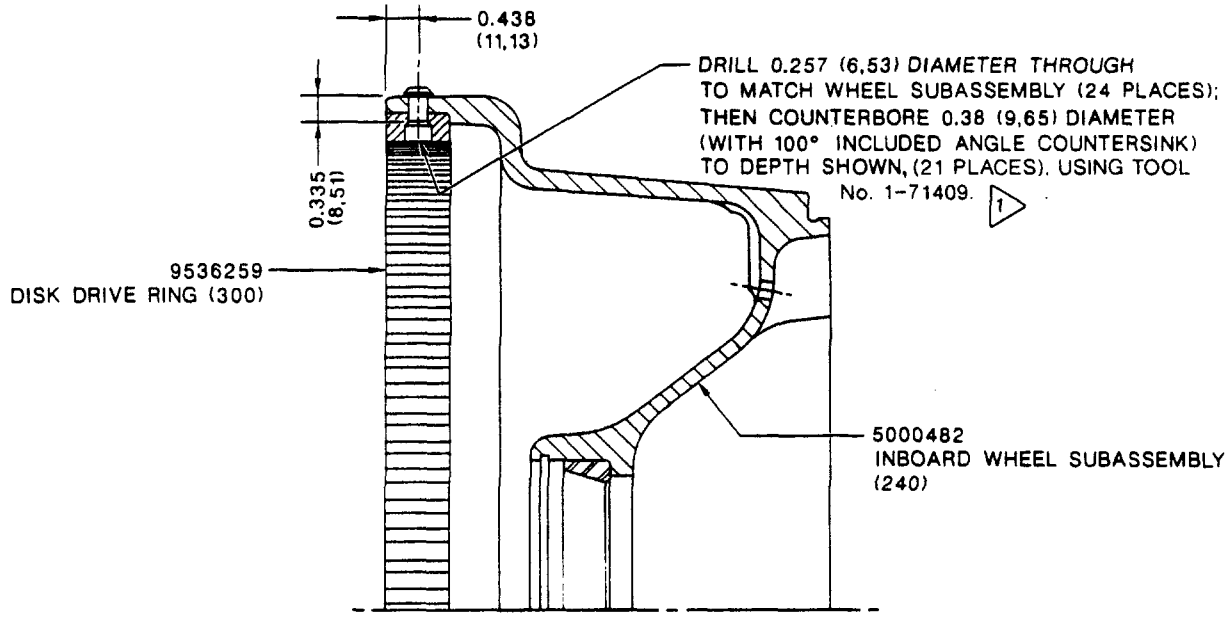
(3) Remove rivets (280) and plain washers (290).

CAUTION: DO NOT OVERHEAT WHEEL SUBASSEMBLY OR PROLONG THE HEATING PERIOD. OVERHEATING WILL ADVERSELY AFFECT THE WHEEL'S SERVICE LIFE.

(4) Heat wheel subassembly in an oven not exceeding 250°F (121°C) for 30 minutes. Tap disk drive ring carefully out of wheel subassembly with a fiber or phenolic drift pin.



(5) Check wheel subassembly rivet holes for enlarged or elongated holes or if rivets were found loose prior to removal of disk drive ring. Repair rivet holes on inboard wheel flange in accordance with Repair No. 3 - Drive Flange Rivet Hole Repair or Repair No. 4 - Drive Flange Tee Bar Plunger Hole Repair.



B. Install aluminum disk drive ring (300) in inboard wheel subassembly (240) as follows (Ref. Fig. 603):

CAUTION: DO NOT OVERHEAT WHEEL SUBASSEMBLY OR PROLONG THE HEATING PERIOD. OVERHEATING WILL ADVERSELY AFFECT THE WHEEL'S SERVICE LIFE.

(1) Heat inboard wheel subassembly (240) in an oven not exceeding 250°F (121°C) for 30 minutes.

(2) Remove wheel subassembly from heat source.

SECTION A-A

NOTE:

1 NO COUNTERBORE REQUIRED AT TEE BAR HOLES.

Installing Disk Drive Ring 9536259
Figure 603

CAUTION: THE CENTERLINES OF THE DRIVE GEAR TEETH MUST BE ALIGNED WITHIN 0.008 INCH (0,203 MM) OF THE CENTERLINE OF THE EXISTING HOLES IN THE WHEEL FLANGE. THE THREE PLACES ON THE DISK DRIVE RING WITHOUT A GEAR TOOTH MUST BE ALIGNED WITH THE PROPER HOLES IN THE WHEEL FLANGE TO PERMIT INSTALLATION OF TEE BAR PLUNGERS. MAKE SURE THE DISK DRIVE RING IS PROPERLY ALIGNED AND COMPLETELY SEATED IN THE WHEEL SUBASSEMBLY.

(3) Paint contacting surfaces of wheel and disk drive ring with zinc chromate paste or primer, Specification TT-P-1757 and install disk drive ring immediately into wheel flange while zinc chromate paste or primer is still wet.

NOTE: Disk drive ring should be assembled while ring is at a temperature of 75°F (24°C) and wheel subassembly is at 250°F (121°C). Reducing temperature of disk drive ring will increase clearance and ease of assembly.

(4) Use drill bushing to locate center of holes and using rivet holes in wheel subassembly as a guide, drill size (F) 0.257 inch (6,53 mm) holes through disk drive ring to match (24 places).

(5) Counterbore holes in disk drive ring (21 places) as shown in Figure 603 using tool number 1-71409.

NOTE: 21 holes equally spaced on basis of 24 spaces. Counterbore not required at location of tee bar.

(6) Apply two coats of zinc chromate primer, Specification TT-P-1757 to rivet holes.

NOTE: The aluminum disk drive ring does not require sealant coating.

(7) Rivet disk drive ring to wheel flange with 15 rivets (280) and plain washers (290).

NOTE: Do not install these rivets in holes reserved for installing disk springs.

(8) Insert three tee bar plungers (270) in place as shown in Figure 603.

(9) Slide the disk springs (260) into position with the slots holding the tee bar plungers in place. Then install six rivets (250) to secure the disk springs and tee bar plunger.

C. Remove disk drive ring (300A) from inboard wheel subassembly (240A) as follows:

(1) Cover bearing cup with cardboard or fiber disk to prevent contamination or damage.

(2) Cut lockwire and remove the two hex head bolts (255) holding each disk spring (260) to the wheel flange; then disengage disk spring from the tee bar plunger (270) and remove plunger from inside of wheel.

(3) Cut lockwire and remove remaining hex head bolts (255) and plain washers (290).

CAUTION: DO NOT OVERHEAT WHEEL SUBASSEMBLY OR PROLONG THE HEATING PERIOD. OVERHEATING WILL ADVERSELY AFFECT THE WHEEL'S SERVICE LIFE.

(4) Heat wheel subassembly in an oven not exceeding 250°F (121°C) for 30 minutes. Tap disk drive ring carefully out of wheel subassembly with a fiber or phenolic drift pin.

(5) If applicable, remove adhesive sealant from wheel subassembly and disk drive ring using methyl isobutyl ketone (MIBK), Specification TT-M-268.

NOTE: When disk drive ring has been removed, check wheel subassembly for cracks at radius behind the drive ring seat. Replace any wheel subassembly cracked in this area. Check threaded holes in wheel flange for damage or cracks.

D. Install steel disk drive ring (300A) in inboard wheel subassembly (240A) as follows (Ref. Figs. 604 and 605):

(1) Coat contacting surfaces of inboard wheel subassembly (240A) for disk drive ring (300A) with Adhesive Sealant 3M776 (Ref. Fig. 604).

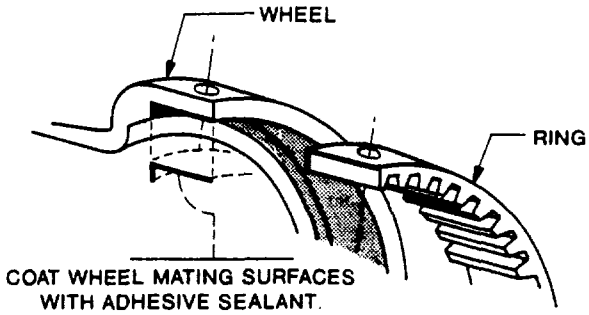
WARNING: SEALANT SOLUTIONS ARE TOXIC AND VOLATILE. USE IN WELL VENTILATED AREA IN ABSENCE OF OPEN FLAME OR ELECTRICAL SPARKS. DO NOT INHALE VAPORS OR ALLOW SOLUTION TO CONTACT SKIN OR CLOTHING.

(a) Allow 24 hours drying time before assembly of disk drive ring into wheel.

(b) Excess material will not harm adjacent areas and may be removed from equipment with methyl isobutyl ketone (MIBK), Specification TT-M-268 and light rubbing with a clean cloth.

CAUTION: DO NOT OVERHEAT WHEEL SUBASSEMBLY OR PROLONG THE HEATING PERIOD. OVERHEATING WILL ADVERSELY AFFECT THE WHEEL'S SERVICE LIFE.

(2) Heat inboard wheel subassembly (240A) in an oven not exceeding 250°F (121°C) for 30 minutes.



(3) Remove wheel subassembly from heat source.

TEMPORARY REVISION NO. 32–2

FILING INSTRUCTIONS: Insert facing page 611

DESCRIPTION: Clarified text—from "between" to "over"— in paragraph 5.D.(4) concerning replacing disk drive ring.

(1) Install disk drive ring, chamfered or radius end first, into heated wheel subassembly. If using the original ring, tap with a fiber drift pin to align the ring in its original position. Align a new ring so that the screw holes in the wheel flange are centered directly over the teeth of the disk drive ring. Disk drive ring must not protrude beyond the face of wheel subassembly.

NOTES:
1. 3M776 ADHESIVE SEALANT SHALL BE APPLIED TO A THICKNESS OF 0.0005 TO 0.003 (0.013 TO 0.076) BY NATURAL BRISTLE BRUSH TO A CLEAN, DRY, GREASE FREE SURFACE
2. IF MULTIPLE COATS ARE REQUIRED TO GET EVEN THICKNESS, ALLOW TEN MINUTES DRYING TIME BETWEEN COATS.
3. MATERIAL MAY BE REMOVED FROM EQUIPMENT WITH METHYL ISOBUTYL KETONE, (MIBK) AND LIGHT RUBBING WITH A CLEAN CLOTH.
4. ALLOW 24 HOURS DRYING TIME BEFORE ASSEMBLY OF RING INTO WHEEL.
5. NEW MATERIAL MAY BE THINNED BY ADDITION OF MIBK TO OBTAIN WORKABLE CONSISTENCY.

Application of Adhesive Sealant
Figure 604

CAUTION: THE CENTERLINES OF THE DRIVE GEAR TEETH MUST BE ALIGNED WITHIN 0.008 INCH (0,203 MM) OF THE CENTERLINE OF THE EXISTING HOLES IN THE WHEEL FLANGE. THE THREE PLACES ON THE DISK DRIVE RING WITHOUT A GEAR TOOTH MUST BE ALIGNED WITH THE PROPER HOLES IN THE WHEEL FLANGE TO PERMIT INSTALLATION OF TEE BAR PLUNGERS. MAKE SURE THE DISK DRIVE RING IS PROPERLY ALIGNED AND COMPLETELY SEATED IN THE WHEEL SUBASSEMBLY.

NOTE: Disk drive ring should be assembled while ring is at a temperature of 75°F (24°C) and wheel subassembly is at 250°F (121°C). Reducing temperature of disk drive ring will increase clearance and ease of assembly.

(4) Install disk drive ring, chamfered or radius end first, into heated wheel subassembly. If using the original ring, tap with a fiber drift pin to align the ring in its original position. Align a new ring so that the screw holes in the wheel flange are centered directly between the teeth of the disk drive ring. Disk drive ring must not protrude beyond face of wheel subassembly.

NOTE: Please see the TEMPORARY REVISION that revises this page.

(5) Being careful not to damage the existing threads, use the bolt holes in the wheel flange as guides, install temporary drill guide and drill and tap holes through disk drive ring to match (24 places) as shown in Figure 605.

(6) Counterbore holes in disk drive ring (21 places) as shown in Figure 605 using tool number 1-71409.

NOTE: 21 holes equally spaced on basis of 24 spaces. Counterbore not required at location of tee bar.

(7) Install drive ring bolts (255) and plain washers (290) as follows (Ref. Fig. 605):

(a) Bolt disk drive ring (300A) to wheel flange with 15 bolts (25) and plain washers (290). Tighten bolts (255) to a torque value of 50 to 70 pound-inches (5,6 to 7,9 N-m).

NOTE: Do not install bolts in holes reserved for installing disk springs.

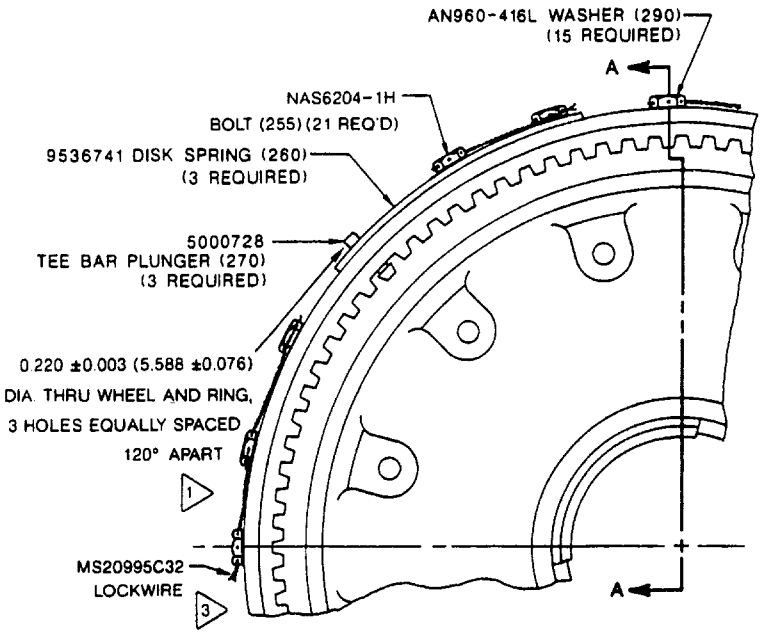
(8) Insert three tee bar plungers (270) in place as shown in Figure 605.

(9) Slide the disk springs (260) into position with the slots holding the tee bar plungers in place. Then install six bolts (255) to secure the disk springs and tee bar plunger (270). Tighten bolts (255) to a torque value of 50 to 70 pound-inches (5,6 to 7,9 N-m).

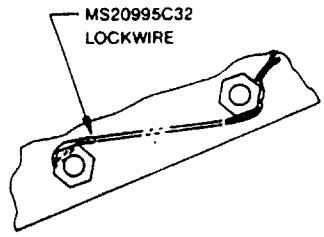
NOTE: Do not install washers under bolts for disk springs.

(10) Safetywire bolt heads (255) in pairs with Lockwire MS20995C32 and safetywire three bolts adjacent to tee bar (3 places) with Lockwire MS20995C32 (Ref. Fig. 605).

6. Re-Treating and Repainting

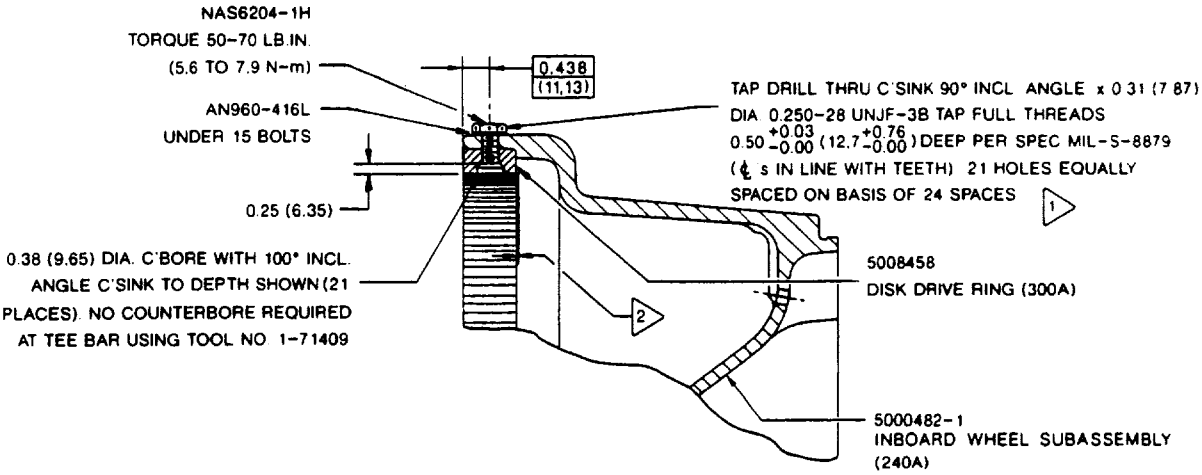


A. Repaired areas of the wheel subassemblies and those having the paint and treated finish removed should be re-treated as follows and repainted in accordance with the following procedures:



B. Re-Treating

WARNING: CLEANING SOLVENTS ARE TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS. AVOID PHYSICAL CONTACT WITH SOLVENT AND DO NOT INHALE VAPORS.



(1) Thoroughly clean surface to be re-treated and repainted. Clean with hot water or methyl isobutyl ketone, Specification TT-M-268, and dry thoroughly with compressed air.

(2) Re-treat all exposed surfaces of wheel subassemblies with chemical film solution conforming to Specification MIL-C-5541 in accordance with the manufacturer's instructions. Refer to Repair Materials for recommended solution.

VIEW SHOWING TYPICAL SAFETY WIRING

SECTION A-A

NOTES:

1. USE 0.125 (3.18) DIA. LOCATOR HOLE IN DRIVE RING FOR DRILLING AND TAPPING HOLES. USE DRILL BUSHING TO LOCATE CENTER OF HOLE.
2. 0.005 (0.127) MAXIMUM GAP ALLOWABLE FOR 1/4 OF SEAT CIRCUMFERENCE
3. THESE 3 BOLTS (3 PLACES) TO BE LOCKWIRED TOGETHER ON THIS SIDE OF TEE BAR

Installing Disk Drive Ring 5008458
Figure 605

C. Touchup painting should be performed as follows:

(1) The part or area requiring touchup painting must be thoroughly clean and free of all contaminants.

(2) Prepare area to be painted (scratches, nicks, chipped paint, etc) by sanding lightly to feather out all edges of adjacent finish, using 320 to 360 grit, wet-or-dry, aluminum oxide cloth. Wet sanding is preferred. Avoid removing more primer than is absolutely necessary from damaged area.

WARNING: CLEANING SOLVENTS ARE TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS. AVOID PHYSICAL CONTACT WITH SOLVENT AND DO NOT INHALE VAPORS.

(3) Wipe repaired surface with a cloth moistened with methyl isobutyl ketone, Specification TT-M-268, and wipe surface dry with a clean cloth.

CAUTION: IF BARE METAL IS EXPOSED BY SANDING, IT MUST BE RE-TREATED BEFORE APPLYING PRIMER.

(4) Starting with the last intact paint layer, reapply paint coats in accordance with repainting wheel assembly.

NOTE: The gloss must be removed in the area to be touched up with an abrasive material, the defective area smoothed and edges feathered. The area must then be cleaned removing all loose and foreign material.

D. Repaint wheel assembly as follows - Method I (Primary) (Ref. Fig. 606).

WARNING: CLEANING SOLVENTS ARE TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS. AVOID PHYSICAL CONTACT WITH SOLVENT AND DO NOT INHALE VAPORS.

(1) Thoroughly clean all surfaces to be treated and/or painted. Wheel subassembly should be washed with methyl isobutyl ketone, Specification TT-M-268.

(2) Treat all exposed metal surfaces of wheel subassemblies with chemical film solution conforming to Specification MIL-C-5541, in accordance with manufacturer's instructions.

CAUTION: DO NOT PAINT ROLLER CONTACTING SURFACES OF BEARING CUPS. PAINT ON THESE SURFACES WILL CONTRIBUTE OR RESULT IN LOSS OF BEARING PRELOAD.

(3) Mask bearing cups (220 and 310) and threaded holes to avoid getting paint on these surfaces.

(4) Mix the aluminum topcoat/primer combination until a viscosity of approximately 25 seconds in a No. 2 Zahn cup is obtained.

NOTE: Aluminum topcoat/primer combination should be at the proper viscosity. If required, thinning can be accomplished using Aeroprite Reducer TH-89.

CAUTION: APPLY ONLY ONE MIST COAT OF TOPCOAT/PRIMER COMBINATION TO REGISTER SURFACES, MATING SURFACES, AND BOLT BOSSES. EXCESSIVE PAINT ON THESE SURFACES MAY CONTRIBUTE OR RESULT IN LOSS OF BOLT PRELOAD.

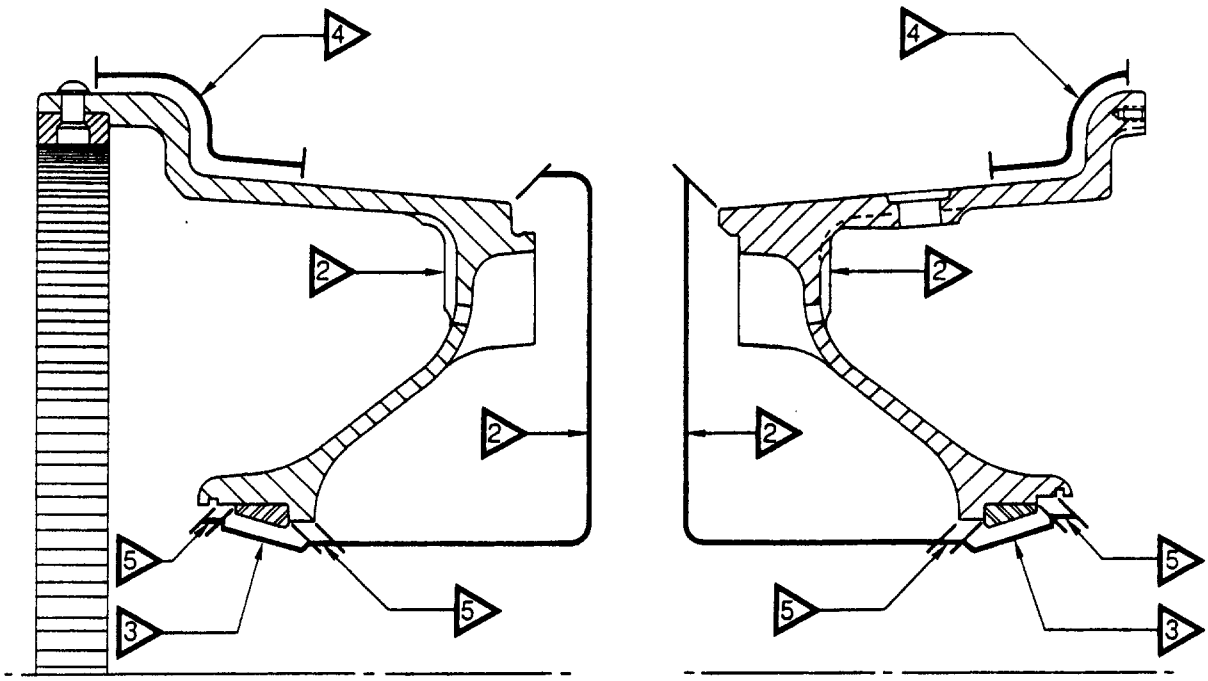
(5) Apply two coats of aluminum topcoat/primer combination in accordance with Figure 606.

(a) Spray one full wet cross coat to a dry film thickness of approximately 0.0004 to 0.0006 inch (0,010 to 0,015 mm).

(b) Air dry for a minimum of 45 minutes before applying a second coat.

(c) Spray a second full cross coat to a dry film thickness of approximately 0.0004 to 0.0006 inch (0,010 to 0,015 mm).

NOTE: Due to abrasion in the tire bead contacting surfaces, it is recommended that tire bead contacting surfaces have a minimum of 0.0015 inch (0,038 mm) thickness of paint.



(d) Air dry 45 minutes before handling. Paint will reach full cure in 72 hours.

E. Repaint wheel assembly as follows - Method II (Alternate) (Ref. Fig. 606):

WARNING: CLEANING SOLVENTS ARE TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS. AVOID PHYSICAL CONTACT WITH SOLVENT AND DO NOT INHALE VAPORS.

(1) Thoroughly clean all surfaces to be treated and/or painted. Wheel subassembly should be washed with methyl isobutyl ketone, Specification TT-M-268.

(2) Treat all exposed metal surfaces of wheel subassemblies with chemical film solution conforming to Specification MIL-C-5541, in accordance with manufacturer's instructions.

NOTES:

1 METHOD I - APPLY TWO COATS OF ALUMINUM TOPCOAT/PRIMER COMBINATION. METHOD II - TWO COATS OF ZINC CHROMATE PRIMER AND TWO COATS OF ALUMINUM LAQUER EXCEPT AS SHOWN.

2 METHOD I - ONE COAT OF TOPCOAT/PRIMER ONLY ON THESE SURFACES. METHOD II - ONE MIST COAT OF PRIMER ONLY ON THESE SURFACES.

3 THESE SURFACES TO BE COATED WITH BEARING GREASE. PAINT OR PRIMER NOT PERMITTED.

4 TIRE BEAD CONTACTING SURFACES MUST BE PAINTED THOROUGHLY.

5 THESE SURFACES TO BE COATED WITH BEARING GREASE. OVERSPRAY PERMITTED.

Wheel Painting Diagram
Figure 606

CAUTION: DO NOT PAINT ROLLER CONTACTING SURFACES OF BEARING CUPS. PAINT ON THESE SURFACES MAY CONTRIBUTE OR RESULT IN LOSS OF BEARING PRELOAD.

(3) Mask bearing cups (220 and 310) and threaded holes to avoid getting paint on these surfaces.

CAUTION: APPLY ONLY ONE MIST COAT OF ZINC CHROMATE PRIMER TO REGISTER SURFACES, MATING SURFACES AND BOLT BOSSES. EXCESSIVE PRIMER ON THESE SURFACES MAY CONTRIBUTE OR RESULT IN LOSS OF BOLT PRELOAD.

(4) Paint exposed metal surfaces in accordance with Figure 606 and as follows:

(5) Apply one coat of zinc chromate primer, Specification TT-P-1757, in accordance with Figure 606.

NOTE: Do not exceed the recommended thickness for the applied topcoats. If the humidity should drop below 20 percent, primer application should be stopped until steps are taken to raise the percent humidity.

(a) Apply one coat of primer to obtain a dry film thickness of 0.0003 to 0.0004 inch (0,00762 to 0,0102 mm).

(b) Allow the primer surface to dry a minimum of two hours and a maximum of 12 hours before topcoating with aluminum lacquer, Specification TT-L-32.

(6) Apply one coat of aluminum lacquer, Specification TT-L-32, in accordance with Figure 606.

(a) Spray one full wet cross coat to a dry film thickness of approximately 0.0004 to 0.0006 inch (0,0102 to 0,0152 mm) over the primer coating.

(b) Air dry 45 minutes before handling. Paint will reach full cure in 24 hours.

REPAIR NO. 1 - INBOARD WHEEL BEARING CUP BORE REPAIR

1. General (Ref. IPL Fig. 1)

   A. This repair is used for the repair of damaged bearing cup bores in Inboard Wheel Subassembly 5000482 (240) and 5000482-1 (240A).

   B. This repair provides for machining the bearing cup bore for installation of Bushing Cup Subassembly 5R4-139.

   C. Disassemble as required in accordance with DISASSEMBLY.

2. Repair of Worn Inboard Wheel Bearing Cup Bores

   A. Should a bearing cup be loose in its bore, repair as follows:

      (1) Remove loose bearing cup from wheel subassembly as described in Replacing Bearing Cups.

   B. Bushing-Cup Repair

      (1) Machine hub bore of wheel subassembly oversized as follows:

         NOTE: One oversize machining operation is available to correct the worn inboard bearing bore.

         (a) Machine hub of wheel subassembly to the dimensions shown in Repair, Figure 601. If bore does not cleanup, replace wheel subassembly.

      (2) Thoroughly clean and then treat newly machined surfaces with chemical film solution, Specification MIL-C-5541.

      (3) Install the proper repair bushing cup subassembly (311) as described in Replacing Bearing Cups.

         (a) The inboard wheel subassembly requires the 5R4-139 bushing cup subassembly (311).

      (4) Metal stamp "5R4-139" in 0.19 inch (4,8 mm) characters after Wheel Assembly 5000444 or 5000444-1 or 5000444-3.

      (5) Re-treat and repaint any displaced metal in accordance with Re-Treating and Repainting.

MACHINING DETAIL FOR INBOARD BEARING BORE

INSTALLATION DETAIL

REPAIR NO. 2 - OUTBOARD WHEEL BEARING CUP BORE REPAIR

1. General (Ref. IPL Fig. 1)

   A. This repair is used for the repair of damaged bearing cup bores in Outboard Wheel Subassemblies 5000484 (100).

   B. This repair provides for machining the bearing cup bore for installation of a Bushing Cup Subassembly 5R4-140.

   C. Disassemble as required in accordance with DISASSEMBLY.

2. Repair of Worn Outboard Wheel Bearing Cup Bores

   A. Should a bearing cup be loose in its bore, repair as follows:

      (1) Remove loose bearing cup from wheel subassembly as described in Replacing Bearing Cups.

   B. Bushing Cup Repair

      (1) Machine hub bore of wheel subassembly oversized as follows:

         NOTE: One oversize machining operation is available to correct the worn outboard bearing bore.

         (a) Machine hub of wheel subassembly to the dimensions shown in Repair Figure 601. If bore does not cleanup, replace wheel subassembly.

      (2) Thoroughly clean and then treat newly machined surfaces with chemical film solution, Specification MIL-C-5541.

      (3) Install the proper repair bushing cup subassembly (221) as described in Replacing Bearing Cups.

         (a) The outboard wheel subassembly requires the 5R4-140 bushing cup subassembly (221).

      (4) Metal stamp "5R4-140" in 0.19 inch (4,8 mm) characters after Wheel Assembly 5000444 or 5000444-1 or 5000444-3.

      (5) Re-treat and repaint any displaced metal in accordance with Re-Treating and Repainting.

REPAIR NO. 3 - DRIVE FLANGE RIVET HOLE REPAIR

1. General (Ref. IPL Fig. 1)

   A. This repair is used for the repair of damaged drive flange rivet holes on Inboard Wheel Subassembly 5000482 (240).

   B. This repair provides for machining the rivet hole oversize and installation of Rivet Bushing 5006511 (281).

   C. Disassemble as required in accordance with DISASSEMBLY and Replacing Disk Drive Ring in REPAIR.

2. Repair of Drive Flange Rivet Holes

   A. If drive ring rivets were found loose prior to drive ring removal from inboard wheel subassembly, repair enlarged or damaged rivet holes in flange of inboard wheel subassembly as follows:

      (1) Machine damaged rivet holes in accordance with Repair Figure 601.

      (2) Treat newly machined surfaces of wheel subassembly with chemical film solution conforming to Specification MIL-C-5541.

      (3) Chill rivet bushing (281) with dry ice or freeze to aid installation (Ref. Repair Figure 601).

      (4) Install chilled rivet bushing (281) in accordance with Repair Figure 601.

      (5) Metal stamp "R" in 0.12 inch (3,05 mm) characters adjacent to each repaired rivet hole.

      (6) Metal stamp "5R81-033" adjacent to Inboard Wheel Subassembly 5000482 number in 0.12 inch (3,05 mm) characters no deeper than 0.015 inch (0,381 mm).

      (7) Re-treat and repaint any displaced metal in accordance with Re-Treating and Repainting.

      (8) Install disk drive ring in accordance with Replacing Disk Drive Ring.

REPAIR NO. 4 - DRIVE FLANGE TEE BAR PLUNGER HOLE REPAIR

1. General (Ref. IPL Fig. 1)

   A. This repair is used for the repair of damaged tee bar plunger hole on the Inboard Wheel Subassembly 5000482 (240).

   B. The first repair provides for machining the tee bar plunger hole oversized and installation of Flange Bushing 5007112 (271).

   C. The second repair provides for machining the tee bar plunger hole oversized and installation of Flange Bushing 5011243 (272).

   D. Disassemble as required in accordance with DISASSEMBLY.

      NOTE: Do not remove disk drive ring for this repair.

2. Repair of Drive Flange Tee Bar Plunger Hole (First Oversize)

   A. If tee bar plunger is found excessively loose or plunger hole is damaged or enlarged in the inboard wheel subassembly and disk drive ring replacement is not required, repair plunger holes as follows:

      (1) Remove tee bar plunger in accordance with Replacing Disk Drive Ring.

          NOTE: Do not remove disk drive ring for this repair.

      (2) Machine damaged plunger hole in accordance with Repair Figure 601.

      (3) Treat newly machined surfaces of wheel subassembly and disk drive ring with chemical film solution conforming to Specification MIL-C-5541.

      (4) Chill flange bushing (271) with dry ice or freeze to aid installation (Ref. Repair Figure 601).

      (5) Coat chilled flange bushing and plunger hole with Loctite RC/620 and install flange bushing (271) in accordance with Repair Figure 601.

      (6) Metal stamp "R" in 0.12 inch (3,05 mm) characters adjacent to each repaired tee bar plunger hole.

      (7) Metal stamp "5R83-008" adjacent to Inboard Wheel Subassembly 5000482 number in 0.12 inch (3,05 mm) characters.

      (8) Re-treat and repaint any displaced metal in accordance with Re-Treating and Repainting.

      (9) Replace tee bar plunger and spring disk in accordance with Replacing Disk Drive Ring.

3. Repair of Drive Flange Tee Bar Plunger Hole (Second Oversize)

A. If tee bar plunger is found excessively loose or plunger hole is damaged or enlarged in the inboard wheel subassembly and disk drive ring replacement is not required, repair plunger holes as follows:

(1) Remove tee bar plunger in accordance with Replacing Disk Drive Ring.

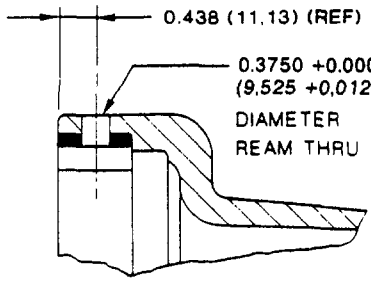
NOTE: Do not remove disk drive ring for this repair.

(2) Remove Flange Bushing 5007112 (271) if installed.

(3) Machine damaged plunger hole in accordance with Repair Figure 602.

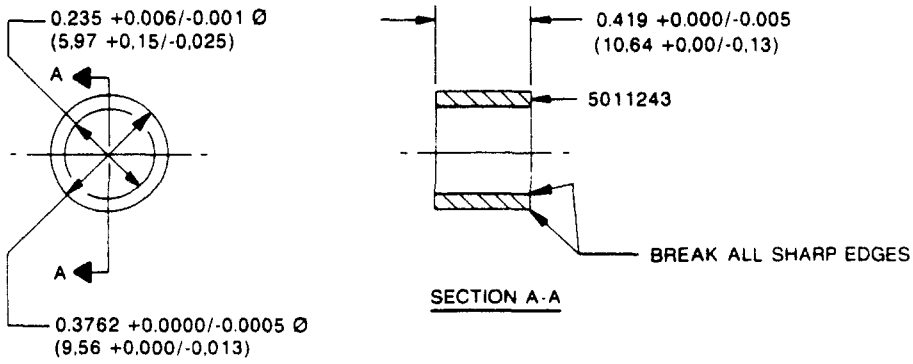
(4) Treat newly machined surfaces of wheel subassembly and disk drive ring with chemical film solution conforming to Specification MIL-C-5541.

(5) Chill flange bushing (272) with dry ice or freeze to aid installation (Ref. Repair Figure 602).



(6) Coat chilled flange bushing and plunger hole with Loctite RC/620 and install flange bushing (272) in accordance with Repair Figure 602.

(7) Metal stamp "R" in 0.12 inch (3,05 mm) characters adjacent to each repaired tee bar plunger hole.



(8) Metal stamp "-1" or "5R83-008-1" adjacent to Inboard Wheel Subassembly 5000482 number in 0.12 inch (3,05 mm) characters to read "5R83-008-1".

(9) Re-treat and repaint any displaced metal in accordance with Re-Treating and Repainting.

(10) Replace tee bar plunger and spring disk in accordance with Replacing Disk Drive Ring.

REPAIR NO. 5 - REPAIR OF FAIRING RETAINING SCREW THREADS, OUTBOARD WHEEL SUBASSEMBLY

1. General (Ref. IPL Fig. 1)

   A. This repair is used for the repair of stripped or damaged fairing retaining screw holes on Outboard Wheel Subassembly 5000484.

   B. This repair provides for machining the fairing retaining screw holes for installation of Heli-Coil inserts.

   C. If the fairing retaining screw hole contains stripped or damaged threads, repair using Heli-Coil inserts. If the fairing retaining screw hole has been repaired with Heli-Coil inserts and contains stripped or damaged threads, replace outboard wheel subassembly.

2. Repair of Fairing Retaining Screw Threads (Heli-Coil Inserts)

   A. The following repair consists of remachining the fairing retaining screw holes and installing Heli-Coil inserts when the fairing retaining threads are stripped or damaged (Ref. Repair Fig. 601).

   B. Machine fairing retaining screw hole oversize to dimension in Repair Figure 601.

      (1) Re-treat all exposed aluminum surfaces with chemical film solution, Specification MIL-C-5541, in accordance with manufacturer's instructions. Refer to Repair Materials for recommended solution.

   C. Install Heli-Coil inserts in accordance with Repair Figure 602.

   D. Metal stamp "5R3-353" adjacent to subassembly number in 0.12 inch (3,05 mm) characters.

Figure 602

ASSEMBLY AND STORAGE

1. Assembly Materials

NOTE: Equivalent substitutes may be used for items listed below.

Isopropyl Alcohol Specification TT-I-735	Commercially available
Grease Specification MIL-G-81322	Commercially available
Antiseize Compound Specification MIL-T-5544	Commercially available

2. General (Ref. IPL Fig. 1)

A. Assemble the main wheel in accordance with the following instructions.

CAUTION: ASSEMBLE WHEEL ON A CLEAN, FLAT SURFACE, BEING CAREFUL NOT TO NICK, SCRATCH OR SCUFF PAINT OR PROTECTIVE FINISH FROM WHEEL SUBASSEMBLIES. ENSURE PROPER PARTS ARE USED FOR EACH WHEEL ASSEMBLY.

B. It is recommended new preformed packings be installed at each reassembly.

C. Install instruction plate (10) and balance weights if removed at disassembly. Instructions for attaching balance weights are given in Wheel Balancing.

D. The use of power wrenches for wheel assembly is governed by the following:

(1) Do not use power wrenches for assembly of any threaded parts made of nonferrous material or parts threaded directly into nonferrous tapped holes.

(2) When power wrenches, other than automatic wrenching systems are used to assemble bolts and nuts, fastener tightness shall not exceed 50 percent of final torque value. Tightening to final torque value shall be accomplished using manual torque wrenches.

(3) Automatic wrenching systems which provide a preload or torque accuracy of ± 4 percent or better may be used to tighten bolts and nuts to final torque value.

3. Assembly Procedures

A. If removed at disassembly, install bearing cups (220 and 310), disk spring (260), tee bar plunger (270), and disk drive ring (300 or 300A) in accordance with procedures in REPAIR.

B. Install instruction plate (10) on outboard wheel subassembly (100) as follows:

(1) Area in which plate is to be installed must be clean. Use a clean cloth dampened with isopropyl alcohol, Specification TT-I-735.

(2) Remove paper backing from adhesive surface being careful not to touch the adhesive.

(3) Apply plate to proper location, press firmly with roller (minimum 5 pounds (2,268 kg) pressure applied to roller) to ensure proper contact to both surfaces. Be sure that edges of plate are rolled down firmly.

(4) A set-up or curing time of approximately 48 hours is required to permanently set the adhesive, and plate should not be disturbed during this time.

C. Position tire/time change counter (210) on outboard wheel subassembly (100) and secure counter in place with screw (200), plain washer (190), and self-locking nut (180).

D. Install valve subassembly (110 or 110A) as follows:

NOTE: If tube-type tire is installed, do not install valve subassembly.

(1) For Main Wheel Assembly 5000444 and 5000444-3 install valve subassembly (110) onto outboard wheel subassembly (100) as follows:

(a) Install preformed packing (170) on valve stem (160) and seat tightly against stem base.

(b) Clean area of outboard wheel subassembly (100) around valve hole thoroughly with a clean cloth. Insert valve stem through valve hole with valve stem towards outside of wheel and preformed packing in valve hole.

(c) Place washer (150) over valve stem and onto preformed packing (170). Install hex nut (140) on valve stem and tighten until preformed packing is firmly compressed and valve hole is sealed.

(2) For Main Wheel Assembly 5000444-1 install valve subassembly (110A) onto outboard wheel subassembly (100) as follows:

(a) Install preformed packing (170) on valve stem (160A) and seat tightly against stem base.

(b) Clean area of outboard wheel subassembly (100) around valve hole thoroughly with a clean cloth. Insert valve stem through valve hole with valve stem towards outside of wheel and preformed packing in valve hole.

(c) Place spacer (150A) over valve stem and onto preformed packing (170). Install hex nut (140A) on valve stem and tighten until preformed packing is firmly compressed and valve hole is sealed.

E. Install "tubeless" tire as follows:

(1) Check tire for word "Tubeless" on sidewall.

(2) Visually check tire with emphasis on bead area for shipping or handling damage.

(3) Make certain tire is free of foreign material and that bead areas are clean.

WARNING: CLEANING SOLVENTS ARE TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS. AVOID PHYSICAL CONTACT WITH SOLVENT AND DO NOT INHALE VAPORS.

(4) Clean tire beads, wheel flange bead seats and wheel register surfaces with a cloth dampened with isopropyl alcohol, Specification TT-I-735.

(5) Place inboard wheel subassembly (240 or 240A) on clean, flat surface with flange down.

CAUTION: EQUALIZE THE PACKING AROUND THE PACKING GROOVE BE CAREFUL PACKING IS NOT STRETCHED, TWISTED, PINCHED OR UNSEATED. REUSED PACKINGS SHOULD BE INSTALLED AS CLOSE AS POSSIBLE TO THEIR ORIGINAL POSITION.

(6) Lubricate preformed packing (230) with light coat of grease, Specification MIL-G-81322, and install into groove on the inboard wheel subassembly (240 or 240A).

(7) Position tire on inboard wheel subassembly (240 or 240A) with red balance dot on tire sidewall up.

(8) Place outboard wheel subassembly (100) in tire with valve subassembly at red dot on the tire and align bolt holes with those in inboard wheel subassembly. Seat wheel subassemblies together.

(9) Make sure preformed packing (230) is not unseated.

F. Install tube-type tire as follows:

(1) Visually check tire with emphasis on bead area for shipping or handling damage.

(2) Make certain tire is free of foreign material and that bead areas are clean.

WARNING: CLEANING SOLVENTS ARE TOXIC AND VOLATILE. USE ONLY IN WELL-VENTILATED AREAS. AVOID PHYSICAL CONTACT WITH SOLVENT AND DO NOT INHALE VAPORS.

(3) Clean tire beads, wheel flange bead seats and wheel register surfaces with a cloth dampened with isopropyl alcohol, Specification TT-I-735.

(4) Place outboard wheel subassembly (100) on a clean, flat surface.

NOTE: Valve subassembly (110 or 110A) and preformed packing (230) are not used when tube-type tire is installed on the wheel.

(5) Inflate inner tube just enough to round it out. Position tube in tire. Align yellow stripe on base with tube with branded red dot on tire sidewall.

(6) Place tire on outboard wheel subassembly (100) and position valve stem through valve hole.

CAUTION: MAKE CERTAIN THE INNER TUBE IS NOT PINCHED BETWEEN WHEEL SUBASSEMBLIES BEFORE WHEEL BOLTS ARE INSTALLED.

(7) Install inboard wheel subassembly (240 or 240A) in tire so that bolt holes align with those in outboard wheel subassembly and seat wheel subassemblies together.

G. Install wheel fasteners as follows:

(1) Lubricate internal wrenching bolt (90) threads and bearing surfaces of the bolt head, self-locking nuts (70) and double-recessed washers (80) with antiseize compound, Specification MIL-T-5544, before each assembly.

NOTE: Use antiseize compound as received. Do not dilute.

CAUTION: INSTALL BOLT HEADS ON INBOARD SIDE OF WHEEL. THERE MUST BE A COUNTERSUNK WASHER UNDER EACH BOLT HEAD AND UNDER EACH NUT.

(2) Place a double-recessed washer (80) on internal wrenching bolt (90) and install through the inboard and outboard wheel subassemblies. Secure with double-recessed washer (80) and self-locking nut (70).

CAUTION: IF ANY BOLT OR NUT IS ACCIDENTALLY TIGHTENED TO MORE THAN 120 PERCENT OF RECOMMENDED FINAL TORQUE VALUE, REPLACE NUT AND BOLT.

IF POWER WRENCHES ARE USED, ANY FASTENERS TIGHTENED TO MORE THAN 50 PERCENT, BUT LESS THAN 120 PERCENT, OF FINAL TORQUE VALUE SHALL BE DISASSEMBLED AND RELUBRICATED WITH ANTISEIZE COMPOUND, SPECIFICATION MIL-T-5544 BEFORE REASSEMBLY.

(3) Install bolts, washers and nuts in four positions, 90 degrees apart and draw up evenly until wheel subassemblies seat; then install remaining bolts, washers and nuts.

NOTE: When tube-type tire is installed, make certain that inner tube is not pinched between wheel subassemblies.

(4) Tighten nuts in a criss-cross pattern in increments of approximately 50 pound-inches (5,6 N-m) to a final Lubtork value of 150 pound-inches (16,9 N-m).

(a) When power wrenches, other than automatic wrenching systems are used to assemble bolts and nuts, fastener tightness shall not exceed 50 percent of final torque value. Tightening to final torque value shall be accomplished using manual torque wrenches.

(b) Automatic wrenching systems which provide a preload or torque accuracy of ± 4 percent or better may be used to tighten bolts and nuts to final torque value.

NOTE: The use of high speed power wrenches for installation of fasteners can reduce the service life of bolts and nuts.

WARNING: PLACE WHEEL/TIRE IN AN INFLATION CAGE FOR INITIAL INFLATION. DO NOT INFLATE TIRE IN EXCESS OF FULL OPERATING PRESSURE TO SEAT THE BEADS. REDUCE TIRE PRESSURE TO RECOMMENDED STORAGE PRESSURE UNTIL WHEEL/TIRE ASSEMBLY IS READY FOR TESTING. TIRE AND/OR WHEEL FAILURE MAY OCCUR, CAUSING INJURY TO PERSONNEL OR DAMAGE TO EQUIPMENT IF THE TIRE IS OVERINFLATED FROM ANY HIGH PRESSURE SOURCE. TIRE AND WHEEL ASSEMBLIES MUST BE SERVICED WITH INFLATION EQUIPMENT WHICH HAS BEEN SPECIFICALLY DESIGNED FOR THIS OPERATION.

H. Install valve core (130) in valve stem. Place wheel/tire assembly in inflation cage and inflate tire just enough to seat beads.

I. Inflate tube-type tires to one-half of recommended operating pressure after beads are seated and then deflate tire completely. Inflate tire again to recommended storage pressure.

NOTE: This procedure permits the tube to equalize within the tire, preventing thinned and stretched sections in the base of the tube and reduces air leakage.

J. Deflate tire to storage pressure. Install valve cap (120) on valve and remove wheel from inflation cage.

K. Install bearings completing the assembly as follows:

CAUTION: HANDLE BEARING CONES WITH EXTREME CARE. MANY AIRCRAFT BEARING FAILURES RESULT FROM MISHANDLING DURING MAINTENANCE.

USE CLASS 2 OR 4 BEARINGS ONLY. DO NOT SUBSTITUTE ANOTHER CLASS BEARING FOR CLASS 2 OR 4.

(1) Pack bearing cones (30 and 60) and coat bearing cups (220 and 310) and lips of bearing seals (20 and 50) with grease, Specification MIL-G-81322.

NOTE: Lubrication of bearings by mechanical or other pressure methods is recommended because it is more efficient, reduces the possibility of contamination and assures a more even distribution of grease within the bearing.

(2) Install bearing cone (60) into hub of inboard wheel subassembly. Align bearing seal (50) with hub and install seal into hub. Secure seal with retaining ring (40).

NOTE: Install retaining ring so that ends of ring are positioned on each side of antirotation lug on bearing seal (Ref. Fig. 1).

(3) Cover hub opening of inboard wheel subassembly (240 or 240A) to protect bearings from dirt and moisture until wheel assembly is installed on aircraft.

(4) Install outboard bearing cone (30) into hub of outboard wheel subassembly (100).

(5) Align outboard bearing seal (20) with wheel hub and install outboard bearing seal (20) into hub of outboard wheel subassembly (100).

(6) Cover hub opening of outboard wheel subassembly to protect bearings from dirt and moisture until wheel assembly is installed on aircraft.

L. Test wheel/tire assembly as required in accordance with TESTING AND FAULT ISOLATION.

M. *Install axle nut as follows:*

NOTE: Data given for information only.

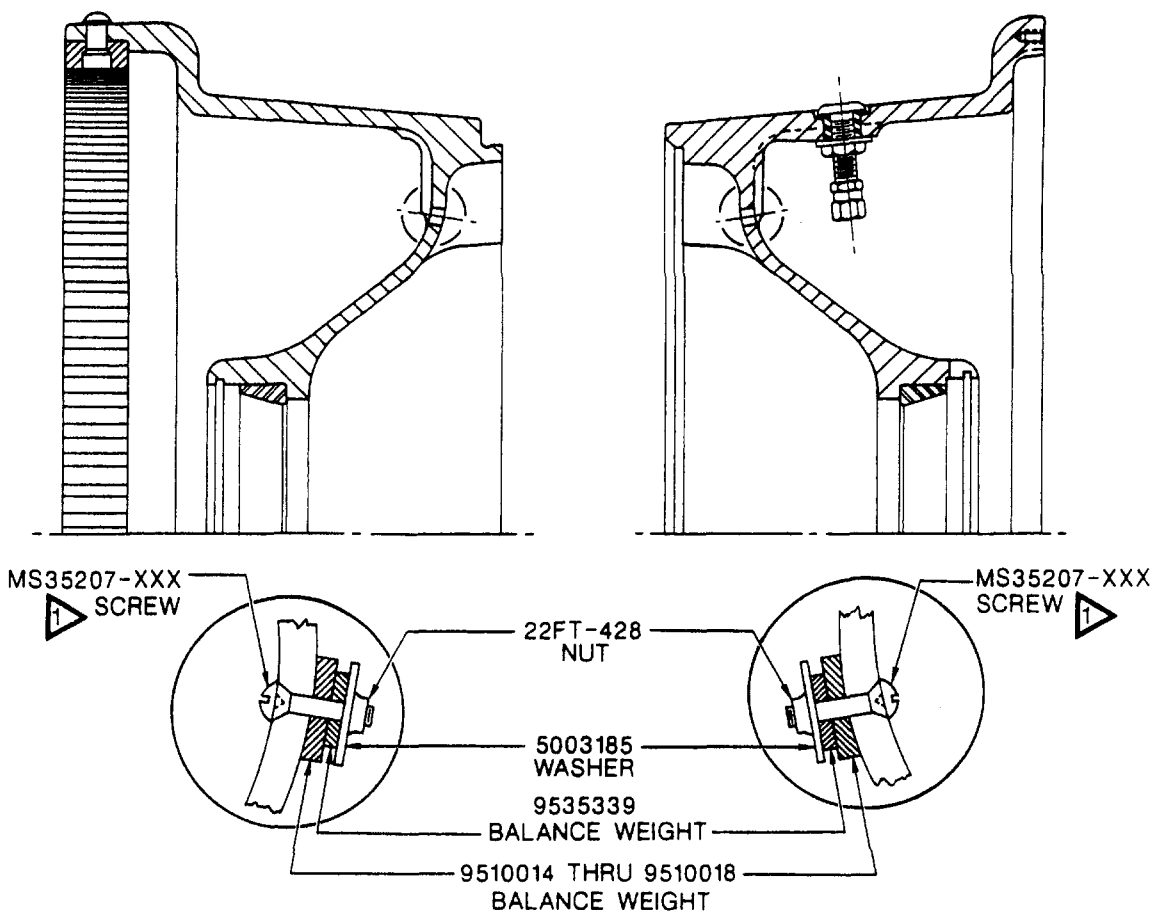
(1) Make sure axle and nut threads are clean and free of burrs.

(2) Apply bearing grease, Specification MIL-G-81322, to all threads and load-bearing surfaces of axle, washer and nut.

(3) Tighten axle nut to 200 pound-inches (22,6 N-m) while manually rotating wheel. Back-off nut to zero pound-inches but with all parts still in contact.

(4) Retighten nut to 100 pound-inches (11,3 N-m) while manually rotating wheel.

(5) If not at a locking position, advance nut to the nearest locking position, not to exceed 30 degrees, and secure.



4. Wheel Balancing

A. Any permanent balance weights removed at disassembly should be reinstalled. The weight values of the permanent balance weights are stamped adjacent and to the right of the hole to which the weights are bolted. See Figure 701 for installation details.

B. Should the wheel require static or dynamic balancing after tire mounting, additional weights may be added to bring the assembly into balance. Secure weights to wheel using the holes provided. Attach weights with a screw of the required length for the number of weights used. Installed weights should not protrude beyond the register edge. See Figure 701 for installation details.

C. If rebalancing of individual wheel subassemblies has been accomplished after wheel repair, then new permanent balance weight values followed by letter "B" should be restamped on flange face adjacent to weights. Obliterate any obsolete values. Balance wheel subassembly to within 1.5 ounce-inches (108 g-cm).

D. Balance weights are available for balancing the wheel/tire assembly. The required weight is obtained by using multiples of the balance weights. Total weight added to the inboard wheel subassembly must not exceed 3.0 ounces (85,05 g). Total weight added to the outboard wheel subassembly must not exceed 3.0 ounces (85,05 g). The installed weights must not extend beyond the register edge of the wheel. The weights are bolted to the wheel web of the wheel subassemblies as shown in Figure 701.

BALANCE WEIGHT P/N	WEIGHT	SCREW LENGTH
9535339	3/4 OZ (21,3 g)	MS35207-280
9510014	1 OZ (28,3 g)	MS35207-280
9510015	1 1/2 OZ (42,5 g)	MS35207-280
9510016	2 OZ (56,7 g)	MS35207-281
9510017	2 1/2 OZ (70,9 g)	MS35207-281
9510018	3 OZ (85,1 g)	MS35207-282

NOTES:

1. INSTALL MS35207 "DASH" WITH PROPER SCREW AS SHOWN IN TABLE, SCREW LENGTH TO ALLOW MINIMUM OF ONE THREAD TO PROTRUDE FROM NUT.
2. USE EXISTING DRILLED HOLE IN WHEEL SUBASSEMBLY AND WEIGHT AS STAMPED NEAR HOLE.
3. COAT SURFACE CONTACT AREAS OF WHEEL AND BALANCE WEIGHT WITH ONE COAT OF ZINC CHROMATE PRIMER.
4. BALANCE WEIGHTS MUST NOT EXTEND BEYOND WHEEL REGISTER EDGE.

Balance Weight Installation
Figure 701

5. Storage Instructions

A. Wheels Stored with Tires Installed

(1) The length of time that a wheel assembly can be stored is governed by the storage life of its rubber components. The usable life may be shortened by exposure to sunlight, ozone concentration, extreme temperatures and contamination by fluids and foreign particles.

(2) The wheel/tire assembly should be stored in a clean, cool, dry storeroom out of direct sunlight. The desirable storeroom temperature range is 32° to 75°F (0° to 24°C). If this temperature range cannot be maintained, temperatures as high as 100°F (38°C) or even 125°F (52°C) can be tolerated for short periods with only minor degradation.

(3) The recommended storage pressure for tires is 40 psi (2,7 bars).

B. Wheels Stored without Tires Installed

(1) The wheel assembly is stored without the wheel preformed packing installed between the two subassemblies. The packaged preformed packing is normally taped to the wheel for initial shipment and should be stored in this manner.

(2) Wheels stored without rubber components have an indefinite storage life.

FITS AND CLEARANCES

Item No. (Ref. IPL Fig. 1)	Nomenclature	Torque Value
70	Self-Locking Nut	150 pound-inches (16,9 N-m) Lubtork*
255	Hex Head Bolt (Steel Drive Ring)	50 to 70 pound-inches (5,6 to 7,9 N-m)
*Lubtork: At each installation, lubricate bolt threads and bearing surfaces of nuts, bolt heads and washers with antiseize compound conforming to Specification MIL-T-5544. Use compound full strength; do not dilute.		

Torque Value
Figure 801

Item No. (Ref. IPL Fig. 1)	Nomenclature	Locking Value
70	Self-Locking Nut	15 pound-inches (1,69 N-m) minimum torque required to assure self-locking capability.
180	Self-Locking Nut	2 pound-inches (0,23 N-m) minimum torque required to assure self-locking capability.

Minimum Locking Value
Figure 802

Item No. (Ref. IPL Fig. 1)	Nomenclature	Wear Limit
300 or 300A	Disk Drive Ring	Replace disk drive ring if three or more teeth are worn to a thickness of 0.125 inch (3,17 mm) or less at a point 0.078 inch (1,98 mm) from the top of the tooth.

Wear Limits

ILLUSTRATED PARTS LIST

1. Introduction

A. General

(1) The Illustrated Parts List (IPL) section illustrates and lists the procurable parts of the assembly(ies) in this publication.

B. Parts List

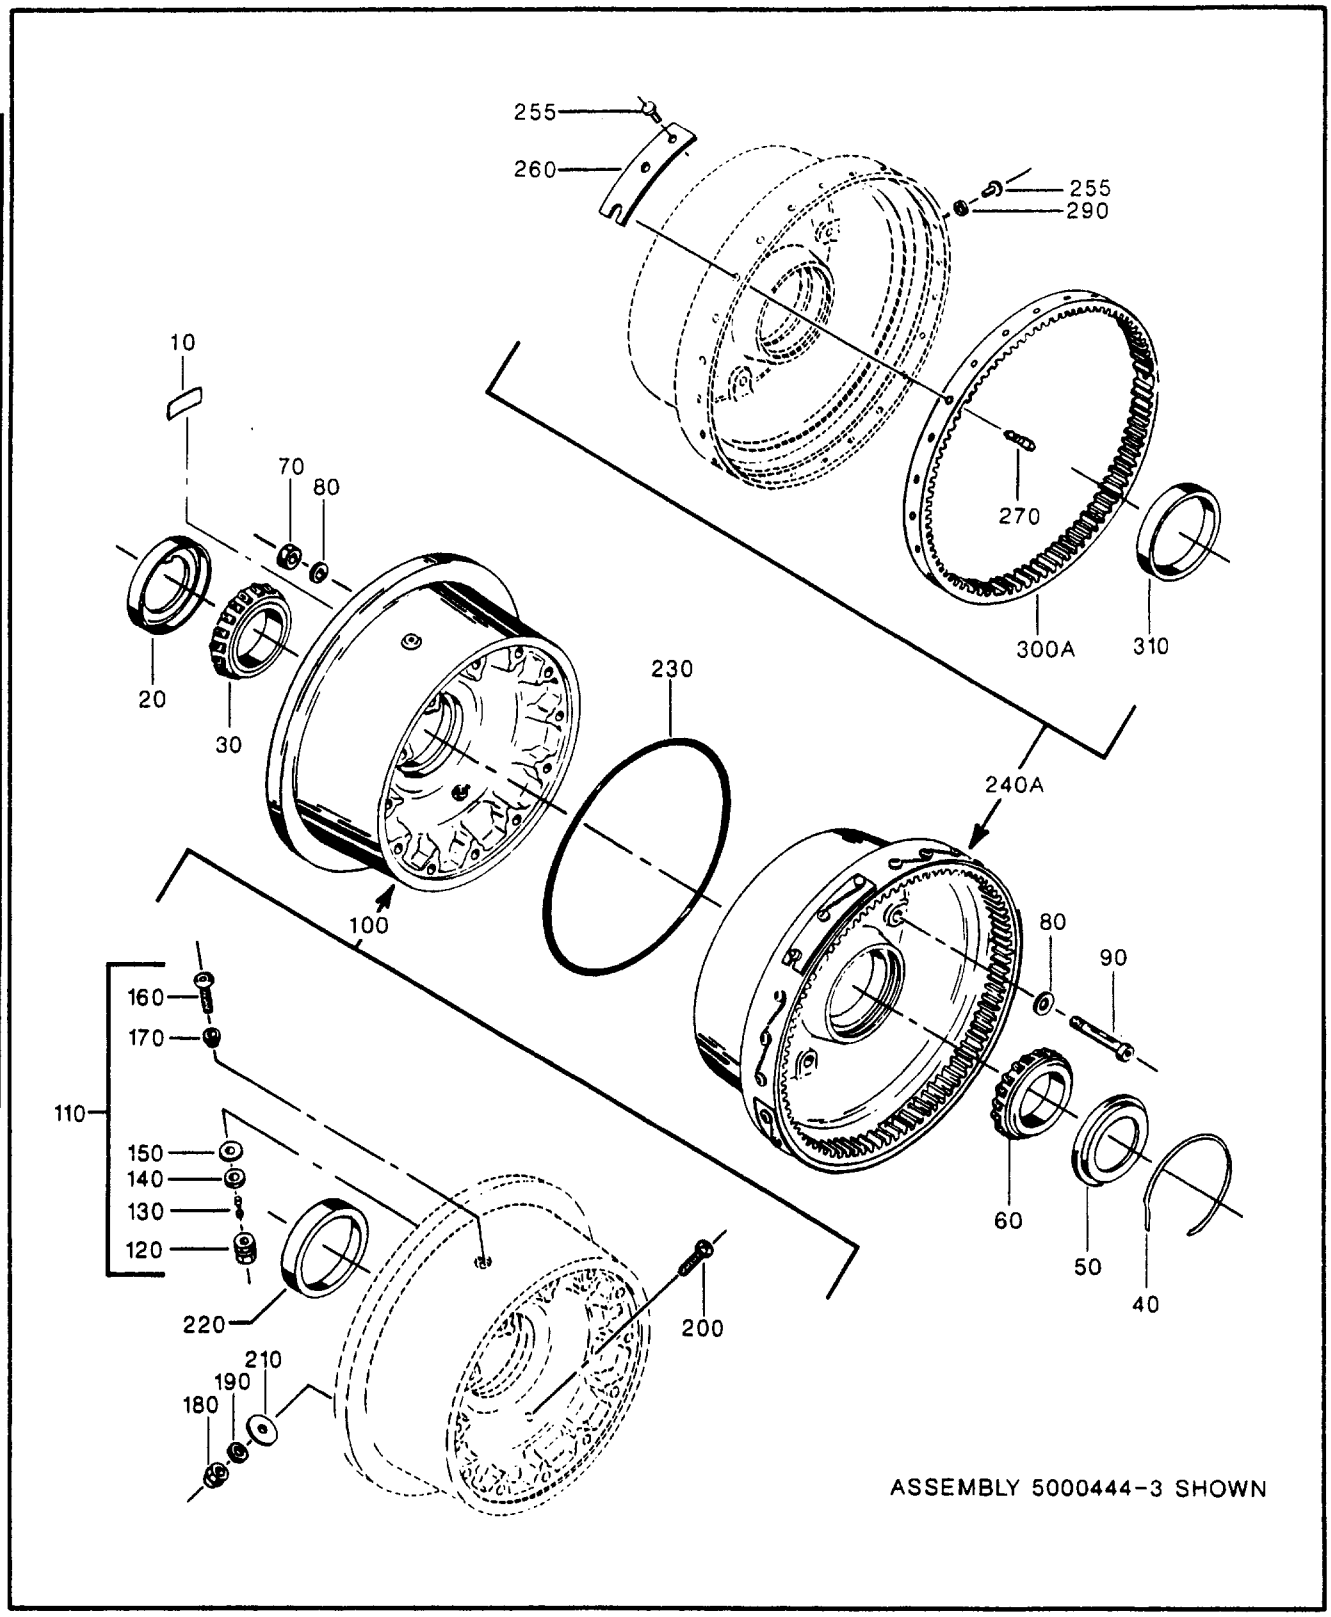
(1) The illustration is an exploded view of assembly(ies) covered by the parts list.

(2) Components in the parts list are listed in order of disassembly.

(3) The Figure and Item column provides the cross reference between the parts list and the associated IPL Figure 1.

(4) The Part Number column gives the part number of the item, which is stamped on the part when practical. This number should be used when ordering parts.

(5) The Airline Stock Number column is provided for the convenience of the operator to enter individual part numbers.



(6) The Nomenclature column gives the basic noun name of each part, together with any descriptive or dimensional information and specifications required to identify the part listed. Parts are indented under the numbered sub-column heading showing the relationship of the parts to their subassemblies and to the assembly. When an alternate part or repair part exists for the recommended part, it is indicated in parentheses following the part nomenclature. A federal supply code number is given for all vendor-supplied items.

(7) The Effect Code column shall establish parts relationship with units or assemblies which are essentially the same but have minor variations. These units or assemblies are the lead items. These units or assemblies shall be assigned reference letters such as A, B, C, D, etc. Parts which are not common to all configurations, but are associated with one or more of the coded lead items, shall carry the letter or letters assigned to the lead item with which it is associated. If a part is common to all lead items, the Effect Code column shall be blank.

(8) The Units Per Assembly column gives the number of parts required for each assembly or subassembly.

C. Federal Supply Codes for Manufacturers

(1) A list of vendor/manufacturer names and addresses is provided following the parts list.

Main Wheel Assemblies 5000444, 5000444-1 and 5000444-3

COMPONENT MAINTENANCE MANUAL
BRAKE ASSEMBLY 5001571

TEMPORARY REVISION NO. 32–2

TO: HOLDERS OF AP-560 (32-43–12) COMPONENT MAINTENANCE MANUAL WITH ILLUSTRATED PARTS LIST FOR BRAKE ASSEMBLIES 5001571, 5001571–1, 5001571–2, 5001571–3, 5001571–4, 5001571–5 AND 5001571–6 USED ON ARAVA 101, 101B, 102, 201 AND 202 AND DEHAVILLAND DHC–6 AIRCRAFT.

PURPOSE: This Temporary Revision is issued to add rework repair limit for brake housing.

FILING INSTRUCTIONS: Record applicable data on the RECORD OF TEMPORARY REVISIONS sheet in front of the manual. Insert page 1 facing the RECORD OF TEMPORARY REVISIONS.

Retain this Temporary Revision until normal revision service incorporates this information into the Component Maintenance Manual.

This Temporary Revision affects page 603 (32–43–12).

RECORD OF TEMPORARY REVISIONS

COMPONENT MAINTENANCE MANUAL
BRAKE ASSEMBLY 5001571

TO: HOLDERS OF XAP-560 (32-43-12) OVERHAUL MANUAL WITH ILLUSTRATED PARTS LIST FOR BRAKE ASSEMBLY 5001571 USED ON ARAVA 101, 201 AND 202 AIRCRAFT.

Attached to this transmittal letter is Revision No. 4 of XAP-560 (basic issue dated 1 June 1972).

REVISION NO. 4 DATED 15 JANUARY 1990

HIGHLIGHTS

REVISION NO. 4 CONTAINS ALL PAGES OF THE MANUAL. Pages which have been added or revised are outlined below, together with the Highlights of the revision.

Please retain all previous HIGHLIGHTS pages inserting them into this manual for future reference.

Chapter/Section and Page No.	Description of Change
All pages	This manual has been prepared with automated word processing equipment. Shifting of text may have occured. Marking of the shifted text has been eliminated. Marking of text pages reflect only actual changes. This manual has been changed from an Overhaul to a Component Maintenance Manual. Sections have been relocated and pages renumbered accordingly. The technical information has not changed unless specified in the following highlights. Added metric units to all dimensions. Changed IPL figure item references to agree with revised parts list, and numbered by increments of 10. Clarified nomenclature in text to agree with parts list.
Cover	Changed from XAP-560 to AP-560 Component Maintenance Manual and added Brake Assemblies 5001571-3, 5001571-4, 5001571-5 and 5001571-6.
Title Page	Changed to Component Maintenance Manual, added part numbers 5001571-3, 5001571-4, 5001571-5 and 5001571-6 and revision date. Clarified aircraft references incorporating Temporary Revision No. 31-1.
Record of Revisions, page 1/2	Added Revision No. 4 and date.
Record of Temporary Revisions, page 1/2	Added Temporary Revision 32-1.

Chapter/Section and Page No.	Description of Change
Service Bulletin List, page 1/2	Added Service Bulletins ARAVA-101-32-1, ARAVA-101B-32-1, ARAVA-102-32-1, ARAVA-201-32-1, ARAVA-202-32-1, ARAVA-101-32-2, ARAVA-101B-32-2, ARAVA-102-32-2, ARAVA-102-32-3, ARAVA-201-32-2, ARAVA-201-32-3, ARAVA-202-32-2.
List of Effective Pages, pages 1/2	Revised to reflect added, revised and/or deleted pages. Changed sections to ATA 100 format.
Table of Contents, pages 1 and 2	Expanded table for clarification.
Introduction, pages 1 thru 4 32-43-12	Added new Introduction with updated field office address list.
page 1	Revised paragraph 1. to add paragraphs 1.A. through 1.E.
page 2	Revised Figure 1 title and added Brake Assemblies 5001571, 5001571-3, 5001571-4, 5001571-5 and 5001571-6. Revised figure item numbering to agree with revised IPL.
page 3	Revised Key to Figure 1 to agree with renumbered IPL. Added new paragraph 3. Handling Procedures.
page 4	Revised paragraph 4. Leading Particulars and added Brake Assemblies 5001571, 5001571-3, 5001571-4, 5001571-5 and 5001571-6. Revised and expanded paragraph 5. Brake Differences.
page 5/6	Added new paragraph 6., Brake Modification. Renumbered previous paragraph 3. to 7. Brake Lining Wear Check. Revised Figure 2 to add Brake Assemblies 5001571, 5001571-3, 5001571-4 and 5001571-6 to existing Brake Assembly 5001571-1. Added Brake Assembly 5001571-5 to existing Brake Assembly 5001571-2.
page 101	Combined information from previous TESTING AND TROUBLESHOOTING section, revised and incorporated into new TESTING AND FAULT ISOLATION section. Revised entire section.
pages 102 and 103/104	Added Figure 101. Renumbered Figure 801 to 102 and revised.

Chapter/Section and Page No.	Description of Change
pages 301 and 302	Revised and relocated entire DISASSEMBLY section. Revised previous DISASSEMBLY section to expand paragraph 1. General, and revise paragraph 2. Disassembly Procedures.
pages 401 thru 405/406	Revised, relocated and renumbered entire CLEANING section. Deleted paragraph 2. General, from previous CLEANING section, and renumbered paragraph 3. to paragraph 2. Cleaning Procedures. Renumbered previous paragraph 4. to 3. and revised to add Method I Dry-Stripping. Previous Wet Stripping is now Method II. Revised paragraph 1, Cleaning Materials to add Dry Stripping materials.
pages 501 and 502	Revised, relocated and renumbered entire CHECK section. Revised paragraph 1. title to Check Materials. Revised paragraph 2. General to add new paragraphs 2.A. and 2.B. Deleted paragraph 3. Check Procedures. Added new paragraph 3. Brake Disk. Added new paragraph 4. Brake Lining, new paragraph 5. Self-Adjusting Pin Nut and new paragraph 6. Self-Adjusting Pin Grip and Steel Washer.
page 503	Added new paragraphs 7. Preformed Packing, and 8. Retaining Ring and Spring Guide. Added new paragraph 9. Brake Release Spring, paragraph 10. Flat Head Pin and paragraph 11. Piston. Added new paragraph 12. Protective Plug and Inlet Adapter and paragraph 13. Bleeder Valve and Bleeder Valve Adapter.
page 504	Added paragraphs 14. Brake Housing, 15. Bolts and Self-Locking Nuts, 16. Disk Guide Lining and 17. Disk Guide Bracket.
pages 601 thru 610	Revised, relocated and renumbered entire REPAIR section.
page 601	Revised and expanded paragraph 1., Repair Materials.
page 602	Revised paragraph 3. and renumbered. Revised previous paragraph 4. title to Repair of Worn Lining Recesses.
page 603	Renumbered previous Figure 401 to Figure 601 and revised title.
page 604	Incorporated information in previous paragraphs 3.A. thru 3.J. into Key to Figure 601.

Chapter/Section and Page No.	Description of Change
page 605	Numbered previous Lining Recess Figure to Figure 602 Lining Recess Edge Repair Limits. Revised paragraph 5. title to Repair of Flat Head Pin.
page 606	Renumbered previous Figure 402 to 603, Lining Recess Repair.
pages 607 thru 611	Added new paragraph 6. Replacing Disk Guide Lining. Relocated previous paragraph 6. Piston Release Springs to CHECK section. Relocated previous paragraphs 7. and 8. to CHECK section. Renumbered previous paragraph 9. to paragraph 7., Re-Treating and Repainting. Added Method I (Primary) for aluminum topcoat/primer combination. Existing method now Method II (Alternate).
pages 611 and 612	Added new paragraph 8. Modification of Brake Assembly 5001571, 5001571-1, 5001571-3 and 5001571-4 to Brake Assembly 5001571-6. Added paragraph 9., Modification of Brake Assembly 5001571-2 to Brake Assembly 5001571-5, incorporating referenced Service Bulletins.
pages 701 thru 705	Revised ASSEMBLY section to ASSEMBLY AND STORAGE section and relocated. Revised paragraph 1., Assembly and Storage Materials to add Pliobond 5001, hydraulic preservative fluid, Specification MIL-H-6083, Rust Veto 4214, and Naptha or Lead-Free Gasoline. Also added antiseize compound (Lubtork), Specification MIL-T-83483 as prime and changed antiseize compound, Specification MIL-T-5544 to alternate. Revised paragraph 2. to add new paragraphs 2.A. and 2.B. Revised paragraph 3. Assembly Procedures to expand and clarify.
page 702	Added new paragraph 3.B. to install bleeder. Added paragraph 3.C. to install inlet and 3.D. to assemble piston units.
page 703	Added new paragraph 3.E. to install piston units. Added new Figure 701 Preformed Packing Installation.
page 704	Added new paragraph 3.F. to install brake fasteners. Added new paragraph 3.G. to install brake linings.
pages 705 and 706	Added new paragraph 4. Installation of Disk Guide Bracket Subassembly. Added new paragraph 5. Storage Instructions, incorporating information from previous Storage Instructions section.

Chapter/Section and Page No.	Description of Change
page 801	Renumbered previous Figure 601 to 801 Spring Values. Revised figure item numbers to agree with revised parts list. Renumbered previous Figure 602 to 802 Wear Tolerances. Revised figure item numbers to agree with revised parts list.
page 802	Renumbered previous Figure 603 to 803, Torque Values. Revised figure item numbers to agree with revised parts list. Deleted previous Figure 604 Conversion Table Inches/Millimeters and added metrics throughout text.
page 901/902	Added SPECIAL TOOLS, FIXTURES AND EQUIPMENT section.
page 1001	Relocated previous Illustrated Parts List section and revised. Revised paragraph 1. Introduction.
page 1002	Revised IPL Figure 1 to add Brake Assemblies 5001571-3, 5001571-4, 5001571-5 and 5001571-6. Added IPL to precede Figure 1 title and renumbered items in Figure 1 to agree with revised parts list. Added "5001571-6 Shown" to field of illustration.
page 1003	Revised parts list as follows: Item 1-1 - Added new item 1 Brake Assembly 5001571, (Order -3) and effect code A. Item 1A - Renumbered previous item 1-1 to 1A for Brake Assembly 5001571-1 (Order -4) and effect code B. Item 1B - Renumbered previous Figure item 1-1A to 1-1B for Brake Assembly 5001571-2 (Order -5) and effect code C. Item 1C - Added Brake Assembly 5001571-3 (Order -6) and effect code D. Item 1D - Added Brake Assembly 5001571-4 (Order -6) and effect code E. Item 1E - Added Brake Assembly 5001571-5 and effect code F. Item 1F - Added Brake Assembly 5001571-6 and effect code G. Item 10 - Renumbered previous item 2 to 10 for Brake Disk 5001585. Added effect codes BDEG. Item 10A - Renumbered previous item 2A to -10A for Brake Disk 5004272. Added effect codes CF. Item 20 - Renumbered previous item 8 to 20 for Brake Lining 9523331. Added effect code B and *- Not procurable, use until stock depletion. Item 20A - Renumbered previous item 8A to -20A for Brake Lining 5004562. Added *- Not procurable, use until stock depletion. Added effect code C.

Chapter/Section and Page No.	Description of Change
page 1003 (Continued)	Revised parts list as follows: Item 20B - Added new Brake Lining 9523331-1* and effect codes DE. This lining is not procurable, use until stock depletion. Item 20C - Added new Brake Lining 5004562-1 and effect code F. Item 20D - Added new Brake Lining 5008993, and effect code G. Item 30 -Renumbered previous item 7 to 30 for Self-locking Nut 22FH-624. Item 40 - Renumbered previous item 5 to 40 for Plain Washer MS2002-6. Item 50 - Renumbered previous item 4 to 50 for Internal Wrenching Bolt MS20006-61. Item 60 - Renumbered previous item 6 to 60 for Countersunk Washer MS20002C6. Item 70 - Renumbered previous item 30 to 70 for Brake Backing Plate 5001581. Item 70A - Added Brake Backing Plate 5010119. Item 80 - Renumbered previous item 9 to 80 for Self-adjusting Pin Nut 9510894. Item 90 - Renumbered previous item 10 to 90 for Self-adjusting Pin Grip 9510895. Item 100 - Renumbered previous item 11 to 100 for Flat Washer 9523046. Nomenclature was self-adjusting pin washer. Item 110 - Renumbered previous item 12 to 110 and changed nomenclature to Preformed Packing AN6227-5. Added effect codes ABC. Item 110A - Added new Preformed Packing MS28775-010, and added effect codes DEFG. Item 120 - Renumbered previous item 13 to 120 for Backup Ring MS28774-327. Item 130 - Renumbered previous item 14 to 130 and changed nomenclature to Preformed Packing AN6227-30. Added effect codes ABC. Item 130A - Added new preformed packing MS28775-327, and added effect codes DEFG. Item 140 - Renumbered previous item 15 to 140 for Spring Retaining Ring MS16625-3137. Item 150 - Renumbered previous item 16 to 150 for Spring Guide 9524307. Item 160 - Renumbered previous item 17 to 160 for Brake Release Spring 9524304. Item 170 - Renumbered previous item 18 to 170 for Brake Release Spring 9524305.

Chapter/Section and Page No.	Description of Change
page 1003 (Continued)	Revised parts list as follows: Item 180 - Renumbered previous item 19 to 180 and revised nomenclature to Flat Head Pin 9524306. Item 190 - Renumbered previous item 20 to 190 for Piston 5000904. Item 200 - Renumbered previous item 21 to 200 and revised nomenclature to Protective Plug 1604-73. Changed vendor code to (V79555). Item 210 - Renumbered previous item 22 to 210 and revised nomenclature to Preformed Packing MS28778-4. Item 220 - Renumbered previous item 23 to 220 and changed nomenclature to Inlet Adapter 9536102. Item 230 - Renumbered previous item 24 to 230 and changed nomenclature to Preformed Packing MS28778-8. Item 240 - Renumbered previous item 25 to 240 for Bleeder Screw MS35207-260. And added effect codes ABC. Item 240A - Added new item 240A MS35207-259 for bleeder screw. Added effect codes DEF. Item 250 - Renumbered previous item 26 to 250 for Bleeder Washer 511846-4. Item 260 - Renumbered previous item 27 to 260 for Bleeder Valve AN6204-1.
page 1004	Item 270 - Renumbered previous item 28 to 270 for Bleeder Valve. Adapter 9511157. Item 280 - Renumbered previous item 29 to 280 and changed nomenclature to Preformed Packing MS28778-8. Item 290 - Renumbered previous item 3 to 290 for Brake Housing 5001582. Item -300 - Added new Disk Guide Bracket Subassembly 5001607**. Added effect codes ADG. Item -310 - Added new Disk Guide Bracket 5000220. Added effect codes ADG. Item -320 - Added new Disk Guide Lining 5001608. Added effect codes ADG. Item -330 - Added new Tubular Rivet GY16B-12. Added effect codes ADG.
page 1005/1006	Changed vendor code number from 65301 to 79555. Added vendor code 56878.

INTRODUCTION

This manual is published in accordance with Air Transport Association Specification No. 100 for the guidance of personnel responsible for the overhaul and/or maintenance of the assembly(ies) covered in this publication. The procedures described in this manual may be altered if better and/or more economical equivalent methods can be employed by the individual facilities. However, the alternate procedures must not lessen the performance or efficiency of operation of the assembly, and all torque and specific limits or values contained herein must be strictly observed.

All dimensions and other values are expressed in U.S. units followed, where applicable, by the appropriate SI (International System) metric units in parentheses. All illustration dimensions are in inches with millimeter conversions in parentheses unless otherwise specified. Dimensions of standard tools or parts such as drills, taps, bolts, nuts, etc. where there are no equivalent metric tools or parts for the application, appear in U.S. units. Illustrations are for reference only and are not drawn to scale. Attempt is made to illustrate relationship to adjoining parts in proper proportion.

The following precautions apply to all procedures in this manual:

NOTICE

Any alteration to or substitution of any part contained in any wheel and/or brake affecting those assemblies could result in unit malfunction, or other adverse effects.

If alteration to or substitution of any part contained in any Aircraft Braking Systems' wheel and/or brake affecting those assemblies is necessary, obtain prior written Aircraft Braking Systems' authorization and instruction before performing such alteration or substitution.

AIRCRAFT BRAKING SYSTEMS ASSUMES NO LIABILITY WHATSOEVER, WHETHER CONTRACTURAL, WARRANTY, TORT OR OTHERWISE, FOR ANY UNAUTHORIZED SUBSTITUTION OF OR ALTERATION TO ANY PART CONTAINED IN ANY WHEEL AND/OR BRAKE OR FOR ANY ALTERATION NOT PERFORMED IN ACCORDANCE WITH AIRCRAFT BRAKING SYSTEMS APPROVED PROCEDURES.

While Aircraft Braking Systems represents the information contained in this manual was current at the time of publication of this issue, and verified by comparison to engineering documentation, the user is cautioned that he must inquire of the nearest authorized distributor or dealer of Aircraft Braking Systems' wheels and brakes as to whether a more recent publication is in existence before proceeding with overhaul or maintenance operations. If you cannot locate a dealer or distributor, make your inquiry directly to our Customer Support Department, Aircraft Braking Systems, 1204 Massillon Road, Akron, Ohio 44306-4186.

Users outside the United States and Canada should contact the nearest Aircraft Braking Systems International Field office as listed in this manual or the closest Aircraft Braking Systems' distributor.

The aircraft maintenance manual shall take precedence for the component's interface connections with the functional features as used in the aircraft. This manual may also describe functional features that may or may not be used when installed as a component of a system in the aircraft.

TSO NOTICE

This assembly for commercial transport usage carries a "TSO" marking which identifies it as having been fully laboratory tested and qualified to the applicable Federal Aviation Administration (FAA) regulations. As a commercial transport category assembly, it is also tested and qualified to the specification requirements of the applicable airframe manufacturer and, finally, is certified on the applicable aircraft.

After final certification, any substitution of or alteration to any part and/or any change of process or material is not permitted without complete requalification of this assembly and resubmittal of the test data to the FAA for approval.

The FAA regulations subject Aircraft Braking Systems, the airframe manufacturer and the operator to constant surveillance to assure that proper Quality Assurance material and processing controls are maintained in order to provide replacement parts that are the same quality as the parts originally certified in this assembly.

SAFETY SUMMARY

Adhere to all manufacturer's Warnings and Cautions for all materials specified in this manual. Wear protective clothing (gloves, apron, etc.) approved for the materials and tools being used.

ON-CONDITION MAINTENANCE

Individual operators shall determine the frequency of maintenance. Since each operator has a different set of operating conditions, overhaul frequency will vary. Aircraft Braking Systems recommends that on-condition maintenance be performed.

World Airlines Technical Operations Glossary (WATOG) defines on-condition maintenance as follows:

A primary maintenance process having repetitive inspections or tests to determine the condition of units, systems or portions of structure with regard to continued serviceability (corrective action is taken when required by item condition).

DATA RIGHTS

The unit charge for this manual covers reproduction and handling costs only and does not constitute purchase of the data or design contained herein, nor does it convey to the purchaser any rights, patent or otherwise, to reproduce or manufacture from said data.
